Reciprocal Constructions

Typological Studies in Language (TSL)

A companion series to the journal *Studies in Language*. Volumes in this series are functionally and typologically oriented, covering specific topics in language by collecting together data from a wide variety of languages and language typologies.

A New commandment I give to you that you love one another,
even as I have loved you, that you also love one another.

(John 13, 34)

Do not speak against one another, brethren. (James, 4, 11)

Table of contents

VOLUME 1

List of contributors	XIII
Foreword by <i>Bernard Comrie</i>	XVII
Preface by <i>Vladimir P. Nedjalkov</i>	XXI
Part I. Typological aspects of the investigation of reciprocals	
1. Overview of the research. Definitions of terms, framework, and related issues <i>Vladimir P. Nedjalkov</i>	3
2. Lexical reciprocals as a means of expressing reciprocal situations <i>Jurij P. Knjazev</i>	115
3. Encoding of the reciprocal meaning <i>Vladimir P. Nedjalkov</i>	147
4. Sociativity, conjoining, reciprocity, and the Latin prefix <i>com-</i> <i>Anna A. Zaliznjak and Aleksej D. Shmelev</i>	209
5. Polysemy of reciprocal markers <i>Vladimir P. Nedjalkov</i>	231
6. Reciprocal and polyadic (Remarkable reciprocals in Bantu) <i>Elena Maslova</i>	335
7. Reciprocal derivation involving non-verbals <i>Vladimir P. Nedjalkov</i>	353
8. Questionnaire on reciprocals <i>Vladimir P. Nedjalkov and Emma Geniušienė</i>	379
9. Some typologically relevant properties of reciprocal markers and arrangement of the subsequent chapters <i>Emma Geniušienė</i>	435

VOLUME 2

Part II. Reflexive-reciprocal polysemy of reciprocal markers:**A. Verbal and pronominal reciprocal markers**

- | | |
|--|-----|
| 10. Reciprocal and reflexive constructions in German

VOLUME 3

Part III. Reciprocal-sociative polysemy of reciprocal markers:**A. Verbal and pronominal reciprocal markers**

22. Reciprocal, sociative, and comitative constructions in Tagalog 887
Lina I. Shkarban and Gennadij E. Rachkov
23. Reciprocals and sociatives in Udehe 933
Irina Nikolaeva
24. Reciprocal, sociative and competitive constructions in Karachay-Balkar 969
Vladimir P. Nedjalkov and Igor V. Nedjalkov
25. Reciprocal, sociative and competitive constructions in Japanese 1021
Vladimir M. Alpatov and Vladimir P. Nedjalkov
26. Reciprocals, sociatives, comitatives, and assistives in Yakut 1095
Igor V. Nedjalkov and Vladimir P. Nedjalkov
27. Reciprocals, sociatives, comitatives, and assistives in Tuvan 1163
Klara B. Kuular
28. Reciprocals, assistives, and plural in Kirghiz 1231
Vladimir P. Nedjalkov
29. Reciprocal, sociative, comitative, and assistive constructions in Buryat and Khalkha-Mongol 1281
Vladimir P. Nedjalkov, Elena K. Skribnik, Evgenij A. Kuzmenkov and Natalija S. Yakhontova

B. Verbal reciprocal marker only

30. Reciprocal and sociative in Tariana: Their genetic and areal properties 1351
Alexandra Y. Aikhenvald
31. Reciprocal constructions in Bolivian Quechua 1367
Simon van de Kerke

Part IV. Reflexive-reciprocal-sociative polysemy of reciprocal markers:**Verbal reciprocal marker only**

32. Reciprocal constructions in Warrungu 1403
Tasaku Tsunoda

Part V. Sociative-reciprocal-iterative polysemy of reciprocal markers:

A. Verbal and pronominal reciprocal markers

33. Reciprocal constructions in Indonesian 1437
Alexandr K. Ogloblin and Vladimir P. Nedjalkov

B. Verbal reciprocal marker only

34. Reciprocal constructions in Nêlêmwa (New Caledonia) 1479
Isabelle Brill
35. Reciprocal, sociative, middle, and iterative constructions in East Futunan 1511
Claire Moyse-Faurie

VOLUME 4

Part VI. Non-prototypical polysemy:

A. Verbal and pronominal reciprocal markers

36. Reciprocals and related meanings in To'aba'ita 1547
Frantisek Lichtenberk

B. Verbal reciprocal marker only

37. Reciprocals in Mundari 1575
Toshiki Osada

Part VII. Monosemous reciprocal markers:

A. Verbal and pronominal reciprocal markers

38. Reciprocals and sociatives in Evenki (with an appendix on Manchu) 1593
Igor V. Nedjalkov and Vladimir P. Nedjalkov
39. Reciprocal and sociative constructions in Even 1643
Andrej L. Malchukov
40. Reciprocal constructions in Chukchi (with an appendix on Koryak) 1677
Vladimir P. Nedjalkov
41. Reciprocal constructions in Nivkh (Gilyak) 1715
†Galina A. Otaina and Vladimir P. Nedjalkov

B. Verbal reciprocal marker only

42. Reciprocals and sociatives in Ainu 1751
Vladimir M. Alpatov, Anna Ju. Bugaeva and Vladimir P. Nedjalkov
43. Reciprocals in Itelmen (Kamchadal) 1823
Aleksandr P. Volodin
44. Reciprocals in Yukaghir languages 1835
Elena Maslova
45. Reciprocal, response-reciprocal and distributive constructions in Cashinahua 1865
Eliane Camargo

C. Mostly pronominal reciprocal markers

46. Reciprocal and sociative constructions in Bamana 1915
Valentin Vydrine
47. Reciprocal constructions in Vietnamese 1941
†Igor S. Bystrov and Nonna V. Stankevich
48. Reciprocal constructions in Ancient Chinese 1961
Sergej Je. Yakhontov
49. Reciprocal constructions in Modern Chinese (with data from wényán) 1985
Monique Hoa, Vladimir P. Nedjalkov and Tamara N. Nikitina

Part VIII. Another perspective on reciprocals

50. Further remarks on reciprocal constructions 2087
Martin Haspelmath

Foreword

Bernard Comrie

Max Planck Institute for Evolutionary Anthropology /
University of California Santa Barbara

I first became acquainted with the work of the St. Petersburg (then: Leningrad) Typology School around 1970, when I was working on the typology of causative constructions. Among the many sources I used for data on causative constructions across the languages of the world, at a time when such typological endeavors were at the margins of mainstream linguistics in the English-speaking world, one source that I encountered continuously and with immense profit was Xolodovič (1969), a volume to which the editor of the present volumes was also a contributor. The collective monograph showed me the strengths of the typological school from which it emerged: parallel treatment of a number of languages from different language families guided by a questionnaire reflecting the interplay of careful consideration of the empirical data from the individual languages treated and the desire to uncover inductive generalizations relating to the internal form, the syntax, and the semantics of the constructions in question. I vowed to use the next opportunity to make the acquaintance of the linguists who had produced this seminal work. My wish was realized a few years later, during both a brief visit to the group in 1975 and an extended visit in 1976, when I was also able to work intensively with Vladimir P. Nedjalkov both on typology and on the Chukchi language.

At this point, one might be tempted to say: And the rest is history. But history is about the past. Of course, the history of projects from the St. Petersburg typological school is impressive indeed, including an earlier substantial edition in English, namely Nedjalkov (1988) on resultative constructions, another volume that had an important influence on my own thinking and research. But, as the present volumes show, this school also has a present. And, if the energy of Vladimir P. Nedjalkov and his younger colleagues is anything to go by, a future.

The present volumes are thus the latest in a series of works, each devoted to a particular grammatical phenomenon from a typological perspective, with substantial introductory chapters laying out the theoretical background and descriptive framework, and a

series of chapters devoted to the phenomenon in question in individual languages, each written by a specialist or specialists on that language. It should be emphasized that the descriptive framework is not an aprioristic concept designed to constrain the writers of the individual chapters, but rather a framework that has itself grown out of empirical descriptive and analytical work, and thus reflects at least one salient aspect of the Leibnizian ideal of “*theoria cum praxi*”, theory with practice. Conversely, while the individual chapters do not attempt to hide the sometimes idiosyncratic properties of particular features of the language in question and the challenges they may pose for generalizations, they are also of genuine typological and theoretical interest through the ways in which they address the general questions posed in the introductory chapters.

The particular phenomenon that is treated in the present volumes is reciprocal constructions, like *they love each other* (or indeed *they hit each other*, though for once I will try and wean myself away from the linguist’s apparent predilection with fisticuffs). This might seem a rather restricted phenomenon, but as the present volumes show – the treatment of reciprocal constructions occupies substantially more pages than the treatment of any of the former topics undertaken by the St. Petersburg group – the phenomenon in fact betrays intricate interaction with a series of other aspects of language, ranging from form to function and meaning, in a way that makes its detailed treatment a particularly challenging, and therefore rewarding, topic both for cross-linguistic investigation and, indeed, for in-depth study in a particular language.

First, languages differ considerably in the range of forms they use in order to express the semantics of ‘X loves Y and Y loves X’, with many languages having more than one form in competition. English uses the dedicated reciprocal pronoun *each other*, but many other languages make use of a pronominal form that also has other meanings and uses (see below), while yet others have verbal affixes to indicate reciprocity (sometimes again involving polysemy with other uses of the same affix). At the opposite extreme from languages that have grammaticalized the expression of reciprocity to the extent of having bound reciprocal morphology, there are languages like many of those of New Guinea that prefer either to decompose the reciprocal situation into its component parts (as in ‘X loves Y and Y loves X’), or to use an adverbial that explicitly indicates only that there is participation in a joint event. (This last type does not exclude the possibility of expressing quite complex relations, as I know from my own experience doing fieldwork in New Guinea when a local leader enjoined the masses not to indulge in mutual grooming during the visit of an important official, more specifically not to ‘seek each other’s fleas’.)

Second, languages differ in the possible range of syntactic relations between the controller and target of reciprocal constructions. While most languages will have a reciprocal construction that expresses ‘they love each other’, with subject–object coreference, things may start getting difficult when it comes to ‘the priest married them to each other’, with object–object coreference, not to mention ‘the priest married them to each other’s sisters’, with coreference between an object and a possessor. However, should readers get the impression that volumes of this size leave nothing for posterity to investigate, the discussion does not encompass the extreme cases of such possibilities that have provided fare for formal grammarians, for instance. The reader is therefore spared for now the need to

consider examples at the margins of English like *the students persuaded me to look at each other* or *we know what each other are thinking*, in whatever language.

These volumes also consider the semantics of reciprocals, in at least two respects. First, there is the question of reciprocals that do not quite get a literal interpretation, as in *the guests followed each other into the drawing room*, where it is certainly not the case that each guest followed every other guest – this is the so-called “chaining” use of reciprocals. But even more importantly, there are the relations of polysemy that characterize many reciprocal markers, with the same marker in many languages also expressing, for instance, reflexivity, though there are also examples of less expected polysemies, for instance between reciprocal and causative. The investigation of polysemies continues to be one of the hallmark strengths of the St. Petersburg school.

But I should emphasize that, with a set of contributions as rich as those constituting the present volumes, every reader will find something of direct interest. To take just one example from my own reading: I have for some years been interested in the generalization that more explicit means of indicating coreference are preferred in narrower syntactic domains (Comrie 1999). Further evidence in favor of this is provided precisely by Kabardian reciprocals. If there is coreference between subject and non-direct object, the single reciprocal affix *-z-* is used. However, in the narrower domain of coreference between subject and direct object, a further morpheme, *-r-*, is required after *-z-*.

The early years of the St. Petersburg typology school coincided with the last decades of the Cold War, with linguists in the then Soviet Union largely cut off from linguists in the West (and, let me not hesitate to add, vice versa). The scope of the present volumes show how far we have come since those days. Not only is there a significant number of contributors from outside Russia, but the range of languages covered has also broadened considerably, so that we now have a number of articles on languages of the Americas and Oceania, for instance, that were largely absent from those earlier volumes. These volumes join the growing number of works showing how different linguistic traditions can mutually – and that means: reciprocally – benefit one another.

Preface

This collective monograph continues the tradition of the Leningrad/St.Petersburg Typology Group (Workshop for Typological Studies, Institute for Linguistic Research of the Russian Academy of Sciences). It follows the sequence of such works as *Tipologija kauzativnyx konstrukcij. Morfologičeskij kauzativ* [The Typology of causative constructions. Morphological causatives] (A.A. Kholodovich (ed.). 1969. Leningrad: Nauka), *Tipologija passivnyx konstrukcij. Diatezy i zalogy* [The Typology of passive constructions. Diatheses and voices] (A.A. Kholodovich (ed.). 1974. Leningrad: Nauka), *Zalogovyje konstrukcii v raznostrukturnyx jazykax* [Voice constructions in structurally diverse languages] (V.S. Xrakovskij (ed.). 1981. Leningrad: Nauka), *Tipologija rezul'tativnyx konstrukcij (rezul'tativ, stativ, passiv, perfekt)* [Typology of resultative constructions (resultative, stative, passive, perfect)] (V.P. Nedjalkov (ed.). 1983. Leningrad: Nauka) and its revised and enlarged version *Typology of Resultative Constructions* (V.P. Nedjalkov (ed.). 1988. Amsterdam/Philadelphia: John Benjamins; English translation edited by Bernard Comrie), *Tipologija iterativnyx konstrukcij* [Typology of iterative constructions] (V.S. Xrakovskij (ed.). 1989. Leningrad: Nauka) and its English translation *Typology of Iterative Constructions* (V.S. Xrakovskij (ed.). Munich-Newcastle: LINCOM EUROPA), and also *The Typology of Reflexives* by E. Geniušienė (1987. Berlin, etc.: Mouton de Gruyter). The St. Petersburg Typology Group has also published a large number of papers on the typology of bipredicative constructions, converbs, inchoativity, antipassives, etc.

The work on the present collective monograph started in 1991, when I was invited by the Laboratory of Formal Linguistics, VII University of Paris, CNRS (France), for joint research on some problems of common interest. I owe much to my colleagues Zlatka Guentcheva, †Katrín Paris, and †Alice Cartier for the discussion of the early drafts of the typological questionnaire on reciprocal constructions.

Unfortunately, the work on reciprocals took much longer than I had planned because for a number of reasons it was stalled and resumed only after long periods of time.

My work on the present monograph was partly financed by the RGNF grant No. 99-04-00155a (1999–2001) and also by a grant of the President of Russian Federation for the support of leading research schools, Grant No. Nsh-2325.2003.6.

In the final stage of my research, a huge help was an invitation extended by Bernard Comrie, Director of the Linguistic Department of the Max-Planck Institute for Evolutionary Anthropology (Leipzig), to spend three months (May–July 2002) at the Institute, which gave me access to the literature, especially the latest, on reciprocals and related problems.

During my work on this monograph, Werner Abraham, Winfried Boeder, Anna Bugaeva, Taisia Bugaeva, Bernard Comrie, Robert M.W. Dixon, Karen Ebert, Martin Haspelmath, Jeffrey Heath, Vadim Kasevich, Maria Koptjevskaja-Tamm, Ekkehard König, Leonid Kulikov, Alfred Majewicz, Andrej Malchukov, Edith Morawczik, Frans Plank, Serguei Say, Masajoshi Shibatani, Nina Sumbatova, Tasaku Tsunoda, Anna Wierzbicka, and Sergej E. Yakhontov generously supplied me with books and xerox copies of numerous (otherwise unavailable) publications. I also benefitted from valuable advice and other kinds of help from all of them. I am deeply indebted and grateful to all of them as well as to those colleagues who are mentioned in the Acknowledgments throughout the monograph.

Special thanks are due to the contributors of this monograph for their hard work and infinite patience with my changing and ever growing demands. I apologize for the delays to those authors who submitted their papers early and had to endure a long wait. Their patience and understanding are much appreciated.

This project was initially planned as a modest volume of about 15–20 short papers on reciprocals in individual languages, with a brief introductory chapter and a questionnaire for future investigation on a broader scale. In the course of research, however, the number of the contributors and languages to be included grew (some people wanted to join the project on hearing about it), and new problems came to light as broader data was accumulated. On many of the languages rather exhaustive data have been collected and subjected to in-depth analysis. As a result, the final version is quite different in scope and volume from what I had in mind initially.

Reciprocals turned out to be integrated in a vast set of semantic categories with a complex system of interrelations and correlations, and the data turned out to be extremely varied and complicated. I did not have the heart to disregard the accumulating data and cut down the number of languages covered. The variety of devices used across languages to denote reciprocity and variety of the types of their polysemy coupled with relatedness to other verbal categories are staggering. Some of the papers had to be rewritten to accommodate the later findings and bring them into line with other papers submitted much later.

The final versions of the general introductory papers on the typology of reciprocals and related categories that provide the conceptual framework (Chapter 1: “Overview of the research. Definitions of terms, framework, and related issues”; Chapter 3: “Encoding of the reciprocal meaning”; Chapter 5: “Polysemy of reciprocal markers”; Chapter 7: “Reciprocal derivation involving non-verbals”; Chapter 8: “Questionnaire on reciprocals”; Chapter 9: “Some typologically relevant properties of reciprocal markers and arrangement of the subsequent chapters”), based on the data of over 300 languages, were the last to be completed in 2002–2005, as they had to take into account the findings of the subsequent papers on the reciprocals of individual languages. The questionnaire (Chapter 8) covers various aspects of investigating reciprocals (85 queries, most of them with suggestions for typologically possible solutions and illustrations).

The chapters just listed constitute Part I, which contains three more chapters (Chapter 2: “Lexical reciprocals as a means of expressing reciprocal situations”; Chapter 4: “Sociativity, conjoining, reciprocity and the Latin prefix *com-*”; Chapter 6: “Reciprocal and polyadic

(Remarkable reciprocals in Bantu”) and which amplify some issues briefly treated in Chapters 1, 3 and 5.

Chapters 10–49 are language-particular studies of reciprocals. They are divided into six groups (Parts II, III, IV, V, VI and VII) according to the type of polysemy of reciprocal markers, monosemous reciprocals constituting one of the types. Within these types the languages have been classified by the type of the reciprocal marker(s) employed (verbal, pronominal, or both). About 40 individual languages have been considered all in all. The monograph is concluded by a critical review of the present research (Part VIII).

Prior to reading Chapters 10–49, the reader is advised to look through Chapter 9 which explains the arrangement of these chapters and stresses some typologically relevant features and some universals in the diversity of the reciprocal domain.

I owe a very special debt of gratitude to my in-house team: my wife Emma Geniušienė, who contributed to the project in all possible ways, including the feat of typing Vietnamese and Ancient and Modern Chinese materials, and my cat Kosha, who faithfully kept me company all these years sleeping on my desk as I worked, thus giving me comfort and moral support.

PART I

Typological aspects of the investigation of reciprocals

CHAPTER 1

Overview of the research

Definitions of terms, framework, and related issues

Vladimir P. Nedjalkov

Institute for Linguistic Studies, St. Petersburg

1. Goal of investigation. Database. The prototypical reciprocal meaning
 - 1.1 Diagnostic feature of derived reciprocals. Reciprocants. Co-participants
 - 1.2 Extension of the prototypical reciprocal meaning. Situations with three and more participants
2. Means of marking reciprocity and main types of reciprocals
 - 2.1 Grammatical (derived) reciprocals
 - 2.1.1 Characteristics of derived reciprocals. Standard reciprocal opposition. Reciprocalization
 - 2.1.1.1 Syntactic reciprocals
 - 2.1.1.2 Morphological reciprocals
 - 2.1.1.3 Clitic reciprocals
 - 2.2 Other classifications of reciprocals
 - 2.2.1 Pronominal vs. verbal reciprocals
 - 2.2.2 Heavy vs. light reciprocal markers
 - 2.2.3 Anaphoric vs. middle markers
 - 2.2.4 Proper reciprocals vs. spatial reciprocals
 - 2.3 Lexical reciprocals
 - 2.4 Idiosyncratic reciprocal expressions
3. Polysemy of reciprocal markers
 - 3.1 Three main types of polysemy
 - 3.2 Changes in the polysemy type of a reciprocal marker
 - 3.3 Iterative-reciprocal polysemy
 - 3.4 Reflexive-sociative and reflexive-iterative polysemy
 - 3.5 Three cases of relations between productive and unproductive meanings of reciprocal markers
4. Reciprocals and valency change. “Voice-oriented” and “non-voice-oriented” reciprocal markers
 - 4.1 Main valency-changing means
 - 4.2 Voice-oriented vs. non-voice-oriented reciprocal markers
5. Object-oriented reciprocals (embedded and derived). Referential ambiguity
 - 5.1 Causatives of subject-oriented reciprocals
 - 5.2 Reciprocals derived from three-place transitives
6. Reciprocal markers for derivatives with two participants only

7. Simple and discontinuous constructions; “one NP” and “two NP” types. Part of the subject or a comitative object?
 - 7.1 The simple reciprocal construction
 - 7.2 The discontinuous construction in languages with non-verb-final syntax
 - 7.3 The discontinuous construction in languages with verb-final syntax
 - 7.4 No criterion for distinguishing between simple and discontinuous constructions?
 - 7.5 An applicative form of reciprocal serves to build a discontinuous reciprocal construction
8. Reciprocal-sociative polysemy. Sociative, comitative, assistive
 - 8.1 Sociative
 - 8.2 Comitative
 - 8.3 Assistive
 - 8.4 Generalizations
9. Formal correlations: (a) simple reciprocal construction (RECS) – (a’) discontinuous reciprocal construction (RECD), and (b) sociative construction – (b’) comitative construction
 - 9.1 Type A. Languages where constructions RECS – RECD and SOC – COM are marked in the same way
 - 9.2 Type B. Languages with the same marker for RECS – RECD and another marker for SOC – COM
 - 9.3 Type C. Languages with RECD and COM derived by the same marker from RECS and SOC respectively
 - 9.4 Type D. Languages lacking RECD, with SOC and COM marked in the same way
 - 9.5 Type E. Languages lacking RECD, with SOC derived from COM by means of a reciprocal marker
 - 9.6 Type F. Languages which have RECS only
 - 9.7 Type G. Languages which lack SOC and COM and have only RECS and “zero” RECD
 - 9.8 Irreversible reciprocal discontinuous constructions and comitative constructions
10. Reciprocals of converse bases
 - 10.1 Verbs
 - 10.2 Prepositions, adverbs, locative nouns, etc.
11. Relations between verbal and syntactic (mostly pronominal) reciprocals across languages
 - 11.1 Case 1. Languages with (one or more) syntactic reciprocal markers only
 - 11.2 Case 2. Languages with (one or more) morphological and clitic markers only
 - 11.3 Case 3. Languages with both types of reciprocal markers
 - 11.3.1 Case 3a. The language has partially interchangeable but not co-occurring reciprocal markers
 - 11.3.2 Case 3b. The language has both types of reciprocal markers which can co-occur and are partially interchangeable
 - 11.3.3 Case 3c. The syntactic marker is used with verbal reciprocals only
 - 11.3.4 Case 3d. Syntactic and verbal reciprocals are in complementary distribution
 - 11.4 Case 4. A verbal and a syntactic markers are obligatorily used together

12. The main diathesis (= syntactic) types of reciprocals. Subject-oriented reciprocals; type A.1
 - 12.1 Reciprocals with argument coreferentiality (type A.1.1)
 - 12.1.1 “Canonical” reciprocals (type A.1.1.1)
 - 12.1.1.1 Reciprocals derived from two-place transitives
 - 12.1.1.2 Reciprocals derived from two-place intransitives
 - 12.1.1.3 Reciprocals derived from three-place transitives
 - 12.1.1.4 Reciprocals derived from three-place intransitives
 - 12.1.1.5 Reciprocals derived from one-place intransitives (sic!)
 - 12.1.2 “Indirect” reciprocals (type A.1.1.2)
 - 12.1.2.1 The standard case
 - 12.1.2.2 Deviations from the standard case
 - 12.2 Reciprocals with non-argument coreferentiality (type A.1.2)
 - 12.2.1 “Possessive” reciprocals (type A.1.2.1).
 - 12.2.1.1 The standard case
 - 12.2.1.2 Deviations from the standard case
 - 12.2.2 “Adverbial” reciprocals (type A.1.2.2)
 - 12.3 “Irreversible” reciprocals (type A.1.3)
 - 12.4 Implicational hierarchy of the diathesis types of reciprocals
13. Object-oriented reciprocals; type A.2 – spatial transitive reciprocals of joining and separating
 - 13.1 The Kabardian case
 - 13.1.1 Introductory
 - 13.1.2 Proper intransitive reciprocals and spatial intransitive and transitive reciprocals
 - 13.1.3 Formation of spatial transitive reciprocals: Labile derivation, reciprocal, locative markers
 - 13.1.4 Reversible and non-reversible spatial reciprocals
 - 13.1.5 The prefix *zə-* as a fixed component of complex preverbs
 - 13.1.6 Lexical range of spatial transitive reciprocals
 - 13.2 Types of derivation of spatial transitives
 - 13.2.1 Type 1. Same marker is used for object- and subject-oriented reciprocals
 - 13.2.2 Type 2. Object-oriented reciprocals are derived from anticausatives by a causative marker
 - 13.2.3 Type 3. Object-oriented reciprocals are derived by a complex reciprocal-causative marker
 - 13.2.4 Type 4. Object-oriented reciprocals are derived from subject-oriented by a causative marker
 - 13.2.5 Type 5. The reciprocal marker is attached to the postposition or preposition and not to the predicate
 - 13.2.6 Type 6. Object-oriented (spatial) reciprocals with “non-voice-oriented” markers (Latin, Ancient Greek)
14. Reciprocal anticausatives (type A.3)
15. “Non-voice-oriented” markers; other meanings
 - 15.1 Introductory notes
 - 15.2 The sociative and comitative meanings (Latin, Ancient Greek)
 - 15.3 The assistive meaning (Ancient Greek)

- 15.4 The response reciprocal meaning
- 15.5 Subject-oriented reciprocals (spatial intransitives) (Latin, Ancient Greek)
- 16. The reciprocal marker on lexical reciprocals
 - 16.1 Introductory
 - 16.2 Subject-oriented lexical reciprocals in discontinuous and simple constructions
 - 16.2.1 Prototypical lexical reciprocals
 - 16.2.2 Lexical semi-reciprocals
- 17. Concluding remarks
 - 17.1 Grammatical and lexical (inherent) reciprocals
 - 17.2 Reciprocal marking devices
 - 17.3 Syntactic (diathesis) types of proper reciprocals
 - 17.4 Spatial transitive reciprocals
 - 17.5 Simple and discontinuous reciprocal constructions
 - 17.6 Lexical range of the main meanings of polysemous reciprocal markers
 - 17.7 Formal relations between simple and discontinuous reciprocal constructions and sociative and comitative constructions

1. Goal of investigation. Database. The prototypical reciprocal meaning

This collective monograph is aimed at a detailed description of reciprocals (= symmetrical predicates) of individual languages in comparable terms with respect to their morphological, syntactic and semantic properties, and their polysemy. In this chapter I shall introduce the principal terms in which reciprocal constructions, i.e. constructions with a reciprocal predicate, either grammatical (= derived; see (2a)) or lexical (if it is an inherent reciprocal; see (1)), are described in this monograph. In the subsequent chapters of Part I, some of these concepts will be explained in more detail. This chapter (as well as Chapters 3, 5, 7 and 8) is based on the data of the subsequent chapters on the reciprocals of 40 individual languages, both genetically related and unrelated. These chapters deal with reciprocals, and also with related phenomena. The data of these chapters are supplemented by the empirical material from the literature on reciprocals and also from literature where reciprocals are dealt with in passing. All in all, about 300 different languages are cited (see Language Index).

The prototypical reciprocal meaning, i.e. the meaning of the type '(to / of / against / from / with / ...) each other', is usually defined as describing situations with at least two entities (participants) which

(a) are in the identical reverse relation to each other, i.e. the semantic arguments have the same semantic content, cf.:

- (1) *John and Bill are friends,*

in particular,

(b) they perform two identical semantic roles (e.g. of agent and patient) each, cf.:

- (2) a. *John and Bill hit each other.*

In other words, (a) implies that two predications

- b. *John hits Bill*

and

- c. *Bill hits John*

are presented as one, i.e. two subevents are shown as one event or situation (cf. also (4), (9) below).

The relations between the participants of a reciprocal situation are transparent enough, therefore it is not accidental that we find more or less similar characteristics of the reciprocal meaning in many earlier and recent works (cf. Popov 1881:294; Porzhezinskij 1903:39; Jespersen 1924:161; Tesnière 1959:242; Wierzbicka 1980:256; Xrakovskij 1981:24–38; Yomdin 1981:89, 91; Lichtenberk 1985:21; Kemmer 1993:95–7, etc.).

The meaning of the reciprocals indicates that they are at least two-place predicates semantically; cf.:

- (3) a. *John is my friend,*
 b. *John and I are friends.*

and they cannot form a construction with a single non-collective participant unless it is an elliptical construction; cf.:

- c. *?John is a friend,*

which provokes a question “Whose friend?”, and predicates denoting situations with only one participant cannot be reciprocal. On the other hand, there are forms implying a multiple participant that are not reciprocal in meaning although they are semantically close to reciprocals as they share the feature of the multiple participant. This pertains to plural verb forms (grammatical or lexical), sociative forms, as well as distributive forms. (Note that the semantic distributive component ‘each’ is usually included in the definition of reciprocal markers, and not infrequently it is a part of a reciprocal marker; cf. *each other*.) And in a number of languages a reciprocal marker also has the function of marking the plural number on verbs, or the function of a sociative marker, or it is a part of a sociative marker.

1.1 Diagnostic feature of derived reciprocals. Reciprocants. Co-participants

Example (2) can serve as a diagnostic test for establishing a reciprocal construction and a marker of reciprocity. It is the pronoun *each other* that, being monosemous, establishes the semantic identity of (2a) with a pair of sentences, viz. (2b) and (2c), containing the same predicate and inverted arguments (this relation is also called cross-reference).

The marker *each other* expresses reciprocity by itself, but in other cases it is only this traditional procedure of establishing the semantic identity of reciprocal sentences like (2a) with two non-reciprocal sentences like (2b) and (2c) that allows to identify the marker of

reciprocity. Thus, in the German sentence (4b), which is equivalent to English (5b), this marker is the highly polysemous clitic *sich*:

- (4) a'. *Anne umarmte Marie.* + a". *Marie umarmte Anne.* = b. *Marie und Anne umarmten sich.*
- (5) a'. *Ann hugged Mary.* + a". *Mary hugged Ann.* = b. *Ann and Mary hugged [each other].*

This traditional procedure of establishing the reciprocal meaning allows to identify reciprocals across languages.

As we see, a reciprocally marked verb in the German example is in opposition to a non-reciprocal verb, i.e. the base verb without a reciprocal marker. A construction containing a reciprocal marker is termed reciprocal; the construction with the corresponding base verb is termed non-reciprocal.

It is asserted above that a reciprocal construction, i.e. (4b) or (5b), covers the semantic content of two non-reciprocal inversely symmetrical constructions (4a') and (4a'') or (5a') and (5a'') respectively. I do not discuss here the obvious fact that (4a') and (4a'') can describe events taking place at different times, while (4b) describes simultaneous or temporally adjacent actions of both reciprocants (see Wierzbicka 1980:256–7; Kemmer 1993:109). The temporal distance between two subevents of a reciprocal situation may be long enough but it does not interrupt continuity of the situation; cf.:

- (6) *They write letters to each other every 5 years.*

The constituents of a reciprocal construction can be termed reciprocal arguments, and they denote reciprocants. Thus, the reciprocal arguments in (4b) and (5b) are 'Anne' and 'Marie', and 'Ann' and 'Mary', respectively. One of the reciprocants can be expressed by a non-subject; in this case it can be termed co-participant.

1.2 Extension of the prototypical reciprocal meaning. Situations with three and more participants

Reciprocals with two participants are considered prototypical (cf. Lichtenberk 1994:3506; Kemmer 1993:98). In this case each participant, as mentioned, is both the agent and the patient of the same action. A typical example is (2a). Besides situations with two participants, there are two more types of situations. The prototypical reciprocal relation of the type *A hits B and B hits A* can be further extended to situations where one or both participants refer to a plural set. This is the case if the subject names a plural participant (it may be both formally and semantically plural, as in (7a), or a coordinated subject comprised of singular noun phrases, as in (7b), or a formally singular collective noun, as in (7c)):

- (7) a. *The boys hit each other.*
 b. *John, Bill and Tom killed each other.*
 c. *People hit one another.*

The relationship between the persons within a plural participant, as illustrated in (7), is somewhat different from the prototypical reciprocal relation: it is unlikely or technically difficult, or outright impossible for each of the participants to perform both roles (of agent and patient) with regard to each other; in other words, the relations between the reciprocants cannot be reduced to the sum of prototypical reciprocal relations. All this also pertains to reciprocal constructions with an indefinite personal pronoun like German *man* or French *on* in the subject position (here the subject is grammatically singular but semantically plural). Situations with three or more singular participants are of theoretical interest but hardly relevant for the typology of reciprocals, although there are languages with a special reciprocal marker for verbs denoting situations with more than two participants (see 5.3).

In the above instances the prototypical reciprocal situation is extended due to the number of the participants exceeding two, and in the case of certain verbs with two (singular) participants, it is extended due to the lexical meaning of the base verb: in reality only one of the participants can perform the act denoted by the base, though it remains unspecified which one of them; cf.:

- (8) a. *We decided to wake each other up in the morning.*
 b. *Charles and Bill followed each other.*

Reciprocals like (8a), where only one of the participants can wake up the other, and also (8b) where one of them follows the other, may be regarded as extended use of a reciprocal marker rather than a special meaning. Cases like (7) are not special meanings either, and this is reflected in the marking of both cases like (7) and (8) across languages in the same way as prototypical reciprocals. However, reciprocals like (8b) take a special place as they derive from a limited number of bases expressing converse relations (cf. *A follows B = B precedes A*), which meaning is close to the reciprocal one (for details see §10).

To sum up, languages usually treat situations like these on a par with prototypical ones, which finds expression in identical reciprocal encoding.

2. Means of marking reciprocity and main types of reciprocals

As mentioned, reciprocals subcategorize into two main types, *grammatical* (or *derived*) and *lexical* reciprocals (they may also be labelled explicit and inherent reciprocals respectively), with possible peripheral types (see 2.3).

2.1 Grammatical (derived) reciprocals

These reciprocals can be divided into three main types which are further subcategorized into seven final subtypes.

2.1.1 Characteristics of derived reciprocals. Standard reciprocal opposition.

Reciprocalization

The term “grammatical (derived)” is used broadly to cover not only morphological derivation but also combinations of verbs with words meaning ‘each other’ and/or ‘mutually’. I assume that derived reciprocals have the following characteristics:

- They are related to an underlying (base) verb without a reciprocal meaning; (a special case is the simultaneous use of two reciprocal markers, especially pleonastically (see (9d)), and also the use of grammatical reciprocal markers on lexical reciprocals; see Section 16).
- They enter into a standard reciprocal semantic opposition with the base verb, its lexical meaning being retained in the derivative and the reciprocal meaning being augmented to it.
- The base verb describes a situation with at least two participants (deviations from this feature will be discussed separately; see reciprocals derived from one-place (sic!) intransitives in (113) and (114)).
- In the reciprocal construction the co-referent non-subject constituents are eliminated, the plural subject denoting both participants each with a double role. This process can be termed reciprocalization (cf. reflexivization, causativization, etc.). In other words, the underlying arguments are reciprocalized (note that in (1) no reciprocalization occurs, the word being inherently reciprocal; for details on lexical reciprocals see Sections 2.3 and 16).

Reciprocal constructions of this type are termed subject-oriented as the antecedent of the reciprocal marker is expressed by the subject (on object-oriented reciprocals see Sections 2.2.4, 5 and 13).

Derived reciprocals are further subdivided into three main types, syntactic, morphological and clitic. Examples of syntactic marking are (2a), (5b) and (9b). Clitic marking is illustrated in (4b) above. Example (9c) illustrates morphological marking by means of a suffix which can be used simultaneously with a syntactic marker (9d).

Yakut (Kharitonov 1963: 36; *-s* = REC; *beje beje-leri-n* is a reciprocal pronoun inflected for person and case; alternation *-ö/-ü* is due to vowel harmony)

- (9) a'. *Aya-m əal-ən öjdö-t-ö.*
 father-my neighbour-POSS.ACC understand-PAST-3SG
 ‘My father understood (his) neighbour.’
- + a". *əal-a aja-bə-n öjdö-t-ö.*
 neighbour-his father-my-ACC understand-PAST-3SG
 ‘The neighbour understood my father.’
- = b. *Aya-m ikki əal beje beje-leri-n öjdö-t-üler.*
 father-my two neighbour self self-their-ACC understand-PAST-3PL
 ‘My father and (his) neighbour understood each other.’
- = c. *Aya-m ikki əal öjdö-s-t-üler.*
 father-my two neighbour understand-REC-PAST-3PL
 (same translation).

- = d. *Aya-m ikki əal beje beje-leri-n öjdö-s-t-üler.*
 father-my two neighbour self self-their-ACC understand-REC-PAST-3PL
 (same translation).

Note that sentence (9d) seems to be preferable to (9b–c), (9c) is the least preferable with this verb, according to one of our informants, though others find it difficult to choose the most acceptable variant.

One of the participants (co-participant) can be backgrounded and it is made object, and this is marked by predicate agreement only with the subject in (9e). The meaning is the same as in (9b, c, d), but only one participant is placed in subject position for pragmatic reasons. It is but natural that the reciprocal pronoun *beje beje-leri-n* cannot be added because of the singular subject as antecedent.

- = e. *Aya-m əal-in kəttə [*beje beje-leri-n] öjdö-s-t-ö.*
 father-my neighbour-ACC with each other understand-REC-PAST-3SG
 (same translation), lit. ‘My father understands each other with (his) neighbour.’

Further on, type (9b, c, d) constructions are termed *simple* reciprocal constructions and those of type (9e) *discontinuous* (for details see Section 7).

2.1.1.1 Syntactic reciprocals. They include two subtypes:

- Subtype A involving a doubling of clauses or verb phrases with the concomitant inversion of the arguments; roughly, this can be illustrated by sentences (9a’) and (9a’’) combined into one compound sentence of the non-grammaticalized type *My father respected his neighbour and the neighbour respected my father* (for details see Ch. 3, §3).
- Subtype B composed of a verb and a component like the following:
 1. A reciprocal (pro)noun like English *each other* and Malayalam *oraal matte aal-e* ‘each other’ (lit. ‘one person other person-ACC’) (Jayaseelan 2000: 148).
 2. A reciprocal adverb like Malayalam *tammil* ‘among them’ (Jayaseelan 2000: 119) and Chinese *hùxiāng* ‘mutually’ (cf. (35) below). Reciprocal pronouns differ from reciprocal adverbs in that they can be case-marked and combine with adpositions.
 3. Adverbs like German *gegenseitig* labelled here *reciprocal specifiers* which are as a rule used in constructions with reciprocal predicates pleonastically or for disambiguation of polysemous reciprocal forms (86).

Strictly speaking, subtype B should be labelled *lexico-syntactic*, as the markers listed above are free morphemes – lexemes denoting reciprocity (cf. Yakut *beje beje-leri-n* in (9b) and also the reciprocals with the pronoun ‘each other’ in the translations of (9b–d), or reflexive pronouns like Polish *siebie* in (17b), etc.).

The distinction between Types 1 and 2 is sometimes not quite clear, especially in isolating languages.

2.1.1.2 Morphological reciprocals. There are four main subtypes:

- Subtype C: periphrastic constructions, e.g. active participle + auxiliary verb (see Nedjalkov Ch. 3, §4.1).
- Subtype D: compounds with recurrent components (see Ch. 3, §5, and also ex. (18) below).
- Subtype E: verbs marked for reciprocity with affixes, i.e. prefixes, suffixes, circumfixes (see (9c), (13), (14b), (16), etc.) and postfixes (like Russian *-sja/-s'* in (30c)).
- Subtype F: verbs marked for reciprocity with root reduplication, which is mostly combined with affixation (see Ch. 3, §7).

Subtypes C, D and F seem to be less widespread cross-linguistically than E.

2.1.1.3 Clitic reciprocals. This type comprises one variety of markers: verbs marked with clitics, including reflexive (clitic or clitic-like) pronouns (like French *se* (33), German *sich* (4)). Functionally, they do not differ from affixes, being intermediate between subtypes B and E. Sometimes, there is no clear-cut distinction between syntactic reciprocals and reciprocals marked with clitic pronouns (see Ch. 3, §8).

2.2 Other classifications of reciprocals

Reciprocals can also be classified according to a number of other features. The following classifications have been suggested.

2.2.1 Pronominal vs. verbal reciprocals

The classes often distinguished in the literature are [pro]nominal reciprocals contrasted to verbal reciprocals which are mostly built by affixes and clitics (the terms *nominal* and *verbal* are used by Faltz (1977: 15, 188) with respect to reflexives). The term *pronominal reciprocals* is used here as a cover term for all the varieties of subtype B. Verbal reciprocals include all the remaining subtypes excepting A. Subtype E is the most prominent among them. Subtypes B, E and F seem to be the most widespread devices of reciprocal marking.

In contrast to pronominal reciprocals, derivation of verbal reciprocals mostly involves detransitivization, as in (9c), although pronominal and especially adverbial reciprocals sometimes preserve some features of transitivity. Thus, *beje beje-leri-n* takes the direct object position in (9b), but not in (9d) where the reciprocal predicate is intransitive and thus *beje beje-leri-n* loses its argument properties and functions here as a reciprocal specifier.

2.2.2 Heavy vs. light reciprocal markers

This subdivision is based on the phonetic “weight” of the markers (see Kemmer 1993: 25, 102–8; cf. also Faltz 1977: 43). It mostly coincides with the above distinction: the pronominal vs. verbal marking is typically represented by heavy vs. light markers. But this is not always the case. On the other hand, verbal markers can also be either heavy or light. Not infrequently, heavy markers are productive and light markers are unproductive. Compare,

for instance, the unproductive reciprocal prefix *ber-* and productive circumfix *ber-...-an* in Indonesian, and the unproductive prefix *fe-* and productive circumfix *fe-...-'aki* (and its variants) in East Futunan (see (25)). This is made more complicated by the fact that in the latter case “middle” heavy markers are possible; cf. the East Futunan circumfix *fe-...-ki* (and its variants) (Moyse-Faurie Ch. 35, §§3.1, 3.2, 3.3). Among pronominal reciprocal markers, one can also distinguish light and heavy ones. This can be exemplified by the German light verbal marker *sich*, which was pronominal at some period of historical development and retained some pronominal features at present, and the pronoun *einander*, which is a heavy marker.

2.2.3 Anaphoric vs. middle markers

This subdivision concerns the semantic aspect though it overlaps with the above two subdivisions. Markers expressing only the reciprocal and/or reflexive meaning (cf. the Yakut reciprocal pronoun *beje-beje-leri-n* in (9b)) may be termed anaphoric, and markers with a number of other meanings that have evolved from, often by way of detransitivization, from the reflexive and/or reciprocal meanings may be termed middle (cf. the Yakut verbal reciprocal *öjdö-s-t-üiler* ‘they understand each other’ and (*bulkuj-* ‘to mix sth and sth’ >) anticausative *bulku-s-* ‘to get mixed’). Pronominal markers are usually anaphoric and middle markers are mostly verbal. But this tendency has exceptions; for instance, the Chukchi suffix *-waly-* is anaphoric since its meaning is exclusively reciprocal. For details see Nedjalkov (2004:315–397).

2.2.4 Proper reciprocals vs. spatial reciprocals

In some languages we find reciprocal markers which, alongside standard reciprocal relations between the underlying subject and object (see (9) above), express similar relations between the underlying direct and non-direct objects (or, much less frequently, between two underlying non-direct objects). These reciprocals usually denote spatial relations of joining (of two or more symmetrical entities) separating an object (into two or more symmetrical entities), and they can be termed object-oriented spatial reciprocals (spatial reciprocals for short), to distinguish them from causatives of subject-oriented reciprocals (like *He caused/let them to help each other*; see §5.1); cf. Ainu subject-oriented intransitive *u-ekap* ‘to greet each other’ (← transitive *ekap* ‘to greet sb’) and object-oriented spatial transitive *u-kotukka* ‘to glue sth (and sth) to one another’ (← transitive *kotukka* ‘to stick sth to sth’) (see (167)–(168) below). (For details see Section 13, in particular 13.2.) Similar pairs of reciprocals can be formed by syntactic markers. Thus, in Lezghian the reciprocal pronoun *sada-sada-* can form both subject-oriented reciprocals with meanings like ‘to trust each other’, ‘to be afraid of each other’, and object-oriented reciprocals with meanings like ‘to put the pieces together’ (Haspelmath 1993:409–410). Cross-linguistically, pronominal markers are used for spatial reciprocals more often than verbal markers.

Spatial reciprocals are opposed to reciprocals proper, i.e. standard reciprocals illustrated in (4b), (7a), (13), (9c), etc.

Note that among seemingly standard reciprocals with detransitivization of two-place transitives, reciprocals with spatial meanings of joining and separating are possible; cf. Ainu *kotuk* ‘to stick to sth/sb’ (vt) → *u-kotuk* ‘to stick to each other’ (vi).

2.3 Lexical reciprocals

These are items whose meaning is not a mere sum of the meaning of the base and the meaning ‘each other’. Their number in a language may run into hundreds (according to some preliminary data, in Russian there are about a thousand lexical reciprocals, and about 400 of them contain the postfix *-sja*; the latter either have no respective base verbs or they are unrelated to the base verbs semantically (cf. *borot’-sja* ‘to fight’, *sorevnovat’-sja* ‘to compete’, *bratat’-sja* ‘to fraternize’, *prepirat’-sja* ‘to squabble’, *soveščat’-sja* ‘to confer’, etc.; see Yomdin 1981: 90). As mentioned above, these are words with an inherent reciprocal meaning. Here belong reciprocals that have

(a) no two-place (or more than two-place) base form belonging to the same class of words (an exception are unproductive reciprocals; see paragraph (iv) below),

(b) with which they might enter into a standard semantic reciprocal opposition (these are reciprocals that do not conform to the requirements listed in 2.1). These are the following categories of words in the first place:

(i) words without a reciprocal marker, namely, root verbs, like *to argue*, *to fight*, *to meet*, *to combine sth and sth*, etc.; also adjectives used predicatively (e.g. *to be next to sb*), verb + noun collocations (e.g. *to shake hands with sb*, *to rub elbows with sb*, *to be on good terms with sb*), and also nouns denoting mostly class membership (cf. *brother*, *partner*, *colleague*, *friend*, etc.) and reciprocal situations and relations (cf. *a fight*, *friendship*, etc.);

(ii) words with a reciprocal marker and without an underlying base, e.g. deponential reciprocals (*reciproca tantum*), i.e. words with a reciprocal marker but without a base word which may have gone out of use (however, there may be an accidental coincidence of a segment of the root with the reciprocal marker), cf. Tuvan *bəra-š-* ‘to be equal in strength, etc.’ (cf. **bəra-*), *kəra-š-* ‘to quarrel’ (cf. **kəra-*) (Kuular, Ch. 27, ex. (151)), Indonesian *ber-kelahi* ‘to quarrel’ (Ogloblin & Nedjalkov, Ch. 33, ex. (32)), Japanese *semegi-a-u* ‘to struggle’, *tonori-a-u* ‘to be next to each other’ (Alpatov & Nedjalkov, Ch. 25, ex. (75)); Danish *kævle-s* ‘to quarrel’, *ene-s* ‘to agree’;

(iii) derived reciprocals with a lexicalized reciprocal meaning (some of them may retain the standard reciprocal or contiguous meaning along with the lexicalized one), like Tuvan *ište-* ‘to fill (a vessel)’ → *ište-š-* ‘to be equal in cubic content (of vessels)’, also ‘to help to fill sth’ (Kuular, Ch. 27, ex. (163)); Japanese *i-u* ‘to say, speak’ → *ii-a-u* ‘to dispute’, *naguru* ‘to hit’ → *naguri-a-u* ‘to fight’, also ‘to hit each other’ (Alpatov & Nedjalkov, Ch. 25, ex. (68)), Ainu *yee* ‘to say to sb’ → *u-yee* ‘to quarrel’ (Alpatov et al., Ch. 42, ex. (107)). As we see, the shift of meaning in lexicalization is very often predictable;

(iv) unproductive reciprocals; they are entered here with reservations and hesitation: verbal reciprocals derived by unproductive means can also be included among lexical reciprocals, like Russian *obnimat’* ‘to embrace (sb)’ → *obnimat’-sja* ‘to embrace each other’ (about 40 items). Such reciprocals are in fact intermediate between grammatical and lex-

ical types. Semantically, they enter mostly into the same domain as reciprocals of the groups just listed. In contrast to the above mentioned 400 Russian lexical reciprocals, they do have bases with which they enter into a standard semantic reciprocal opposition. Small groups of fossilized reciprocals are also registered in Armenian (with the suffix *-v*), Hebrew (with the prefix *het-* and root alternation), Icelandic (with the suffix *-st*), Hungarian (with the suffix *-kod/-koz*) and some other languages. Despite the presence of underlying forms for this type of reciprocals, they display what Kemmer (1993:105–9) calls “low-degree of distinguishability of subevents”.

Example (10) illustrates a lexical reciprocal: (10a') and (10a''), denoting the same situation, are syntactically parallel to (9a') and (9a''), and so is (10b). Constructions of this type can serve to identify several groups of lexical reciprocals. In both (9) and (10), predicates (a') and (a''), namely, *öjdö-t-ö* in (9) and *argues* in (10), express identical relations; the difference is that in (9b) the reciprocal meaning is added in comparison with (9a'–a''), while in (10b) the meaning of (10a'–a'') is retained. The equation symbol signifies identity of denotational content only and neglects possible pragmatic differences, in the sense that the first participant is often interpreted as the more active or the only agent (as in *He always argues*).¹

- (10) a'. *My father argues with his neighbour.*
 = a''. *The neighbour argues with my father.*
 = b. *My father and his neighbour argue [every day].*

Lexical reciprocals sometimes cannot be identified by means of type (10) constructions, because in some languages contrasts of the type (a') ~ (a'') ~ (b) are lacking. There are such reciprocals in English, too. As a rule, they are semantically two-place and syntactically one-place; in this case their identification as lexical reciprocals is explicated by the lexical definition of meaning that contains an explicit marker of reciprocity; cf. (explanation from Hornby 1974:22):

- (11) *My father and the neighbour are alike (= are like one another).*

In this monograph, attention is focused on the type of reciprocals illustrated by (9c) and (9b), while lexical reciprocals are considered mostly from the viewpoint of their possible co-occurrence with reciprocal markers.

Note that with regard to their treatment in dictionaries, (1) lexical reciprocals are commonly entered in dictionaries; (2) syntactic reciprocals are not registered, as a rule, (3) morphological reciprocals are usually registered in dictionaries but with lesser regularity than lexical reciprocals: they tend to be registered if they are lexicalized.

Verbal lexical reciprocals seem to coincide to a considerable degree (if not entirely) with those reciprocals that are distinguished as *natural reciprocals*, i.e. predicates describing naturally reciprocal events in Kemmer (1993:100–8).

1. In some languages the distinction between constructions (10a') and (10a'') is more pronounced than in these English examples, e.g. in Twi where the co-participant is minimally active (Boadi 1975:55–77).

A detailed description of lexical reciprocals is to be found in Knjazev (Ch. 2). Although Chapter 2 is based on Russian data, most of the analysis has typological relevance.

From the view-point of their combinability with reciprocal markers, lexical reciprocals are considered in Section 16 below.

2.4 Idiosyncratic reciprocal expressions

Alongside the above listed cases where reciprocity is either marked in a regular way, there happen occasional language-specific ways of expressing reciprocity. They may be determined by the context or situation. Russian example (12a) characteristic of colloquial speech is one of such cases. We cannot assert it is a structure that encodes reciprocity because the analogous structure under (12b) is not reciprocal in meaning (sentence (12a) probably came into being by analogy with constructions containing two-place lexical reciprocals, like *U nas vražda* ‘There is hostility between us.’).

- (12) a. *U nas [s Maš-ej] ljubov’.*
 at we.GEN with M.-INST love.NOM
 ‘Masha and I love each other’, lit. ‘At us [with Masha] (is) love.’
- b. *U nas [s Maš-ej] gore.*
 at we.GEN with M.-INST misfortune.NOM
 ‘Masha and I have met with misfortune’, lit. ‘At us [with Masha] (is) misfortune.’

Note that *ljubov’* ‘love’ is a two-place noun and *gore* ‘misfortune’ is one-place. The base constructions of (12a) can be sentences analogous to (9a’–a’): *U menja k Maše ljubov’* ‘I love Maša’, lit. ‘At me is love for Masha’ (= ‘I have a love for Masha’) + *U Maši ljubov’ ko mne* ‘Masha loves me’, lit. ‘At Masha is love for me’ (= ‘Masha has a love for me’). Characteristically, *ljubov’* ‘love’ is a highly emotive word, and words denoting emotions may have idiosyncrasies in the ways of expression of reciprocity (cf., for instance, Nedjalkov, Ch. 3, §§3.6; 2.3.7.1 and case 2 in §3.7.3).

Reciprocal constructions with predicates marked by means of affixes and clitic pronouns are in the focus of the present study.

3. Polysemy of reciprocal markers

This section serves to introduce Chapter 5 of this monograph, where this problem is discussed at length.

3.1 Three main types of polysemy

Monosemous reciprocal markers are typically free morphemes/words (pronouns and adverbs), less frequently affixes; they are often of relatively recent origin. An example of a monosemous reciprocal affix is:

Chukchi (-wəly- = REC only; -ə- = epenthetic vowel; -γ?at = 3PL; for details see Nedjalkov, Ch. 40, §3.1.1.1)

- (13) *penrə-nen* 'attacked-he.him' (-nen = 3SG+3SG)
 → *penrə-wəly-ə-γ?at* 'They attacked each other.'

Monosemous morphological reciprocal markers are also attested in Cashinahua, Yukaghir and Itelmen, and monosemous syntactic markers exist in English, Russian, Bamana, Vietnamese, etc.

Polysemous reciprocal markers are mostly affixes and clitic pronouns. There are three main types of the polysemy of reciprocal markers distinguished according to the meaning most frequently compatible with the reciprocal: reflexive – reciprocal, reciprocal – sociative and iterative – reciprocal. The concomitant meaning may be the historically primary meaning of a polysemous marker (as is often the case with the reflexive meaning of reflexive-reciprocal markers and the iterative meaning of iterative-reciprocal markers) or its later development (as is the case with the sociative meaning in some languages).

1. *Reflexive-reciprocal polysemy*, typical of reflexive (clitic) pronouns; inflectional forms called middle may be assigned here as well. The reciprocal meaning is semantically akin to the reflexive meaning as in both cases the same entity(-ies) (person(s)) behave both as agent and patient; cf.:

Hopi (Kalectaca 1978:92, 208; *naa* = REFL, REC and PASS, *-to-* = PL)

- (14) a. *tuuhota* 'to hurt'
 → b. *Itam naa-tuho-(to)-ta* i. 'We hurt *each other*.' reciprocal
 ii. 'We hurt *ourselves*.' reflexive

2. *Reciprocal-sociative polysemy*, i.e. polysemy of markers with a concomitant sociative meaning. Both reciprocals and sociatives presuppose a group of two or more participants which are assigned the same semantic role(s). The sociative meaning shares with the reciprocal the plurality of the participants which take part in the same event and have the same semantic role(s); cf.:

Yakut (Kharitonov 1963:46; *-s/-h-* = REC and SOC)

- (15) a. *kör-* 'to see, look'
 → b. *kör-üs-* i. 'to see *each other*' (also lexicalized 'to meet') reciprocal
 ii. 'to see sth/sb *together*.' sociative

Some of the meanings of this type of polysemy are discussed in Section 8 below.

3. *Iterative-reciprocal polysemy*, i.e. polysemy of markers with a concomitant iterative (and sometimes also sociative) meaning (based on iterativity); see (18) and (19).

Both the sociative (see 8.1 below) and the iterative meanings imply certain plurality, either of participants and/or events.

3.2 Changes in the polysemy type of a reciprocal marker

They are of course possible. For instance, many of the Bantu languages have the reciprocal suffix *-an* and its extensions *-akan-* and *-angan-*, etc. (cf. (16a)), with reciprocal-sociative

polysemy, but several Bantu languages (e.g. Luvale) have partly or entirely replaced it with a marker with reflexive-reciprocal polysemy (cf. Aksenova 1990:179–81; see (16b) below), the older marker preserved in fossilized (and often lexicalized) reciprocals, cf. (16a). Sometimes both markers co-occur in the same verb (16c). In (16a) three fossilized derivatives are cited, with the reciprocal (namely, object-oriented (spatial) reciprocal; see 2.2.4), sociative and iterative meanings respectively.

Luvale (Horton 1949:103; *-a* in (16) and other Bantu examples is the final vocalic inflectional morpheme)

- (16) a. *pàl-akan-a* ‘to press, squeeze sth together’
ly-ángan-a ‘to eat together’ (i.e. ‘at each other’s places’)
hit-akan-a ‘to pass back and forth repeatedly.’

Note that in many languages words meaning ‘together’ (such as English *together*) can be employed in two senses, reciprocal (e.g. *to tie the ends together* ‘to join or bring into contact with each other’; cf. *pàl-akan-a* in (16a) where it denotes bringing into contact two or more objects), and sociative (cf. *ly-ángan-a* in (16a) where it denotes joint action).

Another reciprocal marker in Luvale is the prefix *-li*, taking the place of the direct object marker in the verbal form. In (16b), the derivatives are reflexive, reciprocal and sociative respectively (ibid., p. 117):

- (16) b. *na-li-pihis-a* ‘he has dirtied himself’
vali na-ku-li-vet-a ‘they are beating one another.’
ku-li-nyang-ilil-a ‘to snatch sth together.’ (*-ilil* = proximitive tense).

In the following spatial intransitive reciprocal verb, both reciprocal markers are used simultaneously:

- c. *-li-pàna-akan-a* ‘to draw close together.’

Replacement of a nonreflexive-related reciprocal marker with a reflexive-reciprocal marker is also observed in some other languages. Thus, in Imbabura Quechua the older nonreflexive-related marker *na-ju-* (a cognate of the Bolivian Quechua nonreflexive-reciprocal marker *na-ku-*) retains the sociative meaning of “joint action of some kind” as its main meaning and “does not express reciprocity” (Cole 1982:92). Instead, the reflexive suffix *-ri* has become a new reciprocal marker, while retaining the reflexive and anticausative (pseudopassive in Cole’s terminology; ibid., p. 91) functions. In West Greenlandic Eskimo, according to Fortescue (Ch. 19, §3), the “loss of productivity of *-ut(i)* may have been the immediate motivation for the development of the newer construction type”. He has in mind the use of the reflexive pronoun *immiC* for encoding the reciprocal meaning, as well as the reflexive.

The development of the sociative function of a reciprocal marker (or retention of the sociative meaning conjoined with a weakening or loss of the reciprocal) is also observed for instance in Turkic and some Tungusic languages (cf. Nedjalkov & Nedjalkov, Ch. 38 on Evenki, §14.2). In Udehe, the reciprocal suffix *-masi*, unlike its cognates in the closely related Evenki and Even languages, may have a sociative meaning, although Udehe has a specialized sociative suffix *-niŋa-* (Nikolaeva, Ch. 23, §1.2).

I have no convincing examples of opposite developments, i.e. (a) a sociative marker developing into reciprocal, and (b) a sociative-reciprocal marker preserving a productive sociative function on transitives and becoming unproductive as a reciprocal marker.

A reflexive marker may develop the reciprocal function even in languages where another reflexive-reciprocal marker seems to take care of the reciprocal function. This is the case in Polish where the reflexive pronoun *siebie* (ACC) can be used instead of the reflexive clitic *się* as its synonym, and sometimes the reciprocal reading is even preferable, as, for instance, in (17b).

Polish (Wiemer, Ch. 11, ex. (35))

- (17) a. *Przyjaciele bronili się.* ‘The friends were defending themselves/each other.’
 b. *Przyjaciele bronili siebie.* ‘The friends were defending each other/ themselves.’

The dative form *sobie* of the reflexive pronoun is used as the only dative reciprocal marker, the dative reflexive form *si* having gone out of use; cf. *wierzyć sobie* ‘to trust each other’; on some verbs, however, it preserves its reflexive meaning, cf. *pozwolić sobie* ‘to let oneself (do sth)’ (ibid., §5.2.1.2).

In Czech, a similar expansion of the reflexive pronoun *sebe* (ACC) is observed: it can form reciprocals synonymous to those with the reflexive clitic *se* (ACC); cf. *Chlapci se koulují* ‘Boys snowball each other’ and *Chlapci koulují sebe (navzájem)* with the same translation (*navzájem* = ‘mutually’, ‘each other’; Skoumalová 2002: 30–1).

3.3 Iterative-reciprocal polysemy

Naturally, the reciprocal meaning suggests participant plurality and, in most cases, plurality of actions, i.e. iterativity, as two participants perform at least two actions. But the iterative meaning proper occurs when the iteration refers to a single participant. In Chinese (18) the iterative meaning of the verbal compound is primary and the reciprocal is secondary, both meanings being productive. Another similar case is attested in Samoan where the basic meaning of the prefix *fe-* seems to be “plurality of events, coherent sequence of events or events in turn” (Mosel & Hovdhaugen 1992: 180).

Chinese (Liu 1999: 124; 126; REC marker = auxiliaries *lái* ‘come’ and *qù* ‘to go’ with reduplication of a lexical verb; the main meaning of this form is iterative; judging by Liu’s examples, in compounds with transitives the object is usually omitted)

- (18) a. *dǎ* ‘to hit’
 b. *dǎ-lái-dǎ-qù* i. ‘to hit each other’ reciprocal
 ii. ‘to fight several times (or for a while)’ iterative or durative

Samoan (Mosel & Hovdhaugen 1992: 180–3)

- (19) a. *sogí* ‘to kiss’ → *fe-sogí* ‘to kiss each other’ reciprocal
 b. *a’a* ‘to kick’ → *fe-a’a* ‘to kick sth again and again’ iterative
 c. *a’a* ‘to kick’ → *fe-a’a* ‘to kick’ plural subject
 d. *’eli* ‘to paddle’ → *fe-’eli* ‘to paddle hard.’ intensive

3.4 Reflexive-sociative and reflexive-iterative polysemy

The iterative-reciprocal and the reciprocal-sociative types of polysemy rarely include the reflexive meaning. Apparently, the reflexive and the sociative share no semantic denominator, nor do the reflexive and the iterative. Nevertheless, there occur, though rarely, affixes with reciprocal-reflexive-sociative polysemy; cf. (20) and (16b):

Ritharngu (Heath 1980:61–62, 183; *-mi* = REC, SOC and REFL; *-n/-na* = an augment before derivational suffixes)

(20)	a.	<i>dak-u-</i>	‘to cut sb, cut off’	
	→	<i>dak-u-n-mi-</i>	i. ‘to cut each other’	reciprocal
			ii. ‘to cut oneself’	reflexive
	b.	<i>wa:ni-</i>	‘to go’	
	→	<i>wa:ni-na-mi-</i>	‘to go together’	sociative

The reflexive and the sociative meanings are not directly related, the reciprocal being, in a sense, an intermediate semantic link between them. In other words, if a marker combines the reflexive and the sociative meanings, it usually has a reciprocal meaning.

3.5 Three cases of relations between productive and unproductive meanings of reciprocal markers

Reflexive, sociative and iterative by no means exhaust all possible concomitant meanings of reciprocal markers. Each of all these meanings, and all of them together, may be unproductive, but typologically they may be of special interest if they have parallels in other unrelated languages thus indicating the possible paths of semantic evolution associated with reciprocity.

1. *The reciprocal meaning is productive and a non-reciprocal meaning is not* (Even, Mundari). In Even (Malchukov, Ch. 39, ex. (1); §3.3), the productive reciprocal suffix *-met/-mat* (cf. *žarga-* ‘to scold’ → *žarga-mat-* ‘to scold each other’) is generally monosemous, but there are about a dozen verbs of motion with the iterative meaning containing this suffix, cf. *tia(n)-* ‘to swim’ → *tia-mat-* ‘to swim here and there’ (most of their base verbs contain a component, like *-n-* in *tia(n)-* missing in derivatives), and also some deponent derivatives (cf. *želŋe-met-* ‘to jump repeatedly’, there is no **želŋe-*).

In Mundari (Osada, Ch. 37, ex. (1), also §9.2.3), the productive reciprocal infix *-po-/-pa-/p-* (cf. *dal-* ‘to hit’ → *da-pa-l-* ‘to hit each other’) occurs on a few distributive numerals (cf. *bar-ia* ‘two’ → *ba-pa-r-ia* ‘each two’).

2. *The reciprocal meaning is unproductive and a non-reciprocal meaning is productive* (Russian, Karachay-Balkar). Thus, in Russian, the reciprocal function of the postfix *-sja* is unproductive (as mentioned, there is a closed set of about 40 reciprocals in *-sja*, like *celovat’* ‘to kiss (sb)’ → *celovat’-sja* ‘to kiss each other’), while its other functions, e.g. anticausative and passive, are extremely productive (about 1400 anticausatives in *-sja*, like *otkryvat’* ‘to open sth’ → *otkryvat’-sja* ‘to open’ (vi)).

In Karachay-Balkar, where the productive reciprocal marker is the pronoun *biri-biri-n*,² the suffix *-š-* is unproductive in this function (there are about 60 derivatives like *tabanla-š-* ‘to kick each other’ comprising a closed set; there are no reciprocals from the bases *sij-* ‘to love’, *maxta-* ‘to praise’, etc.) and it is highly productive as a marker of the competitive meaning which is very close to the reciprocal proper (but does not meet the conditions illustrated in (1)); although my list of competitiveness contains about 40 items, competitiveness easily derive from practically all bases whose lexical meaning allows it; cf. *tig-iš-* ‘to compete in sewing’, *saw-iš-* ‘to compete in milking’ (see Nedjalkov, Ch. 5, §9.4.2).

3. *The reciprocal marker is generally unproductive* (Tagalog, Khmer). In Tagalog (Shkarban & Rachkov, Ch. 22, §3.3.1), alongside the productive reciprocal marker *mag...an*, there is an unproductive polysemous reciprocal marker *mag-* (cf. *y-um-akap* ‘to embrace sb’ → *mag-yukap* ‘to embrace each other’; about 30 derivatives) which has some unproductive non-reciprocal meanings, such as converse (cf. *b-um-ili* ‘to buy’ → *mag-bili* ‘to sell’), reflexive (cf. *um-ahit* ‘to shave sb’ → *mag-ahit* ‘to shave oneself’), causative (cf. *um-alis* ‘to go away’ → *mag-alis* ‘to remove’), intensive-iterative (*k-um-ain* ‘to eat’ → *mag-kain* ‘to eat much and often’).

In Khmer, alongside the productive reciprocal pronoun *khnie*, there is an unproductive reciprocal prefix *prv-* (about 60 derivatives; see Gorgoniev 1984:440–57) with a surprisingly rich polysemy, e.g. reciprocal *kham* ‘to bite’ → *prv-kham* ‘to bite each other’, intensive *huə* ‘to peck’ → *prv-huə* ‘peck sth as if vying’, causative *douc* ‘to be like sb/sth’ → *prv-douc* ‘to compare sth with sth’, spatial reciprocal *kɔŋ* ‘to put sth on sth’ → *prv-kɔŋ* ‘to put one upon another’, etc. (cf. (119) in Ch. 5).

4. Reciprocals and valency change. “Voice-oriented” and “non-voice-oriented” reciprocal markers

4.1 Main valency-changing means

Leaving aside a few special cases (see 12.2.1 on “possessive” reciprocals), morphological reciprocal markers reduce the valency of the underlying verb by deleting the direct or indirect object (cf. Yakut (9a’) and (9a’’) vs. (9c’)) and thus belong to valency-changing derivations. In the case of pronominal reciprocals there is hardly any valency reduction (9b).

The main types of valency change correlate with semantic functions as follows:

2. Although generally, whatever their frequency in texts, reciprocal pronouns tend to have minimal restrictions, there occur unexpected rather puzzling restrictions on their usage. For instance, in Japanese, the verb *koros-u* ‘to kill sb’ derives a morphological reciprocal *korosi-a-u* ‘to kill each other’, while the reciprocal pronoun *otagai o* as direct object cannot be used with either *koros-u* or *korosi-a-u*. Equally mysterious is the absence of the form **mi-a-ru* ‘to look at each other’ (< *mi-ru* ‘to look’), instead of which the pronominal reciprocal *otagai o mi-ru* is used (Alpatov & Nedjalkov, Ch. 25, §10.4).

- (21) a. valency reduction or demotion of an argument: reflexive, reciprocal, anticausative, object-oriented resultative,³ antipassive (unspecified object markers), passive (agentless and agented);
- b. valency increase: comitative, benefactive, malefactive, assistive, causative, applicative;
- c. valency retention: sociative (the number of the participants increases without changing the syntactic structure).

The lexical meaning of the base is preserved both in passives and antipassives, while in other cases it undergoes a change.

In general, the three types of polysemy listed in Section 3 are in the following relations with the types of valency change:

- (22) a. reflexive-reciprocal polysemy entails valency reduction, e.g. detransitivization; see (20a);
- b. reciprocal-sociative polysemy entails valency increase; see (ii) and (iii) in (60b);
- c. iterative-reciprocal polysemy entails no valency change; see (18b.ii), (19b, c, d).

Of course, in cases (22b) and (22c) the reciprocal meaning entails valency reduction.

4.2 Voice-oriented vs. non-voice-oriented reciprocal markers

I propose applying the term ‘voice’ to the main valency-changing categories listed above. This means that I do not regard retention of the lexical meaning as one of the properties of voice categories as in the passive voice. The contrast ‘voice-oriented vs. non-voice-oriented’ is proposed here tentatively, and it should be considered specially on a broader empirical basis.

The proposed broad use of the term ‘voice’ is not widely accepted, but it sometimes occurs in the literature, which seems to indicate that there are some grounds for it. Notice that in the grammars of some languages reciprocals are traditionally grouped with voices; cf. such Russian terms as *vzaimnyj zalog* (reciprocal voice), alongside *passivnyj / stradatel’nyj* (passive), *kauzativnyj / pobuditel’nyj* (causative), *refleksivnyj / vozvratnyj* (reflexive) voices in the grammars of Turkic and other Altaic languages written in Russian. This attitude is also accepted in the grammars of some other languages. For instance, Vitale (1981:177) distinguishes the following “voice categories: active, passive, reciprocal and causative, and various combinations of these” in Swahili. Zide & Anderson (2001:519) characterize Munda reciprocals and causatives as voice categories as well. Sechenbaatyar (2003:116–23) distinguishes six voices in the Chakhar dialect of Mongol: active, passive, causative, reciprocal, cooperative, and pluritative. These categories change the semantic content of the subject. Reciprocal markers entering into this system of categories are opposed to other markers which may be labelled ‘non-voice-oriented’.

I find it hard so far to propose precise definitions for voice-oriented and non-voice-oriented reciprocal markers. Although both of these types of markers can produce semantically identical or similar derivatives, they differ prototypically at least in two respects:

3. The object-oriented resultative can be illustrated by the following example: *Er öffnete das Fenster* ‘He opened the window’ → *Das Fenster ist geöffnet* ‘The window is open’ (see Nedjalkov & Yakhontov 1988:3–62).

- Voice-oriented reciprocal markers are productive in the proper reciprocal meaning (see 2.2.4), while non-voice-oriented markers are marginal as expressions of proper reciprocity. As concerns the spatial reciprocal meaning of both transitive and intransitive verbs, non-voice-oriented reciprocal markers can be even more productive in this function than voice-oriented ones.
- A voice-oriented reciprocal marker may be a part of the system of relatively few valency-changing markers of a language, or it may be the only voice-oriented marker in a language. Non-voice-oriented reciprocal markers, on the contrary, are usually a part of the system of numerous polysemous affixes with primary spatial meanings.

The borderline between voice-oriented and non-voice-oriented markers is highly mobile and indeterminate, and there are many intermediate cases across languages.

An example of a voice-oriented reciprocal marker may be the Yakut suffix *-s-* (see (9)), one of a system of five voice markers also including the reflexive suffix *-n-*, passive suffix *-ilin-*, active (zero marking) and causative (suffixes *-t-*, *-tar-*). Another example is the Khalkha Mongol reciprocal suffix *-lda-*: it is a member of the system of four voice markers, alongside with the passive suffix *-gd-*, active (zero marking) and causative suffix *-uul-*.

An example of a non-voice-oriented reciprocal marker may be the Latin prefix *com-*, one of a system of sixteen polysemous prefixes with a more or less prominent spatial meaning (see Zaliznjak & Shmelev, Ch. 4). Only some derivatives in *com-* are proper reciprocals (e.g.: *spondeo* ‘swear solemnly’ → *con-spondeo* ‘swear solemnly to each other’; *ruo* ‘throw oneself at sb/sth’ → *cor-ruo* ‘throw oneself at each other’; for details see 13.1.2, 13.1.3 and 15.5).

As mentioned, non-voice-oriented markers can derive *transitive* spatial reciprocals (which are object-oriented), cf. Latin prefixes *con-/com-/...*, *dis-/dī-* in derivational pairs like *fero* ‘carry sth’ → *cōn-fero* ‘carry sth into one place’, *vendo* ‘sell sth’ → *dī-vendo* ‘sell sth out by parts’. Such affixes can also encode meanings expressed by polysemous voice-oriented reciprocal markers, e.g. sociative, comitative, assistive, etc. (cf. (41), (48), (52), (53)).

Finally, they can also form *intransitive* spatial (subject-oriented) reciprocals, with the meanings of joining and separating of subject referents, but not of the type illustrated in (9), as a rule; cf. Latin *curro* ‘run’ → *con-curro* ‘come running together (to one place) from different directions’ (cf. also (16c)), *dis-curro* ‘disperse’ (vi).

Of course, reciprocal pronouns are not entered in this classification because they do not change the valency of the base verb.

5. Object-oriented reciprocals (embedded and derived). Referential ambiguity

In the subject-oriented reciprocal construction the reciprocants are expressed by the subject (*Uol-lattar* in (23a)), whereas in the object-oriented construction the reciprocants are denoted by the object (*uol-lar-ə-n* in (23c)). Construction (23b) may have a non-object-

oriented interpretation if (a) the subject referents are plural and (b) they belong to the same semantic class. Such referential ambiguity of reciprocals has been noted in the literature for embedded reciprocal constructions with the plural matrix subject. In terms of Section 12, these are two-diathesis reciprocals. Object-oriented reciprocals can be of two types.

5.1 Causatives of subject-oriented reciprocals

Example (23b), where the subject *kiniler* ‘they’ is plural, exhibits referential ambiguity: it can be interpreted as (i) subject-oriented “indirect” and (ii) object-oriented. Interpretation (i) is an instance of the so-called long-distance reciprocal relation, the subject referents of underlying construction (23a) being distant antecedents of the embedded object, i.e. the action ‘to meet’ does not involve the subject referents themselves but the underlying reciprocants denoted by the object, i.e. the sons of the subject referents:

Yakut (Nedjalkov & Nedjalkov, Ch. 26, §5.3)

- (23) a. *Uol-lattar beje-beje-leri-n kör-d-üler.*
 son-their each.other-their-ACC see-PAST-3PL
 ‘Their sons met/saw each other.’
- b. *Kiniler uol-lattar-ən beje-beje-leri-ger kör-dör-d-üler.*
 they son-their-ACC each.other-their-DAT see-CAUS-PAST-3PL
 ‘They made/let their sons meet/see each other.’
- i. ‘each of the subject referents showed his son to the other subject referent’
 (subject-oriented)
- ii. ‘each of the subject referents showed his son to the son of the other subject referent’
 (object-oriented)
- c. *Kini uol-lar-ə-n beje-beje-leri-ger kör-dör-d-ü.*
 he son-PL-his-ACC each.other-their-DAT see-CAUS-PAST-3SG
 ‘He made/let his sons meet/see each other.’
 (object-oriented)

The matrix predicate can be not only a causative verb but also other verbs, e.g. ‘to tell’, ‘to think’, etc. Note also that in some languages there are no morphological causatives of reciprocal verbs, e.g. in Japanese (see Alpatov & Nedjalkov, Ch. 25, §6.2).

5.2 Reciprocals derived from three-place transitives

As in type (23c), there is no referential ambiguity and the sentence is object-oriented if the subject is singular (24c). If the subject is plural, subject-oriented “indirect” interpretation becomes possible; cf. Bamana (24b) and its English translation of which both allow two interpretations:

Bamana (Vydrine, Ch. 46, §3.2.2.3)

- (24) a. *Dú-tigi` yé à mùsò` jira à lá.*
 family-head-ART PFV his wife-ART show him to
 ‘The head of the family introduced his wife to him.’

- b. *Dú-tigi-w yé ù m̀s̀ó-w j̀ira j̀ógn ná.*
 family-head-PL PFV their wife-PL show REC to
 ‘The heads of the families introduced *their wives to each other.*’
- i. ‘The head of one family introduced his wife (wives) to the head of another family and *vice versa.*’ (subject-oriented “indirect”)
- ii. ‘One head of a family introduced his wife (wives) to the wife (wives) of the head of another family, and *vice versa.*’ (object-oriented)
- c. *Dú-tigi` yé à m̀s̀ó-w j̀ira j̀ógn ná.*
 family-head PFV his wife-PL show REC to
 ‘The head of the family introduced his wives *to each other.*’

6. Reciprocal markers for derivatives with two reciprocants only

I have not encountered any reciprocal markers used for two reciprocants only and entirely different from the markers for more than two participants (with one rather ambiguous exception). In most cases the marker used for more than two participants is morphologically more complex (“heavier”) than the marker for two participants. For instance, it can be iconically expressed by additional (root) reduplication (see (26b), (27b)). Reciprocal markers for two participants (‘2’) different from markers for more than two (‘>2’ or ‘≥2’) occur in some Austronesian (Malayo-Polynesian) and Tibeto-Burman languages. In general, three types of oppositions between reciprocal markers are logically possible:

- (1) ‘2’ ~ ‘≥ 2’
- (2) ‘≥ 2’ ~ ‘>2’
- (3) ‘2’ ~ ‘>2’.

Let us consider these types.

(1) ‘2’ ~ ‘≥ 2’. This type of opposition is attested in East Futunan. The ‘2’-marker, as in (25a), occurs on relic reciprocals and ‘≥2’-marker, as in (25b), is productive.

East Futunan (Moyse-Faurie, Ch. 35, §§3.1.1; 3.3.1)

- (25) a. *fe-tā* ‘to hit each other’ (of two only)
 b. *fe-tā-’aki* ‘to hit each other.’ (of two or more)

(2) ‘≥ 2’ ~ ‘>2’. This type is attested in Tagalog, in oppositions of two types: (26a) where *mag-away* is an unproductive (relic) form and (26b) where both forms are productive. It is important to note that the prefix *mag-* can express the dual number on nouns; cf. *klase* ‘class’ → *ka-klase* ‘classmate’ → *mag-ka-klase* ‘two classmates’ (Shkarban & Rachkov, Ch. 22, §4.2.1).

Tagalog (ibid., §§7; 3.2.1)

- (26) a. *mag-away* ‘to fight with each other’ (of two or more)
mag-away-an ‘to fight with each other’ (of more than two)
 b. *mag-ka-sunod* ‘to follow one another’ (of two or more)
mag-ka-sunod-sunod ‘to follow one another.’ (of more than two)

(3) ‘2’ ~ ‘>2’. This type is attested in a number of languages, cf. Latin *alter alterum* ‘2’ and *alius alium* ‘>2’. In Muna, the difference between the two markers is similar to what we find in Tagalog (26b): root reduplication together with the reciprocal marker ‘2’ is used as a ‘>2’-marker (while in non-reciprocal constructions the distinction between ‘2’ vs. ‘>2’ seems to be morphologically irrelevant); cf.:

Muna (van den Berg 1989:206; *po-* = REC for DU, *do-* = 3PL (sic!), *-mo* = PFV)

- (27) a. *do-po-foguru* ‘they teach each other.’ (of two only)
 b. *do-po-logo-logo-mo* ‘they competed with each other.’ (of more than two)

A similar distinction is also attested in Eastern Kadazan (genetically related to Muna), where the prefix *pi-*, termed dual reciprocal by Hurlbut (1988:54), “indicates a mutual action done by two persons to each other or a similar action done in two locations by one person” (ibid., p. 107). The translations of the sentences illustrating these two meanings are (comments on the constructions are mine – V. N.): ‘They followed *one after another*’ (reciprocal), ‘That (creature) keeps running and hiding *hither and thither*’ (dispersive-iterative), ‘I divided it *in two* for them’ (object-oriented reciprocal) (ibid., pp. 107, 54). Another reciprocal prefix *poi-*, termed ‘multiple reciprocal’, “means that more than two people are doing the action together or to each other. <...> It usually co-occurs with the iterative” (ibid., p. 55). The translations are: ‘We have all met *each other*’ (reciprocal), ‘*Several of us* will set off (lit. walk) *at the same time*’ (sociative), ‘So they fastened those boats *side by side*’ (spatial transitive reciprocal) (ibid., pp. 55, 109). Analogous to this pair of reciprocal prefixes and, it seems, genetically related are the markers *po-* and *pada-* in Tukang Besi (Donohue 1999:273).

The same type of opposition is attested for syntactic reflexive-reciprocal markers in Maori, being encoded by the dual vs. plural forms of the respective 3rd person pronouns; cf.: *raaua anoo* ‘they two again’, ‘themselves’, ‘each other’, *raatou anoo* ‘they more than two again’, ‘themselves’, ‘each other’ (Bauer 1993:186).

In Limbu, reflexive-reciprocal markers are different for the plural and dual subjects. The suffix *-siŋ* is used in the reflexive sense if the subject is singular, while with a plural subject its meaning can be either reflexive or reciprocal. The suffix *-ne* is used with a dual subject when it can be either reflexive or reciprocal, depending on the lexical meaning of the predicate; cf. (all the three forms in (28) are interpreted in accordance with the information on pp. 86–7 in van Driem 1987):

Limbu (ibid., p. 383)

- (28) a. *warum-siŋ-aŋ*. ‘I bathed myself.’
 b. *warum-siŋ-ŋʔna*. ‘We (PL.EXC) bathed ourselves/each other.’
 c. *warum-ne-tchi-ge*. ‘We (DU.EXC) bathed ourselves/each other.’⁴

4. It is probably not accidental that the suffix *-ne* functions as a portmanteau affix meaning “1st person (Subj.) → 2nd person (Direct Obj.)” regardless of the number of the subject and object, i.e. with the meanings ‘I – you (SG/PL)’, ‘we (PL/DU) – you (SG/PL)’, cf. *hip-ne* ‘I’ll hit you’ (van Driem 1987:88).

Finally, it may be noted in passing that in Awtuw, the reciprocal marker is obligatorily followed by a dual prefix even if the antecedent is plural (Feldman 1986:67; see (73) in Ch. 3, §6.3.2.4).

7. Simple and discontinuous constructions; “one NP” and “two NP” types. Part of the subject or a comitative object?

7.1 The simple reciprocal construction

In this type of constructions both reciprocants are expressed by the subject alone:

(1) by a single plural (pro)noun (‘one NP’ type; cf. the subject *Kiniler* ‘They’ in (23b) and pronouns *nous*, *vous*, *ils* in (33a)); this seems to be the most common expression of the reciprocants. There are languages where the subject of a reciprocal construction can be a single plural (pro)noun and not two separate (pro)nouns; this is the case in Ngiyambaa (Donaldson 1980:168);

(2) by two separate (pro)nouns (‘two NP’ type), when the conjoining of the (pro)nouns can be of two types:

(2a) the reciprocants are conjoined by a specialized conjunctive marker, cf. *ikki* ‘and’, lit. ‘two’ in (9b–d) and *i* ‘and’ in (30b);

(2b) the reciprocants are connected by a marker with the comitative meaning only or by a marker that can be both comitative and conjunctive (in this case the comitative noun phrase may be interpreted in the same ways as in non-reciprocal sentences). The comitative phrase can be a part of the subject NP, as is shown in (32a, b).

Besides, a comitative phrase can be a comitative object, as in (30a’, a’). This case is different from a simple construction; it is termed here a discontinuous construction (for details see §7.2). Note that there are cases when a comitative phrase may be interpreted either way.

With syntactic reciprocals, only the simple construction is possible; cf., for instance, Yakut (9e), and also sentences with English *each other*, German *einander*, Udehe *mene-mene* (Nikolaeva, Ch. 23, §4.7), as well as German and French reciprocals with reflexive (clitic) pronouns (the few exceptions are lexicalized units; see (33b, c)). Similarly, morphological reciprocals in Kabardian (Kazenin, Ch. 17, §3.1), Tagalog (Shkarban & Rachkov, Ch. 22, §9), and Eskimo (Fortescue, Ch. 19, §9) also allow simple constructions only. In Tagalog, the discontinuous construction is possible only with the comitative form of reciprocals (37c).

In reciprocal constructions of a number of languages the subject can be singular in number. In this case it is usually expressed by a collective noun phrase like ‘crowd’ (there can be subtle restrictions dependent on the meaning of the noun phrase, the meaning of the reciprocal verb and context), and also by an indefinite-personal pronoun like German *man* which occurs not only with verbal but also with pronominal reciprocals; e.g. *Man hat sich/einander umgebracht* ‘They have killed each other.’

7.2 The discontinuous construction in languages with non-verb-final syntax

This group includes type 2b of the previous subsection. In this case there is a clear indication that one of the reciprocants is encoded by a separate comitative argument, in postposition to the predicate (e.g. *na Halima* in (29b)). In languages with subject agreement an additional criterion may be predicate agreement with the first reciprocant only (cf. *a-* = 3SG.SB in (29b)), which is in fact the only subject. The comitative object, as a constituent of lower pragmatic and syntactic status, does not differ semantically from the reciprocant in the subject position; cf.:

Swahili (Vitale 1981: 145, 150–151; see also Maslova, Ch. 6, §3.4)

- (29) a. *Juma na Halima wa-na-pend-an-a.*
 J. and/with H. 3PL.SB-PRES-love-REC-a
 ‘Juma and Halima love each other.’
- b. *Juma a-na-penda-an-a na Halima.*
 J. 3SG.SB-PRES-love-REC-a with H.
 ‘Juma and Halima love each other’, lit. ‘Juma loves each other with Halima.’

At least in some of the Bantu languages where the reciprocal suffix *-an-/ak-an/...* was replaced by a new marker that developed from a reflexive prefix (cf. (16a) and (16b)) the discontinuous construction of type (29b) is also used. This is the case in Kimbundu (see Chatelain 1889/90: 191).

Let us consider discontinuous constructions on the basis of Russian reciprocals with the reflexive postfix (and compare them with the simple construction). As mentioned above, there are no more than 40 verbal *-sja* reciprocals of type (30c); all of them are lexicalized and, with a few exceptions, allow the discontinuous construction (see Knjazev, Ch. 15, §3).

Thus, diagnostic constructions of type (30a’, a”, c’) may also be formed by verbal (but not pronominal!) reciprocals, if these reciprocals can be used in the discontinuous construction at all, – usually with a syntactic object marked by a case form or comitative preposition or postposition. (30a’) and (30a”) are discontinuous constructions where one of the participants is named by a non-subject, while (30c) and (30c’) are simple constructions with both participants named by the subject. The use of a reciprocal verb in the discontinuous construction entails an increase of syntactic valency by one: (30c’) is a one-place construction and (30a’) and (30a”) are two-place, while semantically all of them are two-place (in (30) *-la-* = PAST.SG.F; *-li-* = PAST.PL; *s* = ‘with’):

Russian

- (30) a. *Anja obnja-la Mashu.* + b. *M. obnja-la A.* = c. *A. i M. obnja-li-s’.*
 ‘A. hugged M.’ ‘M. hugged A.’ ‘A. and M. hugged each other.’
- a’. *A. obnja-la-s’ s Mashej* = a”. *M. obnja-la-s’ s A.* = c’. *A. i M. obnja-li-s’.*
 ‘A hugged M.’ ‘M hugged A.’ ‘A. and M. hugged each other.’

The comitative argument with a reciprocal verb (31a), unlike a free comitative adjunct (30a’), cannot be omitted as it is required by the meaning of the reciprocal predicate and the comitative preposition *s* ‘with’ cannot be replaced by its antonym *bez* ‘without’; cf.:

- (31) a. *A. obnja-la-s' s M.* → b. **A. obnja-la-s' bez M.*
 'A. hugged M.' 'A. hugged without M.'

but

- a'. *A. priš-la s M.* → b'. *A. priš-la bez M.*
 'A. came with M.' 'A. came without M.'

At first glance, Russian examples (30a') and (30a'') are (almost) synonymous with (30a) and (30b) respectively and they are translated into English in the same way, but in fact they are not. Therefore, in (30a) the constituent *Mashu* can be replaced by the word *pokojnika* 'the deceased', while in (30a') the phrase *s Mashej* cannot be replaced by *s pokojnikom* 'with the deceased', because the reciprocal verb implies counteraction of the second participant.

Constructions where the second reciprocant is a comitative phrase are a special case. In cases like (31a) the comitative phrase is obviously an object, while (32a–b) when the reciprocants are placed in contact syntactically, poses the problem whether the comitative phrase is an object or a part of the subject NP. Subject-predicate agreement, the singular or plural number of the predicate, the nature of the anaphora control, possible insertion of other words between the reciprocants may help to establish the syntactic status of the comitative phrase. The same problem (a part of the subject or an object) seems to be relevant for non-reciprocal verbs, cf. (32a'–b'). The difference lies in the fact that in (32a) the choice is between a part of the subject and a comitative object (i.e. an argument) and in (32a') we have to choose between a part of the subject and a comitative adjunct (i.e. a non-argument).

- (32) a. *A. s M. obnja-li-s'.* = b. *M. s A. obnja-li-s'.* = c. *A. i M. obnja-li-s'.*
 lit. 'A. with M. hugged e.o.' 'M. with A. hugged e.o.' 'A. and M. hugged e.o.'
 a'. *A. s M. priš-li* = b'. *M. s A. priš-li* = c'. *A. i M. priš-li*
 lit. 'A. with M. came.' 'M. with A. came.' 'A. and M. came.'

The situation is similar to a few French (and German) reciprocals that allow the use in discontinuous constructions (see Guentchéva & Rivière, Ch. 12, §6.2; Wiemer & Nedjalkov, Ch. 10, §4.7). In simple constructions, a reciprocal predicate has *three* person/number forms only (1PL, 2PL, 3PL; see (33a)) and in discontinuous constructions it has all the *six* person/number forms (i.e. 1SG, 2SG, 3SG and 1PL, 2PL and 3PL; see (33b–c)). The following is a paradigm of six forms of the French verb *se battre*, which is a slightly lexicalized derivative from *battre* 'to hit':

- A. The simple construction (one-place)
- (33) a. *Nous nous battons.* 'We fight.'
Vous vous battez. 'You fight.'
Ils se battent. 'They fight.'
- B. The discontinuous construction (two-place)
- b. *Nous nous battons avec Pierre.* 'We fight with Peter.'
Vous vous battez avec Pierre. 'You fight with Peter.'
Ils se battent avec Pierre. 'They fight with Peter.'

- c. *Je me bats avec Pierre.* 'I fight with Peter.'
Tu te bats avec Pierre. 'You fight with Peter.'
Il se bat avec Pierre. 'He fights with Peter.'

Note that in the (b) sentences the plural subject does not include the opposite party, i.e. 'Peter'.

7.3 The discontinuous construction in languages with verb-final syntax

In this case the post-predicate position of the second reciprocant is as a rule impossible (i.e. the term 'discontinuous' does not retain its literal sense here). However, the subject agreement may serve as a criterion for distinguishing between simple and discontinuous constructions, i.e. the state of affairs is then the same as in (29b) or (34a–b). Thus, for instance, in Evenki the main connector between the reciprocants in the conjunctive subject is the comitative marker *-nun*: if the predicate agrees with both reciprocants, we have a simple construction (34a), if the predicate agrees with the first reciprocant only, the construction is discontinuous (though on condition that this reciprocant is in the singular; (34b)). If the first reciprocant is in the plural the difference between simple and discontinuous constructions is morphologically neutralized (34c), and other criteria of distinguishing between them should be found (cf. the text above (32)). In fact, however, the readings do not display any significant semantic difference (the use of some criteria, for instance, insertion of an adverb between the reciprocants transforms a simple construction into discontinuous rather than serves as a diagnostic criterion for the discontinuous construction).

Evenki (Nedjalkov & Nedjalkov, Ch. 38, §3.1.5)

- (34) a. *Eni hunat-nun-mi n'ukani-maat-čere-Ø.* RECS
 mother daughter-with-her kiss-REC-PRES-3PL
 'Mother and her daughter are kissing each other.'
- b. *Eni hunat-nun-mi n'ukani-maat-čere-n.* RECD
 mother daughter-with-her kiss-REC-PRES-3SG
 (same translation as (a))
 lit. 'Mother with her daughter is kissing each other.'
- c. *Nuŋartən hunat-nun-mer n'ukani-maat-čere-Ø.*
 they daughter-with/and-their kiss-REC-PRES-3PL
 i. 'They and their daughter are kissing each other.' RECS
 ii. (same as (i)), lit. 'They with their daughter are kissing each other.' RECD

Turkish differs from Evenki in the following way: in simple constructions the reciprocants are expressed either by a plural noun phrase or two noun phrases conjoined by the conjunction *ile* 'and', the predicate being always marked for plural. In discontinuous constructions, the element *ile* follows the second noun phrase and functions as a postposition 'with', and if the first noun phrase is singular the predicate is also in the singular (Underhill 1979: 366).

A specific situation is observed in Udehe: even if the second participant is expressed by the instrumental case the predicate always agrees “with the complex NP rather than with the first participant alone” (Nikolaeva, Ch. 23, §3.5.1). She asserts: “There are reasons to think that in these cases the instrumental NP does not have an adverbial or object status, but rather has a modifying or coordinative function and forms a complex NP with the subject” (ibid.).

7.4 No criterion for distinguishing between simple and discontinuous constructions?

The problem gets further complicated for the languages where

(a) the comitative and conjunctive meanings share the same means of expression, i.e. there are no specified conjunctive markers (this combination of functions is very widespread across languages),

(b) a concomitant “comitative” phrase cannot be postposed to the verb, and

(c) there is no subject-predicate agreement.

This is the case in Modern Chinese where the word *hé* and a number of other analogous elements may function both as a conjunction ‘and’ and a preposition ‘with’. Not infrequently, the choice of one or another reading (of such units) does not visibly affect the meaning of the sentence and its translation. Thus, the translation of (35a) into Chinese is indicative in this respect: (35b) was translated back into English by another native speaker of Chinese as (35c), i.e. the English sentence with an obvious non-subject *from him* is translated into Chinese by means of a simple reciprocal construction, without an obvious object.

- (35) a. *I am going in the opposite direction from him.*
 b. *Wǒ hé tā hùxiāng nì-xíng.* (F. Li., p.c.)
 I and/with he mutually opposite-go
 c. ‘I and he are going in opposite directions from each other.’

(see also Hoa et al., Ch. 49, §3.1.3)

7.5 An applicative form of reciprocal serves to build a discontinuous reciprocal construction

The applicative marker serves to derive applicatives not only from reciprocals but also from any other verbs whose meaning is compatible with it. In the latter case the applicative form introduces a new argument (see (36)), while in the case of reciprocals this form places one of the reciprocants in a non-subject position (37). Such derivatives are attested at least in two languages, Tagalog and Maasai.

In Tagalog, the applicative-comitative prefix *maki-* (not employed to mark the reciprocal and sociative meanings when used alone) derives comitatives not only from unmarked verbs, but also from reciprocals (37) and sociatives (38). In the latter case the syntactic valency increases by one while the semantic valency is retained (the difference between (36b) and (38c) remains unclear to me). This transformation produces semantic changes in the sentence. To cite Schachter & Otanes (1972:334), the prefix *maki-* often

implies that the performer (subject) is taking part in an activity in which another person (non-subject) “has, in some sense, a prior or more direct involvement.”

Tagalog (Shkarban & Rachkov Ch. 22, §12, ex. (218), (221), (229))

- | | | | | |
|------|----|---------------------------|-----------------------------|--------------------------------|
| (36) | a. | <i>um-inom</i> | ‘to drink’ | |
| | b. | <i>maki-inom</i> | ‘to drink with sb’ | comitative of an unmarked verb |
| (37) | a. | <i>t-um-ulong</i> | ‘to help’ | |
| | b. | <i>mag-tulong-an</i> | ‘to help each other’ | |
| | c. | <i>maki-pag-tulong-an</i> | ‘to cooperate with sb’ | comitative of reciprocal |
| (38) | a. | <i>um-inom</i> | ‘to drink’ | |
| | b. | <i>mag-inum-an</i> | ‘to drink together’ | |
| | c. | <i>maki-pag-inum-an</i> | ‘to drink together with sb’ | comitative of sociative |

In Maasai, there is a polysemous verbal form in *-a* termed “middle” (“neuter” in earlier terminology) which, judging by the examples, can express such meanings as reciprocal (see (39a)), reflexive, anticausative, resultative. There is also a polysemous form with the marker *-ie/-je* or *-re* (after vowels) called “applied or instrumental” in Tucker & Mpaayei (1955: 134–40) and commonly termed applicative in linguistics. The applicative derivative of the middle form can denote actions performed “by means of a specific instrument or directed to a specific person or place” (ibid., p. 157). As (39b) shows, in one of its usages the applicative form can require the discontinuous construction with the shift of one of the reciprocants into a non-subject position, as in Tagalog (37) (although it can hardly be regarded as comitative).

Maasai (Tucker & Mpaayei 1955: 157; *k-* = 1PL, *a-* = 1SG)

- | | | | |
|------|----|--------------------|--|
| (39) | a. | <i>k-iŋor-a</i> | ‘we look at each other.’ |
| | b. | <i>a-iŋor-a-re</i> | ‘I look at him (while he looks at me)’ applicative of reciprocal |

8. Reciprocal-sociative polysemy. Sociative, comitative, assistive

These meanings can be expressed by reciprocal markers. In this section, I will discuss constructions of types (b) and (b’) shown in (40) below and also assistive constructions contiguous to the comitative. First let it be noted that, although constructions (a), (a’) and (b), (b’) are structurally similar, they differ in the following way: in comitative (b’) the non-specified constituent can generally be omitted (cf. (61c), (62) and (65b)), while in discontinuous reciprocal construction (a’) it usually cannot; cf. example (112) in Kuular (Ch. 27, §5.3) (see, however, (73c) below).

- | | | | | | |
|------|----|---------------------------------------|---|-----|--|
| (40) | a. | <i>Simple</i> reciprocal construction | – | a’. | <i>Discontinuous</i> reciprocal construction |
| | | (= RECS) | | | (= RECD) |
| | b. | <i>Sociative</i> construction | – | b’. | <i>Comitative</i> construction |
| | | (= SOC) | | | (= COM) |

The sociative and the comitative meanings are very close to each other, often being expressed by the same marker. But even in this case the grammarians, including native

speakers of the relevant languages, distinguish these meanings under different labels. Thus, in Abaza (Tabulova 1976: 188–91) the comitative marked by the prefix *c-* (see (69b') below) is termed “the category of conjunctivity” (Russian *sojuznost'*) and the sociative marked by the same prefix (see (69b)) is termed the “category of jointness” (Russian *sovmestnost'*). These categories are also differentiated by the authors of the grammars of Yakut; the comitative marked by the suffix *-s* (see (54b.ii)) is termed “contiguous jointness” (*primykajuščaja sovmestnost'*) and the sociative also marked by *-s* (see (54b.i)) is named “combined jointness” (*sovokupnaja sovmestnost'*) (Kharitonov 1963:22).

Note that the sociative does not change the valency of the base, and the comitative and assistive increase it by one.

A striking parallel to the Yakut reciprocal-sociative-comitative-assistive polysemy is attested in Ancient Greek. Incidentally, the Yakut reciprocal marker is listed among reciprocal voice-oriented markers in Yakut grammars, while in the Ancient Greek grammars the prefix *συν-* is not, the expression of reciprocity being a marginal function of this prefix (see 15.5).

8.1 Sociative

The sociative meaning (also called associative, collective, cooperative, etc.) suggests that an action is performed jointly and simultaneously by a group of people (at least two) named by the subject (on objects see below) and engaged in the same activity (Lichtenberk 1985:28; see Kemmer 1993:98–102; 123–27; Wierzbicka 1980:260–4; Zaliznjak & Shmelev Ch. 4, §2.1). The prototypical sociative meaning seems to include related semantic components, such as spatial (the meaning ‘together’), aspectual (‘simultaneously’), number (‘all’, ‘many’, etc.), and modal (‘jointly’).

Of particular interest are some characteristics of the sociative in Yakut, especially in view of the fact that they are pointed out by an author who is a native speaker: “a joint action is understood as one common action in which two or more acting persons participate in equal measure”; “verbs of joint action manifest in their meaning the presence of some inner bond between the participants”; “the linking bond is probably the unity of the cause and the unity of the situation (and of psychological conditions) of the action performed”; “the nature of the inner connection between the components of the idea of joint action may vary depending on the lexical meaning of the verbal stem and the overall meaning of the context” (Kharitonov 1963:24–5). The author illustrates his statements with examples cited below in (44) and (45), where the base constructions with a plural predicate are opposed to constructions with a predicate marked as sociative (the same marker is also used for the reciprocal, comitative and assistive meanings). A picturesque description of sociatives in Tatar is suggested by Zinnatullina (1969:195): sociatives denote actions “not as a single process but as a sum of single actions of a multitude of persons <...> The actions are seen as live, dimensional, dynamic: the action of each person is characterized by peculiarities <...>.”

The general characteristics of the sociative meaning just cited do not cover the cases of “extended” use of the sociative markers, especially those with the inanimate subject referents (see (46) and (47) below).

Like reciprocals, sociatives can be (a) subject-oriented and (b) object-oriented (cf. (a) and (b) respectively in (41); see also (65)). In case (a) the sociative relation holds between the subject referents and in (b) between object referents. This relation is in a sense isomorphic to that between the subject- and object-oriented reciprocals, and also between subject- and object-oriented distributives in a number of languages (cf. Nivkh (Gilyak) *vi-γət-t* ‘each of them left’, *řu-γət-t* ‘picked up each of them’; here *-γət* is an aspect marker and *-t* is a finite marker). Needless to say, if the predicate is intransitive it is always subject-oriented, and a transitive predicate is usually, though not exclusively, also subject-oriented (on object-oriented reciprocals see Section 5 above).

As the examples show, there is a significant semantic difference between these two types with respect to the degree of active participation of the referents in the action. Obviously, the feature ‘jointly’ from the above definition does not apply to object-oriented sociative sentences with the meanings like ‘She washed his shirt and trousers together’. Here the main features are ‘spatial proximity’ and ‘simultaneity (of actions on the object participants)’. ‘Spatial proximity’ and ‘simultaneity’ are also typical of subject-oriented sociatives (thus the situation ‘to be near/next to each other’ can also be interpreted as spatial reciprocal; it is not accidental that it can be marked by reciprocal markers which lack the sociative meaning; see (102), (103)).

Ancient Greek and Latin

- (41) a. *κάθημαι* ‘sit’ → *συγ-κάθημαι* ‘sit next to each other or together’
γεωργέω ‘till land’ → *συγ-γεωργέω* ‘till land together, jointly’
 b. *δεκάζω* ‘bribe’ → *συν-δεκάζω* ‘bribe all (persons) together or entirely’
crucifigo ‘crucify’ → *con-crucifigo* ‘crucify sb and sb simultaneously or together.’

In contrast to intransitive sociatives that usually can be translated in different ways (see the text beneath (45)), the word ‘together’ adequately renders the meaning of transitive sociatives. The sociative meaning is the most common additional function of reciprocal markers (see (54b)). The two meanings usually differ syntactically; thus, the direct object rules out the reciprocal meaning (see reading (i) in (42a)) and, *vice versa*, its absence makes the construction reciprocal (see reading (ii)). But this is possible only if a predicate can take an animate direct object. For instance, the omission of the direct object in (42b) makes the sentence absurd (cf. *‘They paved each other’).

Yakut (Nedjalkov & Nedjalkov, Ch. 26, §9.2.1.2)

- (42) a. *Kiniler* [*is taŋah-ə*] *məɫala-s-t-əlar*.
 they interior clothes-ACC SOAP-REC-PAST-3PL
 i. ‘They soaped the underwear *together*.’ (with the bracketed constituents)
 ii. ‘They soaped *each other*.’ (without the bracketed constituents)
 b. *Kiniler* [*uulussa-nə*] *muostala-s-t-əlar*.
 they street-ACC pave-REC-PAST-3PL

- i. ‘They paved the street *together*.’ (with the bracketed constituent)
 ii. *‘They paved *each other*.’ (without the bracketed constituent)

When both the reciprocal and the sociative meanings are productive enough, the class of base verbs to which sociatives can apply is typically larger than that of the verbs which can be reciprocalized. Firstly, reciprocals do not derive from one-place intransitives, as a rule (see, however, (see (113) and (114)), and secondly, they do not derive from transitives with an inanimate direct object, i.e. like those in (42b) (the exception being the “indirect” and “possessive” reciprocals; see 12.1.2 and 12.2.1 below). Note that judging by the data from the *Yakut-Russian dictionary* (Slepcev 1972), checked with the informants, about 300 reciprocal and 600 sociative derivatives are registered, many derivatives exhibiting both meanings (see Ch. 26, §§9.2.1 and 7). The data for the Tatar language (Zinnatullina 1969:197, 190, 193) also show the prevalence of sociative derivatives (mostly of intransitive bases) over reciprocal derivatives, about 130 and 110 items respectively (out of 660 forms with the suffix -ṣ̌). But the most productive class in Tatar are assistives – 335 items (nearly all derived from transitives).

In a number of languages, sociatives derive mostly or exclusively from intransitives. Thus, in the *Karachay-Balkar-Russian dictionary* (Gochijaeva & Sujunchev 1989) as few as 10 registered sociatives are transitive and as many as 140 are intransitive (in connection with the weakening of the productivity of transitive sociatives it should be noted that in another Turkic language, Kirghiz, sociatives have practically fallen out of use). The main semantic classes of the intransitive base verbs from which sociatives derive (including derivatives with the additional components of meaning like ‘many’, ‘intensively’ and the like) are:

- (a) verbs of producing sounds, e.g. ‘to snore’, ‘to cluck’;
- (b) verbs of shining, e.g. ‘to sparkle’;
- (c) verbs of motion, e.g. ‘to sit down’, ‘to hobble’;
- (d) verbs of physiological processes, e.g. ‘to grow thin’, ‘to grow old’;
- (e) some verbs of psychological states and processes, e.g. ‘to get scared’, ‘to get confused’, ‘to rejoice’;

(f) natural states and processes, e.g. ‘to hang down’, ‘to burst into leaf’, ‘to grow green’ (Nedjalkov & Nedjalkov, Ch. 24 on Karachay-Balkar, §5.2.3). In Yakut, sociatives often derive from numerous intransitives denoting sound production and/or those with aspectual frequentative meanings (see Kharitonov 1963:22–8). The same is the case in Tuvan; cf.:

Tuvan (Kuular, Ch. 27, ex. (105))

- (43) *kattar-aš-* ‘to laugh (of many together)’
mööle-š- ‘to moo (of many cows simultaneously)’
ulu-š- ‘to howl (of many).’

The sociative meaning of intransitives seems to vary within certain semantic limits and therefore, as mentioned, it may be translated in a variety of ways. Thus, Yakut sociatives are translated into Russian by the Yakut linguist N. Kharitonov (1963:25–8) with the help of words meaning ‘together’, ‘jointly’, ‘of many (persons, things) together’, ‘of many’, ‘simultaneously’, ‘all (of them) together’, ‘all at once’, etc. Karachay-Balkar sociatives are also

translated with the help of the expressions ‘all together’, ‘all at once’, ‘all those present’, ‘here and there’, ‘first one then another, overlapping’, ‘interrupting each other without waiting for one’s turn’, ‘in a hurry’, ‘feverishly (as if in competition)’, ‘competing in speed’ (which may imply an intensive action). Sometimes, in broad context or due to the lexical meaning of the base verb, the sociative meaning surfaces in translations in an unpredictable way. Compare examples with intransitive sociatives:

Yakut (Nedjalkov & Nedjalkov, Ch. 26, ex. (146)–(147))

- (44) a. *Turaax-tar daayənə-l-lar.* → b. *Turaax-tar daayəna-h-al-lar.*
 CROW-PL CAW-PRES-3PL CROW-PL CAW-REC-PRES-3PL
 ‘Crows are cawing.’ ‘Crows are cawing (all of them together, jointly).’
- (45) a. *Oyo-lor atə-l-lar.* → b. *Oyo-lor ata-h-al-lar.*
 child-PL cry-PRES-3PL child-PL cry-REC-PRES-PL
 ‘The children are crying.’ ‘The children are crying (all of them together, as if vying with each other).’

Out of context, the meaning of intransitive sociatives can very often be rendered in English more or less adequately by the word ‘together’, but in textual examples they often acquire very subtle semantic nuances (cf. (47)). These nuances are sometimes difficult to express adequately in English: they may be omitted in translation, as in (46), or translated by a separate word and thus acquire inappropriate emphasis absent in the original, as in (44) and (45).⁵

Yakut (Ch. 26, §9.2.1.1)

- (46) *Kölohən-ner-e čallərya-ččə tammala-s-t-əlar.*
 sweat-PL-his drop-CONV drop-REC-PAST-3PL
 ‘Drops of his sweat fell down.’
- (47) *Təhənča-nan hojuu bugul-lar bačəgara-h-al-lar.*
 thousand-INST thick haystack-PL stand-REC-PRES-3PL
 ‘Thousands of haystacks stand here and there’ (the distributive sense ‘here and there’ is used for stylistic purposes to convey the meaning ‘many’, in semantic agreement with the numeral ‘thousands’).

As a rule, sociative markers, including words meaning ‘together’ (or ‘both’), do not combine with grammatical and lexical reciprocals (cf. Dougherty 1974:37–8; Yomdin 1981:100; Reis & Vater 1980:375–7; Zaliznjak & Shmelev 1999:454). This may be due to a collision of the meanings of the two markers: in the sociative the subject referents share *one* semantic role and are presented as a single “indivisible” entity, while in the reciprocal the subject referents are divided [into two parties], each being ascribed *two* roles. The reciprocal denotes an action involving the subject referents, whereas ‘together’ stresses the meaning of *joint* action. Therefore, if a sociative marker is added to a reciprocal sentence with a meaning like ‘They fight’ (> ‘They fight together’), the informants may ask: ‘whom

5. Similar problems arise when a grammatical element of a language is translated into another language where the corresponding meaning is not grammaticalized; cf. the difficulties of rendering Russian aspects in aspectless languages, such as English.

do they fight with?’ The sporadically attested combinations of these two markers may be accounted for by a change of the meaning of the sociative marker when it is combined with a reciprocal marker, for instance, it may acquire the meaning ‘simultaneously’, as in Even (cf. Malchukov, Ch. 39, §§2.5.1 and 7). A different case is attested in Tariana where the combination of both markers means ‘do sth all together to one another’ (Aikhenvald, Ch. 30, §§4.1–4.4) and thus the above mentioned semantic conflict does not hold.⁶

8.2 Comitative

The sociative meaning implies a joint action of participants acting *en masse*, as a single group, whereas the comitative meaning implies *two participants*, each participant being single or collective (as in the reciprocal meaning), acting jointly, together, without indication which of them is the initiator of the action. The second participant is expressed by a non-subject argument, either an indirect object with a comitative marker (postposition, preposition or case marker) or a direct object. Syntactic separation and demotion of this participant may lead to the filling in of this position by the name of a referent unequal to the subject referent in status (cf. 1.9.8). In this construction the subject may be in the *singular* (this also applies to discontinuous reciprocal constructions of type (40a') as well; see (33c), (29b), (30a')). The comitative meaning differs from the sociative where all the participants are equally involved in the action in that it implies that the subject referent, which may be singular, takes part in an action often initiated by another party which can be expressed by a non-subject argument or remain unexpressed. In isolated quotations (and in forms non-inflected for number), a form with a sociative-comitative marker is ambiguous (sociative or comitative) and, often, the dictionary translation as either sociative or comitative is accidental (thus, (48a) may also have a sociative meaning ‘to laugh together’). Comitatives can also be subject-oriented (48a) and object-oriented (48b), although the latter type is rather rare.

Ancient Greek and Latin (henceforth 1SG.PRES forms used as standard citation forms in dictionaries are translated as English infinitives)

- (48) a. γελάω ‘laugh’ → σὺγ-γελάω ‘laugh together with sb’
 b. *creo* ‘create’ → *concreo* ‘create sth together with sth.’

Unlike intransitive (but not transitive) sociatives, which may be translated in different ways, depending on the the lexical meaning, comitatives are more homogeneous: they are mostly translated by means of the phrase ‘(together) with sb’, or ‘(together) with sth’.

As a rule, *comitative constructions can be easily converted into sociative*, but the opposite conversion of sociative into a comitative construction is often impossible. For instance,

6. To a certain degree, the following derivational relationship is characteristic of the semantic relationship between the comitative, reciprocal and sociative: the meaning ‘together’ is expressed in Nivkh and Ainu by reciprocal derivatives from lexical comitatives; cf. Nivkh *-yrə-* ‘to accompany sb’ → *u-yrut* ‘together’ (where *u-* = REC, *-t* = CONV.PL; the alternation *-ə/u-* is unique): thus, ‘together’ literally means ‘accompanying each other’; Ainu *tara* ‘to go with sb’ → *u-tara* ‘together’ (*u-* = REC).

sociative constructions with a non-human subject are not as a rule convertible into comitative for pragmatic reasons; cf. examples (44), (46) and (47) of sociatives cited above. For the following Karachay-Balkar sociatives, comitative transforms are impossible or weird (cf. the literal English translation of the comitative conversion of (49b): ‘A log together with other logs burns breaking into sparkles’).

Karachay-Balkar (Nedjalkov & Nedjalkov, Ch. 24, ex. (93b, k))

- (49) a. *Tawuq-la qanqalda-š-də-la.* (G. 56)
 hen-PL cackle-REC-PAST-3PL
 ‘The hens started cackling all at once.’
 b. *Kösew-le dziltinde-š-ib džan-a-dəla.* (KB. 249)
 log-PL sparkle-REC-CONV burn-PRES-3PL
 ‘The logs (many of them) burn breaking into sparkles.’

There are rather rare exceptions, however, determined by various pragmatic factors. Here are examples of Karachay-Balkar sociative constructions which can be converted into comitative with an unspecified co-participant (50c) and with the co-participant expressed by a comitative phrase (50d), and examples of sociative constructions that can be converted into comitative only if the co-participant is expressed by a comitative phrase (51d) but not with an unspecified co-participant (51c).

Karachay-Balkar (Nedjalkov & Nedjalkov, Ch. 24, ex. (86), (90); -*də* = PAST, -*la* = 3PL, -*š* = REC, *an-ə* = ‘s/he-ACC’, *bla* = ‘with’)

- (50) a. *Ala dabərda-də-la.* ‘They were making noise.’
 b. *Ala dabərda-š-də-la.* ‘They all were making noise [vying with/interrupting each other].’
 c. *Ol dabərda-š-də-Ø.* ‘He was making noise [taking part in the general hubbub].’
 d. *Ol an-ə bla dabərda-š-də-Ø.* ‘He was making noise with him [taking part in the general hubbub].’
 (51) a. *Ala džutlan-də-la.* ‘They fell upon their food.’
 b. *Ala džutlan-əš-də-la.* ‘They fell upon their food (many of them, in a hurry).’
 c. **Ol džutlan-əš-də-Ø.* (intended meaning: ‘He fell upon his food with sb else.’)
 d. *Ol an-ə bla džutlan-əš-də-Ø.* ‘He fell upon his food with him.’

8.3 Assistive

The assistive meaning, like comitative, implies two participants, initiator of the action and the assistant, each single or a group of people jointly performing the same action. The initiator of the action surfaces as a non-subject (often in the dative case), and the assistant as the subject.

Unless there are restrictions determined by the weak productivity of the comitative, *any assistive construction can be converted into comitative*, but the opposite is not true.

Although the distribution of the meanings assigned in a dictionary to derivatives may be accidental, I will illustrate various combinations of the assistive meaning in Ancient Greek with other meanings in polysemous Ancient Greek derivatives: the assistive mean-

3. Valency: the reciprocal implies valency reduction, in the sociative there is no change, and the comitative and assistive display valency increase.

4. Subject/object-oriented constructions: the reciprocal, sociative and comitative can be both subject- and object-oriented (I have in mind the following oppositions respectively: *They hit each other* – *He hit the stones against one another*; *They killed him together* – *He killed them together*; *He built the house with them* – *He cooked the meat with potatoes*; cf. (24), (41), (48b)). The assistive has no object-oriented correlates (it is hard to imagine an object-oriented construction in opposition to the sentence *He helped them to build the house*).

5. In the reciprocal and the assistive the underlying meaning seems to undergo a more essential shift than in the sociative and comitative.

6. In the reciprocal and the sociative the subject referents perform identical actions; in the assistive, the non-subject denotes the main performer; in the comitative the main performer is determined by the context.

7. The following pragmatically conditioned relations typically hold between the four meanings (if all of them are productive in a language) (the illustrations are from Yakut):

7a. A derivative with the assistive meaning can also have a comitative meaning (cf. *ülele-s-* ‘to help sb to work’, ‘to work with sb’), but not *vice versa* (cf. *kel-is-* ‘to come with sb’, but not *‘to help sb to come’);

7b. As a rule, any comitative construction can be converted into sociative (‘to help sb to work’ > ‘to work with sb’ > ‘to work together’), but not *vice versa* (the sociative *tammala-s-* (*tammala-* ‘to drop’) in (46) does not allow a natural comitative phrase ‘with sth’);

7c. While the lexical scope (the range of lexical meanings of the bases) of the assistive is narrower than that of the comitative, which, in turn, is narrower than that of the sociative, the lexical scopes of reciprocal and comitative overlap; as a result, the following classes exist:

(i) derivatives with both the reciprocal and sociative meanings (sometimes with assistive and comitative meanings; e.g. *ölör-üš-* i. ‘to kill *each other*’, ii. ‘to kill sb *together*’, iii. ‘to kill sb *with someone*’, iv. ‘to *help* sb to kill sb’);

(ii) derivatives with the sociative meaning only; besides numerous sociatives of one-place intransitives (cf. *ülele-s-* ‘to work together’, etc.), here belong derivatives of transitives with an inanimate object (cf. *mehij-is-* ‘to knead (dough) together’, *muostala-s-* ‘to pave (the street) together’, etc.);

(iii) derivatives with the reciprocal meaning only (cf. *taapta-s-* ‘to love each other’, *ubura-s-* ‘to kiss each other’, *umn-us-* ‘to forget each other’, *üöx-süs-* ‘to curse each other’, *bil-is-* ‘to know each other’, *axt-æs-* ‘to miss each other’).

The hierarchy of the classes of derivatives can be represented as follows:

$$(55) \textit{reciprocal} \cap \textit{sociative} \supset \textit{comitative} \supset \textit{assistive}.$$

The relations listed in the generalizations under 7 are mostly due to pragmatic reasons. Another relevant parameter is the decrease of productivity of functions, such as sociative and comitative. In some languages the configuration of relations may be different.

Thus, implication 7a is absent in Modern Kirghiz, but this absence does not disprove this implication. The reason of the lack of sociatives and comitatives (whereas assistives and reciprocals are highly productive) is probably due to the fact that the sociative function of the reciprocal marker has developed into an optional 3PL marker on verbs (see Nedjalkov, Ch. 28, §9.2).

9. **Formal correlations: (a) simple reciprocal construction (RECS) – (a') discontinuous reciprocal construction (RECD), and (b) sociative construction – (b') comitative construction**

Sociative constructions are simple by definition, while comitative constructions are always discontinuous (in the sense that the second participant is expressed by a non-subject constituent), also by definition. The following main means of marking these four types of constructions are considered below (note that (56) and (57) repeat the schema in (40)). Syntactically, (56a) relates to (56a') in the same way as (57b) relates to (57b'): in both (57a') and (57b'), as compared with (56a) and (56b) respectively, syntactic valency increases by one, although the number of the participants is retained; on the other hand, the non-subject constituent cannot be omitted in (56a'), while in (57b') it can easily be omitted as it is or it can be implied by the comitative form and context.

- (56) a. *Simple* reciprocal construction – a'. *Discontinuous* reciprocal construction
 (= RECS) (= RECD)
- (57) b. *Sociative* construction – b'. *Comitative* construction
 (= SOC) (= COM)

These categories can use same or different markers which may differ in productivity. The following main types may be distinguished.

9.1 **Type A. Languages where constructions RECS – RECD and SOC – COM are marked in the same way**

All the four types employ the same marker; this is the case in Yakut, Tuvan and a number of Bantu languages; the markers for these languages are:

(58) Yakut; Tuvan

RECS	-s; -š-	RECD	-s; -š-
SOC	-s; -š-	COM	-s; -š-

(59) In some Bantu languages

RECS	-an	RECD	-an
SOC	-an	COM	-an

The allomorphs of the Yakut and Tuvan reciprocal suffix are *-s/-h*, and *-š/-ž/-č* respectively).

Tuvan (Kuular, Ch. 27, ex. (123); in (60), the assistive meaning also characteristic of some other Turkic languages is added here to those used in the constructions listed in (56) and (57))

- (60) a. *Bis sigen kes-ip tur bis.*
 we hay mow-CONV AUX.PRES 1PL
 ‘We make hay.’
- b. *Bis sigen kes-č-ip tur bis.*
 we hay mow-REC-CONV AUX.PRES 1PL
- i. ‘We are making hay *together*.’ sociative
 ii. ‘We are making hay *with sb else*.’ comitative
 iii. ‘We *help sb* to make hay.’ assistive
 iv. ‘We are making hay *together helping each other*.’ reciprocal-assistive

For the RECS and RECD see Swahili (29a–b) above; for SOC and COM see (61b, c) and (62). It is but natural that RECD implies the existence of RECS, and COM seems to imply the existence of SOC.

Rwanda (Coupez 1985: 15)

- (61) a. *kureb-a umugabo* ‘to look at a man’ → *kureb-an-a* ‘to look at each other’
 b. *guhinga umurimá* ‘to till a field’ → *guhing-an-a umurimá* ‘to till a field together’
 c. *guhing-an-a n-úmwána* ‘to till a field with a child (who is also tilling).’

In contrast to discontinuous reciprocal constructions where the non-direct object cannot, as a rule, be omitted (a special case is Cashinahua where this constituent cannot be expressed at all; see 9.7), it is possible in comitative constructions, i.e. the co-participant remains unspecified; cf.:

Karanga (Marconnès 1931: 194)

- (62)=(60) *Ndaka tamb-an-a (sek-an-a) mu church.*
 ‘I played (laughed) with others in church.’

9.2 Type B. Languages with the same marker for RECS – RECD and another marker for SOC – COM

This type of marking is attested in Evenki and in Fula (the Fula reciprocal marker *-indir* has variants *-ootir* and *-tir*, the latter being used after a reduplicated root; Arnott 1970: 345, 357, 358).

(63) Evenki

RECS	<i>-maat</i>	RECD	<i>-maat</i>
SOC	<i>-ldə</i>	COM	<i>-ldə</i>

(64) Fula

RECS	<i>-indir</i>	RECD	<i>-indir</i>
SOC	<i>-d</i>	COM	<i>-d</i>

For the RECS and RECD of (63) see examples (34a, b); for SOC and COM of (63) see (65a, b). Case COM of (64) is illustrated by subject-oriented and object-oriented sociatives in (66a) and (66b) respectively. Note that the sociative meaning is translated into English not only by means of ‘together’ but also ‘all (of them) together’, ‘simultaneously’, etc.

Evenki (Nedjalkov & Nedjalkov, Ch. 38, ex. (47))

- (65) a. *Nuŋartən tatkit-tula ŋene-ldə-re-Ø.*
 they school-ALL go-SOC-NFUT-3PL
 ‘They went to school together.’
 b. *Nuŋan tatkit-tula ŋene-ldə-re-n.*
 he school-ALL go-COM-NFUT-3SG
 ‘He went to school with somebody.’

Fula (Arnott 1970:345)

- (66) a. *be-nast-id-ii* (*fiu*).
 they-come-SOC-PERF all
 ‘They all came in.’
 b. *gujjo nast-id-ii huudi ’amin fiu.*
 thief come-SOC-PERF hut our all
 ‘The thief entered all our huts.’

9.3 Type C. Languages with RECD and COM derived by the same marker from RECS and SOC respectively

This type of marking is attested in Tagalog:

(67) Tagalog

RECS	<i>mag-...-an</i> →	RECD	<i>maki-pag-...-an</i>
SOC	<i>mag-...-an</i> →	COM	<i>maki-pag-...-an</i>

For the RECS and RECD see examples (37b, c); for SOC and COM see (38b, c).

9.4 Type D. Languages lacking RECD, with SOC and COM marked in the same way

This is attested in Abaza. The reciprocal marker in Abaza is *a(i)-* for intransitives (subject – non-direct object coreferentiality) and *a(i)-ba-* for transitives (subject – direct object, subject – indirect object and direct object – non-direct object coreferentiality; cf. Tabulova 1976:191–4).

(68) Abaza

RECS	<i>a(i)-; a(i)-ba-</i>	RECD	–
SOC	<i>c-</i>	COM	<i>c-</i>

Compare:

Abaza (Tabulova 1976:191–2; 188; *j-* = subject agreement marker on intransitives and object agreement marker on transitives; in (69) the Cyrillic spelling is transliterated)

- (69) a. *j-aba-dər-itl.* a'. –
 they-REC-know-PRES
 ‘They know each other.’

- b. *ja-cə-gI-ga-tI.*
that-SOC-we-carry-PAST
'We carried that together.'
- b'. *j-rə-cə-z-ga-tI.*
that-they-COM-I-carry-PAST
'I carried that with them.'

An example for RECS with the prefix *ai-*:

- c. *xI-ai-čvažva-tI.*
we-REC-talk-PAST
'We talked with each other.'

9.5 Type E. Languages lacking RECD, with SOC derived from COM by means of a reciprocal marker

This is the case of Kabardian: the reciprocal markers are *zə-* for the reciprocalization of subject and non-direct object or direct object and non-direct object and *zə-rə-* for subject and direct object reciprocalization.

(70) Kabardian

RECS	<i>zə-; zə-rə-</i>	RECD	–
SOC	<i>zə-də- ←</i>	COM	<i>də-</i>

Kabardian (Shagirov 1957: 135, 130, 129)

- (71) a. ... *də-zə-pselə-a-šb.* a'. –
we-REC-speak-PAST-ASS
'... we had a talk *with each other*.'
- b. ... *unə zə-də-tI-šbI-a-šb.* b'. *v-də-s-tx-a-šb.*
house REC-COM-we-build-PAST you.PL-COM-I-write-PAST
'... we built a house *together*.' 'I wrote it *with you*.'

9.6 Type F. Languages which have RECS only

In this case the discontinuous construction is either non-existent or occurs mostly with lexicalized reciprocals only. This is typical of Indo-European languages, e.g. French reciprocals with *se*, German *sich*. Russian unproductive reciprocals in *-sja* usually allow the discontinuous construction, as they are practically lexicalized reciprocals (see, for instance, (30a'), (30a'') and (30c'); (iv) in 1.2.3). In French only one or two lexicalized reciprocals allow the discontinuous construction, as illustrated by (33b, c). In German, there are about 20 reciprocals that allow the discontinuous construction (Wiemer & Nedjalkov, Ch. 10, §4.7).⁷

Here is the schema for this type (the parentheses indicate that the type is possible as an exception; note that anticausatives derived from three-place lexical reciprocals (= lexical causatives) and homonymous with reciprocals proper can be used in constructions

7. A similar relation is attested in Indonesian where "(...) judging by written texts the use of a reciprocal with discontinuous arguments seems to be determined by the degree of its lexicalization, and also by its semantic affinity to lexical reciprocals" (Ogloblin & Nedjalkov, Ch. 14, §7.3).

formally identical with RECD; cf. German *Er versöhnte Peter mit Paul* ‘He reconciled Peter and Paul’ → *Peter versöhnte sich mit Paul* ‘Peter got reconciled with Paul’; see Section 14):

(72) French, German

RECS	<i>se; sich</i>	RECD	(-)
SOC	-	COM	-

In this connection Bogorodickij’s (1935⁵: 168) assertion on Russian reciprocals may be of interest: “it is natural to assume that at first the forms of the reciprocal voice appeared in the plural number (*my boroli-s’* ... ‘we fought...’), and later the singular number was formed by analogy with other verbs”.

9.7 Type G. Languages which lack SOC and COM and have only RECS and “zero” RECD

The only instance of this type, which is of special interest typologically, is Cashinahua (Camargo, Ch. 45, §3.2.1). The RECD exhibits two important features:

- if the subject (= first reciprocant) is singular (cf. ‘This man’ in (73c)), another reciprocant is nonspecified and cannot be expressed (but it is implied by the reciprocal verb form); moreover, the action of this participant may be separated in time and/or in space from the action of the first one (note that in the discontinuous reciprocal constructions of other languages the comitative phrase denoting the co-participant cannot generally be omitted);
- if the subject is plural the sentence is generally ambiguous: it can have the reciprocal “indirect” reading (as a simple construction, see (i) in (73d)) or be interpreted as a reciprocal construction with an unspecified second reciprocant (see (ii) in (73d)), whereas the plural subject is interpreted as a collective first reciprocant, i.e. this interpretation is analogous to (73c) where the subject is singular.

Cashinahua (Camargo, Ch. 45, ex. (3)); in (73b) *-şun* = BEN is used because in constructions with three-place transitives the addressee is deleted)

- (73) a. *na huni-bu-n paku piti inan-mis.*
 this man-PL-ERG P. food give-HAB
 ‘These men always give food to Paco.’
- b. *na huni-bu-n piti inan-şun-mis.*
 this man-PL-ERG food give-BEN-HAB
 ‘These men always give food to someone.’
- c. *na huni-Ø piti inan-nami-mis.*
 this man-ABS food give-REC-HAB
 ‘This man always gives food to someone else reciprocally (who gives/will give food to this man in return when he needs it...).’
- d. *na huni-bu-Ø piti inan-nami-mis.*
 this man-PL-ABS food give-REC-HAB
 i. ‘These men always give food to each other.’
 ii. ‘These men always give food to someone else (who gives food to these men in return when they need it...).’

9.8 Irreversible reciprocal discontinuous constructions and comitative constructions

In these constructions, the second participant is of a different semantic class than the first one or this second participant is coreferential with the first one, and therefore the discontinuous reciprocal construction cannot be converted into simple, and the comitative construction into sociative. Thus the reason is rather trivial: the (pro-)nouns of different lexical or grammatical classes cannot be linked by co-ordinating conjunctions (cf. ‘they’ and ‘spirit...’ in (74), ‘the man’ and ‘himself’ in (75), ‘he’ and ‘a dog/a book’ in (76)). Therefore, the syntactic detachment of the second participant can lead to semantic separation, and to the loss of the properties of standard reciprocal or comitative constructions in cases like (74)–(76); cf.:

Indonesian (Ogloblin & Nedjalkov, Ch. 33, §7.4)

- (74) *Mereka ingin ber-kenau-an dengan jiwa Dai Nippon.*
 they strive REC-know-REC with spirit state Japan
 ‘They strove to get acquainted with the spirit of the State of Japan.’

Tuvan (Kuular, Ch. 27, ex. (42))

- (75) *Bod-u-bile bod-u čugaala-ž-ïp or-ar kiži boor*
 himself-3.POSS-with himself-3.POSS speak-REC-CONV AUX-NPAST.3 man possibly
be?
 really
 ‘Does the man really talk with himself?’

Nkore-Kiga (Taylor 1982:67–68)

- (76) *y-a-ij-an-a embwa/ekitaba.*
 he-TP-come-REC-a dog/book
 ‘He came with a dog/a book // brought a dog/a book.’

10. Reciprocals of converse bases

This meaning involves both spatial and temporal relations. In this case two underlying constructions contain verbs or prepositions, adverbs, etc. which are in a converse semantic relation and imply one another (cf. ‘to follow’ – ‘to precede’, ‘before’ – ‘after’, ‘at the top’ – ‘at the bottom’, etc.). Reciprocals derived from converse bases are as a rule marked in the same way as proper reciprocals, although there are no prototypical reciprocal relations between the participants.

With respect to the feature of “subsequent distribution of an action or motion among a multiplicity of homogeneous subjects or objects” (cf. Birjulin 2001:198–9), these formations contain a distributive meaning. And with respect to the feature of spatial and/or temporal relation between the participants named by the subject and inherited from the converse bases, with a potential change of the semantic relation between them (‘to follow – to precede’, ‘before – after’, ‘in front of – behind’, etc.) they can be entered among recip-

rocals. Depending on the morphological class of the converse bases, reciprocals function as markers of the distributive meaning ‘one after another’, ‘one by one’ (cf. (84b)), or they function as distributives with meanings like ‘to walk in front of each other’ (82c)). The semantic domains of distributives and reciprocals overlap here to a certain degree.

10.1 Verbs

Languages commonly treat meanings like ‘to follow each other’, often labelled “chaining” (the term was proposed by Lichtenberk 1985:24–6), as common reciprocals and thus have no special markers for them (see, however, (85) where a special marker, though similar to the verbal reciprocal marker, is used on the adverb). Therefore these meanings can hardly be regarded as a special case alongside the prototypical reciprocals and sociatives: it is a reciprocal meaning on a particular lexical group of verbs (cf. Kemmer 1993:100–1).⁸ Their number usually does not exceed five or ten items at the most. Here is a French example and its English equivalent (note that (77) with *two* participants is not covered by chaining, because there is no intermediate participant):

- (77) a. *Les deux compagnies se suivaient à une centaine de pas.*
 b. *The two companies followed one after the other at a distance of a hundred paces.*

Heath (1984:391) distinguishes this meaning in Nunggubuyu as a “unilinear collective sense ($A \rightarrow B \rightarrow C \dots$) in which the individual component actions are one way but in which they add up (like links in a chain) in such a way that all parties can be thought of as collectively associated actions.” Examples:

- (78) a. =*lhama-n’ji-* ‘to beget each other’
 b. =*yaba-n’ji-* ‘to give birth to each other.’

Neither of these sentences can be paraphrased in the same way as in (4), i.e. with the same non-reciprocal verb in (4a’) and (4a’), or (9a’) and (9a’), as

- (79) a’. *Company A followed company B.* + a”. *Company B followed company A.*

Instead, converse verbs must be used:

- (80) a’. *Company A followed company B.* +/= a”. *Company B preceded company A.*

These sentences are analogous to (4a’) and (4a’). In other words, (77b) implies both (80a’) and (80a’).

This problem of converse relations has attracted considerable attention (see, for instance, Fiengo & Lasnik 1973:454–6; Dougherty 1974:16–7; Langendoen 1978:184, 191–3; Xrakovskij 1981:24–5).

It has been pointed out that in some languages there are reciprocals meaning ‘to follow each other’ but no reciprocals with the meaning ‘to precede each other’. One of the

8. Nevertheless, the pronoun *each other* cannot be used in (77b) and this may show that the two situations do not coincide entirely (S. Say, p.c.).

rare exceptions is Nivkh where converse verbs become synonyms when used with the reciprocal prefix (81b). Note that in (81) the reciprocal verbs are reduplicated (reduplication is one of the markers of the distributive meaning and it may signify repetition or plurality of agents).

Nivkh (Otaina & Nedjalkov, Ch. 41, §3.5; *v-/u-* = REC)

- (81) a. *-əri-* 'to follow sb'
 → *v-əri-v-əri-* 'to follow each other', '(in) single file'
 a. *-ənki-* 'to precede', 'to leave behind/overtake'
 → *v-ənki+v-ənki-* lit. 'precede each other', '(in) single file'; 'overtake each other.'

An analogous example is attested in Chamorro by Costenoble (1940:386): the prefix *ǎ-* expresses not only the reciprocal proper (82a) and sociative (82b) meanings but also the "chaining" ("kättenmäsig") meaning (82c):

Chamorro (ibid.)

- (82) a. *ǎ-tuŋuʳ* 'to know each other'
 b. *ǎ-toʳkani* 'to try together'
 c. *ǎ-foʳna* 'to walk in front of each other' ('vor einander hergehen').

10.2 Prepositions, adverbs, locative nouns, etc.

A similar synonymy of reciprocals derived from converse (inflected) postpositions meaning 'after sb' – 'before sb' (not from converse verbs, as in (81a–b)) is attested in Udehe: these reciprocals are formed by reduplication rather than by means of a reciprocal affix; cf.:

Udehe (Nikolaeva, Ch. 23, §5.1)

- (83) a. *amä:ta* 'after sb' → *amä:ta amä:ta* 'after each other'
 b. *zulefe* 'before sb' → *zulefe zulefe* 'one after another.'

This type of reciprocals is characteristic not only of verbs but also of locative prepositions and postpositions, adverbs (see (84)) and locative nouns (85); but, as mentioned above, a language may have a special marker for them different from the reciprocal marker on verbs. Compare Ainu (84) with the shared marker and Evenki (85) with different markers (see also Nedjalkov & Nedjalkov, Ch. 38 on Evenki, §12; Malchukov, Ch. 39 on Even, §8.2; Alpatov et al., Ch. 42 on Ainu, §12; Otaina & Nedjalkov, Ch. 41 on Nivkh, §3.4). Prepositions with a reciprocal marker may be polysemous (cf. Wiemer & Nedjalkov, Ch. 10 on German, §5.5.5). Compare (verbal reciprocal forms are cited for comparison):

Ainu (Tamura 1996:495, 743–4, 817, 799; *u-* = REC)

- (84) a. *siru* 'to rub sth/sb' → *u-siru* 'to rub each other'
 b. *otutanu* 'after, next to' → *u-otutanu* 'in order, one by one.'

Evenki (Vasilevich 1958:27; cf. older REC marker *-lda/-ldə*, now used as a SOC marker; *-lta* = REC used on adverbs; now *-maat/-meet* = REC; *-du-* = DAT)

- (85) a. *bele-* 'to help sb' → *bele-meet-* 'to help each other'
 b. *amar* 'hind part, back' (→ *amar-du* 'behind') → *amaru-lta* 'one after another.'

11. Relations between verbal and syntactic (mostly pronominal) reciprocals across languages

Across languages, five types of the systems of reciprocal markers are attested (the sixth logical type is not registered).

11.1 Case 1. Languages with (one or more) syntactic reciprocal markers only

Here belongs English (where the only explicit reciprocal markers are the pronouns *each other* and *one another*) and Basque (*elkar* ‘each other’, inflected for case; see Saltarelli 1988: 120–128). Close to this type are Eastern Slavic languages, cf. the reciprocal pronouns *drug druga* ‘each other’ and *odin drugogo* ‘one another’ in Russian and its counterparts in the other languages. On the other hand, verbal reciprocals in Eastern Slavic languages are not productive and limited in number (e.g., in Russian, the number of reciprocals in *-sja/-s’*, of type (30b), does not exceed 40). Another instance is Malayalam with five reciprocal pronouns and four reciprocal adverbs (see Ch. 3: ex. (17) and §3.4), the pronouns being the principal markers of reciprocity. Here also belongs the Australian language Djarru (Tsunoda, Ch. 21, §§3.2 and 5.2) with a reflexive-reciprocal pronoun *nga-...-nyunu* inflected for number, person and case (in the slot between the other two components) which takes the position of noun phrases.

11.2 Case 2. Languages with (one or more) morphological and clitic markers only

Here belong Motuna (see Onishi 2000:137), Mundari (Osada, Ch. 37, §1.2), Nêlêmwa (Bril, Ch. 34, §1.1). No reflexive or reciprocal pronouns of any sort are registered in North-Arawakan languages of the Upper Rio Negro (Aikhenvald, Ch. 20, §1.3) and Bolivian Quechua (see van de Kerke, Ch. 31, §1.2). Kabardian (see Kazenin, Ch. 17, §5.1.2) and Tagalog (Shkarban & Rachkov, Ch. 22, §8) may be included here with reservations, as in these languages a syntactic marker of reciprocity is nevertheless used, though very rarely, and in Tagalog it is rare without the support of verbal markers.

11.3 Case 3. Languages with both types of reciprocal markers

Here is a slightly simplified schema, with the logically possible *Case 3d* of complementary distribution of both markers not registered. The subtypes are listed in order of decreasing nominal properties and increasing adverbial properties.

(86)	Co-occurrence of both reciprocal markers	Substitution of syntactic for verbal marker	Language
3a.	–	+	German, Polish (87a)
3b.	+	+	Yakut, Evenki (9)
3c.	+	–	French, Bulgarian (94c)
3d.	–	–	unattested (see, however, Case 3d in §11.3.4)

Let us consider these cases of correlation of both types of markers, and also the case when both markers have become one complex marker in the process of evolution (see Telugu in 11.4).

11.3.1 Case 3a. *The language has partially interchangeable but not co-occurring reciprocal markers*

An example may be the situation in German, where reciprocal markers occasionally co-occurring in colloquial speech are considered non-standard (87d). As the clitic pronoun *sich* is polysemous, in order to resolve its ambiguity in the case of polysemy of a given verb (cf. (87a) and (87b)), the adverb *gegenseitig* ‘mutually’ can be used; this adverb co-occurs with the reflexive pronoun and cannot express the reciprocal meaning by itself (cf. (87e)). Substitution of the reciprocal pronoun for the reflexive clitic (cf. (87a) and (87c)) is generally possible, though with stylistic restrictions (the former being sometimes bookish), as the reciprocal pronoun is not characteristic of colloquial speech: according to Berger et al. (1972:544) the reciprocal pronouns “fast immer gehoben, bei einigen Verben sogar gespreizt”.

- (87) a. *Sie lieben sich.* i. ‘They love *each other*’, ii. ‘They love *themselves*.’
 b. *Sie lieben sich gegenseitig.* ‘They love each other’, lit. ‘... each other mutually.’
 c. *Sie lieben einander.* ‘They love each other.’ (bookish)
 d. **Sie lieben sich einander.* (same intended meaning)
 e. **Sie lieben gegenseitig.* (same intended meaning).

If the base verb takes a prepositional object the reflexive clitic cannot be used as a reciprocalizer, and the reciprocal pronoun is the only choice (cf. the analogous state of affairs in French illustrated by (95) and in Bulgarian illustrated by (105) below); the reciprocal markers are in overlapping distribution.

- (88) a. *Sie warten auf ihn.* ‘They wait for him.’
 b. *Sie warten aufeinander.* ‘They wait for each other.’
 c. **Sie warten auf sich.* (same intended meaning as (b)).

11.3.2 Case 3b. *The language has both types of reciprocal markers which can co-occur and are partially interchangeable*

This co-occurrence of two different markers is rather common across languages. It may be pleonastic, determined, in particular, by the emphasis of reciprocity (cf. Yakut (9b–c–d) above where reciprocity is expressed in three different ways, in particular with a suffix and a pronoun simultaneously), or it may serve to resolve ambiguity if the verbal reciprocal form is polysemous. Synonymous reciprocal constructions with different marking may differ in the degree of acceptability (see the comment preceding Yakut example (9) above).

In the Indo-European languages this relation is either not represented at all or it is represented by a limited number of instances, as in Lithuanian, where a number of verbs form reciprocals with either the reciprocal marker *-si-/-s* or the reciprocal pronoun *vienas kitą* ‘each other’ but not with both, and on a few verbs they may co-occur, as in (89d) (Geniušienė, Ch. 14, §§8.5, 8.6.1). Compare:

Lithuanian

- (89) a. *Jis erzina ją.* 'He teases her.'
 b. *Jiedu erzina-si.* 'They-two tease each other.'
 c. *Jiedu erzina vienas kitą.* (same meaning).
 d. *Jiedu erzina-si vienas kitą.* (same meaning).

Japanese (Alpatov & Nedjalkov, Ch. 25, §1.2)

- (90) a. *Taroo wa Akiko o hagemasi-te-ita.*
 T. TOP A. ACC encourage-CONT-PAST
 'Taro was encouraging Akiko.'
 b. *Taroo to Akiko wa hagemasi-at-te-ita.*
 T. and A. TOP encourage-REC-CONT-PAST
 'Taro and Akiko were encouraging each other.'
 c. *Taroo to Akiko wa otagai o hagemasi-te-ita.*
 T. and A. TOP each.other ACC encourage-CONT-PAST
 (same translation).
 d. *Taroo to Akiko wa otagai o hagemasi-at-te-ita.*
 T. and A. TOP each.other ACC encourage-REC-CONT-PAST
 (same translation).

A reciprocal pronoun may be in complex relations with the reciprocal suffix, in case of overlapping distribution. For instance, the reciprocal pronoun in Kirghiz is odd with the verb *öp-* 'to kiss' in (91c): due to the frequency of the situation named, the respective verbal reciprocal was the first to occupy the niche.

Kirghiz (Nedjalkov, Ch. 28, §1.2)

- (91) a. *Kəz apa-sə-n öp-tü.*
 girl.NOM mother-her-ACC kiss-3.PAST
 'The girl kissed her mother.'
 b. *Kəz menen apa-sə öb-üş-tü.*
 girl.NOM and mother-her.NOM kiss-REC-3.PAST
 'The girl and her mother kissed.'
 c. [?]*Alar birin-biri öp-tü.*
 they each.ACC-other kiss-3.PAST
 'They kissed each other.'

But, on the other hand, the reciprocal suffix is ungrammatical in (92b), probably because the derivative has lexicalized usage shown in (92c). But other explanations are also possible, if we take into account the spatial meaning of the base verb (moreover, the derivative *bajla-š-* has other meanings as well, for instance, 'to help sb to tie sth', 'to tie sth together with sb'; see (181c)). The meaning in (92d) can be expressed by the reciprocal pronoun only:

- (92) a. *Men anə terek-ke bajla-də-m.*
 I.NOM he.ACC tree-DAT tie-PAST-1SG
 'I tied him to a tree.'

- b. **Biz terek-ke bajla-š-tə-k.*
 we tree-DAT tie-REC-PAST-1PL
 (intended meaning:) ‘We tied each other to a tree.’
- c. *Men anə menen bajla-š-tə-m.*
 I.NOM he.ACC with tie-REC-PAST-1SG
 ‘I made a bet with him.’ (lexicalized meaning)
- d. *Biz birin-biri terek-ke bajla-dī-k.*
 we each.ACC-other tree-DAT tie-PAST-1PL
 ‘We tied each other to a tree.’

A reciprocal pronoun may reciprocalize derivatives with the reciprocal suffix if the latter encodes a non-reciprocal meaning, as assistive in (93a), which is thus a reciprocalized assistive relatable to (93b.iii):

Kirghiz (Nedjalkov, Ch. 28, §5.2.2)

- (93) a. *Ata-m eköö-büz biri-biri-biz-ge ot tašə-š-tə-k.*
 father-my two-we each-other-DAT hay cart-REC-PAST-1PL
 ‘My father and I helped each other to cart hay.’

Deletion of the reciprocal pronoun seems to change the meaning of (93a) as follows:

- b. *Ata-m eköö-büz ot tašə-š-tə-k.*
 father-my two-we hay cart-REC-PAST-1PL
- i. ‘My father and I carted hay *together*.’ sociative
 - ii. ‘My father and I carted hay with *somebody else*.’ comitative
 - iii. ‘My father and I *helped* someone to cart hay.’ assistive

11.3.3 Case 3c. The syntactic marker is used with verbal reciprocals only

In other words, a reciprocal pronoun is not interchangeable but co-occurrent with a derivational marker. The reflexive clitic may be more common than a reciprocal pronoun. This is attested in French, Italian, Spanish and Bulgarian, where a reciprocal pronoun cannot be used instead of the clitic, as a rule, but it can be added for disambiguation or pleonastically. These languages lack constructions of the (87c) type; instead, they have type (87d) constructions (cf. (94c)). But in the case of reciprocalization of a prepositional object, a reciprocal pronoun is commonly used, as in (95b). There are exceptions, however. For instance, in French, this rule does not apply to constructions with an animate indirect object with the preposition *à*: in this case, substitution is not possible either and the reciprocal pronoun can be used with this preposition pleonastically.⁹ Since the position of the direct object in this type of constructions is already eliminated by the intransitivizing reflexive clitic pronoun, the pronoun *l’un l’autre* cannot have a claim on this position. Thus *l’un l’autre* tends to lose its argument character and acquire the properties of an adverb of the type *gegenseitig* (see (87b) and (87e)).

9. Compare: *Il plait à Marie* ‘Marie likes him’ → *Ils se plaisent . . . [l’un à l’autre]* ‘They like each other’ (Guentchéva & Rivière, Ch. 12, ex. (32)).

French (Guentchéva & Rivière, Ch. 12, §§1.2; 7)

- (94) a. *Jean embrasse Marie.* 'John embraces Mary.'
 b. *Jean et Marie s'embrassent.* 'John and Mary embrace each other.'
 c. *Jean et Marie s'embrassent l'un l'autre.* 'John and Mary embrace each other.'
 d. **Jean et Marie embrassent l'un l'autre.* (same intended meaning).

In French, as well as in German and Bulgarian (cf. (87), (104), (105)), a reciprocal pronoun is used as the only marker of reciprocity on verbs constructed with prepositional objects (as just mentioned, except for verbs with an indirect object with the preposition *à*), and also on some other verbs, e.g.:

- (95) a. *Jean compte sur Marie.* 'Jean relies on Marie.'
 b. *Ils comptent l'un sur l'autre.* 'They rely on each other.'
 c. **Ils se comptent.* (same intended meaning).
 d. **Ils se comptent l'un sur l'autre.* (same intended meaning).

11.3.4 Case 3d. Syntactic and verbal reciprocals are in complementary distribution

In this case a reciprocal pronoun is neither interchangeable nor co-occurring with an affixal or clitic reciprocal marker and they never overlap. I have no convincing illustrations for this type. Close to it are the following cases:

Case 3a where reciprocals are derived from two-place prepositional intransitives by means of syntactic markers only and from two-place transitives by means of a reflexive (clitic) pronoun interchangeable with a reciprocal pronoun, as is the case in German (see 11.3.1), or

Case 3b where a clitic marker may be co-occurrent with a reciprocal pronoun, as in French (see 11.3.3).

Another instance of similar behaviour of a reciprocal pronoun is observed in Telugu where reciprocals are formed from verbs with the "Dative-subject" (= antecedent) by means of the reciprocal pronoun, and on verbs with the Nominative-subject (= antecedent) the morpheme *-kon-* (descended from a lexical verb meaning 'to take, to buy') must be used, its basic function being analogous to that of reflexive clitics in a number of Indo-European (e.g. Romance) languages, although the reciprocal pronoun unambiguously denotes reciprocity (Subbarao & Saxena 1987: 128; Subbarao & Lalitha 2000: 260).

11.4 Case 4. A verbal and a syntactic markers are obligatorily used together

The nearest to this usage is observed in Telugu where deviations from it, i.e. separate usage of the syntactic and verbal markers, are relatively few. This case, which is not reflected in schema (86), is attested on reciprocals with the Nominative-subject, in contrast to the just considered reciprocals with the Dative-subject which are always pronominal. The verbal marker *-kon-* is used without a reciprocal pronoun on a very limited number of stems with meanings usually expressed by lexical reciprocals:

Telugu (Krishnamurti & Gwynn 1985: 206–8)

- (96) a. *kottu-kon* 'to fight, beat each other.'

Typical reciprocal marking looks as follows (Subbarao & Lalitha 2000: 226):

- b. *wallu okalla-ni okallu tittu-kon-naa-ru.*
 they one.PL-ACC one.PL.NOM abuse-REFL-PAST-3PL.M/F
 ‘they abused each other.’

12. The main diathesis (= syntactic) types of reciprocals. Subject-oriented reciprocals; type A.1

The term “diathesis” is used here to refer to the schema of relations (correspondences) between the semantic roles (agent, patient, etc.) and the syntactic functions (subject, direct object, attribute, adverbial) of a clause. As mentioned, in the grammars of Altaic, Bantu and some other languages the reciprocal is traditionally regarded as voice, together with the passive, causative, reflexive, and some other categories. Here, the term “voice” refers to all the valency changing means, which involve a change in the semantic content of the derived subject (cf. also 4.1 and 4.2).

The main diathesis types are termed “canonical”, “indirect”, “possessive”, “adverbial”. They are termed “reversible”, in contrast to an “irreversible” type in which the reciprocal marker does not mark deletion of any underlying constituent (see A.1.3 in 12.3). These terms can have other meanings, therefore they are spelt between quotes when they refer to the diathesis types.

Reciprocal constructions subcategorize into non-embedded and embedded constructions (see 1.5.5).

Non-embedded reciprocals fall into two sharply distinct groups, A.1 and A.2, with a kind of intermediate A.3 group.

A.1. Subject-oriented reciprocals: reciprocalization involves the subject and a non-subject of the underlying construction.

Group A.1 is further subdivided into two types A.1.1 and A.1.2 (see 12.1 and 12.2 respectively), each falling into two main subtypes.

A.1.1. Coreferentiality holds between the subject and a syntactic argument of the underlying clause; here “canonical” and “indirect” diathesis subtypes are distinguished; see *A.1.1.1* and *A.1.1.2* in 1.12.1.1 and 1.12.1.2 respectively.

A.1.2. Coreferentiality holds between the subject and a non-argument; “possessive” and “adverbial” diathesis subtypes are distinguished here; see *A.1.2.1* and *A.1.2.2* in 12.2.1 and 12.2.2 respectively.

A.2. Object-oriented reciprocals: reciprocalization involves two objects, direct and non-direct (much less commonly, between two non-direct objects). Here also belong derivatives semantically close to them, as a result of semantic extension (see Section 13).

A.3. This type subsumes specific reciprocals which cannot belong to type *A.1* (because they cannot be related to two underlying constructions of type (9a') and (9a'')) or *A.2*: they are in fact anticausative derivatives from three-place lexical reciprocals (which are object-oriented), anticausativization being signified by a reciprocal marker (see Section 14). This is an intermediate class between *A.1* and *A.2*.

As a matter of fact, type A.3 represents polysemy of reciprocal markers but it is entered here because of the change in the diathesis and semantic affinity to type A.2.

12.1 Reciprocals with argument coreferentiality (type A.1.1)

12.1.1 “Canonical” reciprocals (type A.1.1.1)

As a rule, they are intransitive (I have in mind verbal reciprocals only), the base verb being either transitive (97) or, less commonly, two-place intransitive (98)–(100). However, in my list of languages, there are two languages in which the number of registered intransitive-based reciprocals exceeds that of transitive-based reciprocals, namely, Itelmen (where the reciprocal prefix *lo-/lu-* is registered on about 25 transitive-based and about 45 intransitive-based reciprocals; Volodin, Ch. 43, §3.2-3.6) and Kusaiean where, according to Lee (1975:201–3), the reciprocal circumfix *a-...-i* is “usually used with intransitive verbs but some transitive verbs [...] can be used with this” circumfix. Curiously enough, among transitive verbs meaning ‘to see’, ‘to hear’, ‘to love’, ‘to remember’ are cited, and among intransitive verbs meaning ‘to hit’, ‘to kick’, ‘to wash’. The state of affairs in these two languages is possibly connected with the ratio of transitives and intransitives rather than with the peculiarities of the reciprocal markers.

Intransitivity shared by both transitive-based and intransitive-based reciprocal derivatives distinguishes them from transitive “indirect” (see 12.1.2) and “possessive” (12.2.1) reciprocals. Therefore the first two types of derivatives are listed as “canonical”, though in some languages they may differ in marking (see 9.4) and intransitive-based reciprocals may show the same marking as “indirect” reciprocals. And in some languages, there may also be constraints on the reciprocalization of constituents other than direct objects.

12.1.1.1 Reciprocals derived from two-place transitives. Here is an example (see also (24), (29), (30c), (33), (34), etc.):

East-Futunan (Moyses-Faurie, Ch. 35, ex. (48))

- (97) a. *na tamate a Petelo e Paulo.*
 PAST kill ABS P. ERG P.
 ‘Paulo killed Petelo.’
- b. *o fe-tamate-’aki fa’i le kau Alo.*
 and REC-kill-REC only ART CLF A.
 ‘And the Alos killed each other.’

Since these intransitive reciprocals are the prevalent type across languages, they, as will be shown below, may affect certain grammatical peculiarities of transitive reciprocals by way of attracting them and spreading their features upon them (see 12.1.2).

12.1.1.2 Reciprocals derived from two-place intransitives. In many languages we find intransitive reciprocals derived from two-place intransitive bases, and their semantic range is frequently similar enough, covering verbs of emotions and their expression (like ‘to be afraid’, ‘to be angry’, etc.), verbs of speech (like ‘to speak to sb’, etc.), and also verbs

of motion. There are languages where this type of reciprocals is lacking, which is to say that reciprocals derive only from two-place transitives. Ainu is an example: in reciprocal derivation from transitive bases the reciprocal prefix *u-* is placed in the agreement slot of the direct object; the non-direct object does not agree with the predicate and therefore it cannot be reciprocalized. But there is a device to circumvent this constraint: in order to derive a reciprocal from a two-place intransitive verb the latter must be transitivized by means of an applicative marker first (see Alpatov et al., Ch. 42, §3.1.1.2). West Greenlandic Eskimo also lacks reciprocal derivation from intransitives (Fortescue, Ch. 19, §1.2).

Reciprocals derived from intransitives with the meaning of motion or (change of) position or posture enter into semantic oppositions as the following: ‘A stuck to B’ → ‘A and B stuck together’. Syntactically, these intransitive spatial reciprocals may not differ from proper reciprocals. They are peculiar in that they may have more restrictions on derivation by means of verbal markers, pronominal markers being more commonly used. Besides, in some languages such spatial reciprocals may use markers which cannot be used in the derivation of proper reciprocals for semantic reasons, because these markers may involve spatial relations (see (107)). Section 2.2.4 above concerns spatial reciprocals, namely, transitive spatial reciprocals (like *X stuck A to B* → *X stuck A and B together*). They have in fact no syntactic correlates among proper reciprocals (unless we count causativization of subject-oriented reciprocals; cf. 5.1). As to intransitive spatial reciprocals, they can be similar to proper reciprocals syntactically (cf. (101b) and (107b)).

Spatial reciprocals of this type may derive from bases with a weakly governed spatial constituent which can take different locative values, but a spatial value is obligatorily implied by the lexical meaning of the base verb; therefore these reciprocals can be placed here (where argument reciprocalization takes place). From a different viewpoint, they could be classed together with “adverbial” reciprocals in 12.2.2, along with benefactive and also causal reciprocals, with meanings like ‘for each other’ or ‘because of each other’. I will not dwell on the status of the spatial constituent as an argument or adjunct (i.e. a kind of adverbial) and will use the term ‘locative constituent’ to refer to it; as a more general term, the label “non-direct object” is used rather loosely.

Languages that possess both proper and spatial reciprocals derived from intransitive bases display two types of marking (types 1 and 2), each being naturally used on a different set of base verbs.

Type 1. *The reciprocal marking for two-place intransitives is the same as for two-place transitives.* The reciprocal construction derived from a two-place intransitive does not inherit the marking (case inflection, preposition, postposition, etc.) of the non-direct object of the base construction.

1a. Proper reciprocals. Thus, in East Futunan the non-direct object marker *ki* is omitted in the reciprocal construction, and in Japanese it is the postposition *ni* marking the non-direct object that is lost in the reciprocal construction. The derived construction is syntactically identical with that of transitive-based reciprocals; cf.:

East-Futunan (Moyses-Faurie, Ch. 35, ex. (51))

- (98) a. *e 'ita a Paulo ki lona āvaga.*
 IPFV be.angry ABS P. OBL his wife
 'Paulo is angry at his wife.'
- b. *e fe-'ita-'aki a Lotoato mo Sanele.*
 IPFV REC-be.angry-REC ABS L. and S.
 'Lotoato and Sanele are angry at each other.'

Japanese (Alpatov & Nedjalkov, Ch. 25, ex. (15))

- (99) a. *Taroo wa Ziroo ni ozigis-ta.*
 T. TOP Z. DAT greet-PAST
 'Taro greeted Jiro.'
- b. *Taroo to Ziroo wa ozigisi-at-ta.*
 T. and Z. TOP greet-REC-PAST
 'Taro and Jiro greet each other.'

Similar constructions are attested in some isolating languages, e.g. in Mandarin Chinese, where the reciprocal adverb *hùxiāng* does not occur with prepositions. If the underlying sentence contains a prepositional object (see *xiàng tā* in (100a)) the latter is deleted in the reciprocal construction, like the postposition *ni* of (99a) is deleted in (99b); cf.:

Chinese (Hoa et al., Ch. 49, §3.2.1.2)

- (100) a. *Wǒ xiàng tā dào-qian-le.*
 I to he apologize-PERF
 'I apologized to him.'
- b. *Tāmen hùxiāng dào-qian-le.*
 they mutually apologize-PERF
 'They apologized to each other.'

1b. Spatial reciprocals. The same marking is also used for intransitive spatial reciprocals. Such verbs are registered in quite a number of languages, e.g. in Indonesian where the preposition *pada* of the base (101a) is deleted in (101b). Another instance is Itelmen where there are five reciprocal derivatives denoting position or a change of position of two or more entities relative to one another, the reading 'next to each other' being pragmatically the most likely, (see (102); cf. also (41a)).

Indonesian (Ogoblin & Nedjalkov, Ch. 33, §4.2.1.2)

- (101) a. *A me-lekat pada B.* 'A stuck to B.'
 b. *A dan B ber-lekat-an.* 'A and B stuck together.'

Itelmen (Volodin, Ch. 43, ex. (24); *lo-* = REC)

- (102) a. *la-* 'to sit' → *lo-la-* 'to sit next to each other'
 b. *tekej-* 'to stand up' → *lo-tekej-* 'to stand up next to each other.'

Adyghe (Rogava & Kerasheva 1966: 271–272; *zə-* = REC, *gə-* = LOC; $-(\emptyset)x = 3\text{PL}$)

- (103) a. *gə-t* 'he stands next to him' → *zə-gə-t-əx* 'they stand next to each other'

- b. *go-kIə* ‘that (thing) grows up to it’ → *zə-go-kIə-x* ‘they grow together (into one)’
 c. *go-kIə* ‘that one goes away from him’ → *zə-go-kIə-x* ‘they go away from each other.’

Note in this connection that in certain languages, e.g. German and French, verbal reciprocal markers are used to derive spatial intransitive reciprocals only from certain intransitives or not at all; e.g., in Udehe, spatial intransitive reciprocals are not derived from two-place intransitives like *decte-* ‘to separate’, *susa-* ‘to escape’, etc. (Nikolaeva, Ch. 23, §3.2), taking locative constituents which can also be regarded as adverbials. In Udehe, there are no verbal reciprocals of the Itelmen type illustrated in (102). Instead, syntactic reciprocals are formed with a reciprocal adverb *dä: dä: te:-* ‘to sit next to each other’ (< *dä:* ‘next to sb’, *te:-* ‘to sit’). Similarly in Even, a verbal reciprocal marker does not derive a spatial intransitive reciprocal from the base verb meaning ‘to run’. Instead, a pronominal marker is used which inherits the marking, i.e. the ablative case, of the locative constituent (see (107)). The cause of this usage and other analogous cases is the fact that deletion of the marker of the locative constituent entails the loss of the information about the direction of motion which is hard to predict from the meaning of the base: one can run from someone or some place, or towards someone, etc. Therefore verbal intransitive spatial reciprocals are usually formed from intransitives whose meaning implies the final or starting point of motion which is not lost in the process of derivation, like

- ‘to approach’ (cf. Itelmen *tmalsa-* ‘to approach’ → *lo-tmalsa-* ‘to approach each other’, Kabardian *xuəžən* ‘to run to meet’ → *zə-xuəžən* ‘to run together (into one place)’, Japanese *tikazuk-u* ‘to approach’ → *tikazuki-a-u* ‘to approach each other’);
- ‘to go away’ (cf. Yakut *tej-* ‘to move away’ → *tej-is-* ‘to move away from each other’, Japanese *hanare-ru* ‘to move away from sb’ → *hanare-a-u* ‘to move away from each other’); ‘to go to sb’ (cf. Udehe *xuli-* ‘to go to sb’ → *xuli-masi-* ‘to go to each other’; Nikolaeva, Ch. 23, ex. (14)), Itelmen *lale-* ‘to walk’ → *lo-lale-* ‘to go to each other’ (Volodin, Ch. 43, ex. (23));
- ‘to stick’, ‘to bump’ (cf. Chukchi *ittil-* ‘to bump against sth/sb’ → *ittil-wəly-* ‘to bump against each other’), etc.

Verbal reciprocals also derive from spatial intransitives if they undergo lexicalization (cf. ‘to go, walk’ → ‘to visit each other’). In works on reciprocals, the reciprocals of the latter two varieties are usually listed together with proper reciprocals.

Needless to say, languages may have special markers for spatial reciprocals, e.g. of type (191)–(196), which are used to derive proper reciprocals rarely or not at all (see (207)).

Type 2. The reciprocal marking for two-place intransitives is not the same as for two-place transitives. As mentioned, the markers of intransitive-based reciprocals may differ from those of transitive-based reciprocals: in partially different affixes, different case forms of clitics and pronouns, extensive use of prepositional collocations with pronouns; reciprocal forms of postpositions and auxiliary locative nouns. With respect to the latter two cases, it should be stressed that in one case the locative marker (case inflection, preposition, etc.) is attached to the reciprocal marker, and in the other the reciprocal marker is attached to the postposition or locative noun.

2a. Proper reciprocals. The use of different affixes for reciprocal derivation from transitives and intransitives can be illustrated by the following forms in Abaza where the prefixes *aba-/aiiba-* and *a-/ai-* are used respectively: *j-aba-dər-itI* <they-REC-know-PRES> ‘they know each other’ and *xI-ai-čvažva-tI* <we-REC-speak-PAST> ‘we spoke to each other’ (see Ch. 3, §6.2.1.2). An example of the use of different clitics can be the Bulgarian *se* (ACC) and *si* (DAT): *te se gledat* ‘they watch each other’ and *te si pomagat* ‘they help each other’. In the illustrations below, a reciprocal marker retains the preposition of the non-direct object of the base construction (note that clitics in German, Bulgarian and certain other languages do not combine with prepositions at all or when used in the reciprocal function); e.g.:

German

- (104) a. *Er denkt an Peter.* ‘He thinks of Peter.’
 b. *Sie denken aneinander.* ‘They think of each other.’

Bulgarian (Penchev, Ch. 13, §1.2)

- (105) a. *Te gledat kām Petār.* ‘They look at Peter.’
 b. *Te gledat edin kām drug.* ‘They look at each other.’

Vietnamese and Ancient Chinese also display this type of marking. In Ancient Chinese, the main reciprocal marker, i.e. the auxiliary word *xiāng* ‘each other’, combined with the prepositions *yǔ* ‘with’ and *wèi* ‘for’ (cf. *xiāng yǔ xiào zhī* ‘All [of them] laugh at it’; *xiāng yǔ* lit. ‘with each other’, i.e. ‘together’; Yakhontov, Ch. 48, ex. (59)). Later this construction was lost. In Vietnamese, the reciprocal marker *nhau* has retained the ability to combine with prepositions (cf. *tha thứ cho nhau* ‘to forgive each other’, lit. ‘for each other’; see Bystrov & Stankevich, Ch. 47, ex. (16); see also (107b) below).

2b. Spatial reciprocals. Some devices marking proper reciprocals can also be used for the derivation of spatial reciprocals, as in (101)–(103) and (105) where the reciprocal pronoun is used with the preposition of the non-direct object it replaces. In Even, the non-direct object *nöö-duk-i* of (107a) cannot be reciprocalized by means of a verbal reciprocal marker, the reciprocal pronoun with the non-direct marker *-duk-* (ABL) being used instead.

German

- (106) a. *Er stieß/prallte auf ihn.* ‘He bumped into him.’
 b. *Sie stießen/prallten aufeinander.* ‘They bumped into each other.’

Even (Malchukov, Ch. 39, §1.2)

- (107) a. *Hurken-Ø nöö-duk-i tut-te-n.*
 youth-NOM brother-ABL-REFL run-NFUT-3SG
 ‘The youth runs from his (younger) brother.’
 b. *Aknil-Ø meen meen-duk-ur tut-te.*
 brothers-NOM each other-ABL-REFL.PL run-NFUT.3PL
 ‘The brothers run from each other.’

As indicated above, in cases like (106b) and (107b), the locative marker (preposition *auf* or case suffix *-duk-*) is attached to the reciprocal marker, while in the following cases, on

the contrary, the reciprocal marker (prefixes *u-* in Ainu, *u-* in Nivkh, *n'e-* in Yukaghir) is attached to a locative marker, viz. a postposition in Ainu (cf. *ekohopi* 'separately from sth/sb' → *u-ekohopi* 'separately from each other'; Alpatov et al., Ch. 42, §1.12) or an auxiliary locative noun functioning as a postposition and taking case marking. These locative words are two-place predicates. Therefore they can take a reciprocal marker; cf., for instance, Ainu *ka* 'top of sth' → *u-ka* 'one on top of another', *teksam* 'place at the side' → *u-teksam* 'next to each other'. Such reciprocal marking is characteristic of postpositions descended from locative nouns and therefore sometimes taking case marking (cf. the Nivkh postposition *řara* 'opposite' in (108) which can take locative and dative case markers). The postposition of the base sentence can be a part of the locative constituent of an intransitive verb (108a). As to the reciprocal marker, it can be attached to the postposition of a locative constituent only (i.e. the predicate does not contain a reciprocal marker (108b)), or to the predicate as well (109b), in which case reciprocity is marked twice.

Nivkh (Otaina & Nedjalkov, Ch. 41, §3.4, ex. (52))

- (108) a. *if p^ʼ-ətək řara-in hur t'iv-d'.*
 he REFL-father opposite-LOC there sit.down-FIN
 'He sat down opposite his father.'
- b. *if ətək-xe u-t'ara-in hur t'iv-d'-yu.*
 he father-COM.DU REC-opposite-LOC there sit.down-FIN-PL
 'He and [his] father sat down opposite each other.'

Yukaghir (Maslova, Ch. 44, ex. (21))

- (109) a. *tiŋ as'e met numö al'a: uldo:-j.*
 this deer my house to be.tied-3SG.INTR
 'This deer is tied to my house.'
- b. *n^ʼ-al^ʼ-in n'e-uldo:-ŋ.*
 REC-TO-DAT REC-be.tied-3PL.INTR
 'They are tied to each other.'

This double marking of reciprocity is not accidental. It is characteristic of intransitive-based reciprocals in Yukaghir. With regard to prefixed reciprocals of two-place intransitives, Maslova (Ch. 44, §4.2.1) notes that "<...> the reciprocal constructions with underlying intransitive verbs normally involve one of the syntactic reciprocal markers." Although constructions of this kind are mostly characteristic of verbs of motion in Yukaghir, verbs commonly yielding proper reciprocals also sometimes occur here, which is probably due to the implication of direction in the meaning of these verbs; e.g.:

- (110) *tittel n'e-laŋi n'e-mon-ŋi.*
 they REC-TO REC-say-3PL.INTR
 'They said to each other.'

12.1.1.3 Reciprocals derived from three-place transitives. In this rare type the indirect object is retained and the direct object deleted; scarcity of this diathesis type in comparison with reciprocals from two-place bases is due to the much smaller number of three-place

base verbs (this is also true of the subsequent type) and predominance of transitive bases with an inanimate direct object which naturally hinders its reciprocalization; cf.:

Even (Malchukov, Ch. 39, ex. (25))

- (111) a. *Bi etiken-teki nimek-u göön-e-m.*
 I old.man-ALL neighbour-ACC say-NFUT.1SG
 ‘I told the old man about the neighbour.’
 b. *Bi n’imek-n’un etiken-teki göö-met-te-p.*
 I neighbour-COM old.man-ALL say-REC-NFUT-1PL
 ‘I and the neighbour told the old man about each other.’

See also Kirghiz examples (92) which show that, instead of an ungrammatical morphological reciprocal, a syntactic reciprocal is formed from a three-place transitive verb.

12.1.1.4 Reciprocals derived from three-place intransitives. In this rare case, as well as in the previous case, the indirect object of addressee or receiver is retained and the other object (denoting information or a thing that is passed over) is deleted (semantically this type corresponds to “indirect” reciprocals; see 12.1.2).

Yakut (Ch. 26, ex. (64))

- (112) a. *aal-əm kinie-xe ah-ənan-üölü-nen xardala-ər.*
 neighbour-my he-DAT food-INST-food-INST give.in.exchange-PRES.3SG
 ‘My neighbour gives *him* food in exchange.’
 b. *Kiniler ah-ənan-üölü-nen xardala-h-al-lar.*
 they food-INST-food-INST exchange-REC-PRES-3PL
 ‘They exchange their supplies of food with each other.’

12.1.1.5 Reciprocals derived from one-place intransitives (sic!). Two semantic subtypes can be distinguished.

1. The base verbs of this subtype commonly have meanings like ‘to produce sounds’ (of animals), ‘to cheep’, ‘to roar’, ‘to cackle, cluck’, ‘to squeak’, ‘to neigh’, ‘to moo’, ‘to whistle’ (of birds), ‘to croak’, i.e. they denote production of sounds or other signals by animate beings, usually implying an addressee which is practically never expressed. The derivatives denote an exchange of signals provoked by the partner(s). This type is intermediate between reciprocals and sociatives.

Yakut (Ch. 26, ex. (70); cf. §4.1.1.6; -s/-h = REC)

- (113) a. *Bu ənax mayəraa-n bar-d-a.*
 this cow moo-CONV AUX-PAST-3SG
 ‘The cow began to moo.’
 b. *Bu ənax mayəra-h-an bil-s-er.*
 this cow moo-REC-CONV know-REC-PRES.3SG
 ‘The cows recognize each other by mooing to each other.’

Evenki (Nedjalkov & Nedjalkov, Ch. 38, §3.1.1.3)

- (114) a. *Murin keenari-žara-n.*
horse neigh-PRES-3SG
'The horse is neighing.'
b. *Muri-r keenari-maat-čara-Ø.*
horse-PL neigh-REC-PRES-3PL
'The horses are neighing to each other.'

There are about 10 such reciprocals in Yakut. Analogous reciprocals in Evenki number at least 12 items (Nedjalkov & Nedjalkov, Ch. 38, ex. (25). See also Nedjalkov, Ch. 28 on Kirghiz, §4.1.1.4).

2. This subtype includes pairs of antonymous reciprocals with the base verbs implying an object which is never expressed. Not infrequently, the meaning of these reciprocals is expressed in various languages by non-derived verbs, i.e by lexical reciprocals.

Indonesian (Ogloblin & Nedjalkov, Ch. 33, ex. (61'))

- (115) *tepat* 'to hit (the mark)' → *ber-tepat-an* 'to coincide'
salah 'to miss (the aim)' → *ber-salah-an* 'to not coincide.'

12.1.2 "Indirect" reciprocals (type A.1.1.2)

12.1.2.1 *The standard case.* "Indirect" reciprocals are always transitive, due to the reciprocalization of the indirect object of a three-place transitive and retention of the direct object (116). Since languages commonly have fewer three-place than two-place transitives, this diathesis type is much less common cross-linguistically than "canonical" reciprocals, and some languages lack it entirely. The meaning of this type can be rendered by two-diathesis (referentially ambiguous) reciprocals in some languages (see 5.2). The typical meanings of the base verbs are 'to give sth to sb', 'to take sth away from sb', 'to tell sth to sb', 'to show sth to sb', 'to send sth to sb', 'to hide sth from sb', 'to dress sb in sth', 'to entrust sth to sb', 'to explain sth to sb', 'to introduce sb to sb', etc. Here are examples of the standard "indirect" reciprocal construction:

Bolivian Quechua (van de Kerke, Ch. 31, ex. (50))

- (116) a. *Maria wawa-s-man misk'i-ta qu-rqa.*
M. child-PL-ALL sweet-ACC give-3SG.PAST
'Maria gave the children a sweet.'
b. *wawa-s misk'i-ta qu-na-ku-nku.*
child-PL sweet-ACC give-REC-REFL-3PL
'The children give each other a sweet.'

Yakut (Pekarskij 1959:616)

- (117) a. *Ini bii-tten kur-u bəld'a-t-a.*
younger.brother elder.brother-ABL belt-ACC take.away-PAST-3SG
'The younger brother took the belt away from his elder brother.'
b. *Ikki inibii kur-dar-n bəld'a-s-pit-tar ühü.*
two brothers belt-PL-ACC take.away-REC-PERF-3PL they.say
'They say the two brothers are taking belts from each other.'

12.1.2.2 Deviations from the standard case. Some languages impose restrictions on the derivation of this type of reciprocals. For instance, in contrast to Kolyma Yukaghir, “indirect” reciprocals are non-existent in Tundra Yukaghir (Maslova, Ch. 44, §8.2). Greenlandic Eskimo has only “canonical” reciprocals and lacks “indirect” and “possessive” reciprocals (Fortescue, Ch. 19, §§7.1.2 and 7.1.3). Some languages display deviations from the standard type of “indirect” reciprocal constructions. These deviations are mostly due to the pressure of the more common “canonical” (= intransitive) reciprocals. Here are a few instances.

1. Lithuanian. In this language, standard “indirect” reciprocals with the reflexive marker *-si-/s* mostly derive from verbs of speech meaning ‘to whisper’ and the like, taking either a direct object *kažk-q* ‘something’ or prepositional *apie kažk-q* ‘about something’ (as in Russian) deleted or retained in the derived construction (118c). Retention of the direct object in (118b) outrules the reciprocal reading (i), and the construction is interpreted as reflexive-benefactive (ii). Another restriction is on three-place transitives meaning ‘to tell’, ‘to say’, ‘to give’, ‘to send’, with an indirect dative object: they do not form reciprocals with the reflexive marker, reciprocity being expressed syntactically by the phrase *vien-as kit-am* (DAT) ‘to each other’.

Lithuanian (Geniušienė, Ch. 14, §4.1.3)

- (118) a. *Petr-as šnibžd-a kažk-q On-ai.*
 P.-NOM whisper-3.PRES something-ACC O.-DAT
 ‘Peter whispers something to Ann.’
- b. *Petras ir Ona šnibžda-si kažk-q.*
 i. *‘Peter and Ann are whispering something to each other.’
 ii. ‘Peter and Ann are whispering something each to him/herself.’
- c. *Petras ir Ona šnibžda-si apie kažk-q.*
 ‘Peter and Ann are whispering about something between themselves.’

2. Mundari. Another instance of deviation from the expected marking of the “indirect” reciprocal construction is encountered in Mundari. Although the direct object is retained, as in the standard case, the transitive marker *-ʔ-* on the predicate in (119a) is replaced by the intransitive marker *-n-* in (119b), as on “canonical” reciprocals.

Mundari (Osada, Ch. 37, ex. (16); infix *-p/-po-/... = REC*)

- (119) a. *Soma seta hon-ko=eʔ om-ki-ʔ-i-a.*
 S. dog child-PL=3SG.SBJ give-COMPL-TR-3SG.OBJ-PRED
 ‘Soma gave the dog to the children.’
- b. *seta-ko=le o-po-m-ta-n-a.*
 dog-PL=1PL.EXC.SBJ give-REC-give-PROGR-INTR-PRED
 ‘We are giving the dogs to each other.’

A somewhat similar case is observed in Kolyma Yukaghir where “indirect” reciprocals can be inflected both like transitives and intransitives (Maslova, Ch. 44, §3.2).

3. Cashinahua. “Indirect” (and also “possessive”) constructions of this language may retain the direct object and thus remain transitive in contrast to “canonical” reciprocals. But their transitivity is weakened, because the subject cannot be marked for ergative, and

this may be due to the influence of “canonical” constructions which are not ergative because of their intransitivity (see Camargo, Ch. 45, §1.2); cf. (73a, b) with the ergative suffix *-n* on the subject and “indirect” (73c, d) where it is absent).

4. *Warrungu*. In this language, the subject of “indirect” and “possessive” reciprocals is not ergative but nominative, despite the fact that a direct object can be retained (see Tsunoda, Ch. 32, §§1.2, 4.2, and 4.3).

12.2 Reciprocals with non-argument coreferentiality (type A.1.2)

12.2.1 “Possessive” reciprocals (type A.1.2.1)

12.2.1.1 *The standard case*. These are derivatives with reciprocalization of a possessive attribute of the object; the direct object is retained (if there is one in the base construction). Unlike “canonical” and “indirect” reciprocals, “possessive” constructions retain the valency of the underlying verb because the object is retained and the syntactic change involves deletion of an attribute if it is present in the base construction or expressed by a possessive marker on the object. They can be derived from (a) two-place transitives, which is the most common case (120); (b) two-place intransitives (123); (c) three-place transitives; (d) three-place intransitives.

1. *Reciprocals derived from two-place transitives*. This case is illustrated by an example with a unique suffix *-takan/-tak* ‘each other’s’ attested in the Oxotsk dialect of Even (see Malchukov, Ch. 39, §5). This suffix (also used to derive reciprocal pronouns in this dialect) may mark cross-coreferentiality of the subject and the possessor on the head of the possessive phrase in addition to the marking on the predicate.

Even

- (120) a. *Bej hooni-wa-n irič haa-ži-m?*
 man strength-ACC-his how know-FUT-1PL
 ‘How can we try the man’s strength?’
 b. *Honi-l beji-l, hooni-tak-mar irič haa-mat-či-p?*
 strong-PL man-PL strength-takan-REFL.PL how know-REC-FUT-1PL
 ‘Strong men, how can we try each other’s strength?’

Compare also the following.

Yakut (Ch. 26, ex. (78); in (b) reduplication iconically signals two objects; possessivity is marked by suffix *-leri/-teri* only)

- (121) a. [*Bukatær at-a atøn bukatær at-ǰ-n*] *tüü-tü-n, et-ǰ-n,*
 athlete horse-his other athlete horse-his-ACC hair-his-ACC flesh-his-ACC
tirii-ti-n baraa-t-a.
 skin-his-ACC destroy-PAST-3SG
 ‘[The athlete’s horse] destroyed the hair, flesh and skin [of the other athlete’s horse].’
 b. ... *tüü tüü-leri-n, et et-teri-n, tirii tirii-leri-n*
 hair hair-their-ACC flesh flesh-their-ACC skin skin-their-ACC
bara-s-pət-tara.
 destroy-REC-NR.PAST-3PL
 ‘[The horses of the athletes] destroyed each other’s hair, flesh and skin.’

Modern Chinese (Hoa 1983:31)

- (122) *L.Z. hé X.L. hùxiāng fāngwèn chōudū.*
 L.Z. and X.L. REC visit capital
 ‘L.Z. and X.L. visit each other’s capitals (each visits the other’s capital).’

2. *Reciprocals derived from two-place intransitives.* An illustration is from Even (Malchukov, Ch. 39, §3.1.1.4.2; in (123a) the possessive attribute is expressed by izafet: the possessive ending *-n* ‘his’ agrees with the uninflected noun *etiken* ‘old man’; this construction is retained in (123b), cf. the izafet construction *meer ... -wur*; thus the base and the derived construction are syntactically identical):

- (123) a. *Bi etiken žuu-la-n bii-wet-te-m.*
 I old.man house-LOC-his be-ITER-NFUT-1SG
 ‘I (used to) stay in the old man’s house.’
 b. *Mut etike-n’un meer žuu-l-dula-wur bii-wet-met-te-p.*
 we old.man-COM selves’ house-PL-LOC-REFL.PL be-ITER-REC-NFUT-1PL
 ‘I and the old man (used to) stay in each other’s houses.’

Replacement of the verb meaning ‘to be, live’ in (123b) with a verb meaning ‘to die’ would make the sentence ungrammatical or require the use of the reciprocal pronoun. Thus, the morphological reciprocal is sensitive to the nature of the spatial complement of the base verb: expression of place with the verb meaning ‘to be, live’ is implied by the lexical meaning of the verb, while this does not apply to the verb meaning ‘to die’.

The device *meer ... -wur* + reciprocal suffix illustrated in (123b) is the main means of marking “possessive” reciprocals from any bases in written Even, i.e. this marking can be used in (120b) by the speaker of Standard Even. Similarly, a native speaker of the Oxotsk dialect can use in (123b) the means employed for a two-place transitive in (120b).

12.2.1.2 Deviations from the standard case. Languages lacking the standard “possessive” reciprocal construction sometimes find idiosyncratic ways of expressing the same meaning.

In some languages, there are deviations from the standard way of marking “possessive” reciprocals, and various “quasi-possessive” (mostly intransitive) constructions are used. Note that “possessive” reciprocals are generally not attested among morphological reciprocals in many languages, e.g. in Mundari, Lithuanian, etc. In Kabardian, there are no standard “possessive” reciprocals (see 12.2.1), but the respective meaning can be expressed, sometimes by the reciprocal form of benefactive verbs (Kazenin, Ch. 17, §3.2.1.3; see also (127) below).

In what follows I will discuss a number of deviations semantically but not formally corresponding to standard “possessive” reciprocal constructions.

1. *Ainu.* The situation described by (124e) covers the subevents described by (124a) and (124b). Constructions like (124c), to be found in a number of languages (cf. (121b)), are not possible in Ainu, because the verb *nukar* takes only one object which is replaced by the reciprocal marker (*u-nukar* means ‘to look at each other, to meet’ (Tamura 1996:774) but in this context it is interpreted as ‘to test each other’), therefore the object in (124c) is not linked to the intransitive predicate syntactically. (124d) is ungrammatical because the

prefix *u-* can be attached, with few exceptions, as mentioned above, only to names of body parts and locative nouns. Example (124e) is a semantic counterpart of Even (120b).

Ainu (Alpatov, et al., Ch. 42, §3.1.3; cf. “canonical” *kotuk* ‘to stick to sth/sb’ → *u-kotuk* ‘to stick to each other’; cf. also *ibid.*, (50))

- (124) a. *E-kiror-o ku-nukar.* vt
 your-strength-POSS 1SG-see/test
 ‘I test your strength.’
- b. *Ku-kiror-o e-nukar.* vt
 my-strength-POSS 2SG-see/test
 ‘You test my strength.’
- c. **Ci-kiror u-nukar-an.* vi
 our-strength REC-see/test-1PL
 ‘We test each other’s strength’, i.e. ‘We compete in strength.’
- d. **U-kiror ci-nukar.* vt
 REC-strength 1PL-see/test
 (same intended meaning as (c)).
- e. *u-kiror-nukar-an* ‘we (= *-an*) compete in strength’ vi
esi-u-kiror-nukar ‘you (= *-esi*) compete in strength’ vi
Ø-u-kiror-nukar ‘they (= *Ø*) compete in strength.’ vi

2. *Nivkh*. “Possessive” reciprocal verbs are not attested in *Nivkh*, but there are constructions semantically corresponding to “possessive” reciprocal constructions. In these constructions the reciprocal suffix is attached to the direct object. The latter assumes a reduplicated form which is an iconic expression of (distributive) plurality. Compare:

Nivkh (Otaina & Nedjalkov, Ch. 41, §3.2.4; cf. *-y-* ‘to kill sb’ → *u-y-* ‘to kill each other’)

- (125) a. ... *mat’kalk i-dəmk zap-r ler-d’.*
 kiddy his-hand take.hand-CONV.3SG play-FIN
 ‘... the child_i plays holding his_{i,j} hand.’
- b. *mat’kalk-xu u-dəmk rəmk zap-t ler-d’-yu.*
 kiddy-PL REC-hand hand take.hand-CONV.3PL play-FIN-PL
 ‘Children play holding each other by the hand.’

3. *Kolyma Yukaghir* (Maslova, Ch. 44, §3.3.2). In this language, alongside standard “possessive” reciprocals two isolated derivatives are registered which are adjacent to the above two cases: the reciprocal prefix is attached to the noun incorporated in the transitive base which thus functions as an intransitive verb (note that incorporation is not characteristic of *Yukaghir*).

- (126) a. ... *n’e-pöme-aŋs’i-jej’i.*
 REC-louse-look.for-1PL-INTR
 ‘... we are looking for each other’s lice.’
- b. ... *n’e-ažu-medi:-nunnu-l’el-ŋi.*
 REC-word-perceive-HAB-EVID-3PL.INTR
 ‘... they understood each other’s language.’

12.2.2 “Adverbial” reciprocals (type A.1.2.2)

In this case reciprocalization involves a sentence constituent which is not an argument or a possessive attribute. It is an (optional, or weakly governed) constituent which can take different spatial values with verbs of motion and posture, or a constituent not implied by the lexical meaning of the verb (e.g., a benefactive or causal constituent). Thus, in meaning, “adverbial” reciprocals may be spatial, benefactive, causal, etc. The benefactive meaning is close to the “indirect” type both semantically and formally. Generally, “adverbial” reciprocals are rather rare cross-linguistically. In languages that possess both verbal and syntactic reciprocal markers the syntactic marker is used to derive “adverbial” reciprocals exclusively or at least more commonly than the verbal marker. A distant parallel to this distribution is the reciprocal use of a reflexive (clitic) pronoun on bases with a direct object and a reciprocal pronoun on bases with a prepositional object in German (87)–(88), French (94)–(95) and Bulgarian (105).

1. *Spatial reciprocal meaning.* Reciprocals that could be entered in this type are for a number of reasons included among reciprocals derived from two-place intransitives (see 12.1.1.2 above).

2. *Reciprocal-benefactive meaning.* The benefactive meaning can be expressed by a verbal benefactive affix, case inflection on the object or an auxiliary word. In some languages that possess verbal benefactive forms, morphologically marked reciprocals do not derive from them. An example is Mundari where the benefactive and the reciprocal markers do not co-occur (Osada, Ch. 37, §3.1.2), and a reciprocal construction with the meaning like ‘We cut trees for each other’ cannot be derived (probably due to the benefactive verbal base taking the intransitive marker *-n* only; *ibid.*, §2.6.3).

Reciprocal benefactive constructions may be formed both from marked (127) and unmarked benefactive verbs.

2a. *Kabardian* (Kazenin, Ch. 17, §§3.2.1.2.2 and 3.2.1.3; ex. (38)). The reciprocal prefix *-zə-* is attached to the benefactive form with the prefix *-xu[ə]-*:

- (127) a. *unə-r* *Ø-p-xuə-z-o-šbI-Ø*
 house-ABS 3SG.ABS-2SG.OBL-BEN-1SG.ERG-DYN-build-PRES
 ‘I am building this house for you.’
 b. *unə-xə-r* *Ø-zə-xu-f-o-šbI-Ø*
 house-PL-ABS 3SG.ABS-REC-BEN-1PL.ERG-DYN-build-PRES
 ‘We are building houses for each other.’

An analogous form is registered in Quechua, but in derivation of reciprocals from benefactives the benefactive suffix is placed after the reciprocal marker (van de Kerke, Ch. 31, §4.2.1.3).

2b. *Yakut.* In this language benefactive reciprocity is expressed by the dative case of the reciprocal pronoun or, rarely, by the reciprocal suffix or both simultaneously.

- (128) *Kiniler* [*beje-beje-leri-ger*] *die-leri-n* *tut-us-t-ular.*
 they each.other-their-DAT house-their-ACC make-REC-PAST-3PL
 ‘They built houses for each other.’

2c. *Even*. The benefactive meaning is not marked on the verb but on the object by means of the benefactive case marker (*-ga* ‘for sb’ in (129b)) which is always followed by a possessive ending (*-n* in *turki-ga-n* (129b)). The unmarked possessor-beneficiary *bey* in (129a, b) is part of the *izafet* construction, the link in this construction being marked by the possessive ending *-n* (Malchukov, Ch. 39, ex. (31)):

- (129) a. *Etiken bey turki-wa-n ga-d-ni.*
old.man man sleigh-ACC-his take-NFUT-3SG
‘The old man took the man’s sleigh.’
- b. *Etiken bey turki-ga-n ga-d-ni.*
old.man man sleigh-BEN-his take-NFUT-3SG
‘The old man took the sleigh for the man.’
- c. *Etiken hurken-de meer turki-ga-wur ga-mat-ta.*
old.man youth-and selves’ sleigh-BEN-REFL.PL take-REC-NFUT.3SG
‘The old man and the youth took the(ir) sleigh(s) for each other.’

3. *Reciprocal-causal meaning*. Example (130b) contains a syntactic marker of reciprocity. The pronoun is used with the preposition of cause inherited from the base construction. This sentence seems to have no parallels with a verbal marker in any language, since the meaning of cause is not a part of the lexical meaning of the base verb and therefore cannot be expressed by a verbal reciprocal:

Vietnamese (Bystrov & Stankevich, Ch. 47, §1.2, ex. (2))

- (130) a. *Lan khổ vì Hồng.*
‘Lan suffers because of Hong’
- b. *Lan và Hồng khổ vì nhau.*
‘Lan and Hong suffer because of each other.’

12.3 “Irreversible” reciprocals (type A.1.3)

This type is opposed to the diathesis types A.1.1 and A.1.2, as the reciprocal marker does not replace any constituent. This very rare type is attested in Modern Chinese. (With reservations, reciprocals from one-place intransitives, like (113) and (114), can also be regarded as irreversible).

Modern Chinese (Hoa et al., Ch. 49, §3.5.1; the REC marker is optional here)

- (131) *Nǐ bǎ zhè jǐ shuāng xié [hùxiāng] shì-shì.*
you.SG ba this several pair shoe mutually try.on-try.on
lit. ‘Try on some of these pairs of shoes [mutually] (= compare them with each other to see which pair is better).’

12.4 Implicational hierarchy of the diathesis types of reciprocals

In conclusion of the discussion of subject-oriented reciprocals, I propose the following implicational hierarchy for verbal reciprocal markers where each subsequent type implies the existence of the previous types. Pronominal reciprocals are taken into consideration if they are the only or main type of reciprocals in a language.

(132) “canonical” ⊃ “indirect” ⊃ “possessive” ⊃ “adverbial” ⊃ ‘irreversible’.

This is supported by the fact that there are languages

1. With “canonical” reciprocals only, e.g. Tariana (see Aikhenvald, Ch. 30, §1.2), West Greenlandic Eskimo (Fortescue, Ch. 19, §§1.2 and 7), Lithuanian where “indirect” reciprocals are practically absent (see (118) above), To’aba’ita (see Lichtenberk, Ch. 36, §4); in Chukchi the other diathesis types are not attested reliably (see Nedjalkov, Ch. 40, §3.1.1);

2. With “canonical” and “indirect” reciprocals only, e.g. German (see Wiemer & Nedjalkov, Ch. 10, §§4.1–4.2), Kabardian (Kazenin, Ch. 17, §3.2.1.3), Nivkh (Otaina & Nedjalkov, Ch. 41, §§3.2.1–3.2.4), Ainu (Alpatov et al., Ch. 42, §§3.1.1, 3.1.2, 3.1.3.2), Udehe (curiously enough, if a pronominal marker is used, a verbal reciprocal is possible; see Nikolaeva, Ch. 23, §§3.1, 4.1);

3. With “canonical”, “indirect” and “possessive” reciprocals only, e.g. Yakut (see Nedjalkov & Nedjalkov, Ch. 26, §§4.1.1–4.1.3), Even (see Malchukov, Ch. 39, §3.2), Khalkha-Mongol and Buryat (see Nedjalkov et al., Ch. 29, §3.1.1–3.1.3), Mundari (see Osada, Ch. 37, §§3.1.1–3.1.3).

(Almost) all the diathesis types are represented by syntactic reciprocals in some languages, e.g. by reciprocals with the adverb *hùxiāng* in Modern Chinese, pronoun *each other* in English, *drug druga* in Russian, etc.

Thus, if a language has only one diathesis type of reciprocals it is likely to be “canonical”, if it has two types, they are certain to be “canonical” and “indirect”, etc.

13. Object-oriented reciprocals; type A.2 – spatial transitive reciprocals of joining and separating

This section is a sequence to 2.2.4 and to two subsections (b) in 12.1.1.2.

13.1 The Kabardian case¹⁰

Spatial transitive reciprocals are considered here mostly on the basis of Kabardian where this class of verbs has morphological marking and seems to have reached maximum development (this also pertains to the closely related Adyghe language).

10. On transliteration of the Cyrillic characters of the Adyghe and Kabardian alphabet: phonetic transcription is used for many consonants and vowels (e.g. the Latin letters *b, g, d,* etc., and *a, o, u,* etc.). The letters *ə* and *e* (which usually signifies the diphthong /jə/) are preserved. The following letters are preserved: *l* (glottal stop), *ʙ* and *ɸ* (the latter two change the value of the previous letter; cf. *g = /g/* and *gɸ = /ɣ/*). The Cyrillic letter *ʙ* is replaced by schwa (ə). The letter *ʉ* is replaced by the combination *ʂʙ*. This mixed transliteration is also used in Chapters 3, 5, 7 and in Ch. 18 on Adyghe reciprocals. However, in Chapter 17 on Kabardian reciprocals, phonetic transcription is used.

13.1.1 *Introductory*

Spatial reciprocals are in fact two antonymous lexical groups, of joining and separating, with numerous derivatives more or less related in meaning to them. In the *Kabardian-Russian dictionary* (Apazhev et al. 1957) and in the *Russian-Kabardian dictionary* (Kardanov & Bichoev 1955), at least 230 spatial transitive reciprocals with the prefix *zə-* are registered, about 150 of them with the meaning of joining and about 80 denoting separating (the number of base roots without preverbs is much more limited).

Note that in Kabardian, spatial transitive reciprocals are derived by means of the prefix *zə-* alone (133a, b), which also reciprocates non-direct objects of two-place intransitives (133c) and three-place transitives (133d), whereas for the direct object the prefix *zə-rə-* is used (133e):¹¹

- | | | | | |
|-------|----|--|---|---|
| (133) | a. | <i>klərə-dən</i> ‘to sew sth onto sth’ | → | <i>zə-klərə-dən</i> ‘to sew two pieces together’ |
| | b. | <i>pə-upšvIən</i> ‘to cut sth off sth’ | → | <i>zə-pə-upšvIən</i> ‘to cut sth through/in half’ |
| | c. | <i>guoun</i> ‘to shout to sb’ | → | <i>zə-guoun</i> ‘to shout to each other’ |
| | d. | <i>tən</i> ‘to give sth to sb’ | → | <i>zə-tən</i> ‘to give sth to each other’ |
| | e. | <i>zexuən</i> ‘to chase sb’ | → | <i>zə-rə-zexuən</i> ‘to chase each other.’ |

Spatial transitive reciprocals, like the one in (134), crucially differ from proper reciprocals semantically, as their reciprocal arguments are object referents, i.e. patients manipulated

11. The data for this section are obtained from the *Kabardian-Russian dictionary* (Apazhev et al. 1957) and the *Russian-Kabardian-Cherkess dictionary* (Kardanov & Bichoev 1955). In the examples below, the verbs are, as a rule, segmented into morphemes (the masdar suffix *-n* is not singled out).

Kabardian has ergative-absolutive structure: *-(ə)m* is a case marker for the ergative subject and non-direct and oblique objects, and *-(ə)r* marks the absolutive subject and direct object. Admitting that *-(ə)m* in both functions is the same case I nevertheless indicate in the glosses the function (ERG or OBL) and not the name of the case for the reader's convenience, though I realize the illogicality of this decision (influenced by the choice of Kazenin for Kabardian (Ch. 17, §2.1). Nouns with the double conjunctive suffix *-rə* are always marked for the oblique case whatever their syntactic function. The 1st and 2nd person pronouns have no ERG and ABS forms. The plural suffix is *-xə*.

The morphological structure of a reciprocal verb is very complex, a simplified pattern being REC-PREV-CAUS-ROOT. Agreement markers are inserted either before the root (or before the causative prefix *gəə-*, as in (134)), and/or the preverb, depending on the syntactic function of the argument they refer to. In many forms 3rd person object agreement markers are zero. The reciprocal prefix takes the agreement slot of the reciprocalized object.

Kabardian preverbs are mostly locative; a verb form may contain more than one locative preverb, sometimes three, to reflect very subtle locative meanings. All in all, the number of simple and complex preverbs reaches about 100 (Kazenin, Ch. 17, §9.2.4). Many of the preverbs denote position somewhere: they point to the part of the object where the action takes place, e.g. inside (*švIə-/švIə-*) or in its upper or lower part, or in its opposite part, or on its vertical surface (*klərə-*), or in the front of the object (*pə/pə-*), etc., rather than the direction of motion towards some place or away from it. Direction ‘towards’ or ‘from (sth)’ is determined by the lexical meaning of the root, which may be a bound morpheme. Therefore the same prefix may denote opposite directions of motion on different derivatives (cf. *pə-gəə-švən* ‘to weld sth to sth’ and *pə-gəə-švən* ‘to cut sth off sth’; Apazhev et al. 1957: 162, 451–2). This antonymy is retained on spatial reciprocals with the same preverb (cf. *zə-pkəərə-lə-xən* ‘to assemble sth from parts (e.g. a rifle)’ and *zə-pkəərə-xən* ‘to dismantle sth into parts’; Shardanov 1983: 74).

In Kabardian example (167), there occurs the preverb *kəə-* with the main meaning of direction towards the speaker.

by the subject referent. Despite obvious differences between them, the fact that in many languages both types of reciprocals share the same markers, verbal or pronominal, shows their semantic affinity (see 13.2.1, where such reciprocal markers from eight languages are cited). As a rule, spatial transitive reciprocals derive from three-place transitives: in the process of derivation the non-direct object position is deleted and its referent comes to be denoted by the direct object together with the referent of the base direct object; hence valency decrease. As a rule, spatial reciprocals are two-place transitives. Syntactically, they form simple constructions (to use the term introduced in Section 7), as the reciprocalized referents are expressed by the same (conjoined) constituent. An example (recall that the English word *together*, as well as its equivalents in numerous other languages, has two meanings: (i) sociative of joint action and (ii) spatial of coming or bringing two entities into contact):

- (134) a. *Inal-əm surət-ər txələmpIə-m kIərə-i-gəə-pšb-a-šb.*
 I-ERG photo-ABS paper-OBL PREV-3SG-CAUS-stick-PAST-ASS
 ‘Inal stuck the photo to the paper.’
- b. *Inal-əm txələmpIə-r surət-əm kIərə-i-gəə-pšb-a-šb.*
 I-ERG paper-ABS paper-OBL PREV-3SG-CAUS-stick-PAST-ASS
 ‘Inal stuck the paper to the photo.’
- c. *Inal-əm surət-əm-rə txələmpIə-m-rə zə-kIərə-i-gəə-pšb-a-šb.*
 I-ERG photo-OBL-and paper-OBL-and REC-PREV-3SG-CAUS-stick-PAST-ASS
 ‘Inal stuck the photo and the paper together.’

Syntactically, derivation of spatial transitive reciprocals is somewhat similar to that of “in-direct” reciprocals proper, like ‘A introduced B to C and C introduced D to A’ → ‘A and C introduced B and D to each other’. By the way, the latter example seems to be one of the few among “indirect” reciprocal constructions that allows object-oriented interpretation, which is obvious if the subject is singular: ‘A introduced B and D to each other’ (see 12.1.2 above; see also object-oriented reciprocals in (23c) and (24c) above). But reciprocity concerns the subject referents in the case of proper “indirect” reciprocals (the referent of the base indirect object is also denoted by the subject of the derivative), and both perform reciprocated actions while in the case of spatial reciprocals cross-coreference concerns the object referents subjected to one action only.

The spatial meanings of joining and separating occupy a special place among locative meanings. It is significant that they can also be expressed by polysemous reciprocal markers with the anticausative meaning, as is the case in Muna:

Muna (van den Berg 1989: 314; *po-* = REC)

- (135) a. *paliki* ‘to visit sb’ → *-po-paliki* ‘to visit each other’
 b. *tai* ‘to stick sth (in)to sth)’ → *-po-tai* ‘to be bound together’
 c. *kuta* ‘to break sth’ → *-po-kuta* ‘broken in two pieces.’

Expression of separating by a reciprocal marker is attested in a number of languages where it is also used to express joining together, and there are also languages where the reciprocal marker has only the latter meaning. I propose a tentative implication: if a reciprocal

marker is used to denote separating it is also used to denote joining together, but the opposite is not necessarily true.

13.1.2 Proper intransitive reciprocals and spatial intransitive and transitive reciprocals
 Constructions with the first two types of reciprocals, i.e. proper (“canonical”) and spatial intransitive, do not differ from each other syntactically in Kabardian (see 12.1.1.2 above). However, there is a marked semantic difference between them (cf. proper reciprocals like ‘to speak to each other’ and spatial intransitive reciprocals like ‘to stick to each other’) and, in some languages (not in Kabardian whose spatial reciprocal marker is voice-oriented, to use the term introduced in 4.2), their marking may differ, e.g. spatial reciprocals may have a special marker (cf. the Russian non-voice-oriented spatial reciprocal marker *s-* in *s-kleit’-sja* ‘to stick together’ (vi); cf. (142b); see also case 6 in 13.2.6).

The relations of the three types of reciprocal constructions named with the respective pairs of base constructions look as follows (note that a plural noun phrase is more common than coordinated phrases like *A and B*):

- (a) Proper “canonical” reciprocal
 (136) a’. *A spoke to B.* + a”. *B spoke to A.* = b. *A and B spoke to each other.*
- (b) Spatial intransitive reciprocal
 (137) a’. *A stuck to B.* + a”. *B stuck to A.* = b. *A and B stuck to each other.*
- (c) Spatial transitive reciprocal
 (137’) a’. *S stuck A to B* + a”. *S stuck B to A.* = b. *S stuck A and B together/to each other.*

In construction (b), the valency of all three oppositions decreases, if the derivative has a verbal reciprocal marker. This valency decrease is due to the expression of the reciprocants by one constituent, i.e. a construction termed simple is used (cf. (138c), (139c) and (134c)). The following examples illustrate the syntactic identity of proper “canonical” and spatial intransitive reciprocals:

- (138) a. *sələt-xə-r* *bij-xə-m* *j-o-zəuə-Ø.*
 soldier-PL-ABS enemy-PL-OBL OBJ-DYN-fight-PRES
 ‘Soldiers are fighting with (=against) enemies.’
- b. *bij-xə-r* *sələt-xə-m* *j-o-zəuə-Ø.*
 enemy-PL-ABS soldier-PL-OBL OBJ-DYN-fight-PRES
 ‘Soldiers are fighting with (=against) enemies.’
- c. *sələt-xə-m-rə* *bij-xə-m-rə* *z-o-zəuə-Ø.*
 soldier-PL-OBL-and enemy-PL-OBL-and REC-DYN-fight-PRES
 ‘Soldiers and enemies are fighting (with each other).’
- (139) a. *surət-ər* *txələmpIə-m* *klərə-pšb-a-šb.*
 photo-ABS paper-OBL PREV-stick-PAST-ASS
 ‘The photo stuck to the paper.’
- b. *txələmpIə-r* *surət-əm* *klərə-pšb-a-šb.*
 paper-ABS photo-OBL PREV-stick-PAST-ASS
 ‘The paper stuck to the photo.’

- c. *surət-əm-rə* *txəlθəmpIə-m-rə* *zə-kIərə-pšb-a-šb.*
 photo-PL-OBL-and paper-OBL-and REC-stick-PAST-ASS
 ‘The photo and the paper stuck together.’

13.1.3 Formation of spatial transitive reciprocals: Labile derivation, reciprocal, locative markers

Spatial transitive reciprocals may enter into morphological oppositions both with same-root spatial (one-place) intransitive reciprocals and underlying three-place transitives (= bitransitives). Four forms are theoretically possible which may enter into four semantic oppositions between themselves, two reciprocal (English (140a)–(140b) and (140’a)–(140’b)) and two causative ((140a)–(140’a) and (140b)–(140b’)).

Similarly, among four Kabardian same-root predicates in (141) and (141’), and four Russian same-root predicates in (142) and (142’), there are analogous causative oppositions, and forms (a) and (b) also enter into reciprocal relations. In Kabardian, the causative member is marked with a causative prefix (141’), and in Russian, the anticausative member is marked with a medial postfix (142). The semantic oppositions illustrated by (137) and (137’) can be expressed by different formal oppositions. There are three main marking strategies:

1. *Labile derivation* (with optional or obligatory addition of an adverb like *together*); this strategy is employed in English, where the same verb form is used in all four meanings:

- English
- | | | | |
|--------|-------------------------------|---|--|
| (140) | a. ‘to stick to sth’ (vi) | ↔ | b. ‘to stick together’ (vi) |
| | ↓ | | ↓ |
| (140’) | a. ‘to stick sth to sth’ (vb) | ↔ | b. ‘to stick sth and sth together.’ (vt) |

2. *Reciprocal derivation*: a spatial transitive is derived from a bitransitive base by means of a voice-oriented reciprocal affix (cf. (141’a) → (141’b)) or from an intransitive reciprocal by means of a causative marker (cf. (141b) → (141’b)); these strategies are employed in Kabardian:

- Kabardian
- | | | | |
|--------|---|---|--|
| (141) | a. <i>kIərə-pšbIən</i> ‘to stick to sth’ (vi) | → | b. <i>zə-kIərə-pšbIən</i> ‘to stick together’ (vi) |
| | ↓ | | ↓ |
| (141’) | a. <i>kIərə-gθə-pšbIən</i> ‘to stick sth to sth’ (vb) | → | b. <i>zə-kIərə-gθə-pšbIən</i> ‘to stick sth and sth together’ (vt) |

3. *Locative derivation*: derivational locative affixes with the meaning of joining or separating are used; they are non-voice-oriented; a spatial reciprocal derives from the base verb; cf. Russian *kleit* ‘to stick, paste’ → *s-kleit* ‘to stick, paste sth together’, *pri-kleit* ‘to stick, glue sth to sth’), the prefixed derivatives comprise an (additional) equipollent opposition where the affix of one denotes joining of one object to another and the affix of the other member has a reciprocal meaning: *pri-kleit* ‘to stick, glue sth to sth’ (142’a) ↔ *s-kleit* ‘to stick, glue sth and sth together’ (142’b). In other words, in this case the reciprocal meaning in Russian is expressed by substitution of the prefix *s-* for *pri-*:

Russian

(142) a. *pri-kleit'-sja* 'to get stuck to sth' (vi) ⇔ b. *s-kleit'-sja* 'to get stuck together' (vi)
 ↑ ↑

(142') a. *pri-kleit'* 'to stick sth to sth' (vb) ⇔ b. *s-kleit'* 'to stick sth and sth together.' (vt)

Russian spatial reciprocals like *skleit'* 'to stick sth and sth together' (142'b) are regularly translated into Kabardian by means of reciprocals like *zə-kIəɾə-gʷə-pšbIən* with the same meaning. Analogous correspondences are attested among Russian spatial reciprocals of separating with the prefix *raz-* which are also regularly translated by means of the reciprocal prefix *zə-*.

13.1.4 Reversible and non-reversible spatial reciprocals

Spatial reciprocals relating to two non-reciprocal base constructions with inverted arguments like (139a, b) and (134a, b) which can be used in intransitive type (139c) constructions and transitive type (134c) constructions can be termed reversible. Thus, semantically, a reversible reciprocal construction equals two non-reciprocal constructions, being the "sum" of their meanings. Reciprocals of separating are, as a rule, non-reversible, only a few conforming to the conditions for reversible reciprocals; e.g.:

- (143) a. *markə-xə-r_i j zə-kIəɾə-gʷə-pšbIə-kIən.*
 'to unstick/unglue the stamps [from one another].'
 b. *markə-m-əɾ_i markə-m-əɾ_j zə-kIəɾə-gʷə-pšbIə-kIən.*
 'to unglue a stamp_i from a stamp_j.'
 c. *markə-r_i markə-m_j kIəɾə-gʷə-pšbIə-kIən.*
 'to unglue a stamp_i from a stamp_j.'
 d. *markə-r_j markə-m_i kIəɾə-gʷə-pšbIə-kIən.*
 'to unglue a stamp_j from a stamp_i.'

In fact, this schema, in contrast to its counterpart with verbs of joining, is represented by a very limited number of derivatives, because the situation of separating such homogeneous objects (e.g. two stamps) is a comparatively rare phenomenon. Much more frequent are situations when a whole object is divided into parts. In this case the reciprocal construction relates only to one base construction (cf. (144b), viz. to a spatial transitive reciprocal of type (137'a')), inversion of the objects in (144b) being precluded by the difference in the semantic status of the object referents and/or the lexical evolution of spatial reciprocals. Not infrequently, a reciprocal construction is not related semantically to any base construction of type (137'a') at all (cf. (153b)).

It is obvious that the two main lexical groups of spatial reciprocals are antonymous in respect of the relationship between a whole (object) and its parts, and it is a greater or lesser symmetricity of the parts (either fully separated or in spatial contact) of the same whole entity that make the employment of the reciprocal marker possible. In the case of joining, separate parts exist prior to the whole object. In the case of separating, the relation is the opposite. These opposite images manifest themselves in the background of various spatial reciprocals to a different degree, depending on the lexical meaning of the base verb and/or lexical meaning of the objects. Reciprocalization may involve

various kinds of metonymical re-interpretation. I will cite a number of most common non-prototypical cases, cases with minor deviations and some where no connection to the reciprocal meaning can be traced.

Case 1: the object referent of the reciprocal construction is a single whole subjected to dividing into parts. Thus, for instance, spatial reciprocal (144a) is related only to one base construction (144b) meaning ‘to break off a piece of bread’; needless to say, the meaning ‘to break off bread from a piece’ is hardly natural.

- (144) a. *šbIakxčbuš-r zə-pə-šbIə-kIən* ‘to break (a loaf) of bread’
 b. *šbIakxčbuš Iəxbə pə-šbIə-kIən* ‘to break off a piece of bread.’

Case 2: the object referents (two or more than two) of the reciprocal construction are in converse relation to each other. Sentences (145) and (146) illustrate typical deviations from the cases illustrated in (139) and (143). The main factor is the lexical meaning of the base verb and non-symmetry (or similarity?) of the object referents. In (145) the reciprocants (i.e. chair and table) can appear as conjoined reciprocated objects only as in (145b), and hardly in the inverted order ‘to put the chair and the table one upon another’; thus (145b) relates only to one base construction, namely (145a), where inversion of the direct and non-direct objects (i.e. ‘to put a table *on* the chair’) is rather unlikely, a converse statement like ‘to put the table *under* the chair being more natural (see §10).

- (145) a. *šənt-ər stIol-əm te-gčə-uvən.*
 chair-ABS table-OBL PREV-CAUS-stand
 ‘to put a chair on the table.’
 b. *stIol-əm-rə šənt-əm-rə ze-te-gčə-uvən.*
 table-OBL-and chair-OBL-and REC-PREV-CAUS-stand
 ‘to put the table and the chair one upon another.’

The following instance differs from (145) in that the object referents are identical entities (bricks) and the reciprocal predicate naturally denotes their joining together into a whole by placing one upon the other (although spatially they are not symmetrical, one brick being on top of another, etc., i.e. this is a converse situation like (145)). The reciprocal generates a construction of type (146a):

- (146) a. *mə čərbəš-ər mo čərbəš-əm te-ləxbən.*
 this brick-ABS that brick-OBL PREV-put
 ‘to put this brick on that brick.’
 b. *čərbəš-xə-r zə-te-ləxbən.*
 brick-PL-ABS REC-PREV-put
 ‘to put bricks one upon another.’

Case 3: the object referent of the reciprocal construction is a whole resulting from joining separate entities/parts together:

- (147) a. *čərbəš-xə-r blən-əm te-ləxbən.*
 brick-PL-ABS wall-OBL PREV-put
 ‘to put bricks into a wall.’

- b. *blən-ər čərbəš-u zə-te-ləxəən.*
 wall-ABS brick-ADV REC-PREV-put
 ‘to build a wall with bricks.’
- (148) a. *Iu-e-šbə.* ‘Someone (= -e-) plaits (works) sth into sth.’
 b. *bədz-əm bədzəxə zə-Iu-e-šbə.* ‘A spider spins a web.’

Case 4: the object referent is an entity (= a whole) to which another entity (= its part) is attached (see (149)) or somewhat separated from it (e.g., (150b)). Recall that the suffix *-(ə)r* is ABS.

- (149) *zə-te-pIən* ‘to close (a book)’
- (150) a. *šəxəteplə-r te-xən* ‘to take a lid (off sth)’
 b. *pxəuantə-r zə-te-xən* ‘to open a suitcase.’

Case 5: the object referent of a spatial reciprocal, being unrelated to other referents as their whole or part, enters into spatial relations with them by being placed inside or taken out. There are also a few spatial reciprocal forms synonymous with their bases, both denoting joining or separating of an entity and its parts while the whole is kept intact; cf.:

- (151) a. *sabij-r xə-pxən* ‘to swaddle a baby’
 b. *sabij-r zə-xə-pxən* ‘to swaddle a baby.’
- (152) a. *saugəət-ər kəəp-əm kəə-kluəclə-xən* ‘to unpack a gift (lit. out of a bag)’
 b. *saugəət-ər kəə-zə-kluəclə-xən* ‘to unpack a gift.’

Case 6: lexicalized reciprocals. Object-oriented reciprocals are not always necessarily spatial proper, they can also denote “mental joining” of two entities, e.g. of the ‘original’ and ‘copy’. The relation of the reciprocal to the base is necessarily non-standard: in (153b) a verb meaning ‘to compare, collate’ derives from the base meaning ‘to count, take into consideration’ (at least this is the only meaning registered in the dictionary for this verb).

- (153) a. *ləətən* ‘to count, take into consideration’
 b. *tratxəkIa-m-rə zətratxəkIa-m-rə zə-ləətən*
 original-OBL-and copy-OBL-and compare
 ‘to compare the copy with the original.’

Case 7: finally, it may be useful to mention that there are derivatives with the prefix *zə-* which have nothing in common with spatial reciprocals of joining or separating, and no individual semantic development from these meanings can be traced. Thus, the form *gəə-pə-šbəən* which might be the base for *zə-gəə-pə-šbəən* (154) is not registered in the dictionaries; instead, we find the root verb *šbəən* as a synonym of this derivative.

- (154) *zə-gəə-pə-šbəən* ‘to create’, ‘to form (e.g. a government), ‘to equip (an expedition).’

13.1.5 *The prefix zə- as a fixed component of complex preverbs*

Not all verbs containing *zə-* can be counted as derivatives of the types just considered. As a matter of fact, there are quite a number of complex preverbs in Kabardian whose meaning does not follow immediately from that of the components (the existence of complex preverbs containing *zə-* shows its ancient origin). The second part of a complex preverb

can also be used in its own meaning alone (exceptions are very few; e.g. *zə-bgə-rə-* where *-bgə-rə-* is not used alone); cf.: *te-gəə-uvən* ‘to put sth upon sth’ → *zə-te-gəə-uvən* ‘to put [two] things one upon another’ and *šxən* ‘to eat’ → *zə-te-šxə-xb-ən* ‘to eat up all that was served’. Many of these preverbs may also have meanings adjacent to the reciprocal, among them meanings which in some other languages may be denoted by polysemous reciprocal markers without any additional components; e.g. the intensive meaning (155a, b, c), dispersive (155d), distributive (155e.ii), iterative (155e.i), sociative (155f), prolative (155g), the meaning ‘many’ (155h):

- | | | | |
|----------|---------------------------------------|---|---|
| (155) a. | <i>gəə-sxbən</i> ‘to burn sth’ | → | <i>zə-te-gəə-sxbən</i> ‘to burn everything’ |
| b. | <i>txbəšbIən</i> ‘to wash’ | → | <i>zə-ščIə-txbəšbIən</i> ‘to wash everything’ |
| c. | <i>čətxən</i> ‘to tear into parts’ | → | <i>zə-xə-čətxən</i> ‘to tear violently into small parts’ |
| d. | <i>xun</i> ‘to drive (sb) away’ | → | <i>zə-bgə-rə-xun</i> ‘to drive sb (many) away in different directions’ |
| e. | <i>ləelən</i> ‘to jump over sth’ | → | <i>zə-kIə-ləelən</i> i. ‘to jump over sth several times in succession’, ii. ‘to jump one after another’ |
| f. | <i>tədžən</i> ‘to stand up’ | → | <i>zə-švə-tədžən</i> ‘(of all) to stand up together’ |
| g. | <i>šən</i> ‘to lead sb’ | → | <i>zə-pə-rə-šən</i> ‘to lead/take sb across a street, etc.’ |
| h. | <i>šbIə-xbən</i> ‘to enter somewhere’ | → | <i>šbIə-zə-rə-xbən</i> ‘(about many) to squeeze somewhere’ (cf. the reciprocal meaning of <i>zə-rə-</i> in (133e)). |

See also Shardanov (1983:73–4), Urusov (1983:48), Kumaxov (1989:237–9).

13.1.6 *Lexical range of spatial transitive reciprocals*

I will list the main lexical groups of verbs (about 110 derivatives out of 230) to show their lexical range. I find it interesting to delimit the range of meanings of joining and separating and related meanings and establish the maximum semantic field, where a language perceives similarity or affinity with joining and separating. In the lists below, the base forms are not supplied for some derivatives, because it is not always possible to find their semantic and/or formal correlates in the dictionaries. Sometimes, e.g. in the case of reciprocals with meanings like ‘to compare’ (see (153)) and some others, the meaning of the base verb does not relate to that of the derivative, probably due to the individual evolution of meaning. Alongside verbs with a more or less clear meaning of joining or separating, there is a number of related less typical verbs. Occasionally, the dictionary definitions of the base and derived forms coincide, which possibly shows the expansion of the use of the reciprocal prefix on verbs whose meaning contains a component of joining or separating. For instance, it happens when the meaning of the base verb is close to the reciprocal meaning. Below, lists of verbs of joining precede those of separating, each is followed by a residual group (cases 1.7 and 2.5 below respectively) of related verbs.

1. *Derivatives of joining*

1.1. *Joining of two or more objects by contact or fixation.* This is the most numerous lexical group. The following cases of joining can be distinguished: (a) bringing into contact and fixing together, (b) mixing together of two substances, (c) bringing into contact with-

out fixation. Group (d) of verbs denoting various actions upon body parts is distinguished on a different basis.

For instance, out of seven verbs meaning ‘to sew (the hem, from beneath, from above, along, etc.)’ only one is chosen.

- (156) a. Bringing into contact and fixing together
- | | |
|---|---|
| <i>pxən</i> ‘to tie sb/sth’ | → <i>zə-pxən</i> ‘to tie two things together’ |
| <i>flə-dən</i> ‘to sew sth to sth’ | → <i>zə-flə-dən</i> ‘to sew sth (make sth by sewing)’ |
| <i>flə-gvə-nən</i> ‘to hook sth to sth’ | → <i>zə-flə-gvə-nən</i> ‘to hook, attach sth one to another’ |
| <i>flə-lun</i> ‘to pin, fasten sth to sth’ | → <i>zə-flə-lun</i> ‘to pin, fasten sth together’ |
| <i>guə-gvə-pšvən</i> ‘to stick sth to sth’ | → <i>zə-guə-gvə-pšvən</i> ‘to stick sth together’ |
| <i>švIə-švIən</i> ‘to harness, yoke’ | → <i>zə-švIə-švIən</i> ‘to harness (horses), yoke (oxen), etc.’ |
| <i>pə-gvə-žbən</i> ‘to weld sth to sth’ | → <i>zə-pə-gvə-žbən</i> ‘to weld (parts of sth) together’ |
| <i>pə-švən</i> ‘to plait, weave sth into sth’ | → <i>zə-pə-švən</i> ‘to interlace, plait, weave together’ |
| <i>pə-gvə-klən</i> ‘to make sth grow to sth’ | → <i>zə-pə-gvə-klən</i> ‘to knit (the bones) together.’ (vt) |
- b. Mixing substances together
- | | |
|---|---|
| <i>guə-gvə-xbən</i> ‘to mix’ | → <i>zə-guə-gvə-xbən</i> ‘to mix sth together’ |
| <i>xə-plətIən</i> ‘to press sth into sth’ | → <i>zə-xə-plətIən</i> ‘to mix by stirring together.’ |
- c. Bringing into contact without fixation
- | | |
|--|---|
| <i>te-upllən-švən</i> ‘to put sth in layers’ | → <i>zə-te-upllən-švən</i> ‘to fold (e.g. a sheet of paper in two)’ |
| <i>švIə-gvə-kvūən</i> ‘to prop sth up’ | → <i>zə-švIə-gvə-kvūən</i> ‘to stack together (e.g. rifles).’ |
- d. Verbs denoting various actions/motions of body parts
- | | |
|------------------------------------|---|
| <i>gvə-lvən</i> ‘to make jump’ | → <i>pə-r zə-gvə-lvən</i> ‘to wrinkle one’s nose’ |
| <i>te-gvə-uən</i> ‘to click, snap’ | → <i>dzə-r zə-te-gvə-uən</i> lit. ‘to chatter with one’s teeth’ |
| <i>te-kvuzən</i> ‘to press’ | → <i>dzə-xə-r zə-te-kvuzən</i> ‘to clench one’s teeth.’ |

The base forms, general or semantically related, of many of the derivatives with the reciprocal prefix are lacking in the dictionaries, most likely, by accident. It should also be taken into account that sometimes the absence of the base form without *zə-* may be due to the fact that *zə-* constitutes a complex preverb with the preverb that follows it (this may also be the case in (162), (163b, c), (164b, d), etc.). Here are some of these derivatives:

- | | |
|---------------------------------------|---|
| e. <i>zə-xə-də-xbən</i> | ‘to make patchwork’ |
| <i>zə-xə-gvə-švə-xbən</i> | ‘to interlace, plait with one another’ |
| <i>zə-xə-vən</i> | ‘to intermix (soil and turf) when ploughing’ |
| <i>zə-xə-xbə-žən</i> | ‘to grind sth (e.g. wheat and barley) together’ |
| <i>zə-švə-xvūən</i> | ‘to rub sth against sth’ |
| <i>zə-švIə-kvūən</i> | ‘to put together (e.g. papers)’ |
| <i>zə-te-plIən</i> (<i>nə-xə-r</i>) | ‘to close (one’s eyes).’ |

1.2. *Placing one thing upon another.* In this group of verbs the relations between the joined objects are converse, i.e. an object which is on top of another can be under a third object (see Section 10 above). This type is illustrated by (145) and (146). Here are a few reciprocals with base verbs:

- (157) *te-lubən* ‘to cover sth with sth’ → *zə-te-lubən* ‘to cover (plates, etc.) one with another’
te-gəə-sən ‘to seat, put sth on sth’ → *zə-te-gəə-sən* ‘to pile, heap one upon another’
te-dzən ‘to put sth on top’ → *zə-te-dzən* ‘to throw sth one upon another’
te-kəuən ‘to pull sth over sth’ → *zə-te-kəuən* ‘to pull sth one upon another’
flə-un ‘to pass sth through’ → *zə-flə-un* ‘to thread together’
šəxəə-šəə-gəə-žən ‘to spill, pour’ → *zə-šəxəə-šəə-gəə-žən* ‘to pour a part from one vessel into another.’

1.3. *Putting objects into one place without fixing them together.* The derivatives of this class subdivide into two main lexical groups: (a) of moving (animate or inanimate) objects (in)to one place (including figurative usages like *zə-gəə-zəxuən* ‘to save (e.g. money)’; *zə-xuə-gəə-sən* ‘to concentrate’); (b) of mixing sth, e.g. cooking several ingredients together in the same pot (this case is close to object-oriented sociatives, due to the patiency of the reciprocants and their spatial proximity).

- (158) a. Moving objects into one place
te-ləxəən ‘to put sth upon sth’ → *zə-te-ləxəən* ‘to put sth together’
te-təuən ‘to rake sth on sth’ → *zə-te-təuən* ‘to rake sth together, into a heap’
te-klutən ‘to rake sth’ → *zə-te-klutən* ‘to put, pour (e.g. potatoes) into a heap’
xuə-šə-sən ‘to carry sth to sb’ → *zə-xuə-šə-sən* ‘to carry (in)to one place.’
- b. Mixing, cooking several ingredients in the same pot or dish
xə-gəə-vən ‘to boil sth in sth’ → *zə-xə-gəə-vən* ‘to boil sth together in the same pot’
xə-gəə-žəən ‘to fry sth in sth’ → *zə-xə-gəə-žəən* ‘to fry sth together in the same frying pan’
xə-šuuən ‘to salt sth in sth’ → *zə-xə-šuuən* ‘to salt sth (e.g. cucumbers and tomatoes) together’
xə-šən ‘to milk cows into sth’ → *zə-xə-šən* ‘to milk cows into the same vessel.’

1.4. *Making an object smaller by pressing it or otherwise, or changing its internal structure/mixing it up inside*

- (159) *šəə-guən* ‘to press (e.g. a stack)’ → *zə-šəə-guən* ‘to press sth together’
te-kəuzən ‘to squeeze’ → *zə-te-kəuzən* ‘to squeeze sth together’
lə-gəə-xəən ‘to entangle sth’ → *zə-lə-gəə-xəən* ‘to entangle (a thread, etc.)’
flə-gəə-zəə-xəən ‘to muddle up’ → *zə-flə-gəə-zəə-xəən* ‘to muddle up (e.g. a problem).’

1.5. *The meaning of closing, wrapping sth up*

- (160) *lu-dzən* (also *xun*) ‘to weave’ → *zə-lu-dzən* (also *xun*) ‘to spin’
lu-šəən ‘to interweave’ → *zə-lu-šəən* ‘to weave (fabric)’
lu-pIən ‘to close (e.g. a door)’ → *zə-lu-pIən* ‘to close (e.g. shutters)’
klučlə-pxən ‘to swaddle’ → *zə-klučlə-pxən* ‘to swaddle (a baby)’
klučlə-šə-xəən ‘to reel, wind’ → *zə-klučlə-šə-xəən* ‘to reel, roll sth up’

<i>šbIə-ufən</i> ‘to cover sth/sb’	→	<i>zə-šbšbIə-ufən</i> ‘to wrap up, muffle sb’
<i>te-pIən</i> ‘to cover sth with sth’	→	<i>zə-te-pIən</i> ‘to close (a book)’
<i>xuə-šbIən</i> ‘to close’	→	<i>zə-xuə-šbIən</i> ‘to close (a window, a shop), finish (a meeting).’

1.6. *The meaning of comparing.* This abstract figurative meaning is close to that of joining. Nearly all the derivatives of this group contain the reciprocal prefix. They are either related to their base verbs in an individual way or they lack bases.

- (161) *zə-gvə-pšbən* ‘to compare, confront’ (cf. *pšbən* (vt) ‘to measure’)
zə-ləə-tən ‘to collate (sth with the original)’ (cf. *ləə-tən* ‘to count’)
zə-pə-gvə-šbə-čən ‘to weigh equal measures’, fig. ‘to compare sth’ (cf. *šbə-čən* ‘to weigh sth’)
zə-pə-ləə-tən ‘to compare’ (cf. (153) above)
zə-te-gvə-xuən ‘to coordinate’ (cf. *te-gvə-xuən* ‘to make sth hit sth’)
zə-xuə-gvə-dən ‘to consider equal to each other’ (cf. *xuə-gvə-dən* ‘to compare, make alike to sb’)
zə-xuə-pləən ‘to collate (sth with the original)’ (cf. *pləən* ‘to look somewhere...’)
zə-xuə-gvə-dizən ‘to equalize sb/sth in measure, size; make level’ (cf. *xuə-gvə-dizən* i. ‘to equalize, ii. ‘to compare in sight, size’).

1.7. *Non-spatial figurative use with a weakening of the reciprocal meaning.* In contrast to the preceding case where the relatedness to the meaning of joining is transparent enough, in the derivatives cited below and many others like them the meaning of joining is either not traceable or less obvious.

- (162) *zə-xvəuə-kIən* ‘to replace sth with sth, substitute sth for sth’
zə-blə-xvəun ‘to replace sth with sth, substitute sth for sth’
zə-xə-šən ‘to form’
zə-gvə-pə-šbən ‘to create’
zə-xə-šbIə-kIən ‘to be aware, to perceive (e.g. reality).’

2. Derivatives of separating

2.1. *The meaning of dividing an object into parts.* This is the main lexical group. It is the counterpart of the first lexical group of verbs of joining.

- (163) a. *guə-udən* ‘to chop, break off’ → *zə-guə-udən* ‘to break (e.g. a plate), chop into parts’
guə-gvə-zən ‘to split sth off the side’ → *zə-guə-gvə-zən* ‘to split, chop, cleave, splinter’
guə-txəən ‘to tear st off the side’ → *zə-guə-txəən* ‘to tear sth lengthwise’
pə-upšbIən ‘to cut off’ → *zə-pə-upšbIən* ‘to cut up (e.g. a wire) (into parts)’
pə-xən ‘to saw off’ → *zə-pə-xən* ‘to saw (e.g. a log) into parts’
pə-čən ‘to tear sth off sth’ → *zə-pə-čən* ‘to tear (e.g. a thread) in(to) two’
pə-fə-šbIə-kIən ‘to tear sth off’ → *zə-pə-fə-šbIə-kIən* ‘to tear into small bits’
pə-gvə-sə-kIən ‘to burn the end of sth’ → *zə-pə-gvə-sə-kIən* ‘to burn through, cut in half by fire’
pə-gvəu-kIən ‘to gnaw the end of sth’ → *zə-pə-gvəu-kIən* ‘to gnaw through in(to) two’

- pə-udən* ‘to break sth off sth’ → *zə-pə-udən* ‘to break (e.g. a leg)’
pə-šxə-klən ‘to bite off the end of sth’ → *zə-pə-šxə-klən* ‘to bite (e.g. a thread) in two’, ‘to cut (e.g. a thread) in two with teeth.’

The following derivatives denote dividing into parts without indication of the manner; the base underlying forms are not registered in the dictionaries:

- b. *zə-guə-gvə-klən* ‘to divide into parts’
zə-šbxbə-ščə-xən ‘to divide into parts.’

An object can denote a thing which is damaged rather than broken into parts.

- c. *ləpə-r zə-guə-pxəun* ‘to cut a finger’
šbxbə-r zə-guə-udən ‘to break (one’s) head’.

In the following derivatives the meaning of separating manifests itself as intervals between lines:

- d. *klə-šbIə-txən* ‘to write under sth’ → *zə-klə-šbIə-txən* ‘to write sth with small intervals between the lines’
xə-bzə-klən ‘to cut sth out of sth’ → *zə-xə-bzə-klən* ‘to count (objects) separately and assort (them)’.

The following derivative may be entered here (its base form is lacking in the dictionary):

- zə-xə-pIə-klən* ‘to bring (children) up differently (one with greater care, another with less)’

2.2. *The meaning of expanding, spreading (antonyms of compressing); the meaning of opening an object (the lid, eyes, mouth, door, window) (antonyms of closing).* This group also covers derivatives usually denoting an action that implies a prior action (the so-called reversible meaning, like ‘unwind’ – ‘wind up’), and many of them contain the verb *klən* ‘to go out’ used as an auxiliary.

- (164) a. *pə-gvə-klən* ‘to separate sth’ → *zə-pə-gvə-klən* ‘to demarcate, delimit’
guə-xən ‘to take sb from sb’ → *zə-guə-xən* ‘to draw, move sth apart’
te-šən ‘to unwind, unroll’ → *zə-te-šən* ‘to unwind, unroll’
kluəclə-xən ‘to take sth from a wrapping’ → *zə-kluəclə-xən* ‘to unwind, unwrap sth’
klərə-gvə-pšvə-klən ‘to unglue sth from sth’ → *zə-klərə-gvə-pšvə-klən* ‘to unglue’ (what was glued together previously).

The base verbs of the following derivatives are not registered in the dictionaries:

- b. *zə-guə-klən* ‘to throw (e.g. a collar) open’
zə-guə-tIəpIə-klən ‘to unrip, rip, undo’
zə-guə-uxuənxə-klən ‘to untwist, untwine (e.g. a rope)’
zə-guə-uluəntIə-klən ‘to untwist, untwine (e.g. a rope)’
zə-lə-pə-šbIə-gvə-klən ‘to separate (e.g. fighting men)’
zə-klə-šbIə-gvə-klən ‘to disconnect’

<i>zə-te-gvə-xun</i>	‘to pull down (e.g. a stack of hay)’
<i>zə-klucIə-xən</i>	‘to unwind sth.’

The following verbs denote opening an object by taking sth off or moving a part, etc. The meanings of the base verb and the derivative may coincide:

- | | | | |
|----|--|---|--|
| c. | <i>te-xən</i> ‘to take a lid off sth’ | → | <i>zə-te-xən</i> ‘to open (e.g. a suitcase)’ |
| | <i>Iu-xən</i> ‘to open (a door, the shop)’ | → | <i>zə-Iu-xən</i> ‘to open’ |
| | <i>te-txvən</i> ‘to rip sth from sth’ | → | <i>zə-te-txvən</i> ‘to open (a suitcase), unseal (an envelope).’ |

The following small group is somewhat close to it; no bases with preverbs are registered.

- | | | |
|----|--------------------------|--|
| d. | <i>zə-gvə-dzə-klən</i> | ‘to turn (e.g. a sack) inside out’ |
| | <i>zə-gvə-dzə-kləžən</i> | ‘to turn (e.g. a suit, a coat)’ |
| | <i>zə-dzə-klən</i> | i. ‘to turn sth over’, |
| | | ii. ‘to translate from one language into another’. |

2.3. *Expanding an object without breaking it.* Most of the derivatives contain the root *šən* ‘to pull’ and thus are more or less synonymous, varying in the spatial characteristics due to the different preverbs; but the base verbs with preverbs are lacking in the dictionaries. A kind of analogy to these derivatives are the verbs with the meaning of pressing objects together (see (159) above): in both cases the object is preserved, though with a change of form or volume.

- | | | |
|-------|-------------------------|---------------------------------------|
| (165) | <i>zə-flə-šən</i> | ‘to stretch sth’ |
| | <i>zə-Iə-šən</i> | ‘to stretch all around’ |
| | <i>zə-pə-šən</i> | ‘to stretch (e.g. an elastic)’ |
| | <i>zə-Iə-flə-šən</i> | ‘to stretch sth’ |
| | <i>zə-klə-šəbIə-šən</i> | ‘to stretch in all directions’ |
| | <i>zə-Iə-gvə-klən</i> | ‘to stretch, widen, broaden, expand’. |

2.4. *A kind of distributive meaning.* The object usually names either a substance (water, mud, etc.) or separate things, or animates moving in different directions. More commonly, this meaning is expressed by the complex preverb *zə-bgəra-* (cf. (155d)).

- | | | | | |
|-------|----|---|---|---|
| (166) | a. | <i>te-dzən</i> ‘to throw down, away’ | → | <i>zə-te-dzən</i> ‘to scatter sth’ |
| | | <i>xə-švən</i> ‘to plunge sb into water’ | → | <i>zə-xə-švən</i> ‘to dissolve (e.g. lime)’ |
| | | <i>klə-šəbIə-xən</i> ‘to take sth from under’ | → | <i>zə-klə-šəbIə-xən</i> ‘to plant out, plant (e.g. sprouts) apart’. |

A semantic affinity can be perceived in the following derivative where spreading concerns light:

- | | | | |
|----|--|---|---|
| b. | <i>šəbIə-gvə-nən</i> ‘to strike a match, light a lamp’ | → | <i>zə-šəbIə-gvə-nən</i> ‘to kindle (a fire, the firewood)’. |
|----|--|---|---|

The dictionaries do not register base verbs with preverbs for the following derivatives with the reciprocal prefix:

- c. *zə-lə-xun* 'to splash (e.g. mud with feet)' (cf. *xun* 'to drive away, roll out')
zə-klə-rə-xun 'to splash (e.g. mud with feet), drive sb away from each other'
zə-klə-šb-lə-xun 'to disperse, scatter'
zə-klə-šb-lə-pxəən 'to scatter, spray, disperse' (cf. *pxəən* 'to scatter sth dry, disperse')
zə-klə-šb-lə-čən 'to thin (e.g. plants) out.'

2.5. *The non-spatial meaning of differentiating, distinguishing between sth.* There are no corresponding base verbs with respective preverbs in the dictionaries. This semantic group has counterparts among derivatives of joining with the meaning of comparing.

- (167) *zə-xə-gəə-klən* 'to discriminate, distinguish between sth and sth'
 (cf. *guə-gəə-klən* i. 'to distinguish sth from sth')
zə-xə-gəə-klə-fən 'to establish differences'
kəə-zə-xə-clə-xu-klən 'to distinguish between sth and sth'
 (cf. *pəž-ər pclə-m kəə-xə-clə-xu-klən* 'to distinguish truth from a lie')
zə-šb-xəə-šbə-gəə-klən 'to distinguish sb/sth, differentiate'
zə-xə-gəə-žən 'to differentiate between sth and sth, make distinctions'
 (cf. *xə-gəə-žən* – 'to single sth out, distinguish among others').

13.2 Types of derivation of spatial transitives

There are languages that seem to lack derived object-oriented spatial reciprocals. There are no such reciprocals in Indonesian (Ogloblin & Nedjalkov, Ch. 33, §5), Even (one exception is registered; see Malchukov, Ch. 39), Cashinahua (Camargo, Ch. 45), Nivkh (Otaina & Nedjalkov, Ch. 41, §3.2), Yukaghir (Maslova, Ch. 44, §4.3.2), Udehe (Nikolaeva, Ch. 23, §4.1). Note that in 13.2.5 below the reciprocal marker is attached to the postposition and not to the verb.

There are at least five types of derivation of spatial reciprocal transitives, each of the types using the marker of proper reciprocals in various ways, either alone or in combination with other affixes; the latter marker is either the only one that derives spatial reciprocal transitives or it is part of such a marker or it marks derivatives from which spatial reciprocal transitives are formed. One more type of derivation of spatial transitives involves the use of affixes which are entered among non-voice-oriented markers above (see 4.2). These six types are considered below.

There are derivations of spatial transitive reciprocals by means of markers that are unrelated to reciprocal markers and have no locative meaning of their own. For instance, there is a case of spatial transitive reciprocals in Tagalog labelled relational verbs. They are derived from three-place transitives with the prefix *i-* (see (168a)) replaced by the circumfix *pag-...-in* which is a marker of relational verbs (see (168b) (Schachter & Otanes 1972:341), and they "express actions that establish a relation shared by two or more objects". Verbs of this type are two-place transitives (semantically they remain three-place).

Tagalog (ibid.)

- (168) a. *i-sama mo ang karne sa gulay.*
 PASS-put YOU.GEN NOM meat OBL vegetable
 ‘Put the meat in with the vegetables.’
 b. *pag-samah-in mo ang karne at gulay.*
 pag-put-PASS YOU.GEN NOM meat and vegetable
 ‘Put the meat and the vegetables together.’

As is known, all the verb forms in Tagalog are marked and the direction of derivation is not obvious. The cited forms are also related to the same root forms *s-um-ama* ‘to come close to sth/sb’ (two-place vi) and *mag-sama* with two meanings i. ‘to get together, join each other’ (one-place vi), ii. ‘to put sth to sth’ (three-place vt). This verb in meaning (ii) coincides with the meaning of *i-sama* in (168a), but it differs in voice. A few more examples:

- (169) a. *i-dikit* ‘to stick/paste sth onto sth’ → *pag-dikit-in* ‘to stick/paste sth together’
 b. *i-hivalay* ‘to separate sth from sth’ → *pag-hivalay-in* ‘to separate sth from one another’
 c. *i-tabi* ‘to put sth beside sth’ → *pag-tabih-in* ‘to put sth beside one another.’

13.2.1 Type 1. Same marker is used for object- and subject-oriented reciprocals

The following languages display this type of marking. In the examples for each language below, first the derivation of a proper reciprocal is illustrated prior to that of a spatial transitive reciprocal.

1. Kabardian (Apazhev et al. 1957: 107, 110, 117)

- (170) a. *pəmən* ‘to smell, sniff sth’ → *zə-pəmən* ‘to sniff at each other’
 b. *fləlun* ‘to pin, fasten sth to sth’ → *zə-fləlun* ‘to pin, fasten sth together’
 c. *pəxən* ‘to saw sth off’ → *zə-pəxən* ‘to saw sth into parts’.

Compare also Kazenin (Ch. 17, §3.2.2.2).

2. Siuslaw (Frachtenberg 1922: 505, 506)

- (171) a. *tqūl-* ‘to shout at sb’ → *tqūl-nawa* ‘to shout at one another’
 b. *sū’qu-* ‘to join sth’ → *sū’qu-nawa* ‘to join sth together’
 c. *āq-* ‘to take sth off’ → *āq-nawa* ‘to take sth apart’.

3. Ainu (Alpatov et al., Ch. 42, ex. (40d, g))

- (172) a. *ekap* ‘to greet sb’ → *u-ekap* ‘to greet each other’
 b. *kamure* ‘to cover sth/sb with sth’ → *u-kamure* ‘to lay one on top of another’
 c. *kotukka* ‘to stick sth to sth’ → *u-kotukka* ‘to stick sth and sth to each other’.

In this language, at least 20 object-oriented reciprocals are attested (discounting object-oriented reciprocals derived from subject-oriented by causativization) with the same marker as subject-oriented reciprocals. They all denote joining or separating (one derivative) of objects (Alpatov et al., Ch. 42, §§3.2.2.1 and 3.2.2.2).

4. Nêlêmwa (Bril, Ch. 34, §§3.1.1.1.1, 3.2)

- (173) a. *nô* ‘to watch sb’ → *pe-nô* ‘to watch each other’
 b. *na* ‘to put sth on sth’ → *pe-na* ‘to pile up objects.’

5. Tidore (van Staden 1969: 116)

- (174) a. *yo-mako-karo* ‘they call out to each other’
 b. *fo-maku-kapu* ‘we mix sth with sth.’

6. Khmer (Gorgoniev 1984: 440–57; cf. also (119g, h) in Ch. 5)

- (175) a. *kiək* ‘to embrace sb’ → *prv-kiək* ‘to embrace each other tightly’
 b. *kəŋ* ‘to put sth long on sth’ → *prv-kəŋ* ‘to put sth one upon another.’

Note in passing that the unproductive prefix *prv-* is unique in the sense that it also has a causative function. In this case it derives (a few) causative spatial transitive reciprocals, and the bases are lexical reciprocals:

- c. *təh* ‘to lie across sth’ → *prv-təh* ‘to put sth together crosswise’
douc ‘to be like sb/sth’ → *prv-douc* ‘to compare sth with sth.’

7. Muna (van den Berg 1989: 206)

- (176) a. *-po-semba* ‘to kick each other (about two persons)’
 b. *-po-ka-tapu* ‘to bind sth together.’

An anticausative derivative denoting separation with the prefix *-po* is given in (135c) above.

8. Fula (Arnott 1970: 358–9)

- (177) a. *min-’yam-indir-i* ‘we asked each other’
 b. *’o-jokk-indir-i boggi ...* ‘He joined the ropes together ...’
 c. *’o-horf-indir-i kosde maako* ‘He tucked his legs together’ (i.e. he sat cross-legged).’

13.2.2 Type 2. Object-oriented reciprocals are derived from anticausatives by a causative marker

This is the case in Kirghiz and Buryat. As a rule, three-place lexical reciprocals serve as underlying verbs from which anticausatives are derived by means of a reciprocal marker. In the anticausative derivative the valency decreases by one and the causative meaning is deleted (but the reciprocal meaning is retained); the causative affix brings back the meaning of the base verb or slightly changes it or the case frame. Thus, in Kirghiz, three-place transitives of joining are mostly causatives derived from anticausatives which are in their turn derived from three-place lexical reciprocals by means of the reciprocal suffix, the first and the third members of the derivational chain being semantically similar and sometimes even synonymous (Nedjalkov, Ch. 28 on Kirghiz, §13.2). Examples follow.

1. Kirghiz (ibid., §13)

- (178) a. *ula-* ‘to join sth with sth’ lexical reciprocal
 → b. *ula-š-* ‘to join’ (vi) anticausative
 → c. *ula-š-tər-* (same as (a)) causative of anticausative

2. Buryat (Nedjalkov et al., Ch. 29, ex. (60))

- (179) a. *xolbo-* 'to tie, join sth together' lexical reciprocal
 → b. *xolbo-ldo-* 'to be tied, joined' anticausative
 → c. *xolbo-ld-uul-* (same as (a)) causative of anticausative

3. Tuvan. No significant changes either in the meaning or case frame take place, and the reciprocal marker puts emphasis on the object-oriented reciprocal meaning, while retaining both objects without any change (cf. (197) below):

Tuvan (Kuular, Ch. 27, ex. (131))

- (180) a. *Ol spirt-ti sug-bile xolu-p tur.*
 he alcohol-ACC water-with mix-CONV AUX.PRES.3SG/PL
 'He is mixing alcohol with water.'
 → b. *Spirt sug-bile xolu-ž-a ber-gen.*
 alcohol water-with mix-REC-CONV AUX-PERF.3
 'Alcohol has mixed with water.'
 → c. *Ol spirt-ti sug-bile xolu-š-tur-up tur.*
 he alcohol-ACC water-with mix-REC-CAUS-CONV AUX.PRES.3SG/PL
 (same translation as in (a)).

In such cases the difference is that the base sentence can have two meanings, of attaching one object to another and of joining two objects, while the derived (180c) denotes only the joining of two substances together; cf. also Kirghiz *bajla-* 'to tie *sth to sth*, tie sth up' → *bajla-štər-* 'to tie *sth and sth together*' (Ch. 28, §13). In (180c), equality of the semantic status of the participants is determined by the meaning of the derived lexical reciprocal *xolu-š-tur-*, whereas in the corresponding base constructions their equal semantic status is denoted by the lexical meaning of the participants as well as by the type of the syntactic connection between them.

13.2.3 Type 3. Object-oriented reciprocals are derived by a complex reciprocal-causative marker

In this case the intermediate member, of type (b) in (178), (179), is either absent (see (c) in (183) and (184)) or has a meaning unrelated to (b) in the derivatives with a complex suffix (see (c) in (181) and (182)). In Japanese, only two-member chains are attested, as the reciprocal marker has no anticausative function.

1. Kirghiz (Nedjalkov, Ch. 28, §13)

- (181) a. *bajla-* 'to tie sth to sth, tie sth up' lexical reciprocal
 → b. *bajla-š-tər-* 'to tie (e.g. horses) together' object-oriented reciprocal
 [c. *bajla-š-* i. 'to help sb to tie sth' assistive
 ii. 'to tie together with sb' sociative]
- (182) a. *sal-* 'to put sth into sth'
 → b. *sal-aš-tər-* 'to put several things one into another'
 [c. *sal-aš-* 'to help sb put sth into sth'].

2. Lillooet (van Eijk 1985: 185; *-twál'* = REC, *-min'* = CAUS)

- (183) a. *nuk^wʔan-twálʔ* ‘to help *each other*’
 b. *maχ-un* ‘to mix sth’ (vt) → *maχ-min^w-twál^w-ən* ‘to mix things together’
 c. *cúq^w-un* ‘to add sth’ (vt) → *cúq^w-min^w-twál^w-ən* ‘to add several pieces of rope together.’

In contrast to the prior cases, in Lillooet spatial transitive reciprocals the reciprocal suffix is preceded by the causative suffix *-min^w-*, although the forms *maχ-min^w-* and *cúq^w-min^w-* are not attested. As we see, in Lillooet, as well as in the above two languages, the reciprocal and the causative suffixes function together as complex markers, though with the opposite sequence of the components.

3. Japanese. Forms superficially and semantically analogous to Kirghiz *bajla-š-tər-* are attested in Japanese; e.g.:

(Alpatov & Nedjalkov, Ch. 25, ex. (50d), (57c))

- (184) a. *har-u* ‘to paste sth and/with sth’
 → b. *hari-aw-ase-ru* ‘to paste sth *together*’
 [c. **hari-a-u*]
- (185) a. *nu-u* ‘to sew sth’ (sewing involves joining together pieces of fabric)
 → b. *nui-aw-ase-ru* ‘to sew two things *together*’
 [c. **nui-a-u*]

Here, *-aw* (allomorph *-a*) is identical with the reciprocal suffix and *-ase* is a causative suffix. In (184b) and (185b) the complex *-aw-ase-* functions as a single morpheme, because causatives cannot derive from reciprocals in Japanese. Besides, there are no reciprocal forms of the verbs *har-u* (184a) and *nu-u* (185a); see (184c) and (185c).

This calls for a question: where do forms (184b) and (185b) come from? As a matter of fact, they are compounds of two verbs, the base verb and the verb *aw-ase-ru* i. ‘to join’, ii. ‘to coordinate’, iii. ‘to compare’ (there are about 80 such compounds in Japanese; see Himeno 1982: 17–52; Hasselberg 1996: 46–51). The verb *aw-ase-ru* is the causative form of the verb *a-u* ‘to meet’, ‘to come up’, i.e. the verb that was the source of the reciprocal suffix *-a/-aw*. Incidentally, some native linguists consider reciprocal derivations as compounds with the verb *a-u* as well (Nishigauchi (1992: 157) calls it “the reciprocal verb *-aw*”). But in other publications the component *-a/-aw* is regarded as a suffix (derived from the verb *au* ‘to meet’; Iwasaki 2002: 144). (My thanks to M. Shibatani for his advice on the Japanese data.)

Japanese examples (184) and (185) are precise formal (though not morphological) and semantic counterparts of the Turkic material in (181)–(182) and they reveal the same tendency to derive two-place spatial reciprocals from three-place bases.

13.2.4 Type 4. Object-oriented reciprocals are derived from subject-oriented reciprocals by a causative marker

Note that not all languages form causatives from reciprocals. For instance, in Japanese, suffixed reciprocals have no causative derivatives with the suffix *-sase/-ase-*, i.e. they have no related object-oriented constructions (see Alpatov & Nedjalkov, Ch. 25, §3.6.1). Here are examples where the morphological causatives are derived from subject-oriented re-

reciprocals, i.e. in (b) of both examples the underlying subject is retained (cf. 13.2.2 where the causatives are derived from anticausatives whose derived subject corresponds to the underlying object of the base verb):

1. Yakut (Nedjalkov & Nedjalkov, Ch. 26, §4.2; *-is/-ih* = REC; *-ter/-ner/...* = CAUS; REFL *-in* is obligatorily added when CAUS is attached to the REC suffix)

- | | | | | |
|-------|----|---------------------------------------|---|------|
| (186) | a. | <i>bil-</i> | ‘to know sb/sth’ | (vt) |
| | b. | <i>bil-is-</i> | ‘to become acquainted with each other’ | (vi) |
| | c. | <i>bil-ih-in-ner-</i> (REC-REFL-CAUS) | ‘to acquaint sb with sb, introduce sb to sb.’ | (vb) |

2. Ainu (Alpatov et al., Ch. 42, §3.2.1)

- | | | | | |
|-------|----|-------------------|---|-------|
| (187) | a. | <i>kotuk</i> | ‘to stick to sth’ | vt |
| | b. | <i>u-kotuk</i> | ‘to stick to each other’ | vi |
| | c. | <i>u-kotuk-ka</i> | ‘to stick sth and sth to each other (with glue).’ | vb(?) |
| | | | cf. (172) with a different sequence of the derivatives. | |

13.2.5 Type 5. The reciprocal marker is attached to the postposition or preposition and not to the predicate

Illustrations are from Yukaghir and German.

1. *Yukaghir*. In this language, the reciprocal prefix may be attached to a spatial postposition instead of the verb (cf. (109b) and (110) where both usages, i.e. on the verb and on the postposition, are illustrated).

Yukaghir (Maslova, Ch. 44, ex. (26); *laŋin* ‘to, towards, in the direction of’)

- | | | | |
|-------|----|--|--|
| (188) | a. | <i>n'e-laŋin ulte-č-ie-m.</i> | |
| | | REC-DIR tie-DISTR-INGR-3SG.TR | |
| | | ‘He began to tie (them) to each other.’ | |
| | b. | <i>tude touke-pul n'-iŋer ulte-č-um.</i> | |
| | | his dog-PL REC-separately tie-DISTR-3SG.TR | |
| | | ‘He tied his dogs separately from each other.’ | |

2. *German*. The syntactic reciprocal marker *einander* can always replace *sich* in the reciprocal function but the opposite substitution is usually forbidden when *einander* is used with a preposition and in particular if it forms an adverb (cf. (87) and (88) above). In German, there is a considerable number of adverbs formed from prepositions with the reciprocal pronoun *einander* ‘each other’. Some of them that are formed from spatial prepositions have a tendency to be used as a kind of preverb spelt together with the predicate. Here is a list of spatial prepositions: *an* ‘at’, *auf* ‘on(to)’, *aus* ‘from, off, out’, *bei* ‘at’, *gegen* ‘against’, *hinter* ‘behind’, *in* ‘in’, *neben* ‘beside’, *über* ‘above’, *unter* ‘under’, *zu* ‘(directed) at/towards’; all in all, about 15 prepositions combine with *einander*. It is often unclear whether these combinations are to be regarded as parts of a verb lexeme (“Verbzusatz”) or as separate adverbs, as in the following instance which is followed by a list of the adverbs-preverbs (cf. Wiemer & Nedjalkov, Ch. 10, §5.5.1, ex. (71)).

- | | | | |
|-------|----|---------------------------------------|--|
| (189) | a. | <i>Er will Karl auf Peter hetzen.</i> | |
| | | ‘He wants to set Karl against Peter.’ | |

- b. *Er will Karl und Peter aufeinanderhetzen.*
 ‘He wants to set Karl and Peter against each other.’
- (190) *aneinanderreihen* ‘to line sth/sb up next to each other’
aufeinanderhäufen ‘to heap things together’
beieinanderhalten ‘to keep sth/sb together’
gegeneinanderlegen ‘to put sth/sb next to one another’
ineinanderschieben ‘to push sth into one another’
übereinanderstapeln ‘to pile sth on top of one another’
zueinanderordnen ‘to group sth/sb together.’

As regards the two main lexical meanings of joining and separating, it is characteristic that the former is often expressed either without the reciprocal pronoun (cf. the adverb-preverb *zusammen* in *zusammenkleben* ‘to glue sth together’) and the latter by means of the adverb-preverb *auseinander* (cf. *auseinanderjagen* ‘to disperse sb’) whose derivatives do not have any base verbs with the preposition *aus*, contrary to other derivatives of type (189). Since the markers *zusammen* and *auseinander* do not derive proper reciprocals, they are not entered in list (190), and included in (195) as specialized markers of joining and separating.

13.2.6 Type 6. Object-oriented (spatial) reciprocals with non-voice-oriented markers (Latin, Ancient Greek)

These markers were considered briefly in 4.2 and 13.2.1–13.2.5 where they were opposed to “voice-oriented” markers such as Yakut *-s*, Bantu *-an*, Evenki *-maat*, Fula *-indir*, etc. The “non-voice-oriented” markers dealt with below derive transitive spatial reciprocals with the same meanings as in 13.2–13.5 above, i.e. they denote joining and separating, bringing into contact and related meanings. As regards intransitive spatial reciprocals with the same markers, they correspond mostly semantically to the transitive spatial reciprocals (see 15.5). Not infrequently, they enter into a semantic (and even morphological) causative opposition (see (141), (141’), (142), (142’) above).

The markers in question are not materially related to the proper reciprocal markers. In many languages that have no specialized verbal markers for proper reciprocals there are verbal markers for encoding the meanings of joining and separating. The base verbs are often lexical reciprocals. Below, only the use of affixes with the object-oriented reciprocal meaning is illustrated. Their other meanings (only those relating to the polysemy of reciprocal markers) are considered in Section 15 below. These same prefixes may derive a limited number of subject-oriented reciprocals, usually spatial reciprocals.

One of the main markers of reciprocity in Latin is the phrase *inter se* ‘each other’ for 3PL, lit. ‘among themselves’, marked for person only; cf.: *inter nos* ‘each other’ for 1PL, lit. ‘among us’; *inter vos* ‘each other’ for 2PL, lit. ‘among you’. And in Ancient Greek it is a reciprocal pronoun marked for number, gender, and case, e.g. *ἄλλήλους* <PL.M.ACC> ‘each other’, *ἄλλήλω* <DU.M/N.ACC>. In the formation of transitive spatial reciprocals, other markers, especially prefixes, play a more prominent role, although the syntactic means just named and the corresponding means of other languages may also take part in their derivation. For instance, the Greek reciprocal pronoun marks transitive spatial reciprocals

meaning ‘to compare sb/sth and sb/sth with each other’ alongside proper reciprocals like ‘to kill each other’.

The invariable reciprocal pronoun *čere* with the initial meaning ‘friend, peer, mate’ in Koyra Chiini occurs in both proper and transitive spatial reciprocal constructions with the meanings like ‘you help each other’ and ‘they sew (= braid) it (= straw) together’ (Heath 1999:341–5).

In many cases, the base verb and the derivative are close in meaning (191a), and the prefix may be regarded as pleonastic, although sometimes it may change the case frame. On the whole, derivatives of this type are highly lexicalized, the base verb being often out of use. Here are a few examples from Latin and Ancient Greek.

1. Latin. In this language, one of the meanings of the highly polysemous prefix *com-/con-/co-/...* (one out of 15 prefixes) is ‘joining’ (see Zaliznjak & Shmelev, Ch. 4, §3). Separating is encoded by the prefix *dis-/di-*. (The examples are borrowed from Dvoreckij 1976.) The meanings of object joining of the prefix *com-* and disjoining of the prefix *dis-* seem to be their main meanings (Dvoreckij 1976). They are attested for the largest number of verbs among the derivatives with these prefixes.

- (191) a. *glūtino* ‘glue sth (together)’ → *con-glūtino* ‘glue sth together’
ligo ‘tie sth together, tie’ → *col-ligo* ‘tie, join sth together’
fundo ‘pour sth out, pour’ → *cōn-fundo* ‘pour sth into one place, mix, join’
coquo ‘boil sth’ → *con-coquo* ‘boil together one thing with another’
 b. *socio* ‘join sth’ → *dis-socio* ‘separate sth’
vendo ‘sell sth’ → *di-vendo* ‘sell sth out by parts.’

2. Ancient Greek. Verbs of joining and separating are formed mostly with two prefixes (out of 18): *συν-/συνγ-/...* and *δια-* (see (192b) and (192c)) respectively. A few object-oriented derivatives are attested with the prefix *ἀντι-*. Their base verbs have practically the same meaning. Examples are from Dvoreckij (1958).

- (192) a. *κατακτείνω* ‘put sth’ → *συν-κατακτείνω* ‘put sth together, next to one another’
χέω ‘pour sth’ → *συν-χέω* ‘fuse, pour sth into one together’
ἄθέω ‘push sth/sb’ → *συν-ἠθέω* ‘make collide, knock sth together’
ράππω ‘sew, sew together’ → *συν-ράππω* ‘sew sth together’
 b. *πρίω* ‘saw sth’ → *δια-πρίω* ‘saw sth into halves’
ζεύγνυμι ‘harness’ → *δια-ζεύγνυμι* lit. ‘unharness’
κρίνω ‘divide sth’ → *δια-κρίνω* ‘divide sth into halves’
 c. *κολλάω* ‘glue sth’ → *δια-κολλάω* ‘glue sth together’
πλέκω ‘weave sth’ → *δια-πλέκω* ‘weave, plait sth together’
 d. *παραβάλλω* ‘compare sth’ → *ἀντι-παραβάλλω* ‘compare with one another’
ρέπω ‘weigh sth’ → *ἀντι-ρέπω* ‘balance, counterbalance sth.’

It may be noted in passing that similar object-oriented reciprocals are formed by means of non-voice-oriented markers in a number of other Indo-European languages:

3. Vedic, Sanskrit (*sám-/ví-*) (Kochergina 1978:706, 581)

- (193) *bandh* ‘to tie sth’ → *sam-bandh* ‘to tie, join sth together’
kart ‘to cut, cut into sections’ → *vi-kart* ‘to cut, cut into sections’).

4. Russian (for details see Knjazev, Ch. 15, §6)

- (194) *kleit'* 'to glue, paste sth' → *s-kleit'* 'to glue, paste together' (vt)
ras-kleit' 'to unglue' (vt).

5. German (Wiemer & Nedjalkov, Ch. 10, §§7.2; 5.5.3; 5.5.1)

- (195) *leimen* 'to glue sth' → *zusammenleimen* 'to glue sth together'
schneiden 'to cut sth' → *auseinanderschneiden* 'to cut sth apart'.

6. Wappo (Radin 1929:38). Analogous spatial affixes are attested in non-Indo-European languages, e.g. in Wappo. In this language, judging from Radin's data, a prefix *pa-/po-* 'together' forms object-oriented reciprocals, usually from three-place transitives; the proper reciprocal meaning is marked by the suffix *-lil* which also has a reflexive meaning (ibid., p. 113).

- (196) *pa-pʰtʰiti* 'to tie strings together'
pa-mepi'le 'to fold'
pa-li'he 'to push together'
pa-he'ye 'to rub together'
pa-nak.a'ε 'to bite (action of bringing lips together)'
pa-li'm'i 'to make deer-drive (drive together).'

14. Reciprocal anticausatives (type A.3)

These are specific reciprocals that cannot be grouped with type A.1 or A.2: they are in fact *anticausative derivatives from three-place potential lexical reciprocals* (which are transitive spatial reciprocals and lexical causatives), the loss of the causative meaning being indicated by a reciprocal marker, while the reciprocal sense is preserved. Thus this type is intermediate between A.1 and A.2. In languages that have devices like middle and polysemous reflexive markers, anticausatives with these markers are derived from various verbs, not only from three-place lexical reciprocals, cf. German *öffnen* 'to open' (lexical causative vt) → *sich öffnen* 'to open' (anticausative vi).

As a rule, reciprocal markers are used to mark anticausativity on three-place lexical reciprocals. Naturally, in the process of evolution the anticausative function of a reciprocal marker may expand and the marker can acquire other meanings semantically related to the reciprocal. In reciprocal anticausatives, the reciprocal relation between the object referents of the underlying transitive spatial construction is retained in the derived spatial reciprocal construction as a relation between the subject referents.

Tuvan (Kuular, Ch. 27, ex. (131); *-š/-ž* = REC; *-bile* = 'with', 'and')

- (197) a. *Ol spirt-ti sug-bile xolu-p tur.* (T. 481) (= (180a, b))
 he alcohol-ACC water-with mix-CONV AUX.PRES.3
 'He is mixing alcohol with water.'
 b. *Spirt sug-bile xolu-ž-a ber-gen.*
 alcohol water-with mix-REC-CONV AUX-PERF.3
 'Alcohol has mixed with water.'

A few more Tuvan reciprocal anticausatives (Kuular, Ch. 27, examples (192), (153), (154), (162), (164)):

- | | | |
|-------|---|---|
| (198) | <i>onaa-</i> ‘to distribute sth’ | → <i>onaa-š-</i> ‘(of sth) to become sb’s share’ |
| | <i>borbakta-</i> ‘to roll sth up into a ball’ | → <i>borbakta-š-</i> ‘to roll oneself into a ball’ |
| | <i>bökpecte-</i> ‘to gather sth into a heap’ | → <i>bökpecte-š-</i> ‘to gather into a heap/crowd’ |
| | <i>dolga-</i> ‘to coil/wind sth’ | → <i>dolga-š-</i> ‘to get entangled’ |
| | <i>düj-</i> ‘to tie sth in a knot/ wrinkle’ | → <i>dü-üs-</i> ‘to become tied, tie itself in a knot.’ |

In Tuvan, anticausatives are derived in a regular way from transitives (that are not lexical reciprocals) by means of the passive and reflexive suffixes, and sometimes these markers are used to derive reciprocal anticausatives from three-place lexical reciprocals. The selection rules are rather intricate: there are instances of two parallel reciprocal anticausatives with the passive and the reflexive marker, as in (199a), one anticausative with the reflexive marker only, as in (199b) and, finally, there are parallel anticausatives of which one is built with the reciprocal marker and the other contains both the reciprocal and reflexive markers, but the form with the reflexive marker only is ungrammatical, as in (199c), where the first two forms also have the sociative meaning:

Tuvan (Kuular, Ch. 27, ex. (176), (192), (25); *-l* = PASS, *-n* = REFL)

- | | | | | | |
|-------|----|----------------------------------|--|-------------------------------------|---------------|
| (199) | a. | <i>ilga-</i> ‘to distinguish’ | → <i>ilga-š-/ilga-l-</i> ‘to differ from each other’ | | |
| | b. | <i>ögle-</i> ‘to marry sb to sb’ | → <i>ögle-n-</i> ‘to get married’ | | |
| | c. | <i>badala-</i> ‘to register’ | → <i>badala-š-</i> / <i>badala-n-iš-</i> / <i>*badala-n-</i> | | |
| | | | i. | ‘to get married at the registrar’s’ | anticausative |
| | | | ii. | ‘to register together’ | sociative |

A similar interplay of the reciprocal, reflexive and passive markers is observed in another Turkic language, viz. Yakut. Thus, in (200a) synonymous reciprocal anticausatives are derived with the reciprocal and reflexive suffixes, and in (200b) they are formed with the reciprocal and passive suffixes:

Yakut (Nedjalkov & Nedjalkov, Ch. 26, ex. (206); *-s* = REC, *-n* = REFL, *ülün-* = PASS)

- | | | | |
|-------|----|--------------------------------|---|
| (200) | a. | <i>silimnee-</i> ‘to glue sth’ | → <i>silimne-s-</i> / <i>silimne-n-</i> ‘to get glued together’ |
| | b. | <i>tüm-</i> ‘to gather sth’ | → <i>tüm-üs-</i> / <i>tüm-ülün-</i> ‘to gather’ (vi) |

15. “Non-voice-oriented” markers; other meanings

15.1 Introductory notes

Section 13.2.6 concerns transitive spatial reciprocals formed with the markers other than those used for the derivation of proper reciprocals (cf. 13.1 and 13.2.1), namely, with “non-voice-oriented” reciprocal markers. In 13.2.6, only one function of these markers is discussed, i.e. the function of marking transitive spatial reciprocals. But their meanings are not limited to this function. They may also express a number of other meanings, such as intransitive (spatial and non-spatial) reciprocal, sociative, comitative, assistive, and response action. All of these meanings can also be expressed by reciprocal “voice-oriented”

markers in a number of languages. The meanings discussed below do not exhaust the polysemy of these markers (for details see especially Zaloznjak & Shmelev, Ch. 4).

15.2 The sociative and comitative meanings (Latin, Ancient Greek)

These two meanings differ syntactically (cf. 8.1 on sociatives and 8.2 on comitatives): as mentioned above, the construction is sociative if both participants are expressed by the subject, and the construction is comitative if one of the participants is expressed by a non-subject. There are few restrictions on the transformation of sociatives into comitatives and even fewer on opposite transformations. Translations in the dictionaries often do not differentiate between these meanings.

1. *Latin*. The sociative-comitative meaning is one of the main meanings of the prefix *com-/con-/...* Both meanings can derive from intransitive and transitive verbs. In the latter case we observe a semantic affinity to transitive spatial reciprocals. Some of the derivatives are ambiguous: they can be interpreted as either transitive spatial reciprocals or transitive sociatives. Interestingly, in the *Latin-Russian dictionary* (Dvoreckij 1976) there are practically no derivatives explicitly translated into Russian as transitive sociatives rather than transitive spatial reciprocals. Most of the registered derivatives with the sociative meaning are formed from intransitive verbs (201a). Only a few transitive sociatives (201b) are registered in Dvoreckij (1976). Subject-oriented derivatives from transitive verbs are very few in number. A number of derivatives can be interpreted either as transitive spatial reciprocals or as transitive sociatives (cf. (201c)); note that the Greek equivalent is cited in (192d) as a spatial reciprocal. This affinity is due to the similarity of the situations described; see Zaloznjak & Shmelev (Ch. 4, §5).

- | | | |
|----------|----------------------------------|---|
| (201) a. | <i>bibo</i> ‘drink’ | → <i>com-bibo</i> ‘drink together’ |
| | <i>rīdeo</i> ‘laugh’ | → <i>cor-rīdeo</i> ‘laugh together’ |
| | <i>vēscor</i> ‘eat, feed on sth’ | → <i>con-vēscor</i> ‘feed together’ |
| | <i>sono</i> ‘sound’ | → <i>cōn-sono</i> ‘make noise together’ |
| | <i>ferveo</i> ‘boil, cook’ | → <i>cōn-ferveo</i> ‘boil, cook together’ |
| | <i>altercor</i> ‘argue’ | → <i>co-altercor</i> ‘take part in an argument’ |
| b. | <i>aestimo</i> ‘estimate’ | → <i>co-aestimo</i> ‘estimate sth and sth together’ |
| | <i>creo</i> ‘create’ | → <i>concreo</i> ‘create sth together with sth’ |
| | <i>crucifigo</i> ‘crucify’ | → <i>con-crucifigo</i> ‘crucify sb and sb simultaneously or together’ |
| c. | <i>pendo</i> ‘weigh’ | → <i>com-pendo</i> ‘weigh sth and sth together.’ |

2. *Ancient Greek*. Sociatives and comitatives are formed with the prefix *συν-*. The following examples illustrate subject-oriented sociatives derived from intransitives (202a) and transitives (202b); and object-oriented sociatives derived from transitives (202c).

- | | | |
|----------|----------------------------|---|
| (202) a. | <i>γελᾶω</i> ‘laugh’ | → <i>συν-γελᾶω</i> ‘laugh together with sb’ |
| | <i>κάθημαι</i> ‘sit’ | → <i>συν-κάθημαι</i> ‘sit next to each other or together’ |
| b. | <i>γεωργέω</i> ‘till land’ | → <i>συν-γεωργέω</i> ‘till land together, jointly’ |
| | <i>φίλῶ</i> ‘love sb’ | → <i>συν-φίλῶ</i> ‘love sb together’ |

- | | | | |
|----|-----------------------------|---|---|
| c. | <i>καταθάπτω</i> ‘bury’ | → | <i>συγ-καταθάπτω</i> ‘bury sb (and sb) together’ |
| | <i>καθείρω</i> ‘lock sb in’ | → | <i>συγ-καθείρω</i> ‘lock, leave sb with sb in private’ |
| | <i>δεκάζω</i> ‘bribe’ | → | <i>συν-δεκάζω</i> ‘bribe all (persons) together or entirely.’ |

Some transitive derivatives can express both sociative (see (203i)) and spatial reciprocal (see (203ii)) meanings: they are often almost indistinguishable (in Dvoreckij (1958), the sociative meaning is explicated by words like ‘together’ and also by the word ‘simultaneously’).

- | | | | |
|-------|--------------------|---|--------------------|
| (203) | <i>συγ-γομώ</i> i. | ‘knock, drive sth in simultaneously’ | sociative |
| | ii. | ‘nail sth together.’ ‘knock sth together’ | spatial reciprocal |

15.3 The assistive meaning (Ancient Greek)

It is expressed by the same prefix as the comitative-sociative. The valency increases by one, as in the comitative.

- (204) *αλεαίνω* ‘heat sth’ → *συν-αλεαίνω* ‘help sb to heat sth.’

According to Dvoreckij (1958), the assistive is (a) the only meaning of some derivatives with *συν-* or (b) the second meaning alongside the sociative, or (c) the third meaning alongside spatial reciprocal and sociative; see (204), (52b), (53b) respectively. It seems that sometimes the author’s choice of translations is accidental.

15.4 The response reciprocal meaning

This meaning, which can also be termed “delayed reciprocal”, is one of the most frequent meanings of the prefix *ἀντι-/ἀντ-* on verbal bases in Ancient Greek:

- | | | | |
|-------|--------------------------|---|---|
| (205) | <i>ωφελέω</i> ‘help’ | → | <i>ἀντ-ωφελέω</i> ‘help sb in return’ |
| | <i>φιλέω</i> ‘love’ | → | <i>ἀντι-φιλέω</i> ‘pay sb for love with love’ |
| | <i>ζητέω</i> ‘search’ | → | <i>ἀντι-ζητέω</i> ‘search, look for sb in return’ |
| | <i>τιμάω</i> ‘respect’ | → | <i>ἀντι-τιμάω</i> ‘respect sb in return’ |
| | <i>σκώπτω</i> ‘ridicule’ | → | <i>ἀντι-σκώπτω</i> ‘ridicule sb in return’ |
| | <i>μισέω</i> ‘hate’ | → | <i>ἀντι-μισέω</i> ‘pay sb with hate for hate.’ |

Derivatives with the meaning of response reciprocity are also attested in Cashinahua (see 9.7 above). Note, however, that in Cashinahua, the subject denotes the participant who can perform not only an action of the type illustrated in (205), i.e. the action in response, but also (which should be obvious from the extralingual situation) an action in advance, in expectation of the response action at a later date (a) of the person who is the target of his action, or (b) from the latter’s relatives. The response action of the suffering party need not be the same as that of the subject referent (though usually but not necessarily it is the same kind of action) (Camargo, Ch. 45, examples (38c), (56); §§3.2.1–3.2.3; see also ex. (168) in Ch. 5, §10).

15.5 Subject-oriented reciprocals (spatial and non-spatial intransitives) (Latin, Ancient Greek)

This section amplifies 12.1.1.2. Reciprocals considered here are derived, with a few exceptions, from one-place intransitives. Some bases are lexical reciprocals (cf. *pūgno* ‘fight’ in (206c)).

1. *Latin*. The prefix *com-/con-/...* denotes joining, among other meanings (see Zaloznjak & Shmelev, Ch. 4, §3). It also serves as a subject-oriented reciprocal marker. It forms intransitive reciprocals denoting the following:

(a) spatial relations, namely, coming together (206a) and dispersing of subject referents (206b); the base verbs are one-place intransitives, the valency is retained but the meaning is changed and the subject becomes plural; these formations are sometimes regarded as sociatives, which seems imprecise to me because plurality is here implied by the reciprocal meaning of moving from different directions to one place (thus, the meaning ‘together’ in the translations is reciprocal and not sociative).

- | | | |
|----------|----------------------------|---|
| (206) a. | <i>crēsko</i> ‘grow’ | → <i>con-crēsko</i> ‘accrete, grow together, into one’ |
| | <i>curro</i> ‘run’ | → <i>con-curro</i> ‘come running together’ |
| | <i>eo</i> ‘go, walk’ | → <i>co-ēo</i> ‘come together, gather’, ‘to copulate’ |
| | <i>fluo</i> ‘flow’ | → <i>confluo</i> ‘flow together’ |
| | <i>venio</i> ‘come’ | → <i>convenio</i> ‘convene’ |
| b. | <i>curro</i> ‘run’ | → <i>dis-curro</i> ‘run away in different directions, disperse’ |
| | <i>verto</i> ‘make a turn’ | → <i>dī-verto</i> ‘disperse, go away in different directions.’ |

(b) Non-spatial relations; the bases are transitive or intransitive; the derivatives mostly denote aggressive actions implying contact. Sometimes the prefix *con-* is pleonastic. The valency decreases, i.e. the derivatives behave like regular “canonical” reciprocals in this respect.

- | | | |
|-------|---|--|
| (207) | <i>futuo</i> ‘have sexual intercourse’ (vt) | → <i>con-futuo</i> ‘copulate’ |
| | <i>pūgno</i> ‘fight’ | → <i>com-pūgno</i> ‘fight, struggle’ |
| | <i>ruo</i> ‘throw oneself’ | → <i>cor-ruo</i> ‘throw oneself upon each other’ |
| | <i>fligo</i> ‘hit’ | → <i>con-fligo</i> ‘fight’ |
| | <i>spondeo</i> ‘swear solemnly’ | → <i>con-spondeo</i> ‘swear solemnly to each other.’ |

2. *Ancient Greek*. Subject-oriented reciprocals with all the three prefixes dealt with above are rather rare. They may denote the following:

(a) spatial relations, viz., coming together (208a) and dispersing of plural subject referents (208b); the bases are one-place intransitives, the valency is retained but the meaning is changed and the subject becomes plural (but the derivatives are not sociatives):

- | | | |
|----------|------------------------------|--|
| (208) a. | <i>θέω</i> ‘run’ | → <i>συν-θέω</i> ‘gather running’ |
| | <i>κυρέω</i> ‘come across’ | → <i>συν-κυρέω</i> ‘come across, meet’ |
| | <i>τρέχω</i> ‘run’ | → <i>συν-τρέχω</i> ‘run, come together for a battle’ |
| b. | <i>θέω</i> ‘run’ | → <i>ἀντι-θέω</i> ‘run away in all directions’ |
| | <i>θέω</i> ‘run’ | → <i>δια-θέω</i> ‘run away in different directions’ |
| | <i>πίπτω</i> ‘fling oneself’ | → <i>δια-πίπτω</i> ‘run away in all directions’ |
| | <i>τρέχω</i> ‘run’ | → <i>δια-τρέχω</i> ‘run away in different directions.’ |

(b) Non-spatial relations, e.g. competition (209a), hostile actions (209b); in the latter instance valency decrease takes place and in the verbs of competition the valency relations are not clear.

(209) a.	<i>σεμνύμαι</i> ‘pride oneself’	→ <i>ἀντι-σεμνύμαι</i> ‘compete in pride’
	<i>θέω</i> ‘run’	→ <i>ἀντι-θέω</i> ‘compete in running’
	<i>μέτειμι</i> ‘try to achieve’	→ <i>ἀντι-μέτειμι</i> ‘compete’
	<i>δημαγωγέω</i> ‘fawn upon people’	→ <i>ἀντι-δημαγωγέω</i> ‘compete in fawning’
	<i>διφρεύω</i> ‘go in a chariot’	→ <i>δια-διφρεύω</i> ‘compete in chariots’
	<i>τοξεύω</i> ‘shoot arrows’	→ <i>δια-τοξεύομαι</i> ‘compete in shooting arrows’
	<i>θέω</i> ‘run’	→ <i>δια-θέω</i> ‘compete in running’
b.	<i>πίτνω</i> ‘fling oneself’	→ <i>συμ-πίτνω</i> ‘fling oneself at each other’
c.	<i>μολογέω</i> ‘agree’	→ <i>δι-ομολογέω</i> ‘come to an agreement.’

16. The reciprocal marker on lexical reciprocals

This section is an amplification of Section 2.3 above.

16.1 Introductory

There is no clear-cut borderline between the main semantic groups. Some reciprocal verbs can be included in two groups. (For details see Knjazev, Ch. 2, §3.3.3; see also Yomdin 1981:89–105; Kemmer 1993:104–5).

(a) Verbs of spatial relations, i.e. joining and separating (both physical and mental), with meanings like ‘to mix sth and sth together’, ‘to divide sth’, ‘to tie sth and sth together’, ‘to connect sth and sth’, ‘to combine sth and sth’, ‘to gather, collect sth’, ‘to separate sth from sth’, etc.

(b) Verbs of identity, similarity, difference, etc., with typical meanings ‘to compare sth and sth’, ‘to identify sth with sth’, ‘to differentiate between sth and sth’, ‘to distinguish sth from sth’, ‘to equalize sth and sth’, etc.

(c) Verbs of human relations, e.g. ‘to marry sb to sb’, ‘to introduce sb to sb’, ‘to reconcile sb and sb’, ‘to grant a divorce to sb’, ‘to make sb and sb related/relatives’, ‘to cause sb and sb to quarrel’, etc.

Diagnostic constructions of type (4a’, a’’, b) may be generated by verbs which contain no morphological marker of reciprocity. For instance, sentences (210a’) and (210a’’) with inversed arguments are synonymous both with each other and with (210b). In this case we can hardly find any difference between the roles of the subject and object referents as they are defined in 1.1. And there is no doubling of roles: as a matter of fact, each participant can be assigned only one role, and both have the same semantic role. Of course, pragmatically, the sentences in each of triplets (210) and (211) are not identical: the hierarchical relations between the participants in a particular sentence may violate the identity of *reversed* sentences like (210a’) and (211a’’). Moreover, syntactic context, e.g. the use of negation, may result in the highlighting of the first participant as more active and in the

subsequent defocusing of the co-participant, cf. *He always argues; Don't argue!*. When used with a phasal marker of inceptivity, the first participant is, in a way, presented as the causer of a reciprocal situation, cf. *John began to argue with Peter*.

Compare Russian and the English equivalents (note that the Russian preposition *s* 'with' and English *with* in the comitative sense are lexical reciprocals: *John with Mary = Mary with John*).

A. Discontinuous constructions

B. Simple construction

- (210) a'. *Ivan sporit s Mashej.* = a". *Masha sporit s Ivanom.* = b. *Masha i Ivan sporjat.*
 (211) a'. *John argues with Mary.* = a". *Mary argues with John.* = b. *Mary and John argue.*
 (212) a'. *John met Peter.* = a". *Peter met John.* = b. *John and Peter met.*
 (213) a'. *John fought Peter.* = a". *Peter fought John.* = b. *John and Peter fought.*

In (210)–(213) reciprocity is inherent in the lexical meaning of the predicates rather than expressed by a special morpheme (word). As the three clauses in each of the four cases, i.e. (210a', a", b) – (213a', a", b), are synonymous with each other and the first two in each group are syntactically alike (we disregard here possible pragmatic differences), they have no non-reciprocal correlates like (4a'–a"). As mentioned in §2.3, verbs of this type are termed here lexical reciprocals. This phenomenon is sometimes also called covert reciprocity (Langendoen 1978:190) or inherent reciprocity (denoting naturally reciprocal events) (Kemmer 1993:102–8). In these cases the reciprocal meaning is integrated in their lexical meaning, which means they are not related to any non-reciprocal bases which function as non-reciprocal predicates (i.e. they have no counterpart as German *umarmte* 'hugged (sb)' for reciprocal *umarmten sich* 'hugged each other' from (4)).

At first glance, the term lexical reciprocal is parallel to the term lexical causative. However, lexical causatives usually have non-causative derived, i.e. anticausative, or non-derived, e.g. labile or suppletive counterparts (cf. *otkryvat* 'to open' (vt) → *otkryvat*'-*sja* 'to open' (vi), *to break* (vt) – *to break* (vi), *to kill* – *to die* respectively). By contrast, lexical reciprocals normally do not have non-reciprocal counterparts (cf., however, *to argue* – *to object*; this opposition may be encoded with a reciprocal marker in some languages; cf. Fula *yedd-ondira* 'to argue' ← *yedda* 'to object'), nevertheless, their reciprocal meaning can be explicated not only by diagnostic constructions like (210)–(213), but also by a lexicographic definition; cf., for instance, the English translation of the definition of the Russian verb *družít* 'to be friends' in the *Explanatory Combinatorial Dictionary of Modern Russian* (Mel'čuk & Zholkovsky (eds.) 1984:311) in which the reciprocal pronoun is repeated five times and two lexical reciprocals (*partner* and *contact*) are used:

- (214) *X družít s Y-om* 'X is friends with Y' = 'X and Y, knowing *each other* well, are emotionally well-disposed *towards each other*, and X and Y are not sexual *partners*, they understand the motives of *each other's* actions and are ready, in case of necessity, to help *each other*, which causes X and Y to want to be in *contact with each other* ...'

16.2 Subject-oriented lexical reciprocals in discontinuous and simple constructions

(On transitive spatial lexical reciprocals see Section 13.) Five main types of the use of reciprocal markers on lexical reciprocals can be distinguished, depending on the properties of the base verbs. These types may differ in productivity in the same language, and the number of verbs in one lexical group may vary across languages. On the whole, the picture is extremely variegated and often idiosyncratic; therefore I shall only illustrate the cases that seem to be most common cross-linguistically. The reciprocals in question are semantically two-place predicates. They are intransitive in the simple construction and transitive or mostly intransitive in the discontinuous construction. In accordance with the nature of the discontinuous and simple use and co-occurrence with a reciprocal marker, the five types may be grouped into two classes, prototypical lexical reciprocals (see 16.2.1) and lexical semi-reciprocals (see 16.2.2). Verbs of the former class are used in both types of constructions without a reciprocal marker (as in (215a) and (215c), while in (215b) the marker is optional) and the verbs of the latter class are used either in the simple construction only (there may be a corresponding two-place construction but it is not reciprocal, cf. *He kissed her* in (215d)), or without a reciprocal marker in the discontinuous construction only and with this marker in the simple construction, as in (215e). All these usages fall into the following schema:

Simple construction	Discontinuous construction
(215) a. (Japanese) <i>T. to A. wa kekkonsi-ta.</i>	= <i>T. wa A. to kekkonsi-ta.</i>
b. <i>They argued [with each other].</i>	= <i>He argued with her.</i>
c. <i>They are alike.</i>	–
d. <i>They kissed [each other].</i>	≠ (<i>He kissed her</i>).
e. <i>They resembled each other.</i>	= <i>He resembled her.</i>

These cases deserve to be discussed in more detail.

16.2.1 Prototypical lexical reciprocals

These are lexical reciprocals that may be used in the same form in both discontinuous and simple constructions, while retaining the reciprocal meaning in either of them, or they have no discontinuous construction. This is probably the most common case cross-linguistically; it may be illustrated by (210)–(213), (215a, b, c). Here belong:

- (a) reciprocals without a reciprocal marker (like *to argue*);
- (b) *reciproca tantum*, i.e. verbs containing a reciprocal marker that have lost the base verb (cf. Buryat *xoybo-ldo-* ‘to hobnob’ ← [?]*xoybo-*);
- (c) reciprocals taking an optional reciprocal marker in both types of constructions (cf. Buryat *arsa-/arsa-lda-* ‘to argue’);
- (d) lexicalized derived reciprocals (cf. Buryat *ala-lda-* ‘to fight, squabble’, also ‘to kill each other’ ← *ala-* ‘to kill, beat’).

Two subtypes are distinguished among prototypical lexical reciprocals differing in the use of a reciprocal marker in the simple construction. As a rule, a reciprocal marker is used pleonastically or for blocking the reading of a construction as elliptical discontinuous.

Type 1. Lexical reciprocals do not take a reciprocal marker either in the discontinuous or in the simple construction, although the latter remains ambiguous, like (216b). Note that the verb with the meaning ‘to marry’ in Tamil (Annamalai 2000:176) behaves in the same way as its counterpart in Japanese. In Udehe, lexical reciprocals do not take a reciprocal suffix; unlike Evenki lexical reciprocals on which the reciprocal suffix can emphasize the reciprocal meaning (Nikolaeva, Ch. 23, §7).

Japanese (Alpatov & Nedjalkov, Ch. 25, §11.2.1.1)

- (216) a'. *Taroo wa Akiko to kekkonsi-ta.*
 T. TOP A. with marry-PAST
 ‘Taro married Akiko.’
- a". *Akiko wa Taroo to kekkonsi-ta.*
 A. TOP T. with marry-PAST
 ‘Akiko married Taro.’
- b. *Taroo to Akiko wa kekkonsi-ta.*
 ‘T. and A. TOP marry-PAST
 i. ‘Taro and Akiko got married [*to each other*].’
 ii. ‘Taro and Akiko got married [*each to someone else*].’
- c. **Taroo to Akiko wa kekkonsi-at-ta.*
 T. and A. TOP marry-REC-PAST
 (same intended meaning as (b.i)).

Lexical reciprocals with the same meaning differ across languages in their combinability with syntactic markers. Thus, the English verb *to marry* allows an optional reciprocal pronoun; cf. *They got married [to each other]*. But Chinese follows the Japanese pattern in this respect and the verb *jìnhūn* ‘to marry’ does not combine with the reciprocal adverb *hùxiāng*. Judging by the data from Hoa (1983:50–1), many of Chinese lexical reciprocals (e.g., *dǎjià* ‘to fight, quarrel’, *tánhuà* ‘to converse’, *dìngghūn* ‘to be betrothed’) behave in the same way.

Type 2. Lexical reciprocals optionally take a reciprocal marker in the simple construction but not in the discontinuous construction. The marker may be used pleonastically or for disambiguation in the case of polysemy. It may be due to the speaker’s intention to show that the clause is a simple reciprocal construction rather than a discontinuous one with an ellipted second participant.

- (217) a. *John argued with Mary [*with each other].*
 b. *John and Mary argued with each other.*
 c. *John and Mary argued* (probably *with someone else*); cf. also translations in (213b).

Type 3. In this case lexical reciprocals are used in the simple construction only and do not take a reciprocal marker. It takes a special place in this schema, being contiguous to Type 1, on the one hand, and to Type 4, on the other.

- (218)=(11) *My father and the neighbour are alike.*

16.2.2 Lexical semi-reciprocals

Here belong verbs which are: (a) lexical reciprocals in the simple construction only, and (b) lexical reciprocals that require a reciprocal marker when used in the simple construction. (Compare the term semi-symmetric predicates in Turek 1988: 115–24; see also Knjazev, Ch. 2, §2.3.)

Type 4. Lexical reciprocals that function as reciprocals in the simple construction only. The respective discontinuous construction can denote an action which may provoke a response action (see (219a'–a'') and (220a'–a'')). In the simple construction a reciprocal marker can be used optionally for the same reasons as in (217b); cf. English and Russian respectively (in (219a', a'')) *s* = 'with'):

(219) a'. *John kissed Mary.* + a''. *Mary kissed John.* = b. *John and Mary kissed*
[*each other*].

(220) a'. *A pozdorovalsja s B.* + a''. *B pozdorovalsja s A.* = b. *A i B pozdorovalis'*
[*drug s drugom*].
'A greeted B.' 'B greeted A.' 'A and B greeted *each other*.'

Type 5. Lexical reciprocals take a reciprocal marker obligatorily in the simple construction but not in the discontinuous construction. Thus, according to this feature they do not differ in form from common grammatical reciprocals. The distinction from the latter lies in the fact that discontinuous constructions with a lexical reciprocal and reversed arguments are synonymous. Compare French (221) and their English equivalents in (222), as well as Nivkh example (223) with the transitive verb 'to be of the same age as'.

(221) a'. *A ressemble à B.* = a''. *B ressemble à A.* = b. *A et B se ressemblent.*

(222) a'. *A resembles B.* = a''. *B resembles A.* = b. *A and B resemble each other.*¹²

Nivkh (Otaina 1978: 3–31, 34, 53; DO in (a'–a'')) is zero-marked and forms a phonetic unity with the transitive verb)

(223) a'. *ətək əmək nətə-d'.* (vt) = a''. *əmək ətək nətə-d'.* (vt)
father mother have.same.age-FIN mother father have.same.age-FIN
'Father is of the same age as mother.' 'Mother is of the same age as father.'
= b. *ətək-xe əmək-xe u-nətə-d'.* (vi)
father-and mother-and REC-have.same.age-FIN
'Father and mother are of the same age.'

17. Concluding remarks

These notes are meant to reiterate the main points of this chapter.

12. The Tamil verb with the meaning 'resemble' behaves in the same way (Annamalai 2000: 176; cf. also Bystrov & Stankevich, Ch. 47 on Vietnamese, §§6.2.1 and 6.2.2.1).

17.1 Grammatical and lexical (inherent) reciprocals

Grammatical reciprocals comprise all constructions formed by the seven types of markers listed in 1.17.2. The use of markers makes it possible to express the meaning of two underlying base sentences by means of one sentence (traditional diagnostic feature); cf. German:

- (224) a'. *A umarmte B.* + a". *B umarmte A* = b. *A und B umarmten sich* = (4)
 (225) a'. 'A hugged B' + a". 'B hugged A' = b. 'A and B hugged each other.'
 (see §2.1.1).

As for lexical (inherent) reciprocals, they lack semantically underlying non-reciprocal verbs and therefore may not need a reciprocal marker. In (226), syntactically analogous to (224), the following three sentences are semantically equal, all of them being lexical reciprocals, and the difference between them is pragmatic:

- (226) a'. *A argued with B* = a". *B argued with A* = b. *A and B argued* (see §2.3).

Lexical reciprocals fall into three main groups differing in the possibility or necessity of the reciprocal marker when they are used in simple constructions of type (226b), i.e. with both reciprocants in the subject position:

- (a) lexical reciprocals never used with a reciprocal marker (cf. Japanese *kekconsi-ru* 'to marry'; cf. (216) above);
- (b) those with an optional reciprocal marker (cf. Japanese *kooronsu-ru* / *kooronsi-a-u* 'to argue'; see Ch. 25 (on Japanese), ex. (129)), and
- (c) those with an obligatory reciprocal marker (cf. Nivkh *u-ηətə-d'* 'to be of the same age'; cf. (223)).

An optional reciprocal marker may be used in type (b) constructions in order to highlight the reciprocal meaning or to show that the subject denotes both reciprocants and the sentence is complete (cf. *A and B argued with each other*), thus blocking out the possible interpretation of the construction as elliptical discontinuous with an omitted second reciprocant (cf. *A and B argued* = i. 'with each other', ii. 'with someone else'), rather than as simple with the subject as a collective first reciprocant.

The use of a reciprocal marker may vary both on lexical reciprocals within one language and across languages (see Section 16).

As mentioned in bypassing, the following difference may be observed between grammatical and lexical reciprocals (I somewhat simplify the picture):

- for grammatical (non-lexicalized) reciprocals the main or only possible type is the simple construction; discontinuous constructions, if they are possible, require no additional marker (with rare exceptions; see 7.5);
- for lexical reciprocals (most of them two-place intransitives) the main type of construction is discontinuous; the use in the simple construction may require an obligatory or optional grammatical marker of reciprocity or it may not allow it.

17.2 Reciprocal marking devices

As is claimed above (2.1.1.1–2.1.1.3), the seven marking devices registered here are grouped as follows:

- (a) *syntactic markers* comprising clause doubling (type 1); pronouns, adverbs (type 2);
- (b) *morphological markers* comprising periphrastic devices (type 3), compounds (type 4), affixes (type 5), and root reduplication (type 6);
- (c) *clitics* (type 7); they are kind of intermediate between pronouns (type 2) and affixes (type 5).

Reciprocals with morphological markers and clitics under the cover term of *verbal* reciprocals are often contrasted to *pronominal* reciprocals, the most common among syntactic reciprocals. These types of reciprocals are the most widespread across languages and therefore they are in the centre of attention in the literature (see Section 2 above and Nedjalkov, Ch. 3).

With regard to the distribution of pronominal and verbal reciprocals, languages may be classified in the following way (see also Section 11):

- (a) languages employing pronominal marking only (cf. English *each other*);
- (b) languages employing verbal (affixal or clitic) marking only (cf. the infix *-pa-* in Mundari);
- (c) languages employing both types of marking, in which case the relations between the markers may be as follows:
 - (c.1) both markers are interchangeable in certain cases and they do not co-occur, as a rule (e.g. German *einander* and *sich*),
 - (c.2) the two markers are interchangeable and may co-occur (e.g. Yakut *beje beje-lerin* ‘each other’ and *-s*), and
 - (c.3) the two markers may co-occur but in particular cases the pronominal marker is used alone (e.g. in combination with prepositions; cf. French *l’un l’autre* and *se*).

Pronouns, affixes and clitics seem to be the most widespread means of reciprocal marking, at least in my corpus.

If a sentence constituent of the base construction is expressed in a way that is not the most typical and common one, the likelihood of the pronominal rather than verbal marking of its reciprocalization increases. This is often the case if the constituent is a prepositional or postpositional noun phrase. Needless to say, interchangeability may be sometimes determined by conditions that are hard to explicate, and also by traditional usage.

17.3 Syntactic (diathesis) types of proper reciprocals

This concerns non-spatial (= proper) subject-oriented reciprocals. The following main diathesis types are distinguished depending on the reciprocalized sentence constituents:

- (a) reciprocals with argument co-referentiality [reciprocalization involving the base subject and an object], with two subtypes:

(a.1) “canonical” which are always intransitive and derive from two- or three-place transitives (12.1.1) or two- or three-place intransitives (12.1.2), and in some languages, even from one-place intransitives (with covert second valency; cf. 12.1.1.1.5);

(a.2) “indirect” which are always transitive and derive from three-place transitives, with reciprocalized indirect object (12.1.2.1);

(b) reciprocals with non-argument co-referentiality [reciprocalization involving the base subject and a non-argument], with two subtypes:

(b.1) “possessive” which are also transitive, with reciprocalization of a possessive attribute of the object (12.2.1);

(b.2) “adverbial” reciprocals where reciprocalization involves an adverbial (12.2.2). The latter type is rare. Generally it may be assumed that these four types represent the following implicational hierarchy (12.4):

(227) “canonical” (vi) \supset “indirect” (vt) \supset “possessive” (vt) \supset “adverbial” (vi/vt) = (132)

“Canonical” reciprocals are naturally the prevalent type cross-linguistically – due to the prevalence of the derivation base, i.e. of two-place transitives. In some languages, e.g. in Lithuanian, it is the only type of verbal reciprocals. In other languages, “indirect” and “possessive” reciprocals being rather marginal, manifest some features of adaptation to “canonical”, i.e. intransitive reciprocals, e.g.:

(a) the use of the absolutive construction instead of the ergative despite direct object retention (Cashinahua; see 9.7 above);

(b) the use of a transitive suffix instead of the intransitive on the predicate (Mundari, see (119) above);

(c) incorporation of the direct object (denoting the possessee) with the reciprocal prefix attached to it (Ainu (124), Yukaghir (126));

(d) attachment of a reciprocal affix to the direct object (the latter, as a rule, forms one phonetic word with the predicate); (Nivkh (125)).

17.4 Spatial transitive reciprocals

The above concerns proper reciprocals which meet the requirements of the diagnostic test shown in (224). Spatial reciprocals fall into two main lexical classes, those of joining and separating, and there is a number of reciprocals semantically close to them (e.g. the meaning ‘to compare’ in (229.6a) which can be interpreted as mental joining). The diagnostic test for many of the spatial transitive reciprocals denoting joining is syntactically analogous to (224), with the difference that in (224) the reciprocal relations hold between the subject and object and in (228) between two objects:

(228) a'. *S joined A to B.* + a". *S joined B to A.* = b. *S joined A and B together.*

This analogy holds if objects A and B belong to the same semantic class (two details, two pieces of wood, etc.) Moreover, here the verb *join* is a lexical reciprocal and thus (228) is also analogous to (226). Despite obvious differences between proper and spatial reciprocals, the reciprocants of the latter being object referents, the fact that many languages

use the same marker, pronominal or verbal, for both types of reciprocals (e.g. Kabardian (230)), shows their semantic affinity.

The test under (228), relevant for a (large) number of verbs of joining, does not describe as a rule verbs of separating. Reciprocals of joining are usually more numerous than those of separating (it is significant in this respect that reciprocals of joining with the prefix *zə-* in Kabardian number 130 and those of separating, 80). It is probably possible to claim tentatively that if a language has reciprocals of separating it is likely to have (more numerous) verbs of joining; the opposite is not always the case.

Here are the lists of the most typical lexical groups of reciprocals of joining and separating attested in Kabardian, where probably the maximum lexical range is achieved (see 13.1). One can see that all the lexical groups of joining have counterparts among verbs of separating, except the second one.

- (229) 1. a. 'to tie two things together' – b. 'to cut up a wire into bits'
 2. a. 'to pile, heap sth one upon another' –
 3. a. 'to carry sth (in)to one place' – b. 'to disperse, scatter sb/sth'
 4. a. 'to wrap sth up, muffle sb' – b. 'to unwrap, undo sth'
 5. a. 'to press sth together' – b. 'to stretch sth'
 6. a. 'to compare sth and sth' – b. 'to differentiate, discriminate sth/sb.'

To sum up, spatial reciprocals can be derived by three types of markers:

A. A marker of proper reciprocals or a marker containing the latter as a component; three varieties are registered:

(i) the same marker as that of proper reciprocals (see 13.2.1):

Kabardian

- (230) a. *guəun* 'to shout at sb' → *zə-guəun* 'to shout at each other'
 b. *kIəɾə-dən* 'to sew sth onto sth' → *zə-kIəɾə-dən* 'to sew sth together.'

(ii) A causative marker on the anticausative underlying verb derived from a lexical reciprocal (see 13.2.2):

Kirghiz

- (231) a. *kuu-* 'to chase sb' → *kuu-š-* 'to chase each other'
 cf.: b. *ula-* 'to add sth on sth', 'join the ends of sth'
 → c. *ula-š-* 'to join' (vi)
 → d. *ula-š-tər-* 'to tie sth and sth together.'

(iii) A reciprocal-causative complex marker (see 13.2.3):

Kirghiz

- (232) a. *kuj-* 'to pour sth (into)'
 [→ b. *kuj-uš-* 'to help to pull sth (into)']
 → c. *kuj-uš-tur-* 'to pour sth from several vessels into one.'

B. A sociative marker (not used to derive reciprocals proper, or at least not regularly):

Latin

- (233) a. *bibo* 'drink' → *com-bibo* 'drink together'
 b. *suo* 'sew' → *con-suo* 'sew sth and sth together.'

C. Various markers with locative meanings (affixes, adverbs, etc.), (see 13.2.5); cf.:

- Russian
- (234) a. *kleit'* 'to glue sth'
 → b. *s-kleit'* 'to glue sth and sth together.' (cf. also prefix *pa-* in Wappo (196))

17.5 Simple and discontinuous reciprocal constructions

As mentioned (7.1), in the simple construction both reciprocants are expressed by one syntactic argument, viz. subject, and in the latter by two syntactic arguments, viz. subject and non-subject; cf. German:

- (235) a. *A und B schlugen sich.* 'A and B fought with each other.'
 b. *A schlug sich mit B.* 'A fought with B.'

Only about 10 to 20 German verbal reciprocals allow the discontinuous construction, i.e. of the type (235b). Discontinuous constructions with other verbal reciprocals are ungrammatical; cf.:

- (236) a. *A und B begrüßten sich.* 'A and B greeted each other.'
 b. **A begrüßte sich mit B.* lit. 'A greeted each other with B.'

Pronominal reciprocals generally allow the simple construction only, therefore the following concerns languages with verbal reciprocals. These languages can be subdivided at least into the following types.

(a) Languages where verbal reciprocals are used in the simple construction and do not allow the discontinuous construction, although the discontinuous use may be allowed for lexicalized reciprocals. The reciprocants can be expressed:

(a.1) Only by one plural NP subject; so far, this is attested in one language, which is Ngiyambaa (Donaldson 1980:168).

(a.2) Either by one plural NP subject or two NP (conjoined) subjects; these are German and Kabardian. It should be added that languages of which the simple construction is characteristic may exhibit a limited number of reciprocals (three to five, or twenty at the most) which can occur in the discontinuous construction. Thus, the discontinuous construction is secondary to the simple one. There are languages where all reciprocal constructions are simple and discontinuous constructions are either non-existent or they are formed by lexicalized reciprocals of type (235). This is probably related to the "age" of reciprocals: needless to say, the "older" the reciprocals the more numerous lexicalized items are.

(b) Languages where verbal reciprocals allow both simple and discontinuous constructions, without any difference in the marking on the verb. The discontinuous construction involves the following issues:

(b.1) In some languages, the second reciprocant can take the position after the predicate; in this case the construction is unambiguously discontinuous, irrespective of the second constituent bearing a comitative marker or a marker used both as a conjunction and a comitative marker (this is the case in some Bantu languages, see (29b)).

(b.2) There are languages where the second reciprocant follows the subject and precedes the predicate; in this case, if the marker of conjoining is homonymous with the comitative marker (preposition or postposition or a comitative case marker), the problem of distinguishing between a complex subject and a combination of the subject and a comitative object arises. If the first NP is singular and the predicate agrees with it in number, the construction is clearly discontinuous (see (237b) below where the noun phrase *Aya-m* is the subject), and if the predicate is plural (i.e. agrees with both nouns) this means that the construction is simple (see (237a) where the subject is the noun group *Aya-m aal-ən katta*). However, if the first NP is plural the construction is ambiguous and determining the status of the construction is problematic (this is the case in Yakut and Evenki, see examples (34)). It is but natural that both conjoined subjects and subjects including a comitative noun phrase are semantically alike.

(c) Languages where verbal reciprocals occur in both simple and discontinuous constructions but the discontinuous construction is marked by a special applicative marker (of course, it is used not only on reciprocals); this is shown in the Tagalog and Maasai examples (37) and (39).

(d) A special case are languages where the second reciprocant is either expressed by the subject together with the first reciprocant (simple construction) or it is represented by zero: if the subject is singular the construction is unambiguously discontinuous, and if the subject is plural both interpretations are possible; this seems to be the case in Cashinahua (Section 9.7).

17.6 Lexical range of the main meanings of polysemous reciprocal markers

Certain meanings of polysemous reciprocal markers may imply one another. For instance, it has been noted that the passive meaning of a reflexive-reciprocal marker implies that it has (or had) the anticausative meaning. On the other hand, the meanings may differ in the lexical range of their base verbs. For instance, this is the case with some reciprocal-sociative markers. The lexical range of a certain derivational meaning may depend both on the transitivity/intransitivity of the bases, and in the case of intransitive verbs on their one-place or two-place valency. Some of the derivational meanings may be lacking because of their incompatibility with the semantic properties of the base verbs. Besides, extralinguistic pragmatic factors may be at work, too. All this is shown below on the basis of the meanings of Turkic reciprocal-sociative markers as one of the main polysemy types. The data cited are Yakut, but the generalizations suggested seem to be applicable to other languages with similar kinds of polysemy of the relevant markers as well.

In Yakut, the suffix *-s* has the following main meanings: (a) reciprocal, (b) sociative, (c) comitative, (d) assistive; it also has a number of other much less productive meanings more or less close to those listed. These main meanings cover hundreds of derivatives. Each of these meanings is related to a certain lexical range of bases which may either include one another or overlap.

Derivatives of many transitive verbs with a human object, e.g. *ölör-* ‘to kill sb’, may have all the four main meanings, as is illustrated below (both the simple and the discontinuous constructions for the reciprocal meaning are given).

Yakut

- | | | | | | |
|-------|----|--|---------------|--------------------------------------|------|
| (237) | a. | <i>Aya-m</i> | <i>əal-ən</i> | <i>kəttə ölör-üs-t-üler.</i> | RECS |
| | | father-my | neighbour-his | with kill-REC-PAST-3PL | |
| | | ‘My father and his neighbour killed <i>each other</i> .’ | | | |
| | b. | <i>Aya-m</i> | <i>əal-ən</i> | <i>kəttə ölör-üs-t-ö.</i> | RECD |
| | | father-my | neighbour-his | with kill-REC-PAST-3SG | |
| | | (same), lit. ‘My father with his neighbour killed <i>each other</i> .’ | | | |
| | c. | <i>Aya-m</i> | <i>əal-ən</i> | <i>kəttə kini-ni ölör-üs-t-üler.</i> | SOC |
| | | father-my | neighbour-his | with he-ACC kill-REC-PAST-3PL | |
| | | ‘My father and his neighbour killed him <i>together</i> .’ | | | |
| | d. | <i>Aya-m</i> | <i>əal-ən</i> | <i>kəttə kini-ni ölör-üs-t-ö.</i> | COM |
| | | father-my | neighbour-his | with he-ACC kill-REC-PAST-3SG | |
| | | ‘My father <i>with</i> his neighbour killed him.’ | | | |
| | e. | <i>Aya-m</i> | <i>əal-ga</i> | <i>kini-ni ölör-üs-t-ö.</i> | ASS |
| | | father-my | neighbour-DAT | he-ACC kill-REC-PAST-3SG | |
| | | ‘My father <i>helped</i> his neighbour kill him.’ | | | |

As regards bases with inanimate objects, e.g. *muostalaa-* ‘to pave (e.g. a road)’, their derivatives, like *muostala-s-*, may have the assistive (‘to help sb to pave (the road)’), comitative (‘to pave (the road) with sb’) and sociative (‘to pave the road together’) meanings, the reciprocal meaning being naturally outruled.

One-place intransitive bases which cannot acquire the reciprocal meaning, as a rule, differ in the productivity of the other three meanings; cf.:

- the derivative *üleele-s-* (< *üleele-* ‘to work’) has the same three meanings as *muostala-s-* above: assistive (‘to help sb to work’), comitative (‘to work with sb’), and sociative (‘to work together’);
- the derivative *xon-us-* (< *xon-* ‘to spend a night’) has two meanings: comitative ‘to spend a night with sb’ and sociative ‘to spend a night together’;
- the derivative *tammala-s-* (< *tammalaa-* ‘to drop’) has the sociative meaning only which is hard to render adequately in English (46).

These three verbs are listed in the order of diminishing activity of the subject, which correlates with the diminution of the saliency/activity of the [possible] second participant characteristic of the three meanings of the derivatives. In sociatives, all the participants are equally salient, in comitatives the participant expressed by a non-subject constituent may be the initiator, and, lastly, in assistives this second participant is generally the main performer of the action.

As for the relations between the lexical scope characteristic of the three meanings, they may be linked by the symbol of inclusion. In Yakut, the lexical range of bases for assistives seems to be narrower than that for comitatives (an assistive situation is a joint action but not any joint action is assistive), which in turn is narrower than that for socia-

tives (comitative and sociative situations often coincide, both being joint actions, but the expression of one of the participants by a non-subject constituent in some situation can be pragmatically unusual), while the lexical scopes of reciprocals and sociatives overlap:

(238) $\text{reciprocal} \cap \text{sociative} \supset \text{comitative} \supset \text{assistive} (= (55))$ See 8.4 above.

There may be some counterexamples to this implication. Thus, for instance, the Yakut form *bar-əs-* (< *bar-* ‘to go away’) has the comitative meaning ‘to go away with sb’ only and cannot have the meaning ‘to go away together’.

By way of amplifying the above, I will return to the classification of derivatives on the basis of the reciprocal meaning. Three groups can be distinguished here: (a) derivatives which cannot have this meaning but they may have any of the other three meanings (their bases: one-place intransitives and transitives with an inanimate object); (b) derivatives which may have both the reciprocal and some or all of the other meanings (see (237) which has all the four meanings and thus illustrates the possibility of coincidence of the type of the lexical range of reciprocals and sociatives); (c) derivatives which may have the reciprocal meaning exclusively. These are verbs like *tapta-s-* ‘to love each other’, *umn-us-* ‘to forget each other’. It is of course possible to think of situations like ‘to help sb forget sb’, ‘to forget sb together’, but in these cases the literal expression of these meanings is more likely: by means of *kömölös-* ‘to help’ and the adverb *birge* ‘together’ respectively.

17.7 Formal relations between simple and discontinuous reciprocal constructions and sociative and comitative constructions

The relationship between simple and discontinuous reciprocal constructions is symmetrical to that between sociative and comitative constructions: in the simple reciprocal and sociative constructions the participants are expressed by the subject, and in the discontinuous and comitative constructions the second participant is named by a non-subject constituent. This parallelism may manifest itself in the identity of expression for all the four cases (see line 1 in (239)) or in the same expression of RECD and COM (see line 6 in (239)). The meaning of reciprocity and that of sociativity are essentially preserved in both pairs of constructions. Languages often reflect this semantic affinity in a formal way. The following variants of marking are registered:

(239)	<u>RECS</u>	<u>RECD</u>	<u>SOC</u>	<u>COM</u>	<u>languages</u>
1.	-š	-š	-š	-š	Tuvan
2.	-maat	-maat	-ldə	-ldə	Evenki
3.	<i>a(i)-, a(i)ba-</i>	–	<i>c-</i>	<i>c-</i>	Abaza
4.	<i>zə-, zə-r(ə)</i>	–	<i>zə-də-</i>	<i>də-</i>	Kabardian
5.	<i>-nʲji-</i>	–	<i>-nʲji</i>	<i>anʲji-</i>	Nunggubuyu
6.	<i>mag-... -an</i>	<i>maki-pag-... -an</i>	<i>mag-... -an</i>	<i>maki-pag-... -an</i>	Tagalog
7.	<i>se</i>	–	<i>com-</i>	<i>com-</i>	Latin
8.	<i>-nami-</i>	∅	–	–	Cashinahua

For examples and explanations of these forms see: Tuvan (60), Evenki (34) and (65), Abaza (69) and Kabardian (71) above; Nunggubuyu (35) in Ch. 5; Tagalog (36)–(38) and Latin (201) above; for Cashinahua §10 in Ch. 5.

Generally, the means of expression are rather diverse. Alongside the absence of discontinuous reciprocal constructions in a number of languages, I will note that in some languages there are no morphologically entirely different markers for the sociative and the comitative meanings: they coincide either completely or one is part of another.

Acknowledgments

I am grateful to Emma Geniušienė, Martin Haspelmath, Leonid Kulikov, Edith Moravcsik, Sergey Say, and Nina Sumbatova, who have read various versions of this paper and also of Chapters 3 (Encoding of the reciprocal meaning), 5 (Polysemy of reciprocal markers), 7 (Reciprocal derivation involving non-verbals), and 8 (Questionnaire on reciprocals), and helped to improve them considerably. Responsibility for the remaining errors and misinterpretations is entirely mine.

Lexical reciprocals as a means of expressing reciprocal situations

Jurij P. Knjazev

St. Petersburg University

1. Introductory notes
2. Main subtypes of lexical reciprocals
 - 2.1 Morphological subtypes
 - 2.1.1 Underived reciprocals
 - 2.1.2 Deponent and semi-deponent reciprocals
 - 2.1.3 Odd reciprocal derivatives
 - 2.2 Syntactically free and syntactically bound reciprocals
 - 2.3 Symmetric and semi-symmetric reciprocals
3. Notional classes of lexical reciprocals
 - 3.1 General relations
 - 3.1.1 Identity, similarity and difference
 - 3.1.1.1 Non-verbal reciprocals
 - 3.1.1.2 Subject-oriented verbal reciprocals
 - 3.1.1.3 Object-oriented verbal reciprocals
 - 3.1.2 Congruence and non-congruence
 - 3.2 Spatial relations
 - 3.2.1 Proximity and distance
 - 3.2.1.1 Non-verbal reciprocals
 - 3.2.1.2 Subject-oriented verbal reciprocals
 - 3.2.1.3 Object-oriented verbal reciprocals

1. Introductory notes

An insight into the existence of lexical reciprocals can already be gained from the reading of O. Jespersen's "The Philosophy of Grammar" (1924). As he pointed out in the course of discussing the means of expressing reciprocity in various languages, there are verbs that by virtue of their meaning make it possible to reverse the relation between subject and object. Thus, if A meets B, B meets A as well, and if Mary resembles Ann, Ann resembles Mary, too. Meanwhile, A may hate B without B hating A (Jespersen 1924: 161). Hence, reciprocity is necessarily implied in the meaning of verbs like *meet* or *resemble* (but not in that of the verb *hate*), that is, they in themselves indicate reciprocal situations in which, according to Lichtenberk (1985: 21), "there are two participants, A and B, and the relation in which A stands to B is the same as that in which B stands to A".

By analogy with logic where such relations are termed "symmetric", predicates which share the property of actant reversibility and, as a consequence, their cross-coreference (like verbs mentioned by O. Jespersen) are also often called "symmetric predicates".¹ This term does not seem to be the best one possible. On the one hand, the idea of symmetry which includes inverse relations between two (or more) participants is involved in the meaning of all reciprocals irrespective of whether this sense is an inherent part of their meaning or is superimposed by adding a morpheme or some other marker of the reciprocal meaning. On the other hand, although reversibility of actants (being an indispensable corollary of logical symmetry) is the basic distinctive feature of reciprocity, it is widely believed that, in natural languages, "some sort of the presumption of asymmetry is valid for all relations" (Padučeva 1974: 44) and reciprocal actions "are not necessarily symmetrical

1. See, among others, Lakoff & Peters (1961); Borillo (1971); Yomdin (1981); Haiman (1983); Turek (1988).

in human languages” (Kemmer 1988: 138). What conditions favour or, on the contrary, impede the actual symmetry of a predicate is a problem in itself (it is discussed in Section 5 below). At this stage, it will suffice to say that the more uniform, in every respect, relevant actants of a reciprocal predicate are, the more evident are symmetric properties of the predicate.² Preference is therefore given to the label “lexical reciprocals” which reflects nothing but a type of formal difference between this kind of reciprocal predicates and other means of expressing reciprocity.

A greater or lesser number of lexical reciprocals can be found, most likely, in any language.³ Besides being by themselves a widely used means of referring to reciprocal situations, they are also employed as base forms for derived reciprocals. This process is often accompanied by various concomitant effects (see 4.2 below). Further, lexical reciprocals make up the kernel part of so called “natural reciprocals”. This term was introduced by S. Kemmer as a cover term to subsume predicates indicating “events that either necessarily (e.g. ‘to meet’) or very frequently (e.g. ‘to fight’, ‘to kiss’) are semantically reciprocal (Kemmer 1988: 137). In comparison with the class of “natural reciprocals” as a whole, lexical reciprocals may be expected to have a more clear-cut semantic scope. Nevertheless, as will be seen from what follows, lexical reciprocals are not entirely homogeneous even in a single language.

The present study is concerned mainly with Russian lexical reciprocals which are occasionally contrasted with comparable constructions of some other languages. The choice is motivated, firstly, by the fact that Russian is, in this respect, a relatively less-known language (for instance, in comparison with English), although the syntax and semantics of Russian lexical reciprocals have been repeatedly dealt with.⁴

Besides, in Russian the link between lexical and grammatical reciprocals is particularly close. Therefore, a general outline of lexical reciprocals, if only in broad terms, is a necessary prerequisite for a description of Russian reciprocal constructions. Finally, it should be noted that the lists of lexical reciprocals presented below include frequently used words only and are not meant to be exhaustive.

In what follows the distinction between proper reciprocals and sociatives is not drawn.

2. Main subtypes of lexical reciprocals

2.1 Morphological subtypes

Words which are treated below as lexical reciprocals can be subdivided into three morphological subtypes.

2. It is not by mere chance that in works on reciprocals the arguments tend to be represented in the most generalized form, right up to the purely algebraic notation, such as *Mary and Ann*, *A and B*.

3. A. Wierzbicka (1994) regards the reciprocal predicates “similar” and “same” as lexical universals which are supposed to occur in any human language.

4. Cf. Yomdin (1981); Gajsina (1981); Nedjalkov (1991).

2.1.1 Underived reciprocals

Firstly, lexical reciprocals, in the narrow sense of the word, are words which do not contain any reciprocal marker and lack base forms with a non-reciprocal meaning; e.g. *vražđovat* ‘to be enemies with each other’, *poxožij* ‘similar’, *obsuždat* ‘to discuss/talk over’, etc.

2.1.2 Deponent and semi-deponent reciprocals

Another subtype includes words that, despite the presence of a reciprocal marker, either lack a corresponding non-reciprocal counterpart or diverge in particular ways from its meaning. These words may be called *deponents* and *semi-deponents* respectively.⁵ As has been repeatedly pointed out (see, among others, Kemmer 1988: 144; Nedjalkov 1991: 311), lexical reciprocals often appear as deponents and, conversely, deponents with reciprocal markers are, as a rule, semantically reciprocal. A detailed analysis of Russian reciprocals is presented in Knjazev (Ch. 15). The following will suffice for our purposes here.

In Russian there are four affixal markers expressing the reciprocal sense proper and related senses of sociative and comitative. They are:

1. The polysemous reflexive postfix *-sja* (*-s'*) which is able, specifically, to render the reciprocal meaning; e.g.:

- (1) *tolkat* ‘to push’ → *tolkat'-sja* ‘to push each other’
rugat ‘to abuse’ → *rugat'-sja* ‘to abuse each other.’

2. Two antonymous prefixes *s-* (*so-*) and *raz-* (*razo-*, *ras-*), rendering, among others, the meanings of joining and separating of two or more participants; e.g.:

- (2) *gnat* ‘to drive, turn out’ → a. *so-gnat* ‘to drive *together* from different points’
 → b. *razo-gnat* ‘to drive away, disperse.’

When intransitive, these verbs are additionally marked by the reflexive postfix; e.g.:

- (3) *bežat* ‘to run’ → a. *s-bežat'-sja* ‘to come running *together* from different points’
 → b. *raz-bežat'-sja* ‘to run away in different directions.’

3. The comitative-sociative prefix *so-* which is similar both in form and in meaning to the prefix *s-* from (2a) and (3a); e.g.:

- (4) *vladelec* ‘owner’ → *so-vladelec* ‘joint owner, co-proprietor.’

All these markers occur both with deponent reciprocals, as in (5), and with semi-deponent reciprocals, as in (6):

- (5) *borot'sja* ‘to struggle, fight’
smežnyj ‘adjoining, adjacent’
različat ‘to distinguish’
sopernik ‘rival, adversary.’

5. I follow here S. Kemmer’s (1988:30–1) use of the term “deponent”. The label “semideponent” is coined by analogy with it.

- (6) *torgovat'sja* 'to haggle over the price' ← *torgovat'* 'to trade'
sravnivat' 'to compare' ← *ravnyj* 'equal'
raz"edinjat' 'to divide' ← *edinyj* 'united, common'
sopostavljat' 'to compare/confront' ← *postavit'* 'to put.'

2.1.3 Odd reciprocal derivatives

Finally, it seems reasonable to extend the label "lexical reciprocal" to those reciprocals which are related to their non-reciprocal counterparts in marginal or isolated patterns. In Russian, this applies to a good many adverbial and postpositional reciprocals (for more information see 3.2.1.1 below). Derivatives of this sort generally follow two main patterns:

- reduplication of a noun in various case forms; e.g.: *plečo* 'shoulder' – *plečom* (SG.INST) *k pleču* (SG.DAT) 'shoulder to shoulder';
- imitation of case forms of non-existent or semantically divergent nouns; e.g. *napereboj* 'vying each other in telling'. This adverb, whose closest semantic kin is the verb *perebivat'* 'to interrupt sb's speech', is constructed as if it were a combination of the preposition *na* 'on' and the ACC.SG form of the noun *pereboj* that lacks an appropriate meaning.⁶

2.2 Syntactically free and syntactically bound reciprocals

From the viewpoint of the type of cross-coreference, lexical reciprocals, like grammatical reciprocals, depending on whether the subject of the clause is involved in inverse relations or not, may be of two main diathesis types, i.e. subject-oriented, as in (7) and (8):

- (7) *Miš-a i Griš-a poxož-i.*
M.-SG.NOM and G.-SG.NOM similar-PL
'Misha and Grisha are alike.'
- (8) a. *Miš-a poxož na Griš-u.*
M.-SG.NOM similar.M.SG at G.-SG.ACC
'Misha is like (lit. similar to) Grisha.'
- b. *Griš-a poxož na Miš-u.*
G.-SG.NOM similar.M.SG at M.-SG.ACC
'Grisha is like (lit. similar to) Misha.'

or object-oriented, as in (9) and (10):

- (9) *On poznakomi-l Miš-u i Griš-u.*
he acquaint.PFV-PAST.M.SG M.-SG.ACC and G.-SG.ACC
'He made Misha and Grisha acquainted.'
- (10) a. *On poznakomi-l Miš-u s Griš-ej.*
he acquaint.PFV-PAST.M.SG M.-SG.ACC with G.-SG.INST
lit. 'He acquainted Misha with Grisha.'

6. Linguists are not in agreement on the grammatical status of the adverbials belonging to the latter type; see, among others, Vinokur (1959:413); Polivanova (1990:55).

- b. *On poznakomi-l Griš-u s Miš-ej.*
 he acquaint.PFV-PAST.M.SG G.-SG.ACC with M.-SG.INST
 lit. 'He acquainted Grisha with Misha.'

As regards adverbial and prepositional lexical reciprocals (as well as other non-verbal predicates with reciprocal meaning), they seem to be in themselves neutral in this respect, their diathesis type being determined by the syntactic properties of the main verb; cf. examples (32)–(34) below. Nevertheless, they occur most commonly in subject-oriented reciprocal constructions.

The overwhelming majority of Russian lexical reciprocals may easily appear both in the *simple* reciprocal construction in which cross-coreferent actants are equal in syntactic value (cf. (7) and (9)), and the *discontinuous* construction where one of the actants syntactically dominates over the other (cf. (8) and (10)). The selection of one or the other type of construction depends on discourse.

There are, however, a few, “literally unique” (Gajsina 1981: 125), exceptions. Thus, for instance, the widely used verbs *otličat'* and *različat'* both meaning ‘to distinguish, make a distinction’ but with different prefixes (*ot-* and *raz-* respectively) differ in their syntactic properties. Due to the semantic input of the prefix, the verb *otličat'* is used in the discontinuous reciprocal construction only (cf. (11a)), while *različat'* occurs in the simple construction (cf. (11b)):

- (11) a. *On ne otliča-et zolot-o ot med-i.*
 he not distinguish.IPFV-PRES.3SG gold-SG.ACC from copper-SG.GEN
 ‘He does not distinguish gold from copper.’
 b. *On ne različa-et zolot-o i med'.*
 he not distinguish.IPFV-PRES.3SG gold-SG.ACC and copper.SG.ACC
 ‘He does not distinguish between gold and copper.’

A change of the type of construction makes these sentences ungrammatical, cf.:

- (12) a. **On ne otliča-et zolot-o i med'.*
 he not distinguishes gold-ACC and copper.ACC
 ‘He does not distinguish gold and copper.’
 b. **On ne različa-et zolot-o ot med-i.*⁷
 he not distinguishes gold-ACC from copper-GEN
 ‘He does not distinguish gold from copper.’

2.3 Symmetric and semi-symmetric reciprocals

It is worthwhile noting that the syntactic distinction between simple and discontinuous reciprocal constructions appears to be sensitive to some semantic features of lexical reciprocals. From this point of view, they may be subdivided into two large groups.

One group comprises reciprocals whose symmetric properties are not dependent on the type of reciprocal construction and which can occur in both simple and discontinuous

7. This collocation is discussed again in 4.1.3.

constructions in an equal degree. This holds mostly for reciprocals denoting permanent or stable qualities and relationships as well as other stative situations. Thus, the true value of (7) implies the true value of (8), and vice versa.

The other group comprises predicates which are true reciprocals in the simple construction only, while in the discontinuous construction they do not demonstrate symmetric properties. This can be illustrated by the following set of examples with the deponent reflexive verb *pozdorovat'sja* 'to greet' in which the true value of (13a) implies the true value of both (13b) and (13c) but the reverse is not necessarily true:

- (13) a. *Oni pozdorova-l-i-s'*.
they greet.PFV-PAST-PL-REFL
'They greeted each other.'
- b. *On pozdorova-l-sja s nej.*
he.NOM greet.PFV-PAST.SG.M-REFL with she.INST
'He greeted her.'
- c. *Ona pozdorova-l-a-s' s nim.*
she.NOM greet.PFV-PAST-SG.F-REFL with he.INST
'She greeted him.'

This assumption may be illustrated by (14):

- (14) *Ona izbega-l-a menja. Ja s nej zdorova-l-sja, ona*
she avoid.IPFV-PAST-F.SG me I with she.INST greet.IPFV-PAST.M.SG-REFL she
ele otveča-l-a. (M. Roščin)
barely reply.IPFV-PAST-F.SG
'She tried to avoid me. I greeted her, but she barely replied.'

It should be mentioned that some English "natural reciprocals" such as the verbs *to kiss, to fight, to argue, to embrace* reveal similar properties. Thus, for example, if (15a) is true, both (15b) and (15c) are also true, whereas the truth of neither (15b) nor (15c) in themselves implies the true value of the other two sentences (see also Kholodovich 1978: 15):

- (15) a. *A and B kissed.*
b. *A kissed B.*
c. *B kissed A.*

Ch. Turek (1988: 119) called these English verbs "semi-symmetric" on the grounds that they "refer to actions that a person can start or end before another does". This term is accepted below in a somewhat different sense, namely, with respect to the predicates that meet the conditions exemplified in (13). As will be shown in 3.3.1.2 and 3.3.2.3 below, a lot of Russian deponent and semi-deponent reflexive verbs are semi-symmetric in this sense of the word.

3. Notional classes of lexical reciprocals

On the whole, the meanings of lexical reciprocals fall into three main classes:

- general relations (e.g. identity or difference);
- spatial relations (e.g. proximity or remoteness);
- relations between people (e.g. rivalry or collaboration).

Although these notional spheres seem to have little in common, it is hardly possible to draw a precise boundary between these classes.

First of all, these classes may be considered, at least to a certain extent, as semantically enclosed into one another in the order of their enumeration above. As A. Wierzbicka argued, a semantic feature that reciprocals have in common is “their concern with identity. They all say, in one way or another, that the same thing can (or cannot) be said about each member of a group” (Wierzbicka 1980:258). In its turn, the idea of spatial proximity or physical contact between two (or more) participants is involved in the meaning of a large number of lexical reciprocals denoting interpersonal relations.

Besides, due to the process of metaphoric extension or exfoliation, it often turns out that different meanings of a polysemous lexical reciprocal may be attached to different classes. Thus, for example, the adjective *blizkij*, apart from its original concrete spatial meaning of proximity, e.g. *blizkij poselok* ‘near-by (neighbouring) settlement’, has developed other reciprocal meanings associated with the other two classes of lexical reciprocals. This is illustrated by the following examples:

- (16) a. *Ix vzgljad-y blizk-i.*
 their view-PL.NOM near-PL
 ‘Their views are similar.’
- b. *On mne očēn’ blizok.*
 he I.DAT very near.SG.M
 ‘I feel very close to him.’

In (16a) the adjective denotes the general relation of similarity, while in (16b) the interpersonal relation of close friendship is expressed. Lexical polysemy of this sort requires special investigation. In what follows I will restrict myself to mentioning manifestations of this polysemy (provided that it is confined to denoting reciprocal situations) without going into further discussion.

3.1 General relations

This class of lexical reciprocals comprises two semantic subclasses of predicates: one denoting identity, similarity and difference; the other denoting congruence and non-congruence.

3.1.1 Identity, similarity and difference

The relations of identity, similarity and difference seem to be the most evident and widely mentioned instance of symmetric relations. They all can be considered as being linked, in one way or another, with the idea of interchangeability. In Shreider (1971:78) the notion of identity is explicated as a complete interchangeability of two objects in a given situation

while similarity (in a certain respect) displays itself through their partial interchangeability, different objects being, in their turn, non-interchangeable.

3.1.1.1 Non-verbal reciprocals. These reciprocals are of three main types:

- (17) a. Adjectives denoting identity or equality; e.g.: *ravnyj* 'equal', *odinakovyj* 'the same', *identičnyj* 'identical', *toždestvennyj* 'identical', *ekvivalentnyj* 'equivalent'.
- b. A number of quasi-synonymous adjectives meaning 'similar', 'analogous'; e.g.: *analogičnyj*, *poxožij*, *podobnyj*, *sxodnyj*, *blizkij*; cf. (7), (8), (16).
- c. Nouns denoting some specific kinds of identity; e.g.: *rovesnik*, *sverstnik* 'person of the same age as another', *zemljak* 'person born (or living) in the same place (town, country, etc.) as another', *sosed* 'neighbour, person living near another'.

As for the sense of dissimilarity, it is commonly signalled by collocations of the negative prefix *ne-* with the above-mentioned adjectives of similarity and identity; e.g. *neravnyj* 'unequal', *neodinakovyj* 'dissimilar', *nepoxožij* 'unlike', etc. Underived adjectives rendering these meanings, e.g. *raznyj* and *različnyj* 'different, distinct', are few in number and are not typically employed as predicates.

Another possible usage of the greater part of the adjectives listed in this section is that they occur as the first constituent of a number of compounds in which their semantic range is limited to the specific area defined by the second component; e.g.: *ravnocennyj* 'of equal value' (*ravnyj* 'equal' + *cena* 'price'); *raznovremennyj* 'taking place at different times' (*raznyj* 'different' + *vremja* 'time').

3.1.1.2 Subject-oriented verbal reciprocals. In Russian there is only a small number of underived subject-oriented verbal reciprocals. They seem to be confined to the following three cases:

- (18) a. Loan-translations; e.g.: *sovpadat'* 'to coincide with' which can be traced back to the Medieval Latin *coincidere* with the same set of constituents: *co/so* 'together' + *in/v* 'upon' + *cadere/padat'* 'to fall'.
 - b. Borrowings; e.g.: *kontrastirovat'* 'to contrast with'.
 - c. Verbs used figuratively; e.g.: *napominat'* 'to resemble' (lit. 'to remind, recall'), cf. (19)); *sxodit'sja* 'to agree with' (lit. 'to come together from different points'); *rasxodit'sja* 'to disagree with, differ from' (lit. 'go away in various directions')⁸ cf. (20).
- (19) *Amsterdam napomina-et Peterburg.*
A.SG.NOM resemble.IPFV-PRES.3SG P.ACC
'Amsterdam resembles Petersburg.'
- (20) *Naš-i mneni-ja rasxod-jat-sja.*
OUR-PL.NOM opinion-PL.NOM diverge.IPFV-PRES.3PL-REFL
'Our opinions differ.'

Relations signalled by both verbal and non-verbal reciprocals in subject-oriented constructions are mainly restricted to those designating static situations; cf. (7) and (8). If,

8. The verb *podxodit'* 'to fit, suit' with the same root refers to a symmetric relation of congruence; cf. (28).

alternately, it is a change of state that is expressed, the situation is rarely (if ever) logically symmetrical. This holds both for a deliberate (intentional) acquisition of a property, as in (21), and a spontaneous (unintentional) one, as in (22). Thus, the sentences in (21) and (22) are not semantically equivalent and the corresponding noun phrases cannot replace each other without a change of meaning.

- (21) a. *Griš-a podraža-et Miš-e.*
G.-SG.NOM imitate.IPFV-PRES.3SG M.-SG.DAT
'Grisha imitates Misha.'
- b. *Miš-a podraža-et Griš-e.*
M.-SG.NOM imitate.IPFV-PRES.3SG G.-SG.DAT
'Misha imitates Grisha.'
- (22) a. *Griš-a sta-l poxož na Miš-u.*
G.-NOM become-PAST.SG.M similar.M.SG at M.-ACC
'Grisha became similar to Misha.'
- b. *Miš-a sta-l poxož na Griš-u.*
M.-NOM become-PAST.SG.M similar.M.SG at G.-ACC
'Misha became similar to Grisha.'

3.1.1.3 Object-oriented verbal reciprocals. This group of reciprocals comprises a number of causative transitive verbs denoting mental acts of making a comparison between two (or more) things and/or treating them as identical, similar or different; e.g.:

- (23) *differencirovat'* 'to differentiate'
protivopostavljat' 'to contrast with/oppose to'
otoždestvljat' 'to identify'
uravnivat' 'to make equal/equalize'
otličat', različat' 'to distinguish, cf. (7), (8)'
sračnivat' 'to compare'
sopostavljat' 'to compare, confront'
upodobljat' 'to liken to.'

All these reciprocals easily combine with the reflexive postfix *-sja*. This process results in intransitivization of a verb coupled with its transformation into a passive or an anticausative one (see Section 4.2.1). In the latter case, an object-oriented reciprocal construction becomes subject-oriented; cf.:

- (24) *Zolot-o otliča-et-sja ot med-i.*
gold-NOM distinguish.IPFV-PRES.3SG-REFL from copper-GEN
'Gold differs (lit. distinguishes itself) from copper.'

3.1.2 Congruence and non-congruence

Predicates signalling congruence and non-congruence are logically based on an implicit comparison of the present set of qualities or constituent parts of an object with a set which would be expected or desired to be right for the purpose or occasion. For the most part, this group consists of intransitive verbs which are used as subject-oriented reciprocals and refer to static situations; e.g.:

- (25) *sootvetstvovat'* 'to correspond/conform to/be in accordance'
garmonirovat' 'to agree with/be in harmony'
disgarmonirovat' 'to be out of harmony'
podxodit' 'to fit, suit' (lit. 'to come up, approach')
protivorečit' 'to contradict.'

The form of the second complement in discontinuous reciprocal constructions is specific for each of these verbs; cf.:

- (26) *Ego povedeni-e ne sootvetstvu-et ego princip-am.*
 his conduct-SG.NOM not accord.IPFV-PRES.3SG his principle-PL.INST
 'His conduct does not accord with his principles.'
- (27) *Ego slov-a garmoniru-jut s postupk-ami.*
 his word-PL.NOM accord.IPFV-PRES.3PL with deed-PL.INST
 'His words are in accord with his deeds.'
- (28) *Melodi-ja prekrasno podxod-it k slov-am.*
 tune-SG.NOM exactly fit.IPFV-PRES.3SG to word-PL.DAT
 'The tune fits the words perfectly.'

A change of state as well as object-oriented reciprocity is expressed mainly by periphrastic collocations such as *prijti v protivorečie* 'to come into conflict' or *privešti v sootvetstvie* 'to bring into conformity with' consisting of semantically unspecific verbs and nouns derived from the verbs mentioned under (25).

3.2 Spatial relations

Lexical reciprocals referring to spatial relations are arranged below in three groups:

- those denoting proximity and remoteness;
- those in whose meaning the idea of geometrical symmetry is, in one way or another, discernible;
- those denoting relations between the whole and its constituent parts.

3.2.1 Proximity and distance

3.2.1.1 *Non-verbal reciprocals.* These reciprocals are of three structural types:

1. A number of adverbials derived from the adjectives *blizkij* 'near' and *dalekij* 'distant' which are considered, in particular, to refer to the distance between two points or places (Apresjan 1986:18–20; Jakovleva 1994:16–66) along with a few adverbials containing other roots; e.g.:

- (29) *blizko, vblizi, poblizosti* 'nearby'
daleko, vdaleke, vdali 'far away, in a distance'
nedaleko, nevdaleke, nepodaleku 'not far off'
rjadom 'beside' ← *rjad* 'row'
plotnuju 'fast by, close to' ← *plotnyj* 'close, close-packed, dense.'

2. Adverbials consisting of reduplicated case forms of some nouns denoting, mostly, body parts; e.g.:

- (30) *bok o bok* 'side by side' (of people)
bort o bort 'broadside by broadside' (of ships)
plečom k pleču 'shoulder to shoulder'
licom k licu 'face to face, with faces towards each other'
nosom k nosu 'face to face' lit. 'nose to nose.'

3. Adverbials, typical of informal style, taking the case forms of nouns, in particular, forms of the accusative case, as in (31):

- (31) *vpriřtyk* 'edge to edge, in immediate contact' ← *tykat* 'to thrust'
vpriřtirku 'very tightly' ← *priřtirat* 'to grind in'
vpovalku 'side by side/in a disorderly way' (of people) ← *povalit* 'to throw down'
vrassyřnuju 'in all directions, helter-skelter' ← *rassyřpat* 'to spill.'

As can be seen from the following illustrations, these adverbials denote either a state, as in (32), or an action, i.e. a change of state, as in (33), (34), and they occur both in subject-oriented reciprocal constructions (see (32), (34)) and in object-oriented ones (see (33)):

- (32) *Pořt-a nedaleko ot magazin-a.*
 post-office-SG.NOM not.far from shop-SG.GEN
 'The post-office is not far from the shop.'
- (33) *On postavi-l bol's-uju i malen'k-uju krovat-i vplotnuju.*
 he.NOM put.PFV-PAST.SG.M big-SG.F.ACC and small-SG.F.ACC bed-PL.ACC side.by.side'
 'He put the big and the small beds side by side.'
- (34) *Soldat-y brosi-l-i-s' vrassyřnuju.*
 soldier-PL.NOM throw.PFV-PAST-PL-REFL in.all.directions
 'The soldiers scattered (lit. 'threw themselves') in all directions.'

Nevertheless, it often turns out that denotation of an action (change of state) prevents reciprocal reading of these adverbials. Thus, sentences (35a) and (35b), in contrast to the semantically equivalent (36a) and (36b) cannot normally refer to the same situation:

- (35) a. *On se-l rjadom s Griř-ej.*
 he.NOM sit down.PFV-PAST.SG.M next with G.-INST
 'He sat down next to Grisha.'
- b. *Griř-a se-l rjadom s nim.*
 G.-NOM sit down.PFV-PAST.SG.M next with he.INST
 'Grisha sat down next to him.'
- (36) a. *On side-l rjadom s Griř-ej.*
 he.NOM sit.IPFV-PAST.SG.M next with G.-INST
 'He was sitting next to Grisha.'
- b. *Griř-a side-l rjadom s nim.*
 G.-NOM sit.IPFV-PAST.SG.M next with he.INST
 'Grisha was sitting next to him.'

3.2.1.2 *Subject-oriented verbal reciprocals.* Among the few intransitive verbs that can be used in subject-oriented reciprocal constructions are the following:

- (37) *graničit'* 'to border on'
soprikasat'sja 'to be contiguous/border on'
primykat', prilegat' 'to adjoin'
podxodit' 'to adjoin' (lit. 'to come up/approach').

Sentential examples:

- (38) *Armeni-ja granič-it s Turci-ej.*
 A.-NOM border.IPFV-PRES.3SG ON T.-INST
 'Armenia borders on Turkey.'
- (39) *Sad prilega-et (primyka-et, podxod-it) k dorog-e.*
 garden.NOM adjoin.IPFV-PRES.3SG to road-DAT
 'The garden adjoins the road.'

It is more typical of these relations to be expressed by the reflexive derivatives of transitive verbs of joining and separating described in the subsequent section.

3.2.1.3 Object-oriented verbal reciprocals. This group consists of transitive verbs of joining and separation whose common feature is that they are necessarily or, at least, mainly marked by one of the three prefixes mentioned in Section 2.1, i.e. *so-*, *s-* or *raz-*. These prefixes appear either as constituents of deponent and semi-deponent verbs (see (40a)) or, with the exception of *so-*, as markers of the perfective aspect with purely aspectual value, the latter being neutralized in the case of derivation of so-called "secondary" imperfectives from prefixed perfective verbs; cf. (40b):

- (40) a. *so sredotočivat', koncentririvat'* 'to concentrate'
sočetat', sovměščat' 'to combine'
soedinjat' 'to link, join, connect'
sobirat' 'to gather, collect'
sbližat' 'to bring closer to each other'
skrepljat' 'to fasten together'
raz"edinjat' 'to separate'
- b. *mešat'* IPFV → *smešat'* PFV → *smešivat'* IPFV 'to mix'
delit' IPFV → *razdelit'* PFV → *razdeljat'* IPFV 'to divide'
vjazat' IPFV → *svjazat'* PFV → *svjazyvav'* IPFV 'to bind, tie together.'

Examples:

- (41) *Dorog-a soedini-l-a gorod so stolic-ej.*
 road-NOM.F link.PFV-PAST-SG.F town.SG.ACC with capital-SG.INST
 'The railroad linked the town with the capital.'
- (42) *On meša-et (smešiva-et) molok-o s vod-oj.*
 he.NOM mix.IPFV-PRES.3SG milk-SG.ACC with water-SG.INST
 'He mixes milk and water.'

Apart from expressing spatial relations, verbs of joining can indicate mental connection of two entities as well, e.g.:

- (43) *Im-ja Kolumb-a svjazyva-jut s otkryti-em Amerik-i.*
 name-SG.ACC C.-SG.GEN link.IPFV-PRES.3PL with discovery-SG.INST A.-SG.GEN
 ‘The name of Columbus is linked with the discovery of America.’

Transitive verbs of joining and separation freely combine with the intransitivizing reflexive postfix *-sja*, e.g. *soedinjat* ‘to connect’ → *soedinjat’-sja* ‘to be connected’, the distinction being comparable to that between transitive and reflexive verbs of similarity and difference (see 3.1.1.3 and 4.2.1).

3.2.2 Geometrical symmetry

This kind of symmetry, which can be defined as a regular, balanced arrangement on the opposite sides of a dividing line, or plane, or around a center or axis, conforms to the every-day use of the term “symmetry”. The prototypical pattern of geometrical symmetry may be seen in relations between an object and its image reflected in a mirror. There are three main semantic types of lexical reciprocals whose logical symmetry is based on geometrical symmetry: (a) intersecting and being parallel; (b) being or occurring between; (c) alternation.

3.2.2.1 Intersecting and being parallel. This subgroup includes both adverbial, as in (44a), adjectival (as in (44b)) and verbal reciprocals (as in (44c)) denoting, prototypically, spatial relations either of two lines (e.g. ‘parallel’) or of two entities situated face to face or back to back on either side of a dividing line (e.g. ‘opposite’):

- (44) a. *naprotiv* ‘opposite’
krest-nakrest ‘in the form of a cross, cross-wise’
napererez ‘across, by way of intercepting sb/sth’ ← *pererezat* ‘to cut’
- b. *protivopoložnyj* ‘opposite’
parallel’nyj ‘parallel’
perpendikuljarnyj ‘perpendicular’
- c. *vstretit’* ‘to meet/come face to face from different directions’
peresekat’ ‘to go across, intersect with each other (of lines)’
skrestit’ (ruki) ‘to cross (one’s arms), put/place across or over’ ← *krest* ‘a cross.’

Sentential examples:

- (45) *Ego dom naprotiv mo-ego.*
 his house.SG.NOM opposite my-SG.GEN
 ‘His house is opposite mine.’
- (46) *Prjama-ja A parallel’n-a prjam-oj B.*
 line-SG.F.NOM A parallel-SG.F line-SG.F.DAT B
 ‘Line A is parallel to line B.’

Some of these words may express ideas of similarity or difference as well; cf.

- (47) *Ix vzgljad-y protivopoložn-y.*
 their view-PL.NOM opposite-PL.NOM
 ‘Their views are opposite (entirely different).’

- (48) *Meždu et-imi sobyti-jami možno proves-ti paralel'.*
 between this-PL.INST event-PL.INST one.may draw.PFV-INF parallel.SG.ACC
 'One may draw a parallel between these events.'

3.2.2.2 Being or occurring between. It seems reasonable to single out the widely used preposition *meždu* 'between' as a distinct type of lexical reciprocals. In its primary use, this preposition indicates a special kind of mutual spatial arrangement of three entities, one of which may be seen as the center of symmetry with regard to the other two. Consequently, sentence (49a) may be re-worded as (49b):

- (49) a. *Dom sto-it meždu rek-oj i les-om.*
 house.SG.NOM stand.IPFV-PRES.3SG between river-SG.INST and forest-SG.INST
 'The house stands between a river and a forest.'
 b. *Dom sto-it meždu les-om i rek-oj.*
 house.SG.NOM stand.IPFV-PRES.3SG between forest-SG.INST and river-SG.INST
 'The house stands between a forest and a river.'

Secondly, the preposition *meždu* (like the corresponding English preposition *between*) is employed to link reciprocal arguments of deverbal nouns derived from certain lexical reciprocals; cf. (50a) and its synonymous transform (50b):

- (50) a. *Meždu nimi nača-l-a-s' vražd-a.*
 between they.INST begin.PFV-PAST-F-REFL enmity-F.SG.NOM
 lit. 'Enmity began between them.'
 b. *Oni nača-l-i vraždova-t'.*
 they.NOM begin.PFV-PAST-PL be.enemies.IPFV-INF
 lit. 'They began to be enemies.'

Moreover, this preposition in combination with the reflexive pronoun, such as *meždu soboj* lit. 'between (among) themselves' serves as a reciprocal marker (see Knjazev, Ch. 15, §5). Reciprocal markers with a similar structure occur in a number of other languages, too; cf. Latin and Lithuanian respectively:

- (51) *Amant inter se pueri.*
 'The boys love each other.'
 (52) *Jie tyliai šnekė-jo-si tarp sav-ęs.*
 they.NOM softly talk-PAST-REFL between self-GEN
 'They were speaking to each other in low voices.'

3.2.2.3 Alternation. A particular subtype of geometrical symmetry resembling an ornament or tracery may be seen in words meaning alternation or successive reproduction of the same situation; cf.:

- (53) *čeredovat'* 'to alternate, cause to take place one after another in sequence'
poperemanno 'alternately, by turns' ← *peremennyj* 'changeable, variable'
 (54) *Na zavrak on čeredu-et jajc-a i kaš-u.*
 on breakfast.SG.ACC he alternate.IPFV-PRES.3.SG egg-PL.ACC and porridge-SG.ACC
 'He alternates eggs with porridge for breakfast.'

The same idea seems to underlie the meaning of the English verb *exchange* in sentences such as the following:

(55) *He exchanged seats with me*

referring to situations in which there are three participants, an agent, a patient and a recipient, the agent and recipient being coreferential. Note that the verb *exchange* can indicate asymmetrical situations, too; cf.:

(56) *He exchanged a pen for a knife.*

In Russian, these two meanings are expressed in distinct ways. The asymmetric meaning of the type 'to give and receive in return' is rendered by the verb *obmenjat'* whereas its reflexive counterpart *obmenjat'sja* conveys the symmetrical meaning 'to interchange' (see Knjazev: Ch. 15, §3.3).

3.2.3 *Parts and whole*

In this case, it is the relation between the constituent parts of a whole that is symmetrical. It is expressed by a number of verbs:

- (57) *sostojat'* 'to consist of'
vključat' 'to include, comprise'
soderžat' 'to contain'
sostavljat' 'to form together'
vxodit' fig. 'to be a constituent part of' (lit. 'enter').

Syntactically, these verbs follow different patterns. Some of them occur in object-oriented constructions, cf. (58), (59), the others are subject-oriented, cf. (60):

(58) *Beton sosto-it iz cement-a, pesk-a i gravi-ja.*
 concrete.SG.NOM consist.IPFV-PRES.3SG of cement-SG.GEN sand-SG.GEN and gravel-SG.GEN
 'Concrete consists of cement, sand and gravel.'

(59) *Beton vključa-et cement, pesok i gravij.*
 concrete.SG.NOM include.IPFV-PRES.3SG cement.SG.ACC sand.SG.ACC and gravel.SG.ACC
 lit. 'Concrete includes cement, sand and gravel.'

(60) *V sostav beton-a vxod-jat cement, pesok i gravij.*
 in composition.SG.ACC concrete-SG.GEN enter.IPFV-PRES.3PL cement.SG.NOM sand.SG.NOM and gravel.SG.NOM
 'Cement, sand and gravel are components of concrete.'

3.3 Relations between people

This group of lexical reciprocals is the most diverse. It covers words denoting (a) kinship and companionship; (b) rivalry and collaboration; (c) verbal intercourse. These classes are not mutually exclusive nor are the borders between them clear and distinct.

3.3.1 Kinship and companionship

3.3.1.1 *Non-verbal reciprocals.* This group comprises symmetric terms of kinship and companionship such as brothers, friends, relatives, etc. (see Wierzbicka 1980:265) such as the following:

- (61) *rodstvennik* ‘relative’ *drug* ‘friend’
 brat ‘brother’ *tovarišč* ‘comrade’
 sestra ‘sister’ *prijatelj* ‘pal.’

Their symmetry may depend on certain features of the participants such as age, gender, etc. Thus, the relation *byt’ bratom* ‘to be brother to’ is not symmetric unless both of its actants are male persons. Consequently, the names of participants in (62) meeting this condition are interchangeable:

- (62) a. *Miš-a* *brat* *Griš-i*.
 M.-SG.NOM brother.SG.NOM G.-SG.GEN
 ‘Misha is Grisha’s brother.’
 b. *Griš-a* *brat* *Miš-i*.
 G.-SG.NOM brother.SG.NOM M.-SG.GEN
 ‘Grisha is Misha’s brother.’
 c. *Griš-a* *i* *Miš-a* *brat’-ja*.
 G.-SG.NOM and M.-SG.NOM brother-PL.NOM
 ‘Grisha and Misha are brothers.’

As for the relation described in (63a), one of the participants of which (i.e. Masha) is a female person, it is not symmetric and its paraphrase (63b), parallel to (62b) or (62c), makes no sense:

- (63) a. *Miš-a* *brat* *Maš-i*.
 M.-SG.NOM brother.SG.NOM M.-SG.GEN
 ‘Misha is Masha’s brother.’
 b. **Maš-a* *brat* *Miš-i*.
 M.-SG.NOM brother.SG.NOM M.-SG.GEN
 *‘Masha is Misha’s brother.’

It is obvious and seems to require no further explanation that the scope of lexical reciprocals of this sort is determined by language and culture. According to Boadi (1975), in Twi, the mother and her sisters (and, respectively, the father and his brothers) are indicated by the same word. Hence, these relations in Twi turn out to be symmetrical.

3.3.1.2 Subject-oriented verbal reciprocals. This variety of lexical reciprocals covers intransitive verbs which denote establishing, breaking off or continuation of kinship and companionship relations.

In most cases, these verbs are (a) deponent or (b) semi-deponent reflexives; unmarked intransitive verbs of this kind are few in number (c):

- (64) a. *rasstat'sja* 'to part with'
obščat'sja 'to have contacts'
 b. *videt'sja* 'to meet' (lit. 'to see each other')
znat'sja 'to associate/have to do with' (lit. 'to know each other')
priřeret'sja 'to get used to' (lit. 'to get ground')
sojtis' 'to become friends/intimate with' (cf. (20))
razojtis' 'to part, divorce, break with'
 c. *vstupit' v brak* 'to marry' (lit. 'to enter into marriage')
družit' 'to be friends with.'

Sentential examples:

- (65) *Oni vid-jat-sja raz v mesjac.*
 they.NOM see.IPFV-PRES.3PL-REFL once in month.SG.ACC
 'They meet once a month.'
 (66) *On blisko soše-l-sja s doktor-om.*
 he.NOM close come.together.PFV-PAST.M-REFL with doctor-SG.INST
 'He became close friends with the doctor.'

This group also comprises deponent reflexive verbs indicating actions performed by people when they meet each other, part from each other or spend time together:

- (67) *zdrovat'sja* 'to greet each other'
proščat'sja 'to say good-bye to each other'
čokat'sja 'to clink glasses.'

The verbs under (67) are semi-symmetric; see comments on examples (13) and (14) in Section 2.3 above.

As regards deponent and semi-deponent verbs of this group on the whole, it should be noted that a somewhat parallel semantic shift tends to occur across languages. Thus, S. Kemmer gives a number of examples showing that a reciprocal literally meaning 'they saw each other' often "means not only that they saw each other, but that they had some kind of mutual social interaction involving such socio-personal factors as recognition, acknowledgement, and so forth" (Kemmer 1988: 148–9).

On the other hand, some of these reciprocals are characteristic of some languages only. The Russian symmetric predicate *vstupit' v brak* mentioned in (64c) is typical of the formal style. There is a far more common way of expressing this meaning, namely, by means of asymmetric verbs whose meaning reflects the gender of the subject: *vyjti замуž* 'to marry' (← *muž* 'husband') if the subject is female, and *ženit'sja* 'to marry' (← *žena* 'wife') if the subject is male (the latter is a reflexive anticausative of *ženit'* 'to marry a male person to a female person', see 3.3.1.3 below). As a result, the Russian translations of the English

sentences in (68), which serve in (Jespersen 1924:161) as examples of lexical reciprocals, do not share symmetric properties:

- (68) a. *Jack marries Jill.*
Džek ženi-t-sja na Džill.
 Jack.NOM marry.IPFV-PRES.3SG-REFL on Jill
- b. *Jill marries Jack.*
Džill vyxod-it zamuž za Džek-a.
 Jill marry.IPFV-PRES.3SG to Jack-ACC.

The verb *ženiťsja* (but not the collocation *vyjti zamuž*), however, should be still regarded as semi-symmetrical because it can be used in simple reciprocal constructions and, in that case, its arguments are interchangeable:

- (69) *Džek i Džill (=Džill i Džek) xot-jat poženi-t'-sja.*
 Jack and Jill (=Jill and Jack) want.IPFV-PRES.3SG marry.PFV-INF-REFL
 'Jack and Jill (=Jill and Jack) want to get married.'

3.3.1.3 *Object-oriented verbal reciprocals.* These are the following causative transitive verbs:

- (70) *venčat'* 'to marry sb to sb (in church)'
porodnit' 'to make related (relatives)'
razvodit' 'to grant a divorce'
raspisyvat' coll. 'to register (sb's) marriage'
znakomit' 'to acquaint/ introduce sb to sb'
mirit' 'to reconcile sb'
ssorit' 'to embroil, cause to quarrel'
razlučat' 'to separate sb (friends or near ones).'

Examples:

- (71) *Svjaščennik obvenča-l Meri i Džon-a. (=Džon-a i Meri)*
 clergyman.SG.NOM marry.PFV-PAST.M M.ACC and J.-ACC J.-ACC and M.ACC
 'The clergyman married Mary to John (=John to Mary).'
- (72) *Ee razluči-l-i s mater-ju.*
 she.ACC separate.PFV-PAST-PL with mother-SG.INST
 'She was separated from her mother.'

3.3.2 *Rivalry and collaboration*

The words falling into this semantic class are rather numerous and diverse. Among them, however, there seem to be no the object-oriented reciprocals (with the exception of those listed in (70)).

3.3.2.1 *Non-verbal reciprocals.* Non-verbal reciprocals of this class comprise, firstly, agentive nouns differing in stylistic connotations and various evaluative components of meaning, as under (73), and, secondly, adverbial reciprocals that are used mainly to qualify actions as competitive or uncoordinated, as in (74):

- (73) *vrag* 'enemy'
nedrug 'foe'
protivnik, opponent 'opponent'
sopernik 'rival, adversary'
soobščnik 'accomplice'
soratnik 'comrade-in-arms'
kollega 'colleague, person working with another or others'
popučik 'fellow-traveller'
naparnik 'mate, a man working as a pair with somebody else.'
- (74) *vmeste* 'together'
porozn', vroz' 'separately'
vraznobož 'discordantly' ← *raznobož* 'discord'
vrazbrod 'haphazardly, without coordination, raggedly' ← *razbrestis'* 'to disperse (in different directions)'
naparegonki 'trying to overtake each other' ← *peregonjat'* 'to overtake'
naperebož 'interrupting each other, vying with each other in telling' ← *perebivat'* 'to interrupt.'

3.3.2.2 Subject-oriented verbal reciprocals. These reciprocals denote various kinds of rivalry. Almost all of them, with a single exception, (see (75c)), are either (a) deponent or (b) semi-deponent reflexives:

- (75) a. *drat'sja* 'to fight'
sražat'sja 'to fight, have a battle'
borot'sja 'to struggle'
sorevnovat'sja 'to compete'
- b. *bit'sja* 'to fight' ← *bit'* 'to strike, beat'
rubit'sja 'to fight (with cold steel)' ← *rubit'* 'to chop'
streljat'sja 'to fight a duel' ← *streljat'* 'to shoot'
sudit'sja 'to go to law, litigate' ← *sudit'* 'to try (in court)'
torgovat'sja coll. 'to haggle over the price' ← *torgovat'* 'to trade'
tjagat'sja coll. 'to compete, take on' ← *tjagat'* 'to pull'
rezat'sja coll. 'to play cards' ← *rezat'* 'to cut'
- c. *voevat'* 'to wage war, be at war.'

3.3.3 Verbal intercourse

This group of reciprocal consists of speech words whose meaning implies two equally important participants. These are verbs denoting verbal interchange of views, achievement of an agreement as a result of discussion, collective verbal acts such as a dispute or quarrel. They are subdivided below into (a) deponent reflexives and (b) non-reflexives:

- (76) a. *dogovorit'sja* 'to come to an agreement after discussion'
soveščat'sja 'to confer'
ob"jasnjat'sja 'to converse' ← *ob"jasnjat'* 'to explain'
uslovit'sja 'to agree upon'
prepirat'sja coll. 'to argue'
prerekat'sja coll. 'to argue'

- b. *besedovat'* 'to have a talk'
razgovarivat' 'to converse'
obsuždat' 'to discuss, talk over'
sporit' 'to argue'
debatirovat' 'to debate'
diskutirovat' 'to discuss.'

Examples:

- (77) *My dogovori-l-i-s' vstreči-t'-sja v desjat'.*
 we.NOM arrange.PFV-PAST-PL-REFL meet.PFV-INF-REFL at ten
 'We arranged to meet at ten.'
- (78) *My ob"asnja-l-i-s' žest-ami.*
 we converse.IPFV-PAST-PL-REFL gesture-PL.INST
 lit. 'We explained ourselves to each other by gestures.'

3.4 A summary account

As can be seen from the survey above, the overall semantic range of lexical reciprocals is rather limited. It is worth noting that Russian deponent and semi-deponent verbs marked with the reflexive-reciprocal postfixal clitic *-sja* do not go beyond its bounds. Moreover, reflexives form the greater part of some semantic subclasses of lexical reciprocals used to indicate human actions (see 3.3.1.2 and 3.3.2.3 above).

4. Lexical reciprocals in reciprocal constructions

4.1 Lexical reciprocals and overt reciprocal markers

Although the idea of reciprocity is inherent in the meaning of lexical reciprocals, this fact by itself does not determine their ability to collocate with overt reciprocal markers.

There are three logical possibilities here:

- the use of an overt reciprocal marker is blocked;
- the use of an overt reciprocal marker is neither blocked nor obligatory;
- an overt reciprocal marker is obligatory.

4.1.1 Incompatibility with reciprocal markers

It appears to me that Russian lexical reciprocals are all compatible either with the reciprocal pronoun *drug druga* 'each other' (which is the main reciprocal marker in Russian) or with the collocation *meždu soboj* lit. 'between (among) selves' mentioned in 3.2.2.2 above.

Nevertheless, the distributive restriction of this type holds for the greater part of Russian derived reflexive reciprocals such as *tolkat'sja* 'to push each other', *kusat'sja* 'to bite each other' and a number of others (see Knjazev, Ch. 15, §3.1) which seem to fall into the

class of “natural reciprocals” proposed by S. Kemmer. It is hardly possible (or impossible at all) to say something like the following:

- (79) *Oni tolka-jut-sja* **drug s drugom* / **meždu soboj*.
 they push.IPFV-PRES.3PL-REFL one with another among selves
 lit. ‘They are pushing *one another* / *among themselves*.’

4.1.2 Optionality of reciprocal markers

This case can be easily illustrated by English pairs such as (80) from Gleitman (1965:282) or (81) from Kemmer (1988:138):

- (80) a. *The car and the bus collided.*
 b. *The car and the bus collided with each other.*
- (81) a. *The boys fought.*
 b. *The boys fought each other.*

As S. Kemmer points out, the reciprocal marker is used in (81b) to emphasize reciprocity of the action, i.e. to indicate overtly that the boys fought each other as opposed to their fighting someone else together.

As regards lexical reciprocals in Russian, they likewise, for the most part, allow both insertion and deletion of the overt reciprocal marker. In this respect, Russian sentences in (82) may be seen as quite parallel to those in (81):

- (82) a. *Mal'čik-i der-ut-sja.*
 boy-PL.NOM fight.IPFV-PRES.3PL-REFL
 ‘The boys fight / are fighting.’
- b. *Mal'čik-i der-ut-sja drug s drugom.*
 boy-PL.NOM fight.IPFV-PRES.3PL-REFL one with another
 ‘The boys fight / are fighting each other.’

The Russian sentence (82a) also allows, besides, “absolute” (“object-deletion” or “antipassive”) reading as one referring to a situation with two participants, agent and patient, the latter being, however, only implied. It serves to represent an action as a characteristic feature of its subject, mainly, in the “timeless” present.⁹

4.1.3 Obligatoriness of reciprocal markers

Overt reciprocal marking may be seen as obligatory if a lexical reciprocal cannot occur in the simple reciprocal construction unless the syntactic position for the second participant is filled, i.e. if its use in clauses similar to the (a) items under (80)–(82) is semantically incomplete or ungrammatical. In Russian, this property is shared (a) by the few transitive verbs that are allowed in subject-oriented constructions and (b) by some oblique transitive verbs:

9. A combination of the reciprocal and the so-called “absolute” (“object-deletion”) readings is characteristic of derived grammatical reflexive reciprocals in Russian, too. As for the possible explanations of similarity between the two uses see Knjazev (Ch. 15).

- (83) a. *peresekat'* 'to cross, intersect'
vstrečat' 'to meet'
napominat' 'to resemble'
otličat' 'to distinguish'
- b. *graničit'* 'to border on'
primykat', prilegat' 'to adjoin'
sootvetstvovat' 'to correspond/conform to, be in accordance'
protivorečit' 'to contradict.'

These lexical reciprocals are used either in discontinuous reciprocal constructions (see examples (19), (26), (38) and (39) above) or coupled with the overt reciprocal marker. Thus, the ungrammatical sentence (12a) will turn out to be well formed if the reciprocal pronoun *drug druga* 'each other' is inserted:

- (84) *On ne otliča-et zolot-o i med' drug ot druga.*
 he not distinguish.IPFV-PRES.3SG gold-ACC and copper.ACC one from other
 lit. 'He can't distinguish gold and copper from one another.'

In English, as distinct from Russian, a number of transitive verbs can receive reciprocal interpretation when used without an object; cf.:

- (85) a. *John and Mary met each other.*
 b. *John and Mary met.*

The Russian verb *vstretit'* 'to meet' does not occur in clauses such as (85b). To be used in a simple reciprocal construction, it requires either insertion of the reciprocal pronoun or a transformation into the reflexive reciprocal:

- (86) a. **Oni vstreti-l-i.*
 they meet.PFV-PAST-PL
 '*They met ...'
- b. *Oni vstreti-l-i drug druga-a (= vstreti-l-i-s').*
 they meet.PFV-PAST-PL each other-ACC meet.PFV-PAST-PL-REFL
 'They met each other.'

It is worth mentioning that in English, too, there are lexical reciprocals, e.g. the verb *to resemble*, that in this respect are closer to the Russian verb *vstretit'* rather than to its English counterpart *to meet*; cf.:

- (87) a. *John resembles Mary.*
 b. *John and Mary resemble each other.*
 c. **John and Mary resemble.*

The same is true for its Russian near equivalent *napominat'* 'to resemble', cf (19). The interesting point is, however, that both languages do not extend this restriction to the adjectives with a similar meaning: cf. (7), (8) and their translations into English.

Another type of language is Kabardian where the reciprocal marking of lexical reciprocals is obligatory if their arguments are expressed by a single noun phrase as in (85b) or (87c) (Kazenin, Ch. 17).

4.2 Lexical reciprocals and their reciprocal derivatives

The most important derivational processes in which a lexical reciprocal can be involved seem to be its intransitivization and transitivization that usually (but not necessarily) entail changes in its diathesis type and, occasionally, an alteration of aspectual properties.

4.2.1 *Intransitivization of lexical reciprocals*

In Russian, nearly all lexical reciprocals that appear as transitive verbs can take the polylexical reflexive postfix *-sja*. This results in intransitivization of the base verb and in various concomitant semantic effects. Since the semantic range of the postfix *-sja* includes the reciprocal meaning (see Knjazev, Ch. 15, §3), it is important to distinguish between two groups of reflexives with reciprocal meaning: those in which the symmetry of arguments “is inherited” from the base non-reflexive lexical reciprocal, and those in which the reciprocal meaning is introduced by the reciprocal marker.

4.2.1.1 *Change in diathesis type.* Reflexives derived from lexical reciprocals change their diathesis type if, by virtue of this process, the causative component in the meaning of the base verb is eliminated or somehow altered. As a result, the former object figures as a derived subject and, thus, an object-oriented reciprocal becomes subject-oriented.

Depending on the “degree of independence” of the derived subject, these reflexive reciprocals fall into a number of semantic subtypes,¹⁰ none of which are only characteristic of lexical reciprocals only.

1. *Anticausative (in the narrow sense) verbs* that differ from their base transitive verbs in the loss of causative semantic component; cf. the transitive causative lexical reciprocal *smešivat’* ‘to mix’ in (42) above and its reflexive anticausative in (88):

- (88) *Molok-o i vod-a smešiva-jut-sja.*
 milk-SG.NOM and water-SG.NOM mix.IPFV-PRES.3PL-REFL
 ‘Milk and water mix.’

2. *Autocausative verbs*, in which the underlying object is converted into subject and its referent becomes the actor that causes changes in his/her own state (Geniušienė 1983:43). Cf. the transitive lexical reciprocal *poznakomit’* ‘to acquaint sb and/with sb’ in (9), (10) above and the corresponding reflexive in (90):

- (89) *Oni poznakomi-l-i-s’ v teatr-e.*
 they acquaint.PFV-PAST-PL-REFL in theatre-SG.LOC
 ‘They got acquainted at the theatre.’

Some verbs allow both the anticausative and autocausative readings, depending on whether the action is performed under the influence of an outside causer or the referent of the surface subject performs it of his (or her) own will; cf.:

10. I follow here the terminology used in Geniušienė (1983, 1987) and Geniušienė & Nedjalkov (1991).

- (90) a. *On sobra-l det-ej v sad-u.*
 he gather.PFV-PAST.SG.M child.PL-ACC in garden-SG.LOC
 ‘He gathered the children in the garden.’
 b. *Det-i sobra-l-i-s’ v sad-u.*
 child.PL-NOM gather.PFV-PAST-PL-REFL in garden-SG.LOC
 ‘The children gathered in the garden.’

3. *Reflexive-causative verbs*, where the subject referent is both the initiator and the patient, the actor being, most commonly, only implied; cf.:

- (91) a. *Svjaščennik obvenča-l ix.*
 priest.SG.NOM marry.PFV-PAST.SG.M they.ACC
 ‘The priest married them.’
 b. *Oni obvenča-l-i-s’ v cerkv-i.*
 they marry.PFV-PAST-PL-REFL in church-SG.LOC
 ‘They got married in church.’

4.2.1.2 *Retention of diathesis type.* As was mentioned above, the diathesis changes should not be considered a necessary entailment of derived intransitivity of lexical reciprocals by means of the reflexive marker. This assumption may be illustrated by the following instances.

1. *The passive reflexive form* of lexical reciprocals denoting the same situation as the base transitive verb, the difference being that the deep object is encoded by the surface subject; in this case, the reciprocal obviously retains its diathesis type; cf.:

- (92) a. *My ešče ne obsužda-l-i et-u problem-u.*
 we yet not discuss.IPFV-PAST-PL this-ACC problem-SG.ACC
 ‘We have not discussed this problem yet.’
 b. *Et-a problem-a ešče ne obsužda-l-a-s’.*
 this-SG.NOM problem-F.SG.NOM yet not discuss-PAST-F-REFL
 ‘The problem has not been discussed yet.’

2. *Pairs such as vstrečat’ ‘to meet’ – vstrečat’sja lit. ‘to meet oneself’, peresekat’ ‘to cross/intersect’ – peresekat’sja lit. ‘to cross itself’,* where the difference between the two verbs is mainly in their syntactic valency, i.e. in direct object demotion to comitative object in the derived (reflexive) construction, the surface subject (as distinct from the passive) retaining its semantic and syntactic roles; cf.:

- (93) a. *Na ulic-e on vstreti-l drug-a.*
 on street-SG.LOC he.NOM meet.PFV-PAST.SG.M friend-SG.ACC
 ‘He met a friend in the street.’
 b. *Na ulic-e on vstreti-l-sja s drug-om.*
 on street-SG.LOC he meet.PFV-PAST-REFL with friend-SG.INST
 lit. ‘He met himself with his friend in the street.’
 (94) a. *Odn-a lini-ja pereseka-et drug-uju.*
 one-SG.NOM.F line.F-SG.NOM cut.IPFV-PRES.3.SG another-F.SG.ACC
 ‘One line cuts another.’

- b. *Odn-a lini-ja pereseka-et-sja s drug-oj.*
 one line cut.IPFV-PRES-REFL with another-F.SG.INST
 lit. 'One line cuts itself across with another.'

The main functions of the reflexive marker in Russian are anticausative and passive, whereas true reflexives and reciprocals constitute very restricted semantic classes (see Knjazev & Nedjalkov 1985). Therefore, reflexives inheriting the reciprocal meaning from the base lexical reciprocals occur far more often than the true reflexive reciprocals in which the reciprocal meaning is signalled by the reflexive marker only. Nevertheless, in French, where derivation of reciprocals by means of the reflexive marker seems to have almost no lexical restrictions, reflexive anticausatives derived from lexical reciprocals are quite numerous, too (see Kordi 1981:249–51); cf.:

- (95) a. *La guerre a séparé les époux.* 'The war separated the couple.'
 b. *Les époux se sont séparé.* 'The couple separated.'

4.2.1.3 Aspectual shift. The effect of derived intransitivity on the aspectual properties of lexical reciprocals in Russian can be seen in that their reflexive counterparts, unlike their base verbs, indicate permanent or stable static situations far more often than actions; cf. the transitive verb *soedinjat* 'to connect' in (41) and reflexive in (96) or the transitive *čeredovat* 'to alternate' in (53) and reflexive in (98):

- (96) *V nem soedinja-jut-sja energija i um.*
 in he.LOC combine.IPFV-PRES.3PL-REFL energy-SG.NOM and brains.SG.NOM
 'He combines energy with brains.'
- (97) *V et-oj morfem-e čeredu-jut-sja zvuk-i*
 in this-SG.F.LOC morpheme.F-SG.LOC alternate.IPFV-PRES.3PL-REFL sound-PL.NOM
 /a/ i /o/.
 /a/ and /o/
 'In this morpheme the sounds /a/ and /o/ alternate with each other.'

This instance seems to be, to some extent, analogous to Russian constructions with *-n/-t* participles that combine functions of the passive and resultative (indicating states resulting from a previous action) but occasionally denote "non-derived" static situations with no reference to their origins (Knjazev 1989:46–9, 131–41). It is noteworthy that the greater part of statives (in this sense of the term) are derived from lexical reciprocals, cf.:

- (98) *Et-i slov-a protivopostavl-en-y po značeni-ju.*
 this-PL.NOM word-PL.NOM oppose.PFV-PASS-PL in meaning-SG.DAT
 'These words are opposed in meaning.'
- (99) *Angli-ja otdel-en-a ot Franci-i La-Manš-em.*
 E.-NOM separate.PFV-PASS-SG.F from F.-GEN Channel-INST
 'England is separated from France by the Channel.'

4.2.2 Causativization of lexical reciprocals

As Russian lacks morphological causative, the example of a causative derived from a lexical reciprocal is taken from Turkish (Erguvanli 1979); cf.:

- (100) a. *Ali Napoleon-a benz-iyor.*
 A. N.-DAT resemble-PROGR.3SG
 ‘Ali resembles Napoleon.’
- b. *Ali-yi Napoleon-a benze-t-ti-m.*
 A.-ACC N.-DAT resemble-CAUS-PAST-1SG
 ‘I likened Ali to Napoleon.’

In some languages there exist restrictions on derivation of causatives immediately from lexical reciprocals. Thus, in Kabardian (Kazenin, Ch. 17), due to the peculiarities of the marking of simple reciprocal constructions mentioned in 4.1.3, causative marking requires either a comitative arrangement of symmetric actants or an insertion of the reciprocal marker.

5. Conditions for symmetry of lexical reciprocals

As was mentioned in Section 1, logical symmetry is not to be regarded as an obligatory property of lexical reciprocals in a natural language. The possibility of interchanging the actants of a lexical reciprocal without changing its meaning, is determined by a number of heterogeneous factors. They cover, firstly, pragmatic and referential as well as some other properties of the actants of a lexical reciprocal and, secondly, some semantic features of the predicate itself.

5.1 Pragmatic ordering of actants

As has been repeatedly pointed out (see, among others, Yomdin 1981:104; Krysin 1988:333–5; Kemmer 1988:138), the order in which the symmetric actants are mentioned is not arbitrary. The one mentioned second is, most commonly, senior, or more known, or of a higher prestige, or has existed for a longer time than the one mentioned first. Compare the well-formed sentence in (100) signalling the symmetric relation of resemblance in which the role of the “point of reference” is assigned to Napoleon (as against a certain Ali), and the following two sentences the second of which is only (if ever) possible under some specific conditions:

- (101) a. *Syn poxož na otc-a.*
 son.M.SG.NOM resemble.SG.M at father.M-SG.ACC
 ‘The son resembles his father.’
- b. *²Otec poxož na syn-a.*
 father.M.SG.NOM resemble.SG.M at son.M-SG.ACC
 lit. ‘The father resembles his son.’

By way of summing up, we may conclude that the degree of familiarity of the actants of a symmetric predicate is inversely correlated with the degree of their interchangeability. The principal psychological regularities of establishing the hierarchy of the actants in the case of relations of similarity are discussed in depth by Tversky (1977:327–52).

Somewhat similar factors are relevant for the expression of symmetric spatial relations. The entity chosen as ground, is, usually, more stable, bigger in size, more complex geometrically than the figure (Talmy 1983:231). The actants of reversible spatial constructions such as (36) possess these parameters, whereas those of irreversible ones (although with the same lexical reciprocal) do not:

- (102) a. *The bicycle is near the house.*
 b. *?The house is near the bicycle.*

These two examples are discontinuous reciprocal constructions. As for simple reciprocal constructions, it should be noted that co-ordinated noun phrases as a whole (not only those used in reciprocal constructions) tend to be ordered in conformity with the “Me First Principle” (Cooper & Ross 1975). According to this principle, the entity mentioned first usually possesses a set of qualities that are considered to be characteristic of the prototype speaker, i.e. being here, now, adult, positive, singular, friendly, alive, etc. The one mentioned second lacks some of these features. A similar general conclusion was drawn by R. Jakobson in the course of a discussion of the principle of iconicity in language. He pointed out that the order of conjoined nouns tends to mirror a hierarchy of entities denoted by them. In his discussion of the sentence

- (103) *The president and the secretary of state attended the meeting,*

he pointed out that this order of naming the participants of the situation described here “is far more usual than the reverse, because the initial position in the clause reflects the priority in official standing (Jakobson 1990:412).

It is remarkable that in Russian there is a specific way of making the participants of a collective action pragmatically unordered. I have in mind collocations with the plural form of the pronoun functioning as “comitatif inclusif” (Garde 1995:112–3; see also Mrázek 1988:116):

- (104) *my s toboj* lit. ‘we with you’ = ‘I and you’
my s nim lit. ‘we with him’ = ‘I and he’
oni s nej lit. ‘they with her’ = ‘he and she’
my s sosedom lit. ‘we with a neighbour’ = ‘I and a neighbour’
oni s sosedom lit. ‘they with a neighbour’ = ‘he/she with a neighbour.’

The first component of these collocations denotes total combination of the subjects or objects, while the second one (expressed by the instrumental with the preposition *s* ‘with’) specifies its composition; cf. the following line from a song:

- (105) *My s tob-oj dv-a bereg-a u odn-oj rek-i.*
 we.NOM with you.SG-INST two-NOM bank-SG.GEN at one-F.SG-INST river.F-SG.GEN
 ‘You and me (lit. ‘we with you’) are two banks of the same river.’

5.2 Referential modes of actants

As N. D. Arutjunova (1983:6) pointed out, the relations of similarity are really symmetrical and reversible if what is described comprises two entities which are included in the same class; cf.

- (106) a. *Ajv-a po vid-u sxodn-a s jablok-om.*
 quince-SG.NOM in appearance similar-SG.F with apple.N-SG.INST
 ‘A quince resembles an apple in appearance.’
 b. *Jablok-o po vid-u sxodn-o s ajv-oj.*
 apple-SG.NOM in appearance similar-SG.N with quince-SG.INST
 ‘An apple resembles a quince in appearance.’

A disparity in taxonomic membership of the actants of a lexical reciprocal makes it difficult to reverse the objects of comparison: those who consider a man to be similar to a wolf do not necessarily hold the opinion that a wolf, in its turn, resembles a man.

The author also argues that the relation of similarity is commonly, if not always, maintained between entities of the same referential mode. Otherwise inversion of the actants is, as a rule, impossible:

- (107) a. *Pet-ja poxož na ispanc-a.*
 Petja-SG.NOM like.M.SG on Spaniard.M-SG.GEN
 ‘Petja looks like a Spaniard.’
 b. *?Ispan-ec poxož na Pet-ju.*
 Spaniard-SG.ACC like.M.SG at Petja-SG.GEN
 lit. ‘A Spaniard looks like Petja.’

5.3 Static vs. dynamic situations

Stativity has been repeatedly mentioned among features favourable for the real symmetry of a predicate (Fiengo & Lasnik 1973:465; Boadi 1975). The above discussion of examples (21) and (22) in Section 3.1.1.1 or (36) and (36) in Section 3.2.1.1 may be expanded by one more example taken from Boadi (1975). Sentences in (108) with stative predicates are synonymous:

- (108) a. *John resembles Harry.*
 b. *Harry resembles John.*

Meanwhile, the sentences in (109) that contain the same verb in the progressive form are not synonymous and reversible because they can easily refer to a pair of situations in which only one participant becomes different whereas the other remains as he or she was:

- (109) a. *John is resembling Harry (more and more every day).*
 b. *Harry is resembling John (more and more every day).*

Moreover, R. Mrázek argues that, on condition that the described situation is dynamic, the participant referred to by the surface subject acquires “the role of the initiator of the action (that of its protagonist in the interpretation of the speaker)” (Mrázek 1988: 116; see

also Lejkina 1978: 136). That may be the reason of typical irreversibility of the following sentences:

- (110) a. *Miš-a poznakomi-l-sja (possori-l-sja) s*
 M.-SG.NOM acquaint.PFV-PAST.SG.M-REFL quarrel.PFV-PAST.SG.M-REFL with
Pet-ej.
 P.-SG.INST
 'Misha got acquainted (has quarrelled) with Petja.'
- b. *Pet-ja poznakomi-l-sja (possori-l-sja) s*
 P.-SG.NOM acquaint.PFV-PAST.SG.M-REFL quarrel.PFV-PAST.SG.M-REFL with
Miš-ej.
 M.-SG.INST
 'Petja got acquainted (has quarrelled) with Misha.'

In (110a), it is most likely Misha who is the initiator of the action, whereas in (110b) this role is assigned to Petja. This difference prevents these sentences from being unreservedly symmetrical.

CHAPTER 3

Encoding of the reciprocal meaning

Vladimir P. Nedjalkov

Institute for Linguistic Studies, St. Petersburg

1. Introduction
 - 1.1 Anaphoric and middle reciprocal markers
 - 1.2 Seven main types of reciprocal marking
2. Type A. Clause doubling with argument inversion
 - 2.1 Non-grammaticalized constructions
 - 2.1.1 Clauses with inverted arguments
 - 2.1.2 Constructions with a substitute for the second clause
 - 2.2 Grammaticalized constructions
 - 2.2.1 Inverted clauses with both reciprocants named in each (Hua)
 - 2.2.2.1 The structure '[antecedent +] *I + Verb + you, you + Verb + me*' (Chinese)
 - 2.2.2.2 The structure '[antecedent +] *Verb...DS-3SG + Verb...DS-3SG + AUX*' (Amele)
3. Type B. Pronominal marking (cover term for free reciprocal markers such as reciprocal pronouns, nouns, adverbs, auxiliaries, etc.)
 - 3.1 A repeated noun phrase in the subject and object positions
 - 3.2 Reciprocal pronouns
 - 3.2.1 Non-specialized reciprocal pronouns
 - 3.2.1.1 Personal pronouns as reciprocal markers (German, To'aba'ita)
 - 3.2.1.2 A distributive pronoun as a reciprocal marker (Pirahā)
 - 3.2.2 Specialized reciprocal pronouns. Two main types with respect to the retention of the antecedent when a reciprocal is embedded
 - 3.2.2.1 The long-distance antecedent can or must replace the antecedent of the base reciprocal
 - 3.2.2.2 Pronouns that cannot refer to a long-distance antecedent
 - 3.3 Reciprocal semi-pronouns (Chukchi, Eskimo)
 - 3.4 Reciprocal adverbs (Malayalam, Modern Chinese)
 - 3.5 Auxiliary reciprocal words (Indonesian, Ancient Chinese)
 - 3.6 Reciprocal adverbs of limited usage (Nivkh)
 - 3.7 Reciprocal specifiers
 - 3.7.1 Specifiers of the adverbial ('mutually') type (German, French, English, Polish)
 - 3.7.2 Specifiers of the pronominal type ('among/between ourselves/.../themselves')
 - 3.7.3 Relations between reciprocal pronouns and reciprocal specifiers

4. Type C. Periphrastic (analytical) constructions
 - 4.1 Active participle + auxiliary verb (Kiranti)
 - 4.2 Detransitivized notional verb + reciprocal auxiliary (Mvtwang dialect of Dulong/Rawang)
 - 4.3 Deverbal substantive + auxiliary (Kâte)
5. Type D. Compounds with recurrent components (Chinese, Tucano, Japanese)
6. Type E. Affixing, including inflection and zero marking on the predicate
 - 6.1 Detransitivization without any derivational markers
 - 6.1.1 Direct object deletion without change of inflection on the verb (English, Tariana)
 - 6.1.2 Subject agreement instead of subject-object agreement (Eskimo, Chukchi)
 - 6.1.3 Middle (passive) conjugation instead of active conjugation (Modern Greek)
 - 6.2 Derivational-paradigmatic means
 - 6.2.1 A reciprocal marker substituted for an agreement affix
 - 6.2.1.1 One marker for subject and direct object reciprocalization, another for other cases (Kabardian)
 - 6.2.1.2 One marker for two- and three-place transitives, another for two-place intransitives (Abaza)
 - 6.2.1.3 Reciprocalization of two-place intransitives only via transitivity by means of an applicative marker (Ainu)
 - 6.2.1.4 An applicative marker used to mark reciprocity via detransitivization (Eskimo)
 - 6.3 Prefixation
 - 6.3.1 Prefixation without special features
 - 6.3.2 Prefixation with special features
 - 6.3.2.1 Different reciprocal markers for the 1st and non-1st persons (Huichol and some other Southern Uto-Aztecan languages)
 - 6.3.2.2 Reduplication of a reflexive-reciprocal prefix (Apalai)
 - 6.3.2.3 Fossilized reduplicated non-reciprocal prefixes used as reciprocal markers (Abaza)
 - 6.3.2.4 Reciprocal prefix + dual marker (Awtuw)
 - 6.3.2.5 A reciprocal prefix ousting a causative prefix (Palauan)
 - 6.4 Suffixation
 - 6.4.1 Suffixation without special features
 - 6.4.2 Suffixation with special features
 - 6.4.2.1 Different suffixes for plural and dual forms (Limbu)
 - 6.4.2.2 Overlapping suffixes for non-causative and causative reciprocals (Bolivian Quechua, Yakut)
 - 6.4.2.3 Suffixes often co-occurrent with a reciprocal marker (Chukchi, Evenki, Udehe, Khalkha-Mongol, Buryat)
 - 6.5 Infixation (Mundari, Sobei)
 - 6.6 Circumfixation and quasi-circumfixation (Austronesian languages)
 - 6.6.1 Circumfixes (Tongan, East-Futunan, Kusaiean, Nêlêmwa, To'aba'ita, Indonesian)
 - 6.6.2 Quasi-circumfixes? (Tagalog)
7. Root reduplication
 - 7.1 Root reduplication only (Indonesian)
 - 7.2 Root reduplication + affix

- 7.2.1 Root reduplication + prefix (Urubu-Kaapor, Amharic)
 - 7.2.2 Root reduplication + suffix (Dyirbal, Bete, Fula, Tauya, Motuna)
 - 7.2.3 Root reduplication + circumfix (Tigak)
 - 8. Clitics (Indo-European languages)
 - 8.1 Introductory notes
 - 8.2 Full reflexive pronouns as the source of reflexive clitics
 - 8.3 Reflexive pronominal clitics
 - 8.4 Affixal reflexive-middle markers
 - 8.5 Reflexive-middle markers in combination with other affixes
 - 8.6 Areal characteristics
 - 9. Marginal affixal means of reciprocalization (Latin, Chuckhi)

1. Introduction

1.1 Anaphoric and middle reciprocal markers

I will remind first that semantically two main types of reciprocal markers can be distinguished, *anaphoric* and *middle* (2.2.3 in Nedjalkov, Ch. 1).

Anaphoric markers express the reciprocal meaning alone or both the reciprocal and the reflexive meanings. Needless to say, the markers with the reflexive meaning alone are anaphoric by definition as well. Anaphoric markers are usually, though not exclusively, pronouns and/or adverbs. More rare are morphological anaphoric reciprocal markers, like the Chukchi suffix *-wəly* and Evenki suffix *-meet* with the reciprocal meaning only; cf.:

Chukchi

- (1) a. *təm*- 'to kill sb' → *təm-wəly*- 'to kill each other.'

Evenki

- b. *iče*- 'to see sb' → *iče-meet*- 'to see each other.'

Middle markers express the reciprocal and the reflexive meanings (both or one of them) and a number of certain other meanings, e.g. anticausative, absolutive (unspecified object), anticausative, potential-passive, passive, etc., which have developed due to detran-

sitivization (see Ch. 5, §2). Middle markers are usually, though not exclusively, affixes or clitics, rarely pronouns. Instances of the latter type are the Mbay reciprocal pronoun *nāā* and the Tzutujil relational noun *-iiʔ* which also has a number of other meanings and is thus a middle marker by definition:

Mbay (Keegan 1997:65, 66)

- (2) a. *tōl-n* ‘they killed sb’ → *tōl-n nāā* ‘they killed each other’ reciprocal
dūlō-n ‘they twisted sth’ → *dūlō-n nāā* ‘become twisted together’ anticausative

Tzutujil (Dayley 1985:336–337; *x-* = completive aspect; *-kee-/k-* = 3PL; *r-* = 3SG; *-iil* = absolutive form)

- b. *tz'atooj* ‘to see sb’ → *x-kee-tz'at k-iiʔ* ‘they saw themselves/each other’
xib'exik ‘to frighten sb’ → *xib'en r-iiʔ -iil* ‘to be afraid’ anticausative

The term *middle* does not refer to any particular meaning or form but to various markers with a certain semantic potential, including the meanings just mentioned. (For a discussion of this term see Kemmer 1993:1–4; Dixon & Aikhenvald 2000:11–12.)

- On the whole, the meanings considered here as middle correspond to Lyons’s definition (1968:373): “The implications of the middle (when it is in opposition with the active) are that the ‘action’ or ‘state’ affects the subject of the verb or his interests”.

1.2 Seven main types of reciprocal marking

Reciprocal markers may differ from markers of other categories in some respects (e.g. they have, relatively frequently, two-component structure, including reduplication) and also in the combinability with the markers of some categories, such as the applicative and the like.

The variety of reciprocal marking across languages is truly astonishing. Hardly any other valency-changing category (such as causative and resultative) can compete with reciprocals in this respect, except, probably, the reflexive, a semantic category closest to reciprocals, which may be nearly as varied in expression.

As mentioned in Ch. 1 (§2.1), seven main types of reciprocal marking can be distinguished. They are listed below in the order of decreasing syntactic complexity (this feature does not concern clitics which are therefore mentioned last).

Type A. Clause doubling with inverted arguments; see Section 2 below.

Type B. Pronominal marking (cover term for free reciprocal markers, i.e. words dependent on the predicate, e.g. nouns, pronouns, adverbs, etc.); Section 3 below.

Type C. Periphrastic marking: a participle or a converb with an auxiliary (Section 4).

Type D. Compounding: verb compounds with recurrent components (Section 5).

Type E. Affixing: affixes and inflection on the predicate, including zero marking (Section 6).

Type F. Root reduplication (Section 7).

Type G. Clitics: reciprocal markers with some features of affixes and free pronouns (kind of intermediate between Types B and E); Section 8.

There are also marginal devices, mostly affixes with a peripheral reciprocal function (Section 9).

A language may use more than one type of reciprocal marking, and even use them simultaneously (Section 10).

In the literature, the types of reciprocals most commonly distinguished are (pro)nomininal reciprocals, which are reciprocals with Type B markers (excepting adverbs), and verbal reciprocals which are of Type E in the first place. The term is also used with reference to Types C, D and G.

Type A markers are generally, though not always, monosemous and Type E (and also Type G) markers are the most polysemous. In Types A and B the locus of the reciprocal marker is outside the notional base verb, while in Types D and E the marker is a component of the notional verb. In Type C, the reciprocal meaning is expressed by the form as a whole rather than by any component. The distinction between some of the formal types of reciprocal markers is not always clearcut.

Among the languages of my sample, the most widely represented types of markers are B (syntactic markers) and E (morphological, especially affixal markers). Therefore they are naturally in the center of attention in this collective monograph.

2. Type A. Clause doubling with argument inversion

In this case reciprocity is encoded by two coordinate clauses with inverted arguments. The inversion may be syntactically explicit or indicated by grammaticalized pronouns or fossilized agreement markers. This type is represented by two subtypes: non-grammaticalized and grammaticalized constructions.

2.1 Non-grammaticalized constructions

The following subtypes are attested.

2.1.1 *Clauses with inverted arguments*

This type is similar to conjoined sentences (4a') and (4a'') in Ch. 1 whose joint semantic content roughly coincides with the reciprocal meaning of (4b). Roughly speaking, these are constructions structurally similar to (3) below which is not grammaticalized, either:

- (3) *Miranda stared at him and he stared back (at her).*

2.1.2 *Constructions with a substitute for the second clause*

In this case the second clause (with inverted arguments) is replaced by a special phrase, like the Latin borrowing *vice versa* 'and in reverse' used in English; cf.:

- (4) a. *Max loves Susan and vice versa (= and Susan loves Max) (McCawley 1970:278).*

In dialogues, some of the reciprocal specifiers (see 3.7.1) may be used instead of a reply as substitutes to denote a response action analogous to the action in the preceding remark, with the reciprocants referring to the communicants; cf.:

French (see Guentchéva & Rivière, Ch. 12, §8.2)

- (4) b. A.: *'Je; vous; souhaite de bonnes vacances!'* 'I wish you happy holidays!'
 B: *'Et réciproquement!'* 'Same to you!' (= *Je; vous; souhaite...*), lit. 'And reciprocally!'

2.2 Grammaticalized constructions

2.2.1 *Inverted clauses with both reciprocants named in each (Hua)*

I have no "pure" examples of this type. Grammaticalization of reciprocal markers proper does not take place here; it concerns the grammaticalized markers of switch-reference. (The subsequent description is based on Haiman 1980.) There are two types of such reciprocal constructions which differ between themselves in the simultaneity or sequentiality of the reciprocal subevents. The difference is in the nature of the use of switch-reference markers and also in the use of an auxiliary verb in the second type (with simultaneous subevents). There are two switch-reference markers: one agrees in person and number with the subject of the first clause and another is anticipatory and agrees with the subject of the second clause. (When the subjects of both clauses are non-distinct, only one reference marker is used, and the construction is naturally non-reciprocal.) Let us consider the two types.

The type with sequential subevents. The sequence of the predicates corresponds to the sequence of actions in the situation described.¹

Hua (Haiman 1980:532–3; *ebgi* 'to hit', *ga* = 3sg agreement marker of the first clause; *na* = 3sg agreement marker of the second clause; *e* = 3sg final)

- (5) a. *Joe Harry ebgi + ga + na Harry Joe ebgi + e.*
 'Joe hit Harry and Harry hit Joe.' (see also Haiman 1985:73–83 on Kâte)

The type with simultaneous subevents. In contrast to the prior case, in both clauses the switch-reference markers are repeated (*ga + na ... ga + na ...*). The repeated clauses are followed by the auxiliary verb *hu/ha/hi* 'to do' (the allomorph is determined by the subject person) followed in its turn by the final *?e* (= 2/3du.final) which expresses agreement with the conjunction of the subjects of both clauses.

- (5) b. *Joe Harry ebgi + ga + na Harry Joe ebgi + ga + na ha + ?e.*
 'Joe and Harry hit each other.'

1. Haiman (1980:532–3) comments on this type: "Here, if anywhere, we find the structure of language directly reflecting the structure of reality in a most ingenious, aesthetically satisfying way".

Hua also has other means of reciprocalization used if the reciprocants are expressed by one noun phrase, e.g. root reduplication in the perfective aspect in combination with an auxiliary verb (see (115) in Ch. 5, §4.2).

2.2.2 Clauses with an antecedent

Reciprocity can be expressed by inversion of “fossilized” 1SG and 2SG pronouns or by a fossilized 3SG agreement marker followed by a DS (= different subject) marker. Their person does not reflect the person of the antecedent.

2.2.2.1 *The structure* ‘[antecedent +] I + Verb + you, you + Verb + me’ (Chinese). The predicate is repeated with inverted permanent 1SG and 2SG pronouns ‘I ... you, you ... I/me’ serving as a reciprocal marker. It is not accidental that these particular pronouns are used: in the situation of a dialogue, they are in converse relations as they denote the communicants speaking by turns. In Chinese, where there are also other means of reciprocalization (see, for instance, (35), (100) in Nedjalkov, Ch. 1 and (47) and (48) below), this structure is typical of colloquial speech.

Modern Chinese (see also Hoa et al., Ch. 49, §9.3)

- (6) *Wǒmen/nǐmen/tāmen nǐ kàn wǒ, wǒ kàn nǐ.*
 we you they you.SG look I I look you.SG
 ‘We/you/they looked at each other.’
 lit. ‘We/you/they you looked at me I looked at you.’

The referential identity of the pronouns with the antecedent (the subject of the sentence) is possible by accident, when the antecedent happens to be of the same person as the pronoun(s) or agreement marker (cf. ‘we (antecedent) ... I ... you, you ... me’).

2.2.2.2 *The structure* ‘[antecedent +] Verb ... DS-3SG + Verb ... DS-3SG + AUX’ (Amele). This formula shows that in (7) and (8) below the 3SG agreement marker *-b* is used regardless of the person of the subject. The two coordinated verbs are identical in structure. The DS marker *-co* indicates different subjects in the underlying clauses and reciprocal relations between the subject referents. If the underlying sentence is transitive the object is zero-marked (see (7)), and if the object of the underlying clause is indirect the marker *-udo* is used, as in (8) (Roberts 1987:306–8, 131–4; on DS see pp. 116–9). Although this is a complex type the examples in Roberts (1987:132) show that it can express not only “canonical” subject-oriented reciprocals, as is shown in (7)–(8), but also “indirect” and “possessive” reciprocals, and it can be causativized.

Amele (ibid., p. 307)

- (7) *Dana ale qo-Ø-co-b qo-Ø-co-b esi-a.*
 man 3.DU hit-DO-DS-3SG hit-DO-DS-3SG 3.DU-PAST
 ‘The two men hit each other.’
- (8) *Ele ew-udo-co-b ew-udo-co-b ow-a.*
 1.DU despise-3SG-DS-3SG despise-3SG-DS-3SG 1.DU-PAST
 ‘We (two) despised each other.’

3. Type B. Pronominal marking (cover term for free reciprocal markers such as reciprocal pronouns, nouns, adverbs, auxiliaries, etc.)

Pronominal marking is a cover term for free reciprocal markers, such as reciprocal pronouns, nouns, pronouns, adverbs, auxiliaries, etc. These free words and phrases meaning ‘each other’, ‘mutually’ are mostly monosemous (although to a lesser degree than the previous type: some can express reflexivity and some other meanings). They do not appear in subject position, as a rule, and if they do they do not have the reciprocal sense (a special case is discussed in 3.1 below), as this position is reserved for the antecedent. The cases in 3.1 are an exception, where a noun appears as subject in a proverb; in (19), a personal pronoun used reciprocally in the direct object position also appears as subject without changing its form. As far as reciprocal pronouns are concerned, they either retain their meaning in the subject position, which is a rare case (as is shown in Shkarban & Rachkov, Ch. 22 on Tagalog, §8.1.2), or acquire a different meaning, e.g. distributive (cf. ‘each’ in Tuvan; see Kuular, Ch. 27, §4.1.1).

In my material, seven principal subtypes of syntactic marking are registered. Some of the subtypes are probably intermediate.

3.1 A repeated noun phrase in the subject and object positions

This type is represented in our material by proverbs like (9): the noun phrases in these constructions are non-referential and used in the generalized sense ‘each person’: a sentence of this type implies another sentence with the reversed order of the same noun phrases:

- (9) *Homo; homini; lupus est.* (= *Homo; homini; lupus est.*)
 ‘Man to man is wolf.’

This is a generalized formula structured as a discontinuous construction. As a proverb, it cannot be transformed into a simple construction or into a construction with a reciprocal pronoun. Compare Russian:

- (10) a. *Rybak rybak-a vidit izdaleka.*
 fisherman.NOM fisherman-ACC sees from.afar
 ‘Birds of a feather flock together.’
 lit. ‘A fisherman sees a fisherman from afar.’
 b. **Rybaki vidjat izdaleka.*
 ‘Fishermen see from afar (whom?).’
 c. *Rybaki vidjat drug druga izdaleka.*
 fishermen see each other from.afar
 ‘The fishermen see each other from afar.’ (literal sense)

3.2 Reciprocal pronouns

Generally, reciprocal pronouns function as verbal arguments. They can occur with post- and prepositions, and, in inflecting languages, they can be inflected for case and person,

number, gender or animacy. One of the components of a reciprocal pronoun often takes the case form of the subject and the other that of the underlying object or attribute. For instance, in (10c) the Russian reciprocal pronoun *drug* (NOM) *drug-a* (ACC) ‘each other’ repeats the case forms of the subject and object of (10a), i.e. *Rybak* (NOM) *rybak-a* (ACC)...

In comparison with morphological markers, the pronouns are more flexible syntactically and can be used, as a rule, in all the syntactic positions typical of noun phrases (except for the subject). They are used not only with transitive and bitransitive verbs but also with verbs requiring a prepositional object, which is sometimes outruled for the morphological markers (cf. (104)–(107) in Nedjalkov, Ch. 1). On the other hand, these pronouns cannot have a singular antecedent (an exception is the German indefinite-personal pronoun *man*), while morphological reciprocals in a number of languages can be used in discontinuous constructions with a singular subject (see (29b), (30a, a’), (34b), etc. in Ch. 1).

Reciprocal pronouns can be classified into a number of types on the basis of such features as etymology, the number of the components, etc. Frequently, these pronouns are a relatively late development and came into being during the time registered in written records; cf. the reciprocal pronouns of the Indo-European languages. Note that the Turkic languages with the genetically common reciprocal suffix *-s/-š/...* may have different reciprocal pronouns, cf. the Kirghiz and Yakut pronouns below. I propose the following subdivision.

1. *One-component reciprocal pronouns*. Judging by the available data, they may be descended from: (a) a reflexive pronoun (11a), (b) a noun phrase meaning ‘body’ (11b), or (c) a lexical reciprocal (11c):

- (11) a. Polish *siebie* (ACC) i. ‘oneself’, ii. ‘each other’ (*sobie* (DAT))
 b. Hausa *jūnā* ‘each other’ (Jaggar 2001:66, 207, 413; see also (27), (28))
 c. Koyra Chiini *čere* ‘friend, peer, mate’ – *čere* ‘each other’ (Heath 1999:341–3)
 Fulani *band-* ‘relative’ – *band-ībe* ‘each other’ (*-ībe* = POSS; Klingenhoben 1963:142).

2. *Two-component reciprocal pronouns*. In many languages these pronouns are composed of two components, typically a reduplication of the same word (often a reflexive pronoun). The following subtypes are registered.

2a. *Pronouns descended from lexical reciprocals*

- (12) Udehe *za*: ‘relative, friend, associate’ – *za:fi-za:fi* ‘each other’ (*-fi* = POSS.REFL; Nikolaeva, Ch. 23, §§2, 4.1 and 4.6).

2b. *Pronouns derived from reflexive pronouns by reduplication*. Reflexive pronouns in their turn can be descended from words meaning ‘body’, ‘head’, ‘person’, etc. (in the Yakut pronoun *-leri-* = POSS.3PL, *-n* = ACC).

- (13) Yakut *beje-leri-n* ‘(one)self’ – *beje-beje-leri-n* ‘each other’
 Udehe *mene* ‘(one)self’ – *mene-mene* ‘each other’ (Nikolaeva, Ch. 23, §4.6)
 Korafe *tofo* ‘(one)self’ – *tofo tofo* ‘each other’ (Farr & Farr 1975:738)
 Lezghian *čeb* ‘(one)self’ – *čpi-čeb* ‘each other’ (Haspelmath 1993:415–6)
 Twi *hō* ‘(one)self’ – *hō hō* ‘each other’ (Boadi 1975:55)

Sinhala *tamat* '(one)self' – *tamat-taman* 'oneselves/each other'
(Gair & Karunatillake 2000: 723).

2c. *Pronouns containing components with the meaning 'one', 'another', 'each', 'person'.*

- | | | | |
|------|---------------|--------------------------------|---------------------------------------|
| (14) | English | <i>each other, one another</i> | |
| | Kirghiz | <i>biri biri-n</i> (3PL) | lit. 'one one-ACC' |
| | Russian | <i>drug druga</i> | lit. 'other other' ² |
| | German | <i>einander</i> | lit. 'one.other' |
| | Latvian | <i>viens otru, cits citu</i> | lit. 'one second', 'another another' |
| | Lithuanian | <i>vienas kita, kitas kita</i> | lit. 'one another', 'another another' |
| | Malayalam | <i>oraal ... oraal</i> | lit. 'one person ... one person' |
| | Ancient Greek | <i>ἀλλήλους</i> | lit. 'other.other.' |

2d. "Exotic" formations. For instance, in Sinhala, along with other reciprocal pronouns (e.g. reflexive-reciprocal *tamat-taman* mentioned above) there are formations based on reduplicated numerals denoting the number of the participants, like 'two two', 'three three', etc. (Gair & Karunatillake 2000: 723).

Sinhala (ibid., p. 723)

- (15) *Siri-yi Gunapaala-yi Sunil-uyi tundenaa-Tə+tundenaa-Ø aadareyi.*
S.-and G.-and S.-and three.ANIM-DAT+three.ANIM-NOM love.PRED
'Siri, Gunapala and Sunil love each other.' (lit. '... love three-to-three')

2e. (In)separability of two-component pronouns. I mean the degree of fusion: the possibility of including a noun, pre- or postposition, or a case marker between the components and the possibility of changing their sequence. The degree of fusion manifests the degree of grammaticalization of a reciprocal pronoun.

For instance, in the German pronoun *einander* 'each other' the sequence of the components (*ein-ander*) cannot be changed, and they cannot be separated by other morphemes and often form one entity with prepositions (cf. *aufeinander* lit 'one on the other'; cf. (190) in §13.3 of Ch. 1). Thus, it is highly grammaticalized.

A language can use both separable and inseparable forms of a reciprocal pronoun (cf. (16a) and (16b), and (16c) and (16d)). In Kirghiz, the reciprocal pronoun generally has the case marking on the second component, i.e. in this case the components are inseparable; but sometimes the case marking is on the first component and in certain cases the personal-possessive marker is added to both components; the postpositions are usually inserted between the components.

Kirghiz

- (16) a. *biri biri-Ø-n* 'each other' (Ø = 3PL, -n = ACC)
b. *biri-Ø-n biri* 'each other'
c. *biri-biri-biz-di* 'each other' (-biz- = 1PL, -di = ACC)
d. *biri-biz-di biri-biz* 'each other.'

2. The native speaker of Russian perceives the reciprocal pronoun *drug drug-a* as 'friend.NOM friend-ACC' rather than as 'other-NOM other-ACC'.

Interrupted separable reciprocal pronouns are attested in Malayalam. There are *six* of them (besides *five* reciprocal adverbs; see 3.4 below). They are inflected for case, the non-nominative case marker being placed after the first component.

Malayalam (Jayaseelan 2000: 119; Asher & Kumari 1997: 168–9)

- | | | | | |
|------|----|-----------------------------------|--------------------------------|--|
| (17) | a. | <i>oraaL... oraaL</i> | ‘one person ... one person’ | |
| | b. | <i>oraaL... matte aaL</i> | ‘one person ... other person’ | |
| | c. | <i>oorooruttarum... matte aaL</i> | ‘each person ... other person’ | |
| | d. | <i>onnə... onnə</i> | ‘one thing ... one thing’ | |
| | e. | <i>onnə... mattonnə</i> | ‘one thing ... other thing’ | |
| | f. | <i>oru... marrə...</i> | ‘one ... other’. | |

3. *Some more examples.* The examples are from two languages with numerous reciprocal pronouns. For instance, in Gujarati, besides four “adverbial expressions” (Mistry 2000: 241), there are at least five anaphoric reciprocal pronouns, not counting the distributive *potpote* ‘each one’, lit. ‘self self’ (ibid., p. 340): *ekbijaa*, *ekmek*, *paraspar*, *anyonya*, *arasparas*. The last three items are borrowings from Sanskrit. They are stylistic variants of the more common *ekmek* and *ekbijaa*. Likewise, the Marathi language has a number of pronouns genetically related to the Gujarati pronouns: *ekamek* ‘each other’ and *ekadustra*, *paraspar*, *annyonya* (the last two forms are borrowed from Sanskrit (see Wali 2000: 518). Note that words with the reciprocal meaning can be borrowings.

3.2.1 Non-specialized reciprocal pronouns

3.2.1.1 *Personal pronouns as reciprocal markers* (German, To’aba’ita). The use of personal pronouns in the reflexive and/or reciprocal meaning more commonly occurs in the 1st and 2nd persons (18b–d), and a specialized reflexive pronoun is used in the 3rd person (18c’):

German

- | | | | | |
|------|-----|------------------------|-----------------------------|------------|
| (18) | a. | <i>sie lieben uns</i> | ‘they love us’ | |
| | a’. | <i>wir lieben uns</i> | i. ‘we love each other’ | reciprocal |
| | | | ii. ‘we love ourselves’ | reflexive |
| | b. | <i>wir lieben euch</i> | ‘we love you (PL)’ | |
| | b’. | <i>ihr liebt euch</i> | i. ‘you love each other’ | reciprocal |
| | | | ii. ‘you love yourselves’ | reflexive |
| | c. | <i>sie lieben sie</i> | ‘they love them’ | |
| | c’. | <i>sie lieben sich</i> | i. ‘they love each other’ | reciprocal |
| | | | ii. ‘they love themselves’. | reflexive |

However, there occur instances when a 3rd person pronoun is used in this way, i.e. both as a personal, reciprocal and reflexive pronoun (see (iii), (i) and (ii) respectively in (19)). For instance, the pronominal reciprocal (reflexive) marker in To’aba’ita (which has another two reciprocal markers, the prefix *kwai-* and adverb *kwai-liu*) is formally identical with the corresponding personal pronouns:

To’aba’ita (Lichtenberk 1991: 172)

- | | | | | |
|------|----------------|-------------|-----------------|------------------|
| (19) | <i>keero’a</i> | <i>keko</i> | <i>thathami</i> | <i>keero’a</i> . |
| | they.DU | they.DU | like | they.DU |

- i. ‘They like *each other*.’
- ii. ‘They like *themselves*.’
- iii. ‘They_i like *them_j*.’

I will note in passing that in Old and Middle English all the personal pronouns in object position had not only a personal meaning, like (iii) in (19), but also a reflexive meaning, like (ii) in (19); cf. *hi hie þa up ahofon* (Alfred Oros. 94) (cited from Mustanoja 1960: 430), i.e. ‘they rose then’, lit. ‘they_i; them_{i/j}; then up raised’. As Curme (1935: 157) states, “[t]his older usage lingers on in Shakespeare” (although the forms with *-self* are more common); e.g.: ‘A (= he) bears *him* like a portly gentleman.’ (Romeo and Juliet, I, v, 68) (ibid.).

3.2.1.2 *A distributive pronoun as a reciprocal marker (Pirahã).* The word *xogiágaó* ‘everyone’ is defined by Everett (1986: 217–8) as a “collective pronoun”. Judging from the examples, this word can function both as object (20a) and subject (20b) and in both instances the sentence allows reciprocal and other interpretations; note that in the second instance the polysemy is broader. Unfortunately, the brief description available leaves unclear several details of the reciprocal constructions; I hope that the researchers of the Amazonian languages will clarify this issue.

Pirahã (ibid., p. 217; *-áo-* = TELIC, *-b-* = PERF, *-á-* = REMOTE; *-há* = COMPLETE.CERT; *hi* = ‘s/he’, ‘him/her’, ‘they/them’; there is no plural)

- | | | | |
|---------|---|----|---|
| (20) a. | <i>hi hi xib-áo-b-á-há xogiágaó.</i> | b. | <i>xogiágaó hi xobai-xiig-á.</i> |
| | 3 3 hit- everyone | | everyone 3 see-CONT- |
| | i. ‘Everyone hit <i>themselves</i> ’ or | | i. ‘Everyone sees <i>each other</i> ’ or |
| | ii. ‘Everyone hit <i>each other</i> .’ | | ii. ‘Everyone sees <i>themselves</i> ’ or |
| | | | iii. ‘Everyone sees <i>him</i> ’ or |
| | | | iv. ‘Everyone sees.’ ³ |

3.2.2 *Specialized reciprocal pronouns. Two main types with respect to the retention of the antecedents when a reciprocal is embedded*

Both types can be inflected for person or not inflected (cf. (21a) and (21b), (27a) and (27b)).

3.2.2.1 *The long-distance antecedent can or must replace the antecedent of the base reciprocal.* Two formal subtypes are attested: in Subtype 1 the change of the antecedent is not obligatory (or even impossible if the matrix subject is singular), and in Subtype 2 the change of the antecedent is obligatory (the matrix subject in the singular is ungrammatical).

Subtype 1. Pronouns that can be used for the long-distance antecedent (English, Russian, Yakut). When the reciprocal construction is embedded, the antecedent can be retained in

3. The author writes about the ambiguity of (20b) (= (78) in his paper): “The ambiguity of (78) as seen in (i)–(iv) is both structural and semantic. Semantically, the pronoun *hi* is, as has been shown, ambiguous as to number and reflexivity/reciprocity. Syntactically, *hi* can be analyzed in (78) as direct object or a type of agreement marker. When really necessary to express unambiguous reciprocity, the preference is simply to list the participants or, more “commonly” (in quotes because the notion in any form is rare), to use *separate* clauses.”

the base construction. If the matrix subject is singular this antecedent does not change (cf. (22a) and (22c) below and (23c), (24c) in Ch.1, §5.2.1), if it is plural the construction can be ambiguous (see (22b) below and (23b) and (24b) in §5.2.1 of Ch. 1). Here belong two subtypes of pronouns: pronouns unmarked for person like English *each other* and Russian *drug druga* and pronouns marked for person like Yakut *beje-beje-leri-n*; cf. (-n = ACC, the case marker is preceded by a personal-possessive suffix indicating the person):

- (21) a. *each other* b. *beje-beje-biti-n* – for 1PL antecedent
 each other *beje-beje-yiti-n* – for 2PL antecedent
 each other *beje-beje-leri-n* – for 3PL antecedent

In (22b) *each other* can refer to *P. and M.* as its long-distance antecedent or to the subject of the embedded clause *they*, i.e. in the same way as in (22a):

- (22) a. *They loved each other.*
 b. *Peter and Mary said that they loved each other.*
 i. ‘P. and M. said that they (≠ P. and M.) loved each other.’
 ii. ‘P. and M. said that they (= P. and M.) loved each other.’
 c. *He said that they loved each other.*

Subtype 2. Pronouns that must be used for the long-distance antecedent (Even). In the case of embedding, a reciprocal pronoun can refer only to the subject. This type is represented by the Even reciprocal pronoun with the reflexive-possessive plural suffix *-ur/-wur* (when it is used, the accusative is zero-marked). It is the reflexive meaning of the suffix that relates the reciprocal pronoun to the subject. Note that this suffix is not used on the reciprocal pronoun only: its main use is on nouns, as in *bödel-ur* ‘ones’ (PL) feet’, *bödel-i* ‘one’s (SG) feet’.

Even (Malchukov, Ch. 39, §4.2.2)

- (23) *meen meen-Ø-ur* ‘each other’ for the 1PL subject as antecedent
 meen meen-Ø-ur ‘each other’ for the 2PL subject as antecedent
 meen meen-Ø-ur ‘each other’ for the 3PL subject as antecedent.

(24a), which is analogous to (21a) but contains a pronoun marked for the subject-oriented antecedent only, can be converted into a construction like (24b) with reading (ii) ‘the dogs bite the boys’, i.e. into a distant subject-oriented reciprocal. Reading (i) is ungrammatical even if the subject is singular (cf. (24c)), because of the marking for the subject antecedent on the pronoun. Thus, in other words, retention of the subject-oriented reciprocal pronoun in the embedded clause in (24b) either makes the sentence ungrammatical, if the subject is singular (24c), or changes the antecedent if the subject is plural, as is shown in (24b).

Even (Malchukov, Ch. 39, ex. (60); §4.2.1)

- (24) a. *ɲina-l meen meen-Ø-ur itme-Ø-r.*
 dog-PL each other-ACC-PL.REFL bite-NFUT.PL
 ‘The dogs were biting each other.’
 b. *Žör hurke-r₁ hina-l-bu₂ meen meen-Ø-ur₁ itme-mken-Ø-Ø.*
 two youth-PL dog-PL-ACC each other-ACC-PL.REFL bite-CAUS-NFUT.3PL

- i. *‘The two youths caused the dogs to bite each other (= dogs).’
 ii. ‘The two youths caused the dogs to bite each other (= youths); (i.e. hounded each other with dogs).’
 c. *Hurken *hina-l-bu meen meen-Ø-ur₁ itme-mken-Ø-ni*.
 youth dog-PL-ACC each other-ACC.-PLREFL bite-CAUS-NFUT-3SG
 (intended meaning:) ‘The youth caused the dogs to bite each other.’

3.2.2.2 Pronouns that cannot refer to a long-distance antecedent. In such cases the antecedent must be contained in the same clause as the reciprocal pronoun. The reciprocal pronoun can either agree with the antecedent in person (see (25) and (27a)) or not (27b). The embedding of the subject-oriented reciprocals may require a change of the reciprocal pronoun if the antecedent is to be retained. Two subtypes of reciprocal pronouns can be distinguished: those that are used in object-oriented reciprocal constructions only and those that can be used in both subject- and object-oriented constructions.

Subtype 1. Pronouns not used in subject-oriented constructions (Even). Instead of the reflexive-possessive suffixes in (23) and (24b), *personal*-possessive suffixes are used on these pronouns. They relate the reciprocal pronoun to the preceding noun phrase (e.g., to the direct object *hina-l-bu₂* in (26)). Note that these suffixes are used mainly on nouns; cf. *bödel-u-t* ‘our feet’ *bödel-u-hen* ‘your feet’, *bödel-u-ten* ‘their feet’ (*-u* = ACC). Here are the forms:

Even (Malchukov, Ch. 39, §4.2.2; *-me* = ACC)

- (25) *meen meen-me-t* ‘each other’ for the 1PL object as antecedent
meen meen-me-hen ‘each other’ for the 2PL object as antecedent
meen meen-me-ten ‘each other’ for the 3PL object as antecedent.

In order to make (24c) grammatical and retain the antecedent of (24a), the reciprocal pronoun marked for the subject antecedent should be replaced by the reciprocal pronoun marked for the object antecedent (25). Sentence (26) remains grammatical even if the subject of the matrix clause is singular.

Even (Malchukov, Ch. 39, ex. (60); §§4.2.1; 4.2.3)

- (26) *Žör hurke-r₁ hina-l-bu₂ meen meen-me-ten₂ itme-mken-Ø-Ø*.
 two youth-PL dog-PL-ACC each other-ACC-3PL bite-CAUS-NFUT-3PL
 ‘The two youths caused the dogs to bite each other (=dogs).’

Subtype 2. Pronouns used in subject- and object-oriented constructions (Hausa). The reciprocal pronoun in Hausa consists of two parts, *jūna-* (derived from a noun meaning ‘body’; the reflexive pronoun is formed from the noun *kāi* ‘head’) and optional bound 1PL, 2PL, 3PL possessive pronouns with the linker *-n-*; the form *jūnā* can be used for all persons (Jaggar 2001:66, 207, 413; 381); cf. *sun san jūnā* ‘they know each other’ (ibid., p. 207). Here are the forms:

- (27) a. *jūna-n-mù* or b. *jūnā* ‘each other’ for 1PL
jūna-n-kù or *jūnā* ‘each other’ for 2PL
jūna-n-sù or *jūnā* ‘each other’ for 3PL

In embedded constructions the antecedent remains the same. Thus, in (28b) the antecedents are *Bàla* and *Tankò*:

Hausa (Newman 2000: 531)

- (28) a. *Bàla dà Tankò sun cūci jūnā.*
 B. and T. they cheat each other
 ‘Bala and Tinko cheated each other.’
- b. *Kānde dà Jummaj sun san (cēwā) [Bàla dà Tankò]j sun cūci*
 K. and J. they know that B. and T. them cheat
jūnāj.
 each other
 ‘Kande and Jummaj know (that) Bala and Tanko cheated each other.’

3.3 Reciprocal semi-pronouns (Chukchi, Eskimo)

Unlike the reciprocal pronouns discussed above, reciprocal semi-pronouns (in another terminology, reciprocal pronominal adverbs) cannot be used in direct object position. The items labelled here semi-pronouns are attested in two languages of my corpus only, Chukchi and Eskimo which are geographically adjacent ergative languages (an areal phenomenon?). Like reciprocal pronouns of type (27a), they have forms marked for person but not for case (the case marker on these forms is fossilized); but they cannot appear as direct objects. When used with a semi-pronoun, a transitive verb undergoes detransitivization (= antipassivization in the ergative languages; marked with the suffix *-tku/-tko* in Chukchi, with a change of agreement in Eskimo). Note that in Chukchi the reflexive marker *uwik* (meaning ‘body’ when used as a noun) can take the direct object position, in an ergative construction.

1. *Chukchi*. This language has three forms of the monosemous reciprocal semi-pronoun derived from pronominal bases: *muri* ‘we’ - *mur-γ-in* ‘our’, *turi* ‘you.PL’ - *tur-γ-in* ‘your’, *ətri* (*ərrī*) ‘they’ - *ər-γ-in* ‘their’ where the possessive marker *-in* is attached to the locative marker *-k* changed into *-γ-* due to morphophonemic conditions. The complex suffix *-γ-ičγ-u* is perceived as a single unit although historically it consists of three suffixes (locative suffix *-γ*, polysemous “magnifying-honorific” *-čγ* and fossilized essive *-u*). This complex suffix does not occur in any other form (see also Nedjalkov, Ch. 40, case 2 in §8).

Chukchi

- (29) 1_{PL} *mur-γ-ičγ-u* ‘we mutually/each other’
 2_{PL} *tur-γ-ičγ-u* ‘you mutually/each other’
 3_{PL} *ər-γ-ičγ-u* ‘they mutually/each other.’

When used with two-place intransitive verbs, these semi-pronouns replace a non-direct object, and no other device is used to encode reciprocity, the absolutive structure of the underlying construction being retained. If they occur with transitives, the verb should be first intransitivized and the underlying ergative construction transformed into absolutive:

Chukchi (Nedjalkov, Ch. 40, §§4.2.1 and 4.2.2).

- (30) a. *Ajwanal̄-a ʔeqel̄-ət nə-yite-qinet.*
 Eskimo-INST enemy-PL.ABS IMPF-look-3PL+3PL
 ‘The Eskimos looked at the enemies.’
 b. *Ajwanal̄-ət payčeq-etə nə-yite-tku-qinet əryič̄yu.*
 Eskimo-PL.ABS CURIOUS-ADV IMPF-look-APASS-3PL they.mutually
 ‘The Eskimos looked at each other with curiosity.’

2. *West Greenlandic Eskimo.* Unlike the Chukchi reciprocal semi-pronouns, the corresponding Eskimo reciprocal lexeme has a reflexive meaning and in this usage it is also inflected for number and case but it lacks an absolutive form (i.e. the form used for the direct object). In the singular number this semi-pronoun has a reflexive reading while in the plural number it conflates both meanings. It is used in the fossilized allative case with the suffix *-nut* only. The plural forms are most frequently reciprocal (Fortescue 1984: 166). This is the main device for rendering the reciprocal meaning in Eskimo.

The Eskimo semi-pronoun has six such forms, three for the singular which can be reflexive only (see (31a)) and three for the plural with a reciprocal/reflexive polysemy disambiguated by context (see (31b) and (32b)). The reflexive SG semi-pronoun is *immi-* and PL is *immiC-* marked for person. Here are the plural forms:

West Greenlandic Eskimo (Fortescue, Ch. 19, §2.2.3)

- (31) a. *immi-nut* ‘myself, yourself, him/herself’
 b. *immi-tsin-nut* ‘ourselves/each other’, lit. ‘to ourselves’
immi-ssin-nut ‘yourselves/each other’, lit. ‘to yourselves’
immin-nut ‘themselves/each other’, lit. ‘to themselves.’

As in Chukchi, the use of this semi-pronoun requires intransitivization of a transitive verb; cf.:

West Greenlandic Eskimo (Fortescue 1984: 160)

- (32) a. *Tuqup-paa.* → b. *Imminnut tuqup-put.*
 kill-3SG+3SG self.3PL.ALL kill-3PL
 ‘He killed him.’ ‘They killed *themselves/each other*.’

3.4 Reciprocal adverbs (Malayalam, Modern Chinese)

In Malayalam, besides six reciprocal pronouns (see (17) above), there are also four reciprocal adverbs: *anyoonyam* ‘mutually, other-other’, *parasparam* ‘mutually’ (both borrowings from Sanskrit where they were reciprocal pronouns), *tammil* ‘in them’ or ‘among them(selves)’, *tammil-tammil* ‘in them-in them’, *añṇooTTum-iñṇooTTum* ‘that way this way’ (Jayaseelan 2000: 119; Asher & Kumari 1997: 168). Since in inflectional languages reciprocal adverbs are not inflected (while pronouns are), constructions with adverbs are perceived “as less transitive” when an adverb replaces a direct object. Jayaseelan (ibid., p. 121) comments: “Their presence (of the adverbials – V.N.) in the Verb Phrase “intransitivizes” a verb, so that no direct object argument surfaces”; cf.:

Malayalam (ibid., p. 121)

- (33) *awar aηηooTTum-iηηooTTum kaN-Du.*
 they that.way-this.way see-PAST
 ‘They saw each other.’

If there is no case inflection in a language, distinguishing between the adverbial and pronominal status of a reciprocal lexeme may pose problems. The distinctive criteria are (a) the fixed position of the reciprocal adverb relative to the predicate (which differs from the position of the direct object) and (b) the ability to be used with prepositions and postpositions. In particular, the Chinese reciprocal marker *hùxiāng* should be analyzed as an adverb (as it is not used with prepositions, usually placed in contact pre-position to the predicate, unlike a direct object which usually follows the predicate; see Hoa (1983:21–64) and example (85) in Nedjalkov, Ch. 1). Unlike the Chinese *hùxiāng*, the Vietnamese reciprocal marker *nhau* can take the syntactic positions of a noun and combine with prepositions. Therefore it is considered by some specialists a pronoun (see Bystrov & Stankevich, Ch. 47, §1.2); other scholars use the term reciprocal substitute (Nguyen Dinh-Hoa 1997:137). In Bamana, an isolating language, the marker *ɲɔŋɲɛ* ‘each other’ used with postpositions is considered a pronoun (cf. *ɲɔŋɲɛ fɛ* ‘with each other, together’; Vydrine, Ch. 46, §1.2).

There are also reciprocal markers that can function both as pronouns (if inflected for case) and adverbs; this is so for each of the two Korean reciprocal markers: *selo* ‘mutually, each other, together’ used for the antecedent with more than one animate referents and *selo-selo* (same) for the antecedent with more than two referent (Sohn Ho-min 1994:164–7). (On different reciprocal markers depending on the number of the referents see Nedjalkov, Ch. 1, §6.)

3.5 Auxiliary reciprocal words (Indonesian, Ancient Chinese)

A typical instance of this type of reciprocal markers is Indonesian *saling*, the most neutral and least restricted marker of reciprocity in Indonesian. In a way, it is intermediate between an auxiliary verb and a prefix. It cannot be separated from the verb by other words; it does not occur with any other part of speech; it always immediately precedes the predicate. Its linear position differs from that of the direct object, i.e. the phrase it replaces. It is unique in the sense that there seem to be no other words with similar properties in Indonesian (Ogloblin & Nedjalkov, Ch. 33, §6). In reciprocal constructions derived from two-place intransitives, the preposition of the base indirect object is not used:

Indonesian (ibid., ex. (120))

- (34) a. *Amir cinta kepada Fatimah.* ‘Amir loves Fatima.’ (lit. ‘... with Fatima’)
 b. *Amir dan Fatimah saling cinta.* ‘Amir and Fatima love each other.’

Note in this connection that Indonesian employs two more productive markers of reciprocity, a circumfix *ber-...-an* and pre-reduplication of the root; cf. *me-mandang* ‘to look

at' → *ber-pandang-an* 'to look at each other', *pandang-me-mandang* (same), cf. *saling me-mandang* and *saling ber-pandang-an* (same) (ibid., §1.2).

Yakhontov (Ch. 48, §3) notes that in traditional works by Chinese linguists, the Ancient Chinese reciprocal marker *xiāng* 'mutually, each other' is viewed as an "empty" word, while in Western linguistics a word of this class would be regarded as an auxiliary word, a pronoun or an adverb. He himself argues for its auxiliary status because it has an abstract grammatical meaning and belongs to a small closed set of words characterized by a distinctive set of properties, although it combines with prepositions (namely, with *yǔ* 'with', *wèi* 'for'; cf. *xiāng yǔ* 'with each other, together', *xiāng wèi* 'for each other'; ibid., §7).

3.6 Reciprocal adverbs of limited usage (Nivkh)

In Nivkh, there are adverbs *orχ+orχ*, and *rolo* meaning 'mutually', 'reciprocally', which can occur with two-place intransitive verbs and form reciprocal constructions on their own, i.e. they can be the only reciprocal device in a sentence. According to the informant, they are most natural with verbs denoting negative (emotional) relations; e.g.:

Nivkh (Otaina & Nedjalkov, Ch. 41, §6)

- (35) a. *əmək atək-roχ t'axta-d'*
 mother father-ALL get.angry-FIN
 'Mother got angry with Father.'
- b. *əmək-xe atək-xe orχ+orχ t'axta-d'-yu.*
 mother-COM.DU father-COM.DU mutually get.angry-FIN-PL
 'Mother and Father got angry with each other.'

Cf. also examples in Hoa et al. (Ch. 49, §4.3) where the use of a special postposition *zhijiàn* 'among' with nominalizations of verbs denoting emotions and attitudes (like "They developed a mistrust *between us*") is discussed, and paragraph (b) in 6.1.3 on Modern Greek where the medio-passive form used to express reciprocity mostly on emotive verbs is discussed.

3.7 Reciprocal specifiers

Reciprocal specifiers are words and phrases that cannot be used to encode reciprocity on their own. They co-occur with grammatical or lexical reciprocals either for emphasis or for disambiguation (cf. (36a) and (36b) below).

3.7.1 Specifiers of the adverbial ('mutually') type (German, French, English, Polish)

Reciprocal adverbs are used with reciprocally marked verbs only (thus they are additional markers), cf. German *gegenseitig* lit. '(on) the opposite' which occurs (almost exclusively) with the clitic reciprocals (with *sich*):

German (= (87a, b, c) in Nedjalkov, Ch. 1)

- (36) a. *Sie liebten sich.* i. ‘They loved *themselves*’, ii. ‘They loved *each other*.’
 b. *Sie liebten sich gegenseitig.* lit. ‘They loved *each other mutually*.’
 c. **Sie liebten gegenseitig.* lit. ‘They loved *mutually*.’

Other examples of reciprocal specifiers are Polish *nawzajem/wzajemnie* ‘mutually’ (see Wiemer, Ch. 11, §6.1) and Tuvan *udur-dedir* ‘mutually’, ‘face to face’ (see Kuular, Ch. 27, §3.1.5). Judging by the data at my disposal, the Ainu reciprocal adverb *u-tas-pa* ‘mutually, each other, by turns’ (containing a reciprocal prefix) combines with morphological and lexical reciprocals (see Alpatov et al., Ch. 42, §13). Most likely, the To’aba’ita marker *kwai-liu* <REC-walk.past/around, pass (by), roam (about)> (Lichtenberk, Ch. 36, §6) is also a reciprocal specifier if we take into consideration the fact that in the examples cited in Lichtenberk (1991:171–83, 1999:31–62; Ch. 36) it is used either with morphological reciprocals with the prefix *kwai-* pleonastically or with pronominal reciprocals of type (9) for disambiguation.

In Vietnamese, the reciprocal specifier *lãn* i. ‘mutually’, ii. ‘together’ (descended from the verb *lãn* ‘to mix’, ‘to confuse’), is proposed to the reciprocal pronoun *nhau* to stress reciprocity (Bystrov & Stankevich, Ch. 47, §2.7, case 2). The constraints on the use of *nhau* with *lãn* are not quite clear. Thus, the phrases *day lãn nhau* ‘to teach each other’ and *giup do lãn nhau* ‘to help each other’ are grammatical while *yeu lãn nhau* ‘to love each other’ is not.

Note that some of such adverbial specifiers are ungrammatical when used with verbs (36c), but acceptable when used attributively in nominalizations (36d), although there is a restricted selectivity in the latter case (36e) (see also Wiemer, Ch. 11, §§4.6.1, 6.2.2; Wiemer & Nedjalkov, Ch. 10, §4.6). Grammaticality of (36d) is probably due to the fact that nouns like *love* are two-place and can form base constructions of the type *My love for Mary – Mary’s love for me*; cf. *Our (mutual) love* where the adjective *mutual* inherits the syntactic position of the agentive attribute (cf. also (39), (40)). For similar reasons, phrases with reciprocal adjectives like (36d) are correct in German and English, and phrases like (36e) are not: emotive verbs (see Nedjalkov, Ch. 1, §2.4) have a weaker degree of transitivity than verbs like *ermorden* ‘to murder’, and the absence of an object on the noun is less noticeable.

- (36) d. *gegenseitige Liebe* ‘mutual love’
gegenseitiger Hass ‘mutual hatred’
 e. *der gegenseitige Mord* lit. ‘*mutual murder.’

3.7.2 Specifiers of the pronominal type (‘among/between ourselves/.../themselves’)

Like the previous type, these specifiers are peculiar in that they do not encode reciprocity on their own, but they differ from the previous type in that they serve to stress that *the action is confined to the subject referents*, or that the participants are thought of as a group. They occur in many languages, cf. Tuvan *arazanda* ‘among/between themselves’ (see Kuular Ch. 27, §3.1.5). In some languages they are rarely or never used with non-reciprocal predicates, i.e. they are confined to morphological or lexical reciprocals and their deriva-

tives (see Yomdin 1981:103–4). Thus, the Lithuanian reciprocal specifier *tarpusavyje* ‘between selves’, its paraphrase *tarp savęs* with the same meaning and *savo tarpe* lit. ‘in our/your/their midst’ are never used with non-reciprocal verbs. Contrary to the phrase *vienas kitą* ‘each other’, these latter specifiers are used mostly for emphasis. They may refer to many as well as to two participants. These phrases are most common with morphological reciprocals meaning ‘to scold each other’, ‘to quarrel’, ‘to fight’, ‘to talk/whisper to each other’, etc. With some of the reciprocals (cf. (37c)) they are ungrammatical, but the reasons are not clear.

Lithuanian (Geniušienė, Ch. 14, §9)

- (37) a. *Juodu su-si-žvalgė tarpusavyje.*
 ‘They.two(M) exchanged glances between themselves.’
 b. *Jiedvi bara-si tarp savęs.*
 lit. ‘They.two(F) are abusing each other between themselves.’
 c. **Jie su-si-žiedavo tarp savęs.*
 ‘They exchanged rings (got betrothed) between themselves.’

In Even, the reciprocal specifier *meer dooli(-wur)* ‘among themselves’, ‘(to) each other’ is mostly used pleonastically in combination with suffixed reciprocals:

Even (Malchukov, Ch. 39, §6)

- (38) *Heejeke-l hil-žihadur meer dooli maa-mač-čot-ta.*
 Yukaghir-PL suffer-CONV among themselves kill-REC-ITER-NFUT.3PL
 ‘The Yukaghirs killed each other (among themselves) in order not to suffer (not to be tortured).’

3.7.3 Relations between reciprocal pronouns and reciprocal specifiers

In some languages, syntactic reciprocal markers can develop into reciprocal specifiers, or vice versa.

1. *Reciprocal pronoun > specifier.* In some Romance languages, reciprocal pronouns show a tendency to function as reciprocal specifiers, i.e. they fall out of use as independent markers of reciprocity. Thus, French *l’un l’autre* ‘each other’ has lost its pronominal nature on verbs with the reflexive clitic,⁴ and it retains its reciprocal function on verbs constructed with a prepositional object (cf. (94)–(95) in Ch. 1); cf. also Bulgarian *edin drug* (see (90)–(91) in Section 1) and Telugu where the use of the reciprocal pronoun *okaLLa-ni okaLLu* ‘one-ACC one.NOM’ does not require omission of the marker *kon-* on so-called ‘verbal reflexives’ (Subbarao & Lalitha 2000:226; on verbal reflexives in Dravidian languages see Nedjalkov, Ch. 1, §11.4).⁵

2. *Reciprocal specifier > reciprocal marker.*

4. A similar situation is observed in Italian where *l’un l’altro* cannot take the direct object position and co-occurs only with the reflexive clitic *si*, which makes Belletti (1982/1983: 103, 127–8) regard it as an adverbial.

5. Note that in closely related Kannada the reciprocal marking on the verb termed reflexive in Dravidian linguistics (see (79) in Ch. 5) is optional if a reciprocal pronoun is used (Amritavalli 2000:85–6; Subbarao & Lalitha 2000:260).

2a. Specifiers of the *adverbial* ('mutually') type (see 3.7.1) do occur as reciprocal markers, although the examples at my disposal are not always beyond doubt. Here belongs Russian example (39) from fiction, though it is not accepted by some native speakers; this specifier is ungrammatical with verbs, cf. **Oni vzaimno ljubjat* lit. 'They mutually love', but possible in attributive usage, as in *vzaimnaja ljubov'* lit. 'mutual love'. Here, as in a number of other cases, the head words denote emotions and actions (e.g. reprimands, insults, provocations, compliments, services, help, etc.) normally caused by emotions; cf. (4) in 1.2.3, and (36d) in 3.7.1. It is interesting to note that some authors accept the use of the English specifier *reciprocally* as the only reciprocal marker acceptable with certain verbs (according to Miller (1993:194), it "is grammatical though rare", cf. (40)):

(39) *Oni byli vzaimno raspolozheny.* lit. 'They were mutually disposed.'

(40) *They loved reciprocally.* (ibid., p. 193).

Another example is the German specifier *gegenseitig* 'mutually' in the translations of Japanese reciprocals (*-a* = REC) as the only reciprocal marker encountered in a Japanese-German dictionary: *syutyoosi-a-u* 'gegenseitig behaupten', *seme-a-u* 'gegenseitig kritisieren', but cf. *wakari-a-u* 'sich gegenseitig verstehen' (Hasselberg 1996:42, 44).

2b. Specifiers of the *pronominal* ('among selves') type (see 3.7.2). Such cases are also rare. An interesting example is the Latin marker *inter se* 'each other', lit. 'among/between themselves' (*A et B inter se amant* 'A and B love one another') which seems to have developed from a specifier. Another example is Udehe, where, in contrast to the closely related Even language (cf. (38) above), the specifier *mene dolo* 'among themselves' can also function as the only marker of reciprocity, though mostly with intransitive verbs (probably because most of the morphological reciprocals are intransitive).

Udehe (Nikolaeva, Ch. 23, §4)

(41) *Mene dolo e-iti asa.*
REFL within NEG-3PL respect
'They don't respect each other.'

4. Type C. Periphrastic (analytical) constructions

Three periphrastic devices are registered so far.

4.1 Active participle + auxiliary verb (Kiranti)

In such constructions the reciprocal meaning cannot be ascribed to any one of the components. (This is also characteristic of Type A, but in A two notional verbs in two clauses are used, and here we find one notional verb with an auxiliary.) This idiosyncratic device for reciprocalization is attested in the Kiranti languages: for instance, in Bantawa the periphrastic reciprocal construction consists of an active participle with the suffix *-pa* and the postposed inflected auxiliary verb *mi* 'to do'. This construction has a morphological

variant with the agreement marker attached (preposed) to the participle: cf. *tī-* and *im-* in (42) and (43) respectively. In this case, the whole formation should be regarded as an instance of Type D or even Type E, with *-pa-* in (42b) and (43b) as an infix.

Bantawa (Ebert 1994: 54; ex. (43) – K. Ebert, p.c.)

- (42) a. *dhat-pa* *tī-mī-a-nin.* b. *tī-dhat-pa-mī-a-nin.*
 beat-ACT.PART 2-DO-PAST-2PL 2-beat-ACT.PART-DO-PAST-2PL
 ‘you beat each other’, lit. ‘you made fighter’ (same as (a)).
- (43) a. *nop-pa* *im-mī.* b. *im-nop-pa-mī.*
 touch-ACT.PART 3PL-DO 3PL-TOUCH-ACT.PART-DO
 ‘they touch each other’ (same as (a)).

4.2 Detransitivized notional verb + reciprocal auxiliary (Mvtwang dialect of Dulong/Rawang)

In this dialect of a Tibeto-Burman language, reciprocals are formed by means of the intransitivizing prefix *v-* alone (it can also form anticausatives but not reflexives which are formed by the reflexive/middle marker *-shi*):

Dulong/Rawang (Mvtwang dialect; LaPolla 2000:288–9)

- (44) a. *ang-maq v-shvt-ē.*
 3PL PREF-hit/kill-NONPAST
 ‘They are arguing/fighting.’

In this dialect, however, combination of a notional verb with an auxiliary verb is another means of marking reciprocals: “the verb *kē ~ kē* ‘eat (meat), bite’ has grammaticalized into an auxiliary reciprocal marker, and generally the two markers are used together” (ibid.); cf.:

- b. *ang-maq v-yvng kē-ē.*
 3PL PREF-see REC-NONPAST
 ‘They are looking at each other.’

4.3 Deverbal substantive + auxiliary (Kâte)

This reciprocal form is attested in one language where it is derived from a small number of bases and consists of a deverbal noun whose initial syllable undergoes reduplication and an auxiliary verb *e* (Pillhofer 1933:99–101). Reciprocals derived from nouns of action are marked with reduplication of the auxiliary verb.

Kâte (ibid., p. 99)

- (45) a. *baficke* ‘to help/love’ → *ba-bafic e* ‘to help/love each other’
 b. *sopecke* ‘to scold’ → *so-sopec e* ‘to curse each other.’
- (46) a. *bulec* ‘a lie’ → *bulec eec e* ‘to lie to each other’
 b. *pelec* ‘argument’ → *pelec eec e* ‘to argue with each other.’

5. Type D. Compounds with recurrent components (Chinese, Tucano, Japanese)

I have in mind components which are used in many compounds. As Aikhenvald (Ch. 30, §5.1) claims, “[t]ypologically, the use of verb compounding to mark reciprocals is an extremely rare phenomenon”.

1. *Chinese*. The general tendency to replace monosyllabic words with synonymous disyllabic words in Chinese (cf. *bāng* ‘to help’ + *zhù* ‘to help’ → *bāng-zhù* ‘to help’) gives rise to compound reciprocals, built as combinations of two lexical reciprocals (see (47a)).⁶

In such instances the use of the recurrent components *jiāo* ‘to intersect/cross’, ‘to join’, *duì* ‘to be opposite (to) each other’, and some others does not essentially change the meaning of the base verbs. Alongside some compounds of type (47a), the verb *jiāo* and other analogous components form a second group of compounds where the reciprocal meaning is expressed by this initial component. Thus, in (47a) the meaning of the initial component is practically not represented in the semantic structure of the compounds, while in (47b) it is.

Modern Chinese (Hoa et al., Ch. 49, §7)

- | | | | |
|---------|-------------------------------------|---|---|
| (47) a. | <i>hǎo</i> ‘to be friends’ | → | <i>jiāo-hǎo</i> (same) |
| | <i>bǐ</i> ‘to compare sth with sth’ | → | <i>duì-bǐ</i> (same) |
| b. | <i>bài</i> ‘to bow to sb’ | → | <i>jiāo-bài</i> ‘to bow to each other’ |
| | <i>liú</i> ‘to flow’ | → | <i>jiāo-liú</i> ‘to flow together (into one place)’ |
| | <i>kàn</i> ‘to look’ | → | <i>duì-kàn</i> ‘to exchange glances’ |
| | <i>mà</i> ‘to scold’ | → | <i>duì-mà</i> ‘to scold each other.’ |

Compounds with the recurrent initial components borrowed from Chinese are also encountered in Vietnamese (Bystrov & Stankevich, Ch. 47, ex. (47)–(50)).

In the following type of compounds we observe reduplication of the lexical verb combined with the grammaticalized use of the verbs *lái* ‘to come’ and *qù* ‘to go’, denoting motion in opposite directions (this form is more commonly used to denote iterativity):⁷

Chinese (Liu 1999: 124–32; (48) = (18) in Ch. 1)

- | | | | |
|---------|------------------------|----|----------------------------|
| (48) a. | <i>Tāmen dǎ-le ta.</i> | b. | <i>Tāmen dǎ-lái-dǎ-qù.</i> |
| | they hit-PERF he | | they hit-come-hit-go |
| | ‘They hit him.’ | | ‘They hit each other.’ |

2. *Tucano*. In Tucano (see Aikhenvald, Ch. 30), reciprocals are formed by compounding either the verb *poteō* ‘to equalize, restitute, counterbalance’ or *amē* ‘to do each other, do back, retribute, reward’ with a lexical verb. The first verb comes before the lexical verb and the second goes after it. Both verbs can co-occur in the same compound, with a slight difference in meaning.

6. These processes are characteristic not only of reciprocals in Chinese: over two thirds of verbs in everyday vocabulary of Chinese are disyllabic; Hoa et al., Ch. 49, §2.2.

7. The use of verbs meaning ‘to come’ and ‘to go’, i.e. motion in opposite directions, for marking iterativity and, later, reciprocity, reminds one of the fact that the term *reciprocal* is derived from the Latin *reciprocus* ‘reverse, back (motion), moving back and forth’.

Tucano (ibid., §§5.3.1 and 5.3.2)

- (49) *kē* ‘to hit sb’ → *amē-kē-/amē-kē-poteō* ‘to hit each other’
iyá ‘to look at sb’ → *malī iyā-poteā-lā* *we.*
 we look-equalize-PL do
 ‘We are looking at one another (i.e., you are looking at me and I am looking at you back an equal number of times).’

3. *Japanese*. In this language, there is a number of reciprocal verbs derived according to an unproductive pattern with the prefix *a-i-*.

Japanese (Alpatov & Nedjalkov, Ch. 25, §9, ex. (76))

- (50) *koros-u* ‘to kill’ → a. *a-i-koros-u* ‘to kill each other’
 b. *korosi-a-u* (same).

This prefix has evolved from a deverbal noun with the suffix *-i* (cf. *hanasi-a-u* ‘to discuss’ – *hanasi-a-i* ‘discussion’). Thus, the intransitive verb *ai-koros-u* (50a) diachronically is a compound composed of the action noun *a-i* and the transitive verb *koros-u* ‘to kill’. A productive reciprocal marker is the suffix *-a-* (positional variants *-aw-/at-*) going back to the lexical verb *a-u* ‘to meet, fit’ (see Ch. 25, §13). This is a peculiar case because the prefix *a-i-* is also descended from this verb. It is interesting to note that if the prefix *ai-* had retained its productivity it would be the only verbal prefix in Modern Japanese (if we disregard the honorific prefix *o-*).

6. Type E. Affixing, including inflection and zero marking on the predicate

This type is much more varied than the previous ones. Some of the markers are much more polysemous than most markers of Types A-D listed in §1.2 above. In this section, I will discuss seven main morphological means of marking reciprocity:

1. Detransitivization without any derivational means (§6.1).
2. Reciprocal marker in the agreement slot: it acts here as a kind of filler-in (6.2).
3. Prefixation; from a certain point of view, this type overlaps with type 2 (6.3).
4. Suffixation (6.4).
5. Infixation (6.5).
6. Circumfixation (= confixation; 6.6).

In contrast to subtype 2, affixes of subtypes 3–6 do not fill in the slot of any agreement markers. Affixation can be applied simultaneously with reduplication (see (71) and (72)) below).

Although basically the means of expressing reciprocity are formally of the same types as in the case of other grammatical categories, they have a number of peculiarities.

- The reciprocal marker may be the only prefix or the only infix in a language (it is probably not accidental that a language where the only suffix is reciprocal in meaning

has not occurred in my list, although the reasons are not clear to me).⁸ For instance, in Bari, the only verbal prefix *tɔ-* functions as a causative or reciprocal marker (Spagnolo 1933: 157). The reciprocal prefix *u-/v-* is the only prefix in Nivkh, if we disregard the reflexive prefix *p'*- (which can also be treated as a reflexive pronoun *p'i* 'self' in the direct object position), (Otaina & Nedjalkov, Ch. 41). The reciprocal marker *-ep-/pe-/p-/...* (cf. *lel* 'to see' → *le-pe-l* 'to see each other'; Osada, Ch. 37, §1.2) is the only infix in Mundari; in Proto-Munda, though, this infix was used in combination with the reciprocal prefix, and this marking is preserved only in the peripheral Gta? language (cf. *bi?* 'to give' → **ho-b-m-i?* → *ho-m-m-i?* 'to exchange'), while in some other languages of this family the prefix alone is preserved (cf. Juang *gata* 'to talk' → *ko-gata* 'to converse'; Zide & Anderson 2001: 519–20). In Itelmen (Volodin, Ch. 43), the reciprocal prefix *lu-/lo-* and the causative prefix *len-*, *ən-* (usually the initial part of the causative circumfix) are the only derivational prefixes. It is interesting to note that Nivkh, Ainu and Itelmen are in areal proximity and their reciprocal prefixes are formally identical or similar (63)–(65). Note also that Yukaghir surrounded on many sides by languages employing suffixation uses a prefix for denoting reciprocity (66).

- A peculiarity of reciprocal markers in some languages is their frequent co-occurrence with markers more or less close in meaning to them and also with the meaning of plurality (cf. Chukchi *-tku-waly-* in (83) and *-waly-čit-* in (85), Evenki *-ldə-maat-* in (86c), Buryat *-lda-lsa-* in (88b) and *-sa-lda-* in (88a), Udehe *-si-masi-* in (89b)).
- Other peculiarities are the obligatory co-occurrence of the reciprocal marker with a dual prefix in Awtuw even if the antecedent is plural (73), and the existence of a special marker for two participants and another for more than two in a number of languages (see 1.5.3). Root or affix reduplication is a manifestation of iconicity in reciprocal marking (see (71), (75) and Section 6.7).

6.1 Detransitivization without any derivational markers

Judging by the available sources, this type of marking is rare across languages and usually co-exists with some other reciprocalization markers.

6.1.1 Direct object deletion without change of inflection on the verb (English, Tariana)

The reciprocal meaning is expressed by the omission of the (direct) object, in the context of a non-singular subject, as in English sentences with a limited number of verbs, e.g.:

- | | | |
|---------------------------|---|----------------------|
| (51) <i>He kissed her</i> | → | <i>They kissed</i> |
| <i>He embraced her</i> | → | <i>They embraced</i> |
| <i>He met her</i> | → | <i>They met</i> |
| <i>He argued with her</i> | → | <i>They argued.</i> |

Faltz (1977: 12) considers this type of detransitivization as middle strategy: “Interestingly, the range of functions served by *-sja* and those served by the English middle strategies

8. Note in this connection that, as is known, suffixes are much more widespread across languages than prefixes.

overlap considerably, yet do not exactly coincide.” The same reciprocal strategy is observed in Tariana:

Tariana (Aikhenvald, Ch. 30, §3.1.3)

- (52) a. *naha na-kwisa wa-na.* → b. *naha na-kwisa.*
 they 3PL-hate 1PL-OBJ they 3PL-hate
 ‘They hate us.’ ‘They hate each other.’

6.1.2 *Subject agreement instead of subject-object agreement (Eskimo, Chukchi)*

In Eskimo, however, this marking is used together with an applicative suffix, and, usually, with a reflexive-reciprocal semi-pronoun (see (31), (32) above). In Chukchi the more productive markers are a reciprocal suffix *waly-* (83)–(85) and also a reciprocal semi-pronoun (29), (30b).

West Greenlandic Eskimo (Fortescue 1984: 166)

- (53) a. *kunip-paa* ‘he embraced him’ (-*paa* = 3SG+3SG ‘s/he... him/her/it’)
 b. *kunip-put* ‘they embraced’ (-*put* = 3PL ‘they’).

Chukchi (Nedjalkov, Ch. 40, ex. (84))

- (54) a. *ukwen-nin* ‘he kissed her’ (-*nin* = 3SG+3SG ‘s/he... him/her’)
 b. *ukwet-yʔet* ‘they kissed’ (-*yʔet* = 3PL ‘they’).

6.1.3 *Middle (passive) conjugation instead of active conjugation (Modern Greek)*

This type may be ascribed to the types discussed in 6.1 with reservations. The middle inflection is used to express a number of meanings, in particular, reciprocity and reflexivity among them. In Modern Greek, it is used with a limited number of transitives denoting emotional relations, such as love or hatred (cf. (55a–b)), as well as actions caused by these feelings (Joseph & Philippaki-Warburton 1987: 84). In the case of polysemy, the reciprocal prefix *alilo-* may be added for disambiguation, as in (55d), or the expression *metadzu tous* ‘between/among themselves’ (Mackridge 1985: 89).

Modern Greek (ibid., p. 84–5)

- (55) a. *ayap-ame* ‘we love sb’ → *ayap-iomaste* ‘we love each other/ourselves’
ayap-ate ‘you love sb’ → *ayap-iosaste* ‘you love each other/yourselves’
ayap-ane ‘they love sb’ → *ayap-iunde* ‘they love each other/themselves.’
 b. *mis-un* ‘they hate sb’ → *mis-junde* ‘they hate each other/themselves.’
 c. *kitáz-un* ‘they are looking at sb’
 d. *alilo-kitáz-onde* ‘they are looking at each other.’

6.2 Derivational-paradigmatic means

This device is a combination of overt morphological marking of reciprocity and unmarked agreement change. There are at least two distinct subtypes.

Subtype 1: a reciprocal marker is not attached to the verb stem but it is inserted in the object-agreement slot, the agreement marker being deleted (it may be separated from the root by another agreement marker, cf. Abaza *j-aba-xI-* ‘this-REC-we-’ in (57b)).

Subtype 2: a marker with the principal transitivity function (i.e. applicative: non-causative transitivity) marks reciprocity only if the derivative is simultaneously de-transitivized, which is reflected in the substitution of subject agreement for subject-object agreement. If detransitivization does not take place, the same marker has a different meaning (62b).

6.2.1 A reciprocal marker substituted for an agreement affix

The position of the agreement marker is filled by a reciprocal marker.

6.2.1.1 *One marker for subject and direct object reciprocalization, another for other cases (Kabardian).* In Kabardian, the reciprocal marker *zə-r(ə)-* is used to mark reciprocal relations between subject and direct object on a transitive verb, and *zə-* in other cases, namely, between subject and non-direct object, direct and non-direct objects; see (127b) and (141b)–(141’b) in Ch. 1 (Kazenin, Ch. 17, §1.3). The object-agreement marker is omitted and a reciprocal marker fills its position in the verb structure; cf.:

Kabardian (ibid., §§3.2.1.1.1–3.2.1.1.3)

- (56) a. *a-xə-m uə u-a[-o]-cIəx-Ø.*
 they-PL-ERG you 2SG-3PL-DYN-KNOW-PRES
 ‘They know you.’
 b. *a-xə-r Ø-zər-o-cIəx-Ø.*
 they-PL-ABS 3PL-REC-DYN-KNOW-PRES
 ‘They know each other.’

6.2.1.2 *One marker for two- and three-place transitives, another for two-place intransitives (Abaza).* Sentences (57) and (58) from Abaza (genetically related to Kabardian) illustrate this type of marking for three-place transitives. In (57b) and (58b), i.e. in subject-oriented “indirect” and object-oriented reciprocals, the reciprocal prefix *aba-* (< *aj-ba-*) takes the position of the non-direct object marker *-la-/-l-* after the direct object agreement marker and before the subject agreement marker.

Abaza (Tabulova 1976:192)

- (57) a. *j-la-j-xIv-tI* → b. *j-aba-xI-xIv-tI*
 this-she-he-tell-PAST this-REC-we-tell-PAST
 ‘He told her this.’ ‘We told this to each other.’
 (58) a. *də-l-də-r-ba-tI* → b. *xI-aba-də-r-ba-tI*
 he-she-they-CAUS-see-PAST we-REC-they-CAUS-see-PAST
 ‘They showed him to her.’ ‘They showed us to each other.’

Two-place transitives also take the prefix *aba-* but it occupies another position in the word (cf. *də-r-* ‘s/he-they-’ and *j-aba-* ‘they-REC’ in (59)). On two-place intransitives the recip-

rocal marker *aj-/a-* occupies the position of the [non-direct-]object agreement marker, as in (57) and (58); cf. *s-la-* and *xI-aj-* in (60).

Abaza (Tabulova 1976: 191–2, 193)

- | | | | | |
|---------|-----------------------|---|----|---------------------------|
| (59) a. | <i>də-r-dər-itI</i> | → | b. | <i>j-aba-dər-itI</i> |
| | s/he-they-know-PRES | | | they-REC-know-PRES |
| | ‘They know him/her.’ | | | ‘They know each other.’ |
| (60) a. | <i>s-la-čvažva-tI</i> | → | b. | <i>xI-aj-čvažva-tI</i> |
| | I-she-speak-PAST | | | we-REC-speak-PAST |
| | ‘I spoke to her.’ | | | ‘We spoke to each other.’ |

Abaza has at least five more, though unproductive, reciprocal markers (72).

6.2.1.3 *Reciprocalization of two-place intransitives only via transitivization by means of an applicative marker (Ainu).* In Ainu, the reciprocal prefix *u-* takes the position of the object-agreement marker, which means that only transitives can be reciprocalized. The reciprocalization of two-place intransitives is possible only after transitivization by means of the applicative prefix *ko-* (see Alpatov et al., Ch. 42, §3.1.1.2).

Ainu (ibid.; *-as* ‘we’, *eci-un-* ‘you(PL)-us’)

- | | | | |
|---------|-----------------------|--|--------------|
| (61) a. | <i>itak-as</i> | ‘we (INC) speak’ (addressee cannot be named) | one-place vi |
| b. | <i>eci-un-ko-ytak</i> | ‘you (PL) speak to us’ | two-place vt |
| c. | <i>eci-u-ko-ytak</i> | ‘you (PL) speak to each other.’ | one-place vi |

6.2.1.4 *An applicative marker used to mark reciprocity via detransitivization (Eskimo).* This case is entered here in this section with reservations. As mentioned above, a marker here acquires the reciprocal meaning only if the derivative is intransitivized, which is reflected in the change of the agreement marking (as is shown in (62) below) and substitution of the nominative construction for the ergative. In cases (63)–(66) the predicate is also intransitivized but it is marked on the stem (cf. Itelmen *tnete-* ‘to push sb’ → *lu-tnete-* ‘to push each other’ in (65)), i.e. the stem shows that it is a derivative, while cases like (62) require an inflected intransitive form. Reciprocals in Eskimo contain a highly polysemous suffix *-ut(i)* (assimilated as *-up/-u/-ap*) with the main applicative function. It introduces a (new) direct object with meanings like ‘for someone’, ‘with someone’, ‘instead of someone’, ‘together with something’, etc., depending on the lexical meaning of the base verb and context. In principle, these meanings can be expressed by the transitive stem *malirsu-up-* in (62b). As mentioned, this applicative may acquire the reciprocal meaning when this form is intransitivized. Thus we can claim that two operations, viz. addition of the applicative suffix *-up* in (62b) and detransitivization, are applied simultaneously.

West-Greenlandic Eskimo (Fortescue, Ch. 19, §3.2.1)

- | | | |
|---------|-----------------------|---|
| (62) a. | <i>malirsur-paa</i> | ‘he pursued him’ (<i>-paa</i> = 3SG+3SG ‘s/he... him/her/it’) |
| → b. | <i>malirsu-up-put</i> | ‘they pursued one another’ (<i>-put</i> = 3PL ‘they’); cf. (40). |

6.3 Prefixation

6.3.1 *Prefixation without special features.*

The prefix is the main or the only marker of reciprocalization.

- Nivkh (Otaina 1978:121)
 (63) -*γ*- 'to kill'
 → *u-γ*- 'to kill each other.'

- Ainu (Tamura 1996:753)
 (64) *kasuy* 'to help'
 → *u-kasuy* 'to help each other.'

- Itelmen (Volodin 1976:210–1)
 (65) *tnete-* 'to push sb'
 → *lu-tnete-* 'to push each other.'

- Yukaghir (Maslova, Ch. 44, ex. (1))
 (66) *juö* 'to see'
 → *n'e-juö* 'to see each other.'

While in many Indo-European languages reciprocity is expressed by a reflexive clitic (see Section 8) (English, Albanian and Greek employ other means), the Celtic languages use a prefix:

- Welsh (H. Pilch, p.c.)
 (67) a. *gweld* 'to see'
 → *ym-weld* 'to see each other'
 b. *dadlu* 'to debate'
 → *ym-ddadlu* 'debate with each other'

- Breton (H. Pilch, p.c.)
 (68) a. *karout* 'to love'
 → *en em-garout* 'love each other'
 b. *kasaat* 'to hate'
 → *en em-gasaat* 'hate each other.'

Note that this prefix displays a polysemy typical of the Indo-European reflexive clitics: it also has a reflexive meaning, depending on the context and the number of the subject (cf. Welsh *ym-olchodd Wyn* 'Wyn washed himself'; Awbery 1976:134). This prefix is practically lost in Irish but still productive in Welsh (*ym-* < *ambi-*) and Breton (*en em-*, *en* being a fossilized 3SG pronoun used irrespective of the person and number of the subject). This prefix is related to the German *um-*, Old English *ymbe-*, Latin *ambi-*, Greek *ἀμφί-*. Like its German cognate, Celtic *um* also functions as a preposition (see Lewis & Pedersen 1961:264; Vendryes 1927:49–62; Thurneysen 1892:523–7).

6.3.2 *Prefixation with special features*

These special features may concern the structure and form of a reciprocal prefix, conditions of its inclusion in the verb structure, distribution among various valency verb classes, etc.

6.3.2.1 *Different reciprocal markers for the 1st and non-1st persons (Huichol and some other Southern Uto-Aztecan languages).* Below, the reader will find the set of prefixes in Huichol, which render both the reflexive and (in the plural the) reciprocal meanings.⁹

9. The use of *yu-* in 2PL is probably accounted for by the expansion of 3PL, which can also be typologically expected.

Huichol (Langacker 1976:36)

- | | | | |
|------|--|------|--|
| (69) | SG PL
1. <i>ne- ta-</i>
2. <i>ʔa- yu-</i>
3. <i>yu- yu-</i> | (70) | <i>we-pl-yuu-naaki²eri</i>
3PL-ASSR-REFL-love
‘They love each other.’ |
|------|--|------|--|

Alternation of the markers for person and number resembles alternation of pronouns in German (18) and alternation of endings in Greek (55).

6.3.2.2 Reduplication of a reflexive-reciprocal prefix (Apalai). The prefix *os-/ot-/at-/e-* in Apalai denotes both reflexivity and reciprocity, but its *reduplicated* variant is reciprocal only. In our material, the reduplication of affixes is much less common than the root reduplication in reciprocal pronouns (cf. (13)–(17) above).

Apalai (Koehn & Koehn 1986:44)

- (71) *at-at-apoi-Vko toto.*
 REFL-REFL-grab-CONT 3PL
 ‘They (were) grabbing each other (fighting).’

6.3.2.3 Fossilized reduplicated non-reciprocal prefixes used as reciprocal markers (Abaza). In (72) the reciprocal markers are reduplicated fossilized prefixes of comitatives / sociatives (72a), bene- and malefactive (72b, c) and preverbs (72d, e). This is an unproductive type, the productive type being discussed in 6.2.1.2.

Abaza (Tabulova 1976:194–6)

- | | | |
|------|--|---|
| (72) | a. <i>-c-xrəgara</i> ‘to help sb’
<i>-c-naxčəlra</i> ‘to envy sb’
b. <i>-z-x’aclara</i> ‘to believe sb/sth’
<i>-z-clɣlara</i> ‘to ask sb’
c. <i>-čv-bxlara</i> ‘express resentment’
<i>-čv-pxaščara</i> ‘be shy before sb’
d. <i>-šI-pšra</i> ‘to imitate sb’
e. <i>-x’v-lapšra</i> ‘to look at sb’ | → <i>ac-ac-xrəgara</i> ‘to help each other’
→ <i>ac-ac-naxčəlra</i> ‘to envy each other’
→ <i>az-az-x’aclara</i> ‘to believe each other’
→ <i>az-az-clɣlara</i> ‘to ask each other’
→ <i>ačv-ačv-bxlara</i> ‘to resent each other’
→ <i>ačv-ačv-pxaščara</i> ‘be shy before each other’
→ <i>ašI-ašI-pšra</i> ‘to imitate each other’
→ <i>ax’v-ax’v-lapšra</i> ‘to exchange glances.’ |
|------|--|---|

6.3.2.4 Reciprocal prefix + dual marker (Awtuw). In Awtuw, the reciprocal prefix *n-* is obligatorily accompanied by a dual subject prefix (*ti-* in (73)). This double marker is used on the predicate not only if the subject is dual but also with a plural subject (see *-m* in (73)), in which case the verb acquires a plural suffix as well. In other cases, the co-occurrence of a dual prefix and plural suffix in the same form is not allowed (see Feldman 1986:67):

Awtuw (ibid.)

- (73) *Nalpet Kamlakw yakruk ti-n-iy-m-e.*
 Taute Kamnun once DU-REC-SHOOT-PL-PAST
 ‘Taute and Kamnun once had a war (lit. shot at each other).’

6.3.2.5 *A reciprocal prefix ousting a causative prefix (Palauan)*. This rare case is represented by a group of Palauan verbs with the reciprocal prefix *kai-/ka-/kau-/kajuɛ-* which fills the position of the fossilized causative prefix *ol(ɛ)-*, although on some other verbs it is merely attached to the base. The direction of derivation is not obvious here.

Palauan (Josephs 1975: 221)

- (74) *olɛ-ngɛseu* ‘to help’ → *kai-ngɛseu* ‘to help each other’
ol-siuekl ‘to meet’ → *kai-siuekl* ‘to meet each other’
ol-toir ‘to chase’ → *kaiuɛ-toir* ‘to chase each other’
ol-dingɛl ‘to visit’ → *kaiuɛ-dingɛl* ‘to visit each other’
ol-durokl ‘to send’ → *kau-durokl* ‘to send (sth) to each other.’

See also Hagège (1986: 66–7).

6.4 Suffixation

6.4.1 Suffixation without special features

This is probably the most common type of reciprocal marking across languages with prevalent suffixed derivation, e.g. in Turkic, Tungusic, Mongolian, also Quechua, Indonesian, Tagalog, Bantu, etc.; cf.:

- | | |
|--|---|
| <p>Tariana (Aikhenvald, Ch. 30, §1.2)</p> <p>(75) <i>kwisa</i> ‘to hate sb’
 → <i>kwisa-kaka</i> ‘to hate each other.’</p> | <p>Warekena (Aikhenvald, Ch. 20, §2.1)</p> <p>(76) <i>we</i> ‘to leave sb’
 → <i>we-na</i> ‘to leave each other.’</p> |
|--|---|

- | | |
|---|--|
| <p>Bare (Ch. 20, §3.1)</p> <p>(77) <i>kuuyud’ä</i> ‘to embrace sb’
 → <i>kuuyud’a-tini</i> ‘to embrace each other.’</p> | <p>Baniwa of Içana (Ch. 20, §4.1)</p> <p>(78) <i>inua</i> ‘to kill sb’
 → <i>inua-kawa</i> ‘to kill each other.’</p> |
|---|--|

- Warrungu (Tsunoda, Ch. 32, §1.2)
- (79) *paja* ‘to bite’
→ *paja-wa* ‘to bite each other.’

6.4.2 Suffixation with special features

6.4.2.1 *Different suffixes for plural and dual forms (Limbu)*. In order to express reciprocity, Limbu uses the reflexive/reciprocal suffix *-siŋ* on plural forms (on singular forms it has a reflexive meaning; see (28) in Ch. 1) and *-ne* on dual forms (van Driem 1987: 86). On different markers for the varying number of participants, see Ch.1, §5.3.

Limbu (van Driem 1987: 86, 87; the glossing is van Driem’s)

- (80) a. \emptyset -mɛ-bi-siŋ-ɛ- \emptyset
3-NON.SG-gIVE-REFL-PAST-PFV
‘They gave each other [gifts].’
b. *anchige nik-ne-tchi-ge* ...
we.DU fuck-REFL-dPS-EXC (-dPS = dual patient-subject agreement marker)
‘... we are having an illicit relationship.’ (lit. ‘we are fucking each other’ – V.N.).

When used on singular forms, the suffix *-siŋ* expresses the reflexive meaning:

- c. *warum-siŋ-aŋ-Ø*
 bathe(vt)-REFL-1SPS/PAST-PFV (-SPS = SG patient-subject agreement marker)
 ‘I took a bath /I bathed.’

6.4.2.2 *Overlapping suffixes for non-causative and causative reciprocals (Bolivian Quechua, Yakut).* In Bolivian Quechua, the non-causative reciprocal marker *-na-ku* incorporates the reflexive suffix *-ku* which is always subject-oriented (cf. *maylla-ku-* ‘to wash oneself’) and therefore does not appear in the causative-reciprocal marker *-na-chi* (*-chi* = CAUS) which occurs in the object-oriented construction.

Bolivian Quechua (van de Kerke, Ch. 31, §§1.2 and 5.1)

- (81) a. *maylla-* ‘to wash sb’
 → b. *maylla-na-ku-* ‘to wash each other’
 → c. *maylla-na-chi-* ‘to make sb wash each other.’

The opposite is observed in Yakut: causative derivation from reciprocals obligatorily involves the use of the reflexive suffix (*-in* in (82c)) together with the reciprocal:

Yakut (Nedjalkov & Nedjalkov, Ch. 26, §4.2; cf. also 14.3; *-as* > *-ah* in intervocalic position)

- (82) a. *kör-* ‘to look, see’ (cf. *kör-ən* ‘to see oneself’)
 → b. *kör-əs-* ‘to see each other, meet’
 → c. *kör-əh-ən-ner-* ‘to make sb meet’ (*-ner* = CAUS).

6.4.2.3 *Suffixes often co-occurrent with a reciprocal marker (Chukchi, Evenki, Udehe, Khalkha-Mongol, Buryat).* Most commonly, a reciprocal suffix combines with suffixes of similar semantics.

1. The *Chukchi* reciprocal suffix *-wəly* often co-occurs with the polysemous suffix *-tku/-tko* which may be used as an iterative and an antipassive marker. It can be placed either before or after the reciprocal suffix, with an unclear difference in meaning (83a–b), and sometimes it is repeated in both positions to emphasize the verbal meaning (84). *-wəly* may also co-occur with the suffix *-čit/-čət* (with iterative, competitive and reciprocal meanings; cf. (85)). Both *-tku* and *-čit* can express reciprocity on a limited number of bases. In combination with *-wəly* they stress reciprocity or iterativity.

Chukchi (Nedjalkov, Ch. 40, §§3.1.1.1, 5.2.2; *-ə* = epenthetic vowel)

- (83) a. *yite-* ‘to glance, look at sb’
 → *yite-wəly-* ‘to look at each other’
 → *yite-wəly-ə-tku-* ‘to exchange glances repeatedly’
 b. *yite-tku-* ‘to glance, look repeatedly’
 → *yite-tku-wəly-* ‘to exchange glances repeatedly.’

- (84) *Qənwer, təm-ə-tko-wəly-ə-tko-γʔat* (*-γʔat* = 3PL)
 ‘At last (they) killed each other (of many, repeatedly).’

- (85) a. *ləlep-* ‘to look’ (vi/vt)
 → *ləlep-wəly-/ləlep-čit-* ‘to look at each other’
 → *ləlep-wəly-čit-* (same translation).

2. In *Evenki*, the monosemous reciprocal suffix *-maat/-meet/-moot* sometimes co-occurs with the sociative suffix *-ldə*, and thus forms a synonymous complex suffix *-ldə-maat*. This is probably due to the fact that *-ldə* is an ancient marker of reciprocity and probably sociativity which was ousted by the later marker *-maat* in the reciprocal function. On some verbs, the fossilized *-ldə* has retained its reciprocal meaning. As a result, there are three alternative reciprocal forms:

Evenki (Nedjalkov & Nedjalkov, Ch. 38, §§4 and 6.2)

- | | | | | |
|------|----------------------------|---|--|------------|
| (86) | <i>ana-</i> ‘to push’ (vt) | → | a. <i>ana-maat-</i> ‘to push each other’ | reciprocal |
| | | | b. <i>ana-ldə-</i> (same) | reciprocal |
| | | | → c. <i>ana-ldə-maat-</i> (same) | reciprocal |
| (87) | <i>ηene-</i> ‘to go’ (vi) | → | <i>ηene-ldə-</i> ‘to go together’ | sociative |

3. In *Khalkha-Mongol* and *Buryat*, alongside the reciprocal suffix *-lda*, its expanded forms *-ca-lda* (Khalkha) and *-sa-lda* (Buryat) are used. In present-day language, the first component is unproductive and its own meaning is unclear (cf. *nüxer-* ‘friend’ → *nüxese-* ‘to become friends’, *murge-* ‘to collide’ → *mürge-se-* ‘to collide’). Historically it may be related to the second part of the sociative suffix *-l-ca/-l-sa* (the first component being (genetically) related to the plural and iterativity marker; cf. Khalkha *cox-* ‘to hit’ → *coxi-l-* ‘to hit repeatedly’). The expanded variants have the same meanings as *-lda* but occur much more rarely (probably for emphasis). Most of the registered reciprocals denote violent and hostile actions (cf. (88a)). The suffixes *-lda* and *-lsa* are sometimes used indiscriminately both as reciprocal and sociative markers (the choice between them is sometimes unclear) and therefore their co-occurrence is possible, which may result in the formation of three synonyms (88b).

Buryat (Nedjalkov et al., Ch. 29, §5)

- | | | | | | | |
|------|----|-------------------------------|---|--|---|------------------------------|
| (88) | a. | <i>yobur-</i> ‘to hit’ | → | <i>yoboro-ldo-</i> ‘to hit each other’ | → | <i>yobor-so-ldo-</i> (same) |
| | | <i>xatxa-</i> ‘to stab’ | → | <i>xatxa-lda-</i> ‘to stab each other’ | → | <i>xatxa-sa-lda-</i> (same). |
| | b. | <i>xubaa-</i> ‘to divide sth’ | → | <i>xubaa-lda- = xubaa-lsa- = xubaa-lda-lsa-</i> ‘to divide sth among oneself.’ | | |

4. In *Udehe*, the reciprocal suffix *-masi* is very frequently combined with the aspectual suffix *-si* meaning ‘many (subjects or objects)’, and also expressing the imperfective, progressive, multiplicative, diversative and other meanings.

Udehe (Nikolaeva, Ch. 23, §3.4)

- | | | | | | | |
|------|----|-------------------------|---|----------------------|-----|--|
| (89) | a. | <i>teti-</i> ‘to dress’ | → | <i>teti-si-</i> | i. | ‘to dress <i>many children</i> ’ |
| | | | | | ii. | ‘to dress one child <i>many times</i> .’ |
| | b. | <i>bele-</i> ‘to help’ | → | <i>bele-masi-</i> | i. | ‘to help <i>each other</i> ’ |
| | | | | <i>bele-si-masi-</i> | ii. | ‘to help <i>each other</i> .’ |

6.5 Infixation (Mundari, Sobei)

Reciprocals with infix markers are attested in Munda (Mundari, Santali, etc.) and Austronesian (Sobei) languages.

A reciprocal infix seems to be the only means of encoding reciprocity in Mundari (Osada, Ch. 37). In both Mundari and Sobei there are no other infixes (in Sobei, the reciprocal suffix also has an iterative meaning; R. H. Sterner 1975: 137–8; J. K. Sterner 1987: 53).

Sobei (Sterner 1987: 31; *-ra-/-rer-/-...* = REC infix)

- (90) *ri-fe* ‘they beat’ (*ri-* = ‘they’) → *ri-f-ra-fe* ‘they beat each other’
me-toput ‘you hold’ (*me-* = ‘you.PL’) → *me-t-rer-put* ‘you hold each other.’

Mundari (Osada, Ch. 37, ex. (1), (15); *-pe-/-p-/-...* = REC infix)

- (91) *lel* ‘to see’ → *le-pe-l* ‘to see each other’
dal ‘to hit’ → *da-pa-l* ‘to hit each other.’

6.6 Circumfixation and quasi-circumfixation (Austronesian languages)

6.6.1 Circumfixes (*Tongan, East-Futunan, Kusaiean, Nêlêmwa, To’aba’ita, Indonesian*)

In Tongan, the first component of the circumfix is the prefix *fe-* (which may be used on its own as well) and the second is the suffix *-’aki*, sometimes *-faki* or *-laki*. In East Futunan, the principal means of reciprocal derivation is the circumfix *fe-...-’aki*. In Kusaiean, when the reciprocal prefix *a-* is used, the suffix *-i* is also commonly found on verbs (although its function is not quite clear; in a number of the Polynesian languages it is used with underlying transitives only; thus, being a marker of transitivity when used without the reciprocal prefix it nevertheless occurs on reciprocals though they are intransitive). The underlying verbs are usually two-place intransitives, but transitive underlying verbs also occur (see (95b) below). In To’aba’ita (Lichtenberk, Ch. 36, §4) verbal reciprocals are formed with the prefix *kwai-* often accompanied by the suffix *-i* (used only in conjunction with *kwai-*). In Indonesian, reciprocal circumfixes also occur alongside with other markers. Compare:

Tongan (Churchward 1953: 256)

- (92) *’ita* (vi) ‘to be angry’ → *fe-ita-’aki* (vi) ‘to be angry with one another’
kata (vi) ‘to laugh’ → *fe-kata-’aki* (vi) ‘to laugh at one another.’

East Futunan (Moyses-Faurie, Ch. 34, §3.3.1.1.2)

- (93) *’ite* (vi) ‘to be angry’ → *fe-ite-’aki* (vi) ‘to be angry with one another.’

Nêlêmwa (Bril, Ch. 34, §3.1.1.2, see also 3.1.1.3; in certain cases the suffix is not used)

- (94) *ko* ‘to chase’ → *pe-xo-i* ‘to chase each other.’

Kusaiean (Lee 1975: 201–3)

- (95) a. *muhtwacta* (vi) ‘to visit’ → *a-muhtwacta-i* ‘to visit each other’
futfut (vi) ‘to kick’ → *a-futfut-i* ‘to kick each other’
 b. *lohng* (vt) ‘to hear’ → *a-lohng-i* ‘to listen to each other’
kihsruhng (vt) ‘to collide’ → *a-kihsruhng-i* ‘to collide with each other.’

To'aba'ita (Lichtenberk, Ch. 36, §4)

- (96) *'oli* 'to embrace sb' → *kwai-'oli-i* 'to embrace each other.'

Indonesian (Ogloblin & Nedjalkov, Ch. 33, §4.2; the suffix is sometimes optional)

- (97) *me-nubruk* 'to bump (into)' → *ber-tubruk-an* 'to collide'
men-cium 'to kiss sb' → *ber-cium[-an]* 'to kiss each other.'

6.6.2 Quasi-circumfixes? (Tagalog)

In Tagalog, reciprocal formations appear to use circumfixation, being derived with the prefix *mag-* and suffix *-an* (homonymous to the passive suffix *-an*); cf. (98). Nonetheless there is a reason for considering this as a fixed prefix-suffix combination rather than a circumfix: each affix marks a separate derivational step (see Shkarban & Rachkov, Ch. 22, §§1.2, 4.1). Morphologically, these reciprocals are derived from reciprocal nouns with the suffix *-an* by means of the prefix *mag-*. Their interpretation as circumfixed derivatives cannot however be ruled out (I dare say reciprocal verbs like *mag-halik-an* 'to kiss each other' may be more common than respective reciprocal nouns like *halik-an* 'mutual kiss') i.e. there are grounds to assume that the prefix and suffix are attached to the base simultaneously.

Tagalog (Shkarban & Rachkov, Ch. 22, §4.3.1; *-um* = "active" voice)

- (98) a. *h-um-alik* 'to kiss sb' [*halik-an* 'to be kissed']
 → *halik-an* 'mutual kiss'
 → *mag-halik-an* 'to kiss each other.'
 b. *um-ubig* 'to love sb' [*ibig-an* 'to be loved']
 → *ibig-an* 'mutual love'
 → *mag-ibig-an* 'to love each other.'

7. Root reduplication

Cases of marking reciprocity by means of root reduplication alone are rather rare, and so is its joint usage with prefixes (see 6.3.2.1–6.3.2.3 above). More commonly, root reduplication co-occurs with a reciprocal suffix as a means of reciprocalization.

7.1 Root reduplication only (Indonesian)

Reciprocal reduplication termed pre-reduplication in Indonesian grammars is attested in Indonesian, alongside other reciprocal devices.

Indonesian (Ogloblin & Nedjalkov, Ch. 33, §4.5.1)

- (99) *mem-bunuh* 'to kill sb' → *bunuh-mem-bunuh* 'to kill each other'
me-nolong 'to help sb' → *tolong-me-nolong* 'to help each other.'

This type of reciprocals is also attested in Yami, Pacoh and Tzeltal (Moravcsik 1978:320).

In Udehe, where root reduplication is very active in general (cf., for instance, the above mentioned reduplication of postposition *dä*: ‘next to sb’ → *dä:dä*: ‘next to each other’), reciprocals can also be formed by reduplication from adjectives, adverbs and numerals. Reduplicated adjectives can be used as predicatives and prenominal modifiers, cf.:

Udehe (Nikolaeva, Ch. 23, §5.2)

- (100) *Xa:-mule bejeku bejeku bi:-ni.*
 relative-NR similar similar be-3sg
 ‘Relatives look like each other.’

7.2 Root reduplication + affix

7.2.1 Root reduplication + prefix (Urubu-Kaapor, Amharic)

The prefix *ju-* in Urubu-Kaapor encodes both reflexivity and reciprocity, but on a reduplicated root it is reciprocal only. In Amharic (Amberber 2000: 325, 326, 327, 315, 313–4), the reflexive-reciprocal prefix *t(ə)-* has a special reduplicated stem when used reciprocally but not reflexively (see (102)). This prefix can also be used as an anticausative (cf. *səbbərə* ‘to break’ (vt) - *tə-səbbərə* ‘to break’ (vi)) and passive marker (cf. *gənəbba* ‘to build’ - *tə-gənəbba* ‘to be built’).

Urubu-Kaapor (Kakumasu 1986: 340)

- (101) ... *ju-tuka tuka* ...
 3REFL-hit hit
 ‘... they (he and the jaguar) bumped [into] each other.’

Amharic (Amberber 2000: 325, 327)

- (102) a. *nəkəsə* ‘bit’ – *tə-nəkəkəs-u* ‘(they) bit each other’
 cf. b. *at’t’əbə* ‘to wash sb’ – *t-at’t’əbə* ‘to wash oneself’

7.2.2 Root reduplication + suffix (Dyirbal, Bete, Fula, Tauya, Motuna)

Combination of a reciprocal suffix with root reduplication seems to be rather more common than that of prefixes or circumfixes.

In Dyirbal, reduplication in combination with the suffix *-bariy* is the only means of reciprocalization. In Bete, reduplication is coupled with the suffix *-li*. In Fula, there are three reciprocal markers all containing the same component; cf.: *-in-dir*, *-oo-tir* and reduplicated form with *-tir*. These markers differ in the classes of the roots to which they apply. In Arnott (1970: 361) the reduplicated form with *-tir* is termed iterative-reciprocal, the iterative meaning (especially with many participants) being expressed by reduplication (103). Reduplication of stems by itself expresses an intensive-iterative meaning (Klingenberg 1963: 212). Dixon (1980: 433, 1972: 92–3, 251) points out a similar phenomenon in Dyirbal noting that root reduplication (the reciprocal suffix *-(n)bariy* is always coupled with it), has its own function of encoding iterativity or intensity, cf. *balgan* ‘to hit’ → *balga-balgan* ‘to hit too much’. In Tauya, reciprocals are formed by the suffix *wa’ane-*, the verb stem being frequently reduplicated (106). In Motuna, the reciprocal suffix is applied together with root reduplication (107).

Dyirbal (Dixon 1972:92–3)

- (103) *ɖurgay* ‘to spear sb’ → *ɖurgay-ɖurgay-bariy* ‘to spear each other.’

Bete (Sportiche 1987:297)

- (104) *là* ‘to call sb’ → *là-là-li* ‘to call each other.’

Fula (Arnott 1970:362)

- (105) *ndaara* ‘to look at sb’ → *be-ndaar-ndaar-tir-i* ‘they kept on looking at each other.’

Tauya (MacDonald 1990:205)

- (106) *tu-tu-wa²ane-ene-²a*.
give-give-REC-1/2p-IND
‘We gave (it) to each other.’

Motuna (Onishi 2000:137)

- (107) *manni noo-noo-uru-kuu-ng*.
they gather-gather-REC-3paucal/PL.S-imaginative-M
‘they would gather together.’

7.2.3 Root reduplication + circumfix (Tigak)

In Tigak, the reciprocal prefix *e-* which is sometimes accompanied by the suffix *-ai* can also be used in combination with root reduplication; cf.:

Tigak (Beaumont 1979:93–4)

- (108) *rik e-tu-tuk-ai*
‘they stand about together’ (i.e. ‘next to one another’ – V.N.).

8. Clitics (Indo-European languages)¹⁰

8.1 Introductory notes

Clitics, including clitic-like items, are markers like German *sich* (ACC/DAT), French *se* (ACC/DAT), Spanish *se* (ACC/DAT), Polish *się* (ACC), Bulgarian *se* (ACC) and *si* (DAT). By way of extending the domain and in order to remind of the diachronic perspective, I will regard these clitics (see 8.2), reflexive pronouns of the Latin *sē* (ACC) and Russian *sebjā*

10. Needless to say, clitics with the reciprocal meaning are registered not only in the Indo-European languages; cf., for instance, Somali *Wāy is arkeen* i. ‘They saw each other’, ii. ‘They saw themselves’ (*is* = ‘self’ Saeed 1999:77–8). I have chosen the Indo-European languages because of the availability of data.

(ACC) type¹¹ together, from which the clitics have developed (8.3),¹² and affixes, like Scandinavian *-s/-st*, Surselvan *se-*, Russian *-sja/-s'*, Latvian *-s* and Lithuanian *-si/-s*, which have developed from clitics of reflexive origin (8.4). The clitics and the latter type of markers can be labelled together as reflexive-middle markers (a more precise term would be middle markers of reflexive origin). Further on, simultaneous use of reflexive-middle markers and other markers is considered (8.5) and, finally, areal characteristics of the decrease of the reciprocal function of reflexive-middle markers (8.6) conclude this section.

The two main formal types of reflexive-middle markers, viz. (a) clitics and clitic-like markers and (b) affixes, can be said to represent different stages of the decay of their pronominal properties and evolution on the way of integration into the verb (they are sometimes spelt together with the base).

Both types of reflexive-middle markers share the following: (a) their polysemy generally does not exceed a certain range of meanings and bears considerable semantic similarity (for the list of the main meanings see Ch. 5, §2.1); (b) they follow a more or less predictable path of formal and semantic evolution; (c) they are or have once been clitics or clitic-like items.¹³ All of the clitics mentioned above have the reflexive and reciprocal meanings. Some of them have retained certain features of free morphemes, like German *sich*, which can be used as a proclitic and enclitic on the host verb and even be distantly placed from the predicate, according to the general prosodic regularities for all kinds of non-stressed pronouns:

- (109) a. *Sie verteidigten sich immer.* 'They always defended *themselves/each other*.'
 b. *Sie werden sich verteidigen.* 'They will defend *themselves/each other*.'
 c. *Sie werden sich immer verteidigen.* 'They will always defend *themselves/each other*.'

The analogous placement of *sich* is also observed when it is used as a marker in impersonal constructions:

- d. *Hier sitzt es sich bequem.* 'It is convenient to sit here.'
 e. *Er sagt, das es sich hier bequem sitzt.* 'He says that it is convenient to sit here.'

As is known, the distinctive feature of clitics is their non-stressed status: they attach themselves to the stressed host and therefore cannot appear in the position of stressed focus. Clitics cannot be coordinated with nouns and they cannot be topicalized (see, for instance, Zwicky 1977: 2–3; Plungian 2000: 28–35; Haspelmath 2002: 150–5). However, German *sich* has not entirely turned into a clitic and it may be regarded as a clitic-like marker. But for prosodic and other reasons it is convenient to label it as a clitic.

11. They are descended, in their turn, from the Indo-European reflexive pronominal root **sve-* (**se*).

12. As Faltz (1977:53) asserts, "... all verbal reflexives have their origin in NP-reflexives ..."; cf. also "I know of no case of a verbal reflexive which is demonstrably derived historically from a source other than an NP-reflexive" (ibid., p. 223).

13. These issues are discussed in detail in the chapter "How Reflexives Change" in Faltz (1977:208–86) and in the chapter "Diachronic Developments" in Kemmer (1993:151–200).

The clitics in question differ in a number of features, including (a) the degree of boundedness, (b) reflexive proper and/or reciprocal use, (c) case distinctions – accusative and dative, (d) combinability with prepositions, (e) the use of the reflexive form in the 3SG/PL only or in all the persons and numbers.

The clitics differ significantly from affixal markers as the problems of combinability with prepositions and case forms do not exist for the latter. The markers in question are intermediate between Type B markers (namely, reciprocal pronouns, i.e. the subtype considered in 3.2 where the Polish pronoun *siebie* ‘oneself/each other’ is mentioned, see (11a) above) and affixal subtype of Type E, in particular (see prefixation in 6.3 and suffixation in 6.4).

8.2 Full reflexive pronouns as the source of reflexive clitics

Full reflexive pronouns can be subdivided into two subgroups: with the reflexive meaning only and with both the reflexive and reciprocal meanings.

1. *The meaning is reflexive only.* As is known, the reflexive-middle markers of Indo-European languages have evolved from the following two main types of reflexive pronouns with anaphoric functions only:

1a. *Reflexive pronouns* used as the 3SG/PL form only, ordinary personal pronouns being used in the 1st and 2nd persons; cf. Latin *sē* (ACC):

- (110) *amō mē* ‘I love myself’ (lit. ‘... me’) *amāmus nōs* ‘we love ourselves’ (‘... us’)
amās tē ‘you love yourself’ (‘... you’) *amātis vōs* ‘you love yourselves’ (‘... you’)
amat sē ‘he loves himself’ (‘... self’) *amant sē* ‘they love themselves’ (‘... self’).

This distribution of pronouns is not unexpected: in the 1st and 2nd persons the personal or reflexive use of pronouns is quite transparent (see, for instance, Faltz 1977:43), while the use of a personal pronoun in the 3rd person is ambiguous and it may be interpreted either as reflexive or personal referring to a “fourth” person.

1b. *The reflexive pronoun* is used for all the persons and both numbers; cf. Russian *sebja* (ACC):

- (111) *ja ljublju sebja* ‘I love myself’ *my ljubim sebja* ‘we love ourselves’
ty ljubish’ sebja ‘you love yourself’ *vy ljubite sebja* ‘you love yourselves’
on ljubit sebja ‘he loves himself’ *oni ljubjat sebja* ‘they love themselves.’

The distinction shown in Type 1a is retained by the reflexive-middle markers in most of the Romance languages. Among the Germanic languages, this characteristic pertains to German *sich*, Gothic *sik* and Scandinavian *sig* (Swedish, Danish, Icelandic, Faroese)/*seg* (Norwegian). The type shown in 1b is represented by the reflexive-middle markers of the Slavic, Baltic and Scandinavian (-s in Norwegian, Swedish and Danish; -st in Icelandic and Faroese) languages.

2. *The meaning is reflexive and reciprocal.*

2a. With both meanings, the same form for all the persons and both numbers,¹⁴ is registered (cf. Type *1b* above). An example is the Polish reflexive pronoun *siebie*, as in (112), it has no other meanings except reflexive and reciprocal (i.e. the the reciprocal meaning of the reflexive pronoun is not dependent on the development of middle meanings).

(112) *Przyjaciele bronili siebie długo.*

- i. 'The friends defended *themselves* for a long time.'
- ii. The friends defended *each other* for a long time.'

2b. Among Indo-European languages, it seems, only full pronouns with the same form for all the persons and both numbers, are registered in the reflexive and reciprocal meanings. As for full reflexive pronouns used in the 3SG/PL form only, ordinary personal pronouns being used in the 1st and 2nd persons, they are not used in the reciprocal meaning.

To be more precise, there are markers with both anaphoric meanings but they are not full pronouns any longer and have acquired some features of clitics and are in the process of acquiring some middle meanings, as is the case in German and in Romance languages (cf. (109), (118)). This is one of the possible evolutionary paths.

There is also another path of the semantic evolution of full reflexive pronouns characteristic of a number of Indo-European languages: the development of the middle meanings bypassing the development of the reciprocal meaning (as the data of other than Indo-European languages also show; cf. Geniušienė 1987:345–7). This is characteristic of the North-Germanic and East-Germanic languages. For instance, the reflexive pronoun *sig/seg* of the Scandinavian languages and Gothic reflexive pronoun *sik* lack the reciprocal usage although they have already acquired some middle meanings (recall that the Goths once neighboured with Ancient Scandinavians). Thus, semantic expansion of reflexive-middle markers does not necessarily include the reciprocal meaning.

The Scandinavian reflexive pronoun *sig/seg*, the only means of expressing the reflexive meaning in these languages, is descended from the Proto-Germanic pronoun **sik* (which is of Type *1a*), entering into a paradigm with the personal pronouns, like Swedish *mig* (1SG), *dig* (2SG), *oss* (1PL) and *er* (2PL). It should be stressed that although the reciprocal meaning is semantically close to the reflexive (at least much closer than, for instance, anticausative), some languages possess reflexive pronouns with a number of middle meanings and no reciprocal meaning (which is expressed by reciprocal pronouns meaning 'each other', like Swedish *varandra*). Cf. Swedish:

- (113) a. *forsvåra* 'to defend sb' → *forsvåra sig* 'to defend *oneself*', not *'to defend each other'
 b. *sätta* 'to seat sb' → *sätta sig* 'to sit down' autocausative
 c. *öppna* 'to open' (vt) → *öppna sig* 'to open' (vi) anticausative

14. The initial form of the Indo-European reflexive pronoun is traditionally regarded to have been of this type. Faltz (1977:226) cites this point of view with reference to Meillet 1964, Brugman 1911, etc. Faltz does not rule out a pronoun of Type *1a* as the initial one and cites arguments in support of this opinion (*ibid.*, p. 229).

In Scandinavian languages, the pronoun *sig/seg* can be used with prepositions, as the following Icelandic example shows:

(114) *hann talar um sig* ‘he talks about himself.’ (Glendening 1973:14).

As mentioned, the Gothic reflexive pronoun *sik* has the same characteristics: it has no reciprocal meaning while it is used reflexively and in some middle meanings; cf. (borrowed from Streitberg 1928:53, 52, 164):

(115) a. *hāhan* ‘to hang sth/sb’ → *us-hahan sik* ‘to hang oneself’ reflexive
 b. *ushaffjan* ‘to raise sth’ → *ushaffjan sik* ‘to rise’ autocausative
 e. *inwagjan* ‘to make indignant’ → *inwagjan sik* ‘to be indignant’ anticausative

These two types of reflexive-middle markers are considered below.

8.3 Reflexive pronominal clitics

This type comprises German *sich*, French *se*, Spanish *se*, Bulgarian *se*, Polish *się*, with no particular restrictions on their reflexive and reciprocal usage. These markers, excepting German *sich* (see (116b)), do not combine with prepositions. They are productive enough in the middle meanings, such as autocausative, anticausative, potential passive, etc. With regard to the passive function, the German and Polish markers in question practically lack it. The French clitic is used in this function, and it is highly productive in Spanish and Bulgarian. Below, I will briefly illustrate some formal features of the clitics.

1. The reflexive markers of the first three languages are 3SG/PL, i.e. of the type illustrated in (110); cf. German (see also (18) above):

(116) a. *Sie achten sich* ‘They respect *themselves/each other*.’
 b. *Ihr achtet euch* ‘You respect *yourselves/each other*.’
 c. *Wir achten uns* ‘We respect *ourselves/each other*.’

The German marker *sich* has more freedom in regard of the host verb than the other markers listed (109): it can be coordinated with a noun (117a); it also combines with prepositions¹⁵ when used reflexively but not reciprocally (117b). The other four languages do not allow such usage (cf. also Faltz 1977:52–5).

(117) a. *Sie liebten sich und die Eltern.* i. ‘They loved *themselves* and their parents.’
 ii. *‘They loved *each other* and their parents.’
 b. *Sie glaubten an sich.* i. ‘They believed *in themselves*.’
 ii. *‘They believed *in each other*.’

The French clitic *se* and Spanish *se* are mostly proclitic, but in periphrastic verbal forms they are separated from the base verb by an auxiliary; cf. French (118a) and (118b) respectively. In both languages, the clitic is replaced by the emphatic form of the pronoun in the imperative form without negation (118c). In indirect object contexts, the clitic can be sep-

15. Note that Faltz (1977:215) claims that “... the reflexive pronoun must lose the ability to occur in oblique NP’s” in order to become a verbal reflexive.

arated from the host verb by the object clitic (cf. (118d–c)). In the infinitive, the position of the clitic differs in the two languages: it is proclitic in French (cf. *se respecter* ‘to respect each other/themselves’) and enclitic in Spanish (cf. *respetarse* with the same meaning).

- | | | | |
|-------|----|---------------------------------|---|
| (118) | a. | <i>Ils se respectent.</i> | ‘They respect <i>each other/themselves</i> .’ |
| | b. | <i>Ils se sont respecté.</i> | ‘They respected <i>each other/themselves</i> .’ |
| | c. | <i>Respecte-vous.</i> | ‘Respect <i>yourselves/each other</i> .’ |
| | d. | <i>Marie s’achète une robe.</i> | ‘Marie is buying <i>herself</i> a dress.’ |
| | e. | <i>Elle se l’achète.</i> | ‘She is buying it <i>for herself</i> .’ |

2. As in Bulgarian and other Slavic languages, the Polish reflexive pronoun *się* is common for all the three persons in both numbers, as in the type illustrated in (111). This middle marker is usually enclitic (119a); it may be proclitic, e.g. in impersonal constructions, cf. (119b)). Note that *się* is in subtle relations of synonymy with the reflexive pronoun *siebie* as a marker of the reflexive and reciprocal meanings (see, for instance, Wiemer 1999:300–13). The dative clitic *si* has gone out of use and the dative case form *sobie* of the free reflexive pronoun *siebie* is used instead (cf. *wierzyć sobie* ‘to trust each other/themselves’).

- | | | | | |
|-------|----|---------------------------------------|-----|---|
| (119) | a. | <i>Przyjaciele bronili się długo.</i> | i. | ‘The friends defended <i>themselves</i> for a long time.’ |
| | | | ii. | The friends defended <i>each other</i> .’ |
| | b. | <i>Tu się mówi po niemiecku.</i> | | ‘German is spoken here.’ |

The Bulgarian *se* is proclitic if the subject is explicit, and enclitic if the subject is omitted. In indirect object position, this clitic has the dative case form *si*:

- | | | | |
|-------|----|-------------------------------------|--|
| (120) | a. | <i>Nie se viždame / Viždame se.</i> | ‘We see <i>each other/themselves</i> .’ |
| | b. | <i>Te si pomagat / Pomagat si.</i> | ‘They help <i>each other/themselves</i> .’ |

The middle markers in question are considered in the following chapters of this monograph: Wiemer & Nedjalkov on German (Ch. 10), Guentchéva & Rivière on French (Ch. 12), Wiemer on Polish (Ch. 11), and Penchev on Bulgarian (Ch. 13). The examples cited in this section are borrowed from these papers.

8.4 Affixal reflexive-middle markers

This type is represented by the Icelandic postfix *-st*, Surselvan prefix *se*, Russian postfix *-sja/-s’*, Latvian postfix *-s*, and Lithuanian infix-postfix *-si/-s* (postfix = a marker in postinflectional position after the infinitival or agreement marker). Thus, formally, they are of Type E rather than F, and they are considered here for reasons mentioned in 8.1.

These reflexive-middle markers do not alternate for person and number. The Icelandic postfix *-st* (as well as its cognates in other Scandinavian languages) and Surselvan *se*-developed this usage in the process of evolution from the type of expression exemplified in

(110) and (115),¹⁶ while in Russian and Baltic languages, this property is inherited from the markers of the type illustrated in (111).

The markers in question are unproductive with regard to the reflexive and reciprocal meanings, though the number of these derivatives varies considerably across these languages: cf. 160 reciprocals in Lithuanian (more than in Latvian and Russian) and 15 at the most in Icelandic which retains the greatest number of reciprocals with the postfix among the Scandinavian languages. These Scandinavian reciprocals are in fact *relic* formations. With one or two exceptions (cf. the reflexive-like (121a)), the postfix *-s/-st*, in Icelandic and other Scandinavian languages is practically not used in the reflexive meaning, the pronoun *sig/seg* being used in this function. The decay of the reciprocal meaning also finds expression in the obligatory use of the reciprocal pronoun *hver annan* with at least two Icelandic reciprocals (see (121d)). As for Surselvan, Stimm (1973:84) cites textual examples with verbs meaning ‘to suffer’, ‘to pinch’ and ‘to love’ used with the reciprocal pronoun *in l’auter* ‘each other’ rather than the prefix *se-*, and he notes that the prefix cannot be used on the verb meaning ‘to love’. This indicates that reciprocals with *se-* are at least lexically restricted (cf. also Kemmer 1993:176).

A semantic peculiarity of these markers is the high productivity of middle semantics, though to varying degrees, but they differ in expressing the passive meaning: in Lithuanian, Latvian and Surselvan there are no passives with these markers at all, although there are potential passives; reflexive passives are productive in Russian and Swedish, less productive in Norwegian and Danish and lexically restricted in Icelandic and Faroese (Berkov 1985:68).

Here are examples (hyphens are not a part of the orthography):

Icelandic (Berkov 1985:63, 58; *-ti-* = PAST)

- | | | | |
|----------|---------------------------------|---|--|
| (121) a. | <i>klæða</i> ‘to dress sb’ | → | <i>klæða-st</i> , also <i>klæða sig</i> ‘to dress (oneself)’ |
| b. | <i>hata</i> ‘to hate sb’ | → | <i>hata-st</i> ‘to hate each other’ |
| c. | <i>kalla á</i> ‘to call sb’ | → | <i>kalla-st á</i> ‘to call each other’ |
| d. | <i>þeir forða-st hvor annan</i> | | ‘they avoid each other’ |
| e. | <i>greinin bir-ti-st í ...</i> | | ‘the article was published’ (passive). |

Surselvan (Stimm 1973:70, 84)

- | | |
|----------|--|
| (122) a. | <i>jeu se-lavel</i> (vi) ‘I wash (myself).’ |
| b. | <i>Nus se-vesein lu aunc in dil!</i> (Gad. Tsch. 41, p. 124)
‘Once, we shall see each other again.’ |

16. These two markers are not the only cases among the Germanic and Romance languages. Expansion of the reflexive clitic over the 1st and 2nd persons is observed in some other languages of these families, an example is *zix* in Yiddish, which might have acquired this usage under the Slavic influence (Faltz 1977:212, 279). This usage has developed in a number of Romance languages. Besides the Surselvan prefix *se-*, it is registered in some northern French dialects, colloquial French, Catalan, some dialects of Castilian and American Spanish. It is also attested in some northern Italian dialects, also in Rome, Occitan (Turley (1997:25), with reference to Wunderli (1989) and Martin Zorraquín (1979)).

- c. *S'enconuschevan els?* (Rev., p. 57)
'Did they know each other?'

Russian (-*t*' = INF)

- (123) a. *zaščiča-t'* 'to defend' → *zaščiča-t'-sja* 'to defend oneself'
b. *obnima-t'* 'to embrace' → *obnima-t'-sja* 'to embrace each other.'

Latvian (-*t/-tie-* = INF)

- (124) a. *apseg-t* 'to cover (sb/sth)' → *apseg-tie-s* 'to cover oneself'
b. *apkamp-t* 'to embrace' → *apkamp-tie-s* 'to embrace each other.'

Lithuanian (-*si/-s* is a postfix on unprefix verbs and an infix between prefix and root on prefixed verbs; -*ti* = INF)

- (125) a. *gin-ti* 'to defend' (IPFV) → *gin-ti-s* 'to defend oneself' (IPFV)
ap-gin-ti 'to defend' (PFV) → *ap-si-gin-ti* 'to defend oneself' (PFV)
b. *labin-ti* 'to say hello' (IPFV) → *labin-ti-s* 'to say hello to each other' (IPFV)
pa-labin-ti 'to say hello' (PFV) → *pa-si-labin-ti* 'to say hello to each other' (PFV)

It may be surmised that the ratio of derivatives with different meanings shown in (126) below is not accidental. Note that the middle markers in Russian, Latvian and Lithuanian do not derive any new reflexives and reciprocals. In these languages, reciprocals with the middle markers are less numerous than reflexives. On the other hand, in Russian, the reciprocals are the least numerous and anticausatives the most numerous. The passive function, which is absent in the Baltic languages, is the most productive (the postfix -*sja/-s*' derives passives practically from all the imperfective transitives; Korolev (1968: 17); the Russian data for (126) are borrowed from Korolev (1968: 10, 17, 21), Latvian and Lithuanian from Geniušienė (1987: 74, 97)).

(126)		Reciprocal	Reflexive	Anticausative	Passive
	Russian	40	200	1400	4300
	Latvian	80	190	810	–
	Lithuanian	160	290	800	–

It is tempting to generalize the inverse relation between the number of reciprocals and middle meanings over other languages. Note in this respect that there is an opinion that the reflexive-middle markers may have lost their productivity in the reflexive and reciprocal meanings because of the productive passive function (as in Swedish and Russian), but, on the other hand, there is no passive in the Baltic languages and the reflexive and reciprocal meanings are not productive either. At the same time, the passive is highly productive in Spanish and Italian where the reflexive and reciprocal meanings are also productive. It follows that we should look for the explanation elsewhere, possibly in the degree of productivity of the anticausative function.

8.5 Reflexive-middle markers in combination with other affixes

Such combinations can have various meanings, e.g. they may denote reciprocity.

1. The additional component can emphasize the reciprocal meaning, as in a limited number of French reciprocals; analogous formations existed in German but they have gone out of use (Wiemer & Nedjalkov, Ch. 10, §7.4.1).

- (127) *tuer* 'to kill sb'
 → *se tuer* i. 'to kill oneself', ii. 'to kill each other'
 → *s'entre-tuer* 'to kill each other.'

2. In Russian, it is a number of circumfixes with the following functions:

2a. The circumfix *pere-...yva-...-sja*, derives a small group of iterative reciprocals, mostly with the meaning of exchanging information, cf.:

Russian (-*yva-* = IPFV; -*t'/-ti* = INF)

- (128) *pis-a-t'* 'to write' [→ **pis-yva-t'-sja*]
 → *pere-pis-yva-t'-sja* 'to exchange letters, write to each other.'

2b. The circumfixes with different first components and the same postfix: *s-...-sja*, *raz-...-sja* express the meanings of coming together or dispersing/separating (in the locative and/or figurative sense). The derivatives below have neither postfixed counterparts without a prefix nor prefixed counterparts without the postfix (the asterisked forms in (129) are either meaningless or do not have the intended meaning):

- (129) *polz-ti* 'to crawl' [→ **polz-ti-s'*, **s-polz-ti*, **raz-polz-ti*]
 → *s-polz-ti-s'* '(of many) to crawl together (from different places to one place)'
 → *ras-polz-ti-s'* '(of many) to crawl away from one place in many directions.'

8.6 Areal characteristics

In regard of Indo-European languages, one can observe certain areas with mainly reflexive middle marking of the reciprocal meaning and areas where this meaning is expressed by reciprocal pronouns. These languages can be arranged in the order of decreasing productivity, even to the point of extinction, of the reciprocal use of reflexive middle markers. Roughly speaking, the productivity of the reciprocal function decreases from west to east and from south to north (see also Maslova & Nedjalkov 2005: 430–3).

These tendencies are characteristic of the languages of the so-called Circum-Baltic area, excepting Polish. Reciprocals with a middle marker are very limited in number in all Scandinavian languages; for instance, in Swedish there are only a few verbs like *kyssa-s* 'to kiss each other' and the regular marker is the reciprocal pronoun (cf. *kyssa varandra* 'to kiss each other'), combinations with the reflexive pronoun *sig* (cf. *kamma sig* 'to comb oneself') like **kyssa sig* with the intended meaning 'to kiss each other' being ungrammatical. Reciprocals with a middle marker are more numerous in the East Slavic languages, even more numerous in the Baltic languages though unproductive in both families, their lexical range generally not exceeding that of lexical reciprocals (see Nedjalkov, Ch. 1, §§2.3.

and 16), or what is termed “natural reciprocals” in Kemmer (1993: 100–8). A reflexive pronoun was originally absent in Low German and it was later borrowed from High German (Behaghel 1928: 541). In Dutch, the reflexive pronoun *zich* (also borrowed from High German) has neither a reciprocal nor a reflexive meaning (the latter is expressed by the compound pronoun *zichzelf*) and serves to express middle meanings (i.e. the meanings that often accompany the reflexive meaning and develop from it). Reflexive middle markers have not been attested in English and Celtic languages in the known historical period (Faltz 1977: 267–8, 274, 281; Pedersen 1909–13; 2:1, 137).

Reflexive middle markers are highly productive in general and also as markers of the reflexive and reciprocal meanings in High German, South Slavic, West Slavic and also Romance languages, excepting Surselvan (Stimm 1973: 84).

Two opposite tendencies in the marking of reciprocity should be noted: one tendency is observed in Scandinavian languages where the postfix *-s/-st* has practically lost the reciprocal and reflexive meanings and the pronoun *sig/seg* is not used in the reciprocal function. The free niche is filled by reciprocal pronouns. A different tendency is observed in Polish: though a Circum-Baltic language, it is sharply distinct from all the other languages of this area in that it uses both reflexive pronouns, *się* and *siebie*, as reciprocal markers (cf. (112), (119a)).

It remains to note that among the languages of the Circum-Baltic area affixal reflexive middle markers are prevalent, while to the south of this area the prevalent markers are clitics, with the exception of Surselvan.

9. Marginal affixal means of reciprocalization (Latin, Chukchi)

Affixal reciprocal markers have been considered above, and in some languages we find affixes with a marginal reciprocal function, whose main meaning(s) may be sociative, spatial reciprocal, sequential, or competitive, which are usually close to the reciprocal proper meaning in one way or another (cf. the Abaza unproductive marker in the fossilized reciprocals in (72) and the productive marker in 6.2.1.2 above). These markers are (or were, in the case of Latin) more or less active as reciprocalizers and can derive a limited number of proper reciprocals. Two instances will be considered here.

1. *Latin*. In Latin, the main reciprocal marker is the phrase *inter se*, and a number of reciprocals are derived by means of the prefix *con-* whose main meanings are sociative and spatial reciprocal.

(130) a.	<i>bibo</i> ‘drink’	→	<i>com-bibo</i> ‘drink together’	sociative
b.	<i>rīdeo</i> ‘laugh’	→	<i>cor-rīdeo</i> ‘laugh together’	sociative
c.	<i>fluo</i> ‘flow’	→	<i>con-fluo</i> ‘flow together’	spatial reciprocal vi
d.	<i>fundo</i> ‘pour (out)’	→	<i>con-fundo</i> ‘pour into one place’	spatial reciprocal vt

Alongside these meanings, there is a limited number of reciprocals proper:

- e. *ruo* ‘throw oneself’ → *cor-ruo* ‘throw oneself upon each other’
- f. *spondeo* ‘swear solemnly’ → *con-spondeo* ‘swear solemnly to each other’
- g. *fligo* ‘hit’ → *con-fligo* ‘fight.’

For more details see Zaliznjak & Shmelev, Ch. 4, §2.

2. *Chukchi*. In this language, there are two main reciprocal markers, both monosemous: the suffix *-wəly* (see (1) in 1.1) and the semi-pronoun *əryičy* (see case 1 in 3.3 and 1 in 6.4.2.3). There is also a polysemous suffix *-čit/-čet* (with vowel harmony alternation) which is occasionally used to derive reciprocals. The former two main markers seem to have no restrictions on reciprocal derivation, while *-čit/-čet* has unclear restrictions on this function, although in texts one can find new formations with this suffix. Most frequently, this marker denotes competitiveness and play-acting, iterativity, acting by turns and intensity, and there are numerous lexicalized derivations with it (which indicates its ancient character; note that the monosemous reciprocal suffix *-wəly* is more recent). Its reciprocal meaning is context-dependent and of low productivity.

- (131) a. *piri-* ‘to catch, grasp’ → *piri-čit-* ‘to catch sth one after another’
- b. *piŋu-* ‘to jump’ → *piŋu-čit-* i. ‘to jump repeatedly’
ii. ‘to compete in jumping’
- c. *tiŋu-* ‘to pull’ → *tiŋu-čit-* ‘to compete in rope-pulling’
- d. *kelə* ‘devil’ → *kelle-čit-* ‘to play devils’
- e. *atčə-* ‘to hide’ → *atčə-čet-* ‘to play hide and seek’.

Derivation of reciprocals proper with this suffix is probably due to the affinity of the reciprocal meaning proper to the competitive. The reciprocals most commonly denote antagonistic actions. This suffix does not intransitivize verbs and is attached either to intransitives or labile verbs (131h, i) or it combines with the suffix *-tku-/-tko-* which in this case functions as an antipassive marker (131f, g); it is also used in this function if the reciprocal semi-pronoun *əryičy* is present (30b).

- f. *rəttelə-* ‘to push sb’ → *rəttelə-tko-čet-* ‘to push each other, jostle’
- g. *ʔelemqute-* ‘to oust sb’ → *ʔelemqute-tku-čit-* ‘to oust each other’
- h. *wənw-* ‘place’ → *wənw-o-* ‘to force sb out’, lit. ‘to take place from sb’
- *wənw-o-čet-* ‘to force each other out’ (*-o-/-u-* = ‘to take, get, kill’)
- i. *məmə* ‘lice’ → *məml-u-* ‘to look for lice on sb’
- *məml-u-čit-* ‘to look for lice on each other.’

10. Two or more reciprocal markers in a language; possible differences

In languages with more than one reciprocal markers, their number can reach five, as in *Chukchi*, six, as in Indonesian, and even eleven, as in Malayalam (see (17) and §3.4). Some of the reciprocal markers can be interchangeable without noticeable differences, while other reciprocal markers can differ to a greater or lesser degree. Below, are discussed a number of diverse features with respect to which the markers of a language can differ. Some of the markers may differ in two or more features.

10.1 Frequency

A good example of the difference in frequency are the English pronouns *each other* and *one another* which has been widely discussed in the literature (see, among others, Jørgensen 1985:351–7, 1988:355–7; Stuurman 1987:353–9, 1989:356–9; Lees & Klima 1963:26–7). They are the only markers of reciprocity in English (not counting *together* which is used to mark spatial reciprocity; on the meanings like ‘to tie together’ see Ch. 1, §13). The pronoun *each other* is generally more frequent in texts than the other. The million-word Brown Corpus of American English contains 114 instances of *each other* and 45 of *one another* (Raumolin-Brunberg 1997:227). In a selection from 33 English novels by 26 authors, 18 of the authors prefer *each other*, 6 prefer *one another* and 2 use both with equal frequency (E. Geniušienė, p.c.); there seems to be a tendency to prefer the latter if the reciprocants are inanimate, and also after verbs like *to follow*, *to pursue*, etc. A similar pair of markers are the Russian pronouns: productive *drug druga* ‘each other’ and much less common *odin drugogo* lit. ‘one another’ (in colloquial Russian, the synonymous *odin odnogo* is also used).

Especially pronounced can be the difference in the frequency of verbal and pronominal reciprocal markers. An example of this tendency may be Yakut, Tuvan, and Kirghiz, where the main reciprocal marker is a suffix and a reciprocal pronoun is used much less frequently and, often, pleonastically with suffixed reciprocals. Thus, for instance, the reciprocal pronoun is used only once in 6,000 lines of the Yakut epic poem “Kiiš Debeliye” (1993:132) in the clause *Beje-beje-leri-n kör-s-ön tur-but-tar-a...* <each-other-3.POSS-ACC look-REC-CONV AUX-PAST-PL-CONV> ‘(They) having looked at each other...’ where, characteristically, the predicate verb contains the reciprocal suffix *-s-*. In another Yakut epic poem (“Modun Er Sohotox” (“The Powerful Er Sogotox”), more than 6,400 lines), the reciprocal pronoun does not occur at all. It is interesting to note that on p. 217 of the Russian translation of this epic eight pronominal reciprocals with *drug druga* ‘each other’ are used to translate suffixed reciprocals of the original.

10.2 Productivity

In many languages, a reciprocal affix is unproductive and occurs on a small number of verbs, and a reciprocal pronoun is productive. For instance, in Russian, reciprocals with the postfix *-sja* are unproductive (about 40 verbs) and the main reciprocal pronoun *drug druga* does not have any significant restrictions on its usage. The same situation is observed in the Baltic and Scandinavian languages (see 8.4 above). Similarly, in Nivkh the reciprocal prefix *u-/v-* forms about 60 items and the pronoun *p’ñafq ñafq* ‘each other’ is used without particular restrictions (Otaina & Nedjalkov, Ch. 41 on Nivkh). The same concerns the Karachay-Balkar reciprocal suffix *-š* (about 60 reciprocals) and pronoun *biri biri-n* ‘each other’ used on an unlimited number of verbs (Nedjalkov & Nedjalkov, Ch. 24 on Karachay-Balkar): for instance, a suffixed reciprocal *teber-iš-* ‘to push each other’ can be derived from *teber-* ‘to push sb’, but the form **maxta-š-* with the intended meaning ‘to

praise each other' (< *maxta-* 'to praise sb') does not exist though its meaning is clear for the native speaker.

In some languages with two affixal markers, the "heavier" affix may be more productive than the "lighter" one. This is observed in East Futunan, where the reciprocal suffix *fe-* is unproductive and the circumfix *fe-...-'aki* containing it is productive (Moyse-Faurie, Ch. 35, §§3.1-3.3). Another instance is Indonesian where the preserved reciprocals with the prefix *ber-* acquire optionally the additional suffix *-an* by analogy with one of the two productive morphological derivational patterns, viz. with the circumfix *ber-... -an*; cf. *men-cium* 'to kiss' → *ber-cium[-an]* 'to kiss each other' (the other pattern involves pre-reduplication; cf. (138) below).

Needless to say, productivity is not always linked with frequency. For instance, the Russian unproductive reciprocals in *-sja* are unlikely to be less frequent in usage than reciprocals with the productive marker *drug druga*.

10.3 Stylistic differentiation

This can be exemplified by the German productive reciprocal markers, the reflexive clitic *sich* and full pronoun *einander*. In colloquial speech, with certain exceptions, the clitic *sich* is used, as a rule, and *einander* sounds bookish, lofty and solemn (Berger et al. 1972:544); cf.:

- (132) a. *Sie lieben sich.* 'They love each other.'
 b. *Sie lieben einander.* (same).

Another instance is Chinese: according to Wang Liaoyi (1957:59), in colloquial speech the common people (lit. 'the man in the street') usually express reciprocity by means of the simultaneous parallel use of the personal pronouns *wǒ* 'I' ... *nǐ* 'you' (SG), *nǐ* ... *wǒ* (see (6) above) rather than by the pronoun *xiāng* 'mutually, each other' (in Chinese, there are at least two more reciprocal devices; see (47)–(48) above).

Compare also case 3 in 3.2.

10.4 The arguments involved in reciprocalization

Two main cases can be distinguished:

(a) one of the reciprocal markers can be used for the direct object and another for the indirect and oblique object reciprocalization;

(b) one is used for the direct and indirect object and another for an oblique object (the term oblique object is a cover term for postpositional, prepositional objects, and semantically it often denotes spatial relations).

The first of these cases is registered in Kabardian where reciprocalization of the direct object is marked by the prefix *zə-r(ə)-* (133a), and that of the indirect object (133b) by *zə-* (see (133b); cf. also 6.2.1.1).

- (133) a. \emptyset -zər-ocIə-x (= (56b) above)
 they-REC-know-PL
 ‘they (= \emptyset) know each other.’
 b. dā-zə-psəlv-a-sI
 we-REC-talk-PAST-ASS
 ‘we (=dā) had a talk with each other.’

Polish is also of this type, but the system of marking is more complex: reciprocalization of the direct object is marked by the clitic *się* (ACC) and also by the pronoun *siebie* (ACC) (cf. (119a) and (112) respectively); in other cases *siebie* is used: its dative case form *sobie* for the indirect object reciprocalization (dative *si* being out of use), and *siebie* or *sobie* with prepositions for oblique objects (recall that both *się* and *siebie* can be reflexive and reciprocal); cf.:

- (134) a. *One* (F) *liubili się/siebie* (ACC). ‘They liked *each other/themselves*.’
 b. *Oni* (M) *wierzyli sobie* (DAT). ‘They believed *each other/themselves*.’
 (135) a. *Przyjaciele* *czekali na niego*. ‘The friends waited *for him*.’
 b. *Przyjaciele* *czekali na siebie* /**na się*. ‘The friends waited *for each other*.’

German is of type (b): the direct and indirect object are reciprocalized by means of the marker *sich* (and the reciprocal pronoun *einander*) and prepositional objects by *einander*, and never by a combination of *sich* with a preposition which can have a reflexive reading only ((136c).

- (136) a. *Sie küßten sich/einander* (ACC). ‘They kissed.’
 b. *Sie stimmten sich/einander* (DAT) *zu*. ‘They agreed with each other.’
 c. *Sie glaubten an sich*. ‘They believed *in themselves/*in each other*.’
 d. *Sie glaubten aneinander*. ‘They believed *in each other*.’

10.5 The number of the reciprocants

In this case different markers are used for a different number of reciprocants. Three cases of formal relations between the markers are attested.

1. *Affixes are entirely different*. One of the markers may be used for more than two participants and the other for two participants only; cf. Limbu *-siŋ* and *-ne* respectively (see (81) above).

2. *One affix contains another*. For instance, the Tagalog reciprocal circumfix *mag-...-an* contains the marker *mag-*; cf.: *mag-away* ‘to fight with each other’ (of two or more persons) → *mag-away-an* ‘to fight with each other’ (of more than two persons) (see (26) in Ch. 1).

3. *Dual and plural pronouns are used*. Compare Latin *alter alterum* ‘each other’ (for two persons) and *alius alium* ‘each other’ (of more than two persons).

(For details see Nedjalkov, Ch. 1, §6.)

10.6 Co-occurrence and interchangeability

A combination of these two features yields four logical types of which only three are attested. Needless to say, with regard to interchangeability only the general tendency can be shown, and the statements do not concern all reciprocals.

1. The markers are not interchangeable and they do not co-occur, thus being in complementary distribution. This type is not attested in my data.

2. The markers can co-occur and they are interchangeable. This most commonly applies to verbal and pronominal markers (the latter is used pleonastically or for disambiguation in the case of a polysemous verbal marker); cf. Chukchi (*-tko* is an antipassive marker here; cf. 3.3 above):

- (137) *təm-* ‘to kill’ →
- a. *təm-wəly-* ‘to kill each other’
 - b. *əryičyu təmə-tko-* ‘(same)’
 - c. *əryičyu təmə-wəly-* ‘(same)’.

Similarly in Evenki: *iče-* ‘to see’ → *iče-meet-* ‘to see each other’, *memelgiwer iče-* (same), *memelgiwer iče-meet-* (same).

3. The markers are interchangeable but cannot be used simultaneously. This is characteristic of reciprocal pronouns, e.g. *each other* and *one another*, Russian *drug druga* and *odin drugogo*, less frequently it is observed among verbal reciprocals; in the following example the circumfix can alternate with root pre-reduplication; cf. Indonesian (Ogloblin & Nedjalkov, Ch. 33, §1.2):

- (138) a. *me-mandang* ‘to look at sb’
 b. *ber-pandang-an* ‘to look at each other’
 c. *pandang-me-mandang* (same).

Similarly in German and Polish where the respective *sich* and *einander* and *się* and *siebie/jeden drugiego* cannot be used simultaneously (cf. *Sie küßten sich* ‘They kissed (each other)’, *Sie küßten einander* (same), but **Sie küßten sich einander*).

4. The markers are not interchangeable but they can be used simultaneously. This type is attested in languages with a verbal and a pronominal reciprocal markers. In this case the problem of the dominating marker arises. Two main strategies are possible here.

4a. The dominating marker is the verbal one. It is the main one and the syntactic marker is used without the verbal marker and preserves its nominal properties with a limited set of base verbs (mostly those taking a prepositional object), as in French and Bulgarian. Otherwise, i.e. in collocation with reciprocal verbs, the syntactic marker loses its nominal properties and functions very much like a reciprocal specifier (see 3.7). Compare French:

- (139) a. *Jean embrasse Marie.* ‘John embraces Mary.’
 b. *Jean et Marie s’embrassent.* ‘John and Mary embrace each other.’
 c. *Jean et Marie s’embrassent l’un l’autre.* ‘John and Mary embrace each other.’
 d. **Jean et Marie embrassent l’un l’autre.* (same intended meaning).
 (= (94) in Nedjalkov, Ch. 1). (For more details see Ch.1, §11.)

4b. The dominating marker is the syntactic one, and the verbal marker which can optionally co-occur with the syntactic marker is retained as the only marker on a limited set of fossilized derivatives, most of them lexical reciprocals. For instance, in Kannada where the reciprocal pronoun *obbar-anna obbaru* <one-ACC one.NOM> ‘each other’ optionally combines with the highly polysemous verbal marker *-kol/-koN-* (Amritavalli 2000:54).

Outside the limits of 4b, two more instances of the use of the syntactic markers in the Dravidian languages may be pointed out: (a) in Telugu, a syntactic marker must be used simultaneously with a verbal one, as a rule, and this can be regarded as a complex two-component marker (Subbarao & Lalitha 2000:226); (b) in Malayalam, where there are at least ten syntactic reciprocal markers, a verbal marker is lost and syntactic markers are in use (see (17) above and §3.4) (Jayaseelan 2000:119; Asher & Kumari 1997:168).

Across languages with competing syntactic and verbal markers, the tendency for syntactic markers to oust the verbal ones seems to be more common than the opposite one (although the South-Slavic and some of the Romance languages are counterexamples). At least one of the causes of the tendency may be the polysemy of the verbal markers, especially such meanings as the anticausative, passive and other middle meanings. Besides, verbal markers seem to tend to lose productivity in general. The greater or lesser degree of the domination of a syntactic marker over a verbal one is attested not only in the Dravidian languages but also in most of the languages of the Circum-Baltic area (Scandinavian, Baltic, East Slavic) and in a number of Turkic (e.g. Karachay-Balkar and Turkish) languages.

10.7 Semantic differences

As one of the widespread differences between verbal and pronominal reciprocals, the temporal difference is often pointed out, viz. verbal reciprocals with light markers are claimed to denote simultaneous actions of the reciprocants and pronominal reciprocals with heavy markers may be simultaneous or sequential. It seems that these differences are not always related to the character of the reciprocal markers. For instance, two light reciprocal markers may also differ in this respect. Let us consider certain differences that can correlate with temporal differences. To quote Kemmer (1993:109), “[l]ight reciprocal marking is strongly associated with simultaneity, while heavy reciprocal markers are temporally indifferent.” This insightful observation which [being often enough justified] explains many cases analyzed by Kemmer, needs some amplification. In the first place, this difference may take place between (a) two light markers of a language and, in the second place, (b) there are light markers in numerous languages that in combination with certain verbs can express only sequential subevents.

Case (a) is trivial and can be illustrated by Even reciprocals with different light markers: one of them, the suffix *-lda/-lde* with the main sociative meaning is unproductive as a reciprocal marker (it has this function on about ten items) and its derivatives are lexicalized, and the suffix *-mat/-met* derives standard reciprocals: it is productive and monosemous. The semantic difference between derivatives with these markers may be partially temporal and at the same time lexical (140–142), especially in the case of lexi-

calized and non-lexicalized reciprocals with the same stem. Analogous semantic relations between productive and unproductive same stem reciprocals also occur in other languages (sometimes the same temporal difference may exist between two meanings of a derivative with the same marker.) The meaning of a lexicalized derivative is usually more complex and often includes the meaning of the non-lexicalized partners. These derivatives are also entered in a different way in the dictionaries: in an Even-Russian dictionary both types of derivatives can be entered, while in a Russian-Even dictionary derivatives in *-mat/-met* cannot be found because there are no entries like Russian *videt' drug druga* 'to see each other', and the like. These relations can be further complicated by the existence of parallel reciprocals with the heavy marker (cf. *meen meen-ur it-* 'to see each other') which has no distinct restriction on its usage but occurs less frequently than reciprocals with *-mat/-met*.

Even (Malchukov, Ch. 39, §9.1.2)

- (140) *it-* 'to see' → a. *iči-lde-* 'to meet'
 b. *it-met-* 'to see each other.'
- (141) *göön-* 'to say, tell' → a. *göö-lde-* 'to come to an agreement'
 b. *göö-met-* 'to say to each other.'
- (142) *žav-* 'to grasp' → a. *žava-lda-* 'to shake hands', 'struggle'
 b. *žav-mat-* 'to grasp each other', etc.

As regards case (b), it should be noted that the number of reciprocals with light markers denoting sequential arrangement of the subevents is not so small, and this meaning is determined by the lexical meaning of the base verbs if they denote actions that cannot be performed simultaneously upon each other for pragmatic reasons. Compare German:

- (143) *Sie wuschen sich gegenseitig den Rücken* 'They washed each other's back.'

Especially convincing is the following sentence from a Chukchi fairytale where the sequentiality of the subevents is explicated in the text itself.

- (144) *Naqam emrənyite palomtel-wəly-a n-it-qinet: evər ənnen nə-wetyaw-qen,*
 well by.turns listen-REC-INST IMPF-AUX-3PL when one IMPF-tell-3SG
qol-əm nə-palomtel-qen.
 other-EMPH IMPF-listen-3SG
 'Well, they listened to each other by turns: when one talked the other listened.'

And lastly, there is one more case which is often enough used as proof that light markers always denote simultaneous subevents. This favourite example illustrating simultaneity of reciprocal subevents and potential sequence are the verbal and the pronominal derivatives meaning 'to kiss' and 'to kiss each other'. For instance, as Kemmer (1993:111) notes, in the English equivalents of the following German sentences "the two might be kissing each other on the cheek, sequentially", but in the second, "there is almost certainly only one kiss involved"; cf. (bold type is mine – V.N.):

- (145) a. *Hans und Maria haben einander geküßt.* – *John and Mary kissed each other.*
 b. *Hans und Maria haben sich geküßt.* (p. 112) – *John and Mary kissed.*

I will note in passing that simultaneity of actions in (145b) is accounted for by the “technical aspects” of the European kiss which do not allow to describe “kissing each other on the cheek, i.e. sequentially” by means of a reciprocal with a light marker. On the other hand, in some languages the light marker is used to denote “kissing sequentially”: the Kirghiz traditional mutual kiss is on the neck (they never kiss on the lips) and this cannot be performed simultaneously, but it is nevertheless denoted by the reciprocal *öb-üš-* (< *öp-* ‘to kiss sb’). The heavy marker *birin biri* is not used with the verb *öp-* for the trivial reason that frequent events are preferably expressed by shorter items. As regards the choice between *sich* and *einander*, in colloquial German, the former is preferable and (145a) is unlikely. But *einander* is the only one possible in reciprocalization of prepositional objects (136). On the other hand, *einander* can be used instead of *sich* if the derivative is polysemous; cf. *Sie trösteten sich damit* ‘They got consoled with it’; a much less likely interpretation is ‘They consoled each other with it’. For this meaning the proper expression is *Sie trösteten einander damit*. In this and similar cases the issue of simultaneity or sequentiality is more or less irrelevant. This also holds for the (146b) where the heavy reciprocal German marker *einander* translates the English light (= zero) marker (examples from Wandruszka 1969:449; bold type is mine – V.N.):

- (146) a. *Cathleen bent down and Melanie tiptoed. They kissed.* (M. Mitchell)
 b. *Cathleen beugte sich herab und Melly erhob sich auf den Zehenspitzen, und sie küßten einander.*

To conclude the discussion of this example, I will note that the number of such pairs as *to kiss – sich küssen* and *to kiss each other – einander küssen* is relatively limited. In English, the number of pairs like *kiss – kiss each other* hardly exceeds 20.

11. Concluding remarks

I wish to stress the following.

11.1 Iconicity in the expression of the reciprocal meaning

A prototypical reciprocal situation is often represented schematically as *two* points connected by *two* arrows with opposite directions, the schema encoding two participants and their two actions directed at each other (iteration of the same subaction by different subjects). This dual number is iconically reflected in the reciprocal markers in a variety of ways.

The iconicity is reflected in *the two-component structure of many types of reciprocal marking*:

1. Doubling of clauses with argument inversion; here are several subtypes (see §2, especially examples (3), (4), (5)).

2. Verb root reduplication; cf. (100), (101); in most cases it is used in combination with reciprocal affixes, cf. (102)–(108); in (45) the first syllable of the root and in (46) the auxiliary is reduplicated rather than the notional verb.

3. Reciprocal pronouns and adverbs with two-component structure, as is shown in (12), (14), (15), (16), (17).

4. Reduplication of reciprocal pronouns, as is shown in (13), (21b), (23).

5. Reduplication of affixes, including reflexive ones, as is shown in (71), (72).

6. Attachment to the reciprocal affix of optional or obligatory other markers with the meanings of

- (a) iterativity (84), (85);
- (b) iterativity and reciprocity (86);
- (c) iterativity and plurality (89);
- (d) reflexivity (82), (81);
- (e) sociativity and reciprocity (86c), (89b);
- (f) reciprocity (49).

Some of the additional components are not used alone (e.g. Kabardian *-rə-* in 6.2.1.1, Abaza *-ba-* in 6.2.1.2, Buryat *-sa-* in (88a)). It seems that in case 6 the tendency towards a two-component structure also plays a role.

The iconicity of a prototypical reciprocal situation, i.e. a situation with two participants, is also reflected in special reciprocal markers for two reciprocants only different from the markers for situations with more than two reciprocants (cf. the Limbu reciprocal suffixes *-ne* and *-siŋ* respectively in 6.4.2.1 above; see also Ch. 1, §6 for more details), and also by the obligatory use of dual subject agreement marker in Awtuw even on reciprocals describing situations with more than two reciprocants and containing a plural subject agreement marker (73).

The opposite direction of the actions in a reciprocal situation is reflected in markers with deictic complementary (contrasting) words as the source of the reciprocal meaning, like the Chinese markers with double auxiliary components of the types ‘*I* (1SG) *V you* (2SG), *you V me*’ (6) and ‘*V come V go*’ with the meaning of repeated motion in opposite directions (48). The Malayalam reciprocal adverb with the literal meaning ‘this way that way’ (33) can be assigned to this type, and markers whose literal meaning implies the opposite direction of the prior action, like Tucano *amē-* ‘do back’ (49).

Note in passing that reduplication is often used as a marker of iterativity of actions and plurality of participants, among other meanings. The reciprocal meaning overlaps with the meanings named (including sociativity), and a reciprocal situation can be described as a repetition of the same action involving the same participants but with participant roles reversed (in this connection see Moravcsik 1978:316–21).

11.2 Possible differences between reciprocal markers within one language

If a language possesses two or more reciprocal markers, they can be used either more or less indiscriminately though displaying slight differences that are sometimes hard to explicate (cf. (137a) and (137b), (138b) and (138c)), or they may be in overlapping (cf.

(134a), (136a, b)) or complementary (cf. (134b), (135b)) distribution, or they may co-occur, when used simultaneously for emphasis (137c), pleonastically (for no particular reason) or for disambiguation, especially if one of the markers is polysemous and another monosemous.

Apart from the formal differences on the basis of which the six types listed above are distinguished (see 1.2), the reciprocal markers of a language can also differ in frequency, productivity, stylistic characteristics, syntactic status of the reciprocalized arguments, number of the antecedent, mutual co-occurrence and interchangeability, and semantics. Two (or more) reciprocal markers can differ in two or more respects (see Section 10).

If there are both syntactic and verbal reciprocal markers in a language, they may be on competing terms; the former seem to have a better chance of achieving the dominating position. This is the case, for instance, in a number of the Turkic, Dravidian and Indo-European languages (cf. 10.6).

On the other hand, syntactic markers seem to be less stable in the sense that they may be ousted by newer coinages. For instance, all the Turkic languages share the same ancient reciprocal suffix (cf. Yakut *-is-*, Karachay-Balkar *-iŝ-*, etc.), while the reciprocal pronouns differ across these languages (cf. Yakut *beje-beje-leri-n* <each-other-3PL-ACC> and Karachay-Balkar *biri-biri-Ø-n* (same)).

There are certain lexical groups of two-place verbs which can have reciprocal markers not used on other verbs; for instance, reciprocal specifiers are used on a lexically limited range of verbs, e.g. on verbs denoting emotions. This is probably due to their lesser degree of transitivity in comparison with verbs of action like ‘to kill’ (see, for instance, (36d) and the preceding discussion, case 2 in 3.7.3, and also §3.6).

1. Introduction. Definitions. Two main meanings of the prefix *com-*

This paper is concerned with the Latin prefix *com-* (the allomorphs are *com-*, *con-*, *cor-*, *col-*, *co-*; the choice is determined by the initial phoneme of the stem). The main point of interest is verbs, and sometimes nouns with this prefix are also taken into consideration.¹ In case of polysemy, each lexical meaning of a word with the prefix *com-* is regarded as a separate unit and numbered accordingly if a different meaning of the prefix is realized in it. Thus each word represents as many units of analysis as the number of meanings of the prefix *com-* in combination with a given stem. As it is, one index may cover a variety of lexical meanings within one meaning of the prefix.

According to tradition we quote Latin verbs in the 1sg form. We do not take into account figurative and similar secondary meanings of prefixed verbs as this stage of semantic derivation is not immediately related to the problem we are concerned with (for instance, cf. the meaning ‘to study thoroughly’ of the verb *combibo* which is a result of metaphorical development of the meaning ‘imbibe/absorb/drink in’ with the “additive” meaning of the prefix *com-*).

The prefix *com-* may undergo desemantization, in cases when it duplicates a component of meaning potentially present in the verbal stem.

Two main classes can be distinguished among Latin verbs on which the prefix *com-* retains a high enough *degree of semantic autonomy* (see Zaliznjak 1995: 150) for us to speak of the meaning of this prefix:

- *Class A* comprises verbs whose definitions contain the component ‘together with sb/sth’; cf.:
 - (1) *compasco* ‘graze (cattle) together’
condolesco ‘suffer together’, cf. (2):
 - (2) *animus corpori condolescit* ‘spirit/soul suffers together with body’
cf. French *condolérance* ‘condolence.’
- *Class B* comprises verbs with the semantic component ‘draw/bring sth together, come together, join/unite’ (vt/vi); cf.:
 - (3) *committo* ‘bring together’, ‘compare’, ‘join’ (vt)
coeo ‘gather/come together, meet.’

Sometimes, the prefix *com-* adds different meanings when combined with the same stem, e.g.:

- (4) a. *concurro*
 - i. ‘compete’ (← ‘run together’ – the meaning of joint action)
 - ii. ‘come [running] together’ (the meaning of drawing close together)
- b. *combibo*
 - i. ‘drink together with sb’
 - ii. ‘absorb/imbibe, drink/take in’; cf. (5):

1. The sources of Latin data are *A Latin-English Dictionary* (White, Oxon & Riddle 1876) and *the Latin-Russian dictionary* (Dvoreckij 1976).

- (5) *et sicco lacrimas conbibat ore tuas.* (Ovidius. *Ars amatoria*, II, 326)
 ‘and she drank your tears with her dry lips.’

Class A is clear-cut enough: in this meaning the Latin prefix *com-* can be compared to the German *mit-* (cf. Latin *compassio* ‘compassion, sympathy’ and German *Mitleid* ‘compassion’, where this meaning is the main one, in contrast to the Russian prefix *so-* which appears in this meaning mostly in loan words).

The boundaries of *Class B* are less distinct, due to the diffuse nature of the semantic component introduced by the prefix. In this meaning the prefix *com-* undergoes desemantization quite easily: if the idea of ‘drawing together’ is contained in the meaning of the verbal stem the prefix functions as a marker of completion (a kind of “perfectivizer”); cf.:

- (6) *connecto* ‘connect, join together’
commisceo ‘mix’ (vt), etc.

Class B also covers some modifications of the meaning of ‘drawing/coming together’, such as ‘pressing together’, ‘embracing/inclusion’, ‘covering’, etc., which may combine with the meaning of ‘completion’ (‘terminativity’). Among these, especially numerous are verbs on which the prefix is desemantized or is hardly analyzable semantically; cf.:

- (7) *compleo* ‘fill’
commemoro ‘recall, remember.’

Such verbs are of less interest to us.

Thus, the prefix *com-* has two principal meanings, of ‘joint action’ and ‘bringing/coming together’ (cf. two principal meanings of the English adverb *together* in Lasersohn 1990). In the case of joint, or collective action one semantic role is performed by more than one participant (this meaning may be termed *sociative*). The status of this semantic role determines a more precise nature of the semantic effect and changes in the syntactic pattern the prefix produces on the derivative.

In the case of a one-place predicate the prefix indicates that the only semantic role is performed by more than one participant. This is subject-oriented sociativity. Syntactically, it may find expression in two ways: either the only syntactic valency is obligatorily filled with a plural noun (i.e. a noun phrase denoting plurality of entities: a noun in the plural number, a collective noun like *class*, *family*, *multitude*, a conjoined or comitative noun group), or the derivative acquires an additional valency (*cum-* + ABL). Thus, the verb *cubo* means ‘to lie’ and may describe a situation with one participant, while *concu(m)bo* obligatorily implies two participants, which finds syntactic expression either in a plural subject or in the obligatory valency *cum aliquo* ‘with someone’. Similarly, the verb *loquor* ‘talk, speak’ may have a case frame comprised of the subject alone, although it allows variants with a plural subject and an object with the preposition *cum* ‘with’. Contrary to it, the verb *colloquor* ‘talk, converse’ makes one of the two variants obligatory: either a plural subject (in this case *inter se* ‘between selves’ is often added) or an object *cum aliquo* ‘with somebody’ (i.e. the second participant must be named in one way or the other).

So far, we have spoken of joint (collective) actions in the domain of one-place verbs. With two-place verbs that have both a subject and an object valency, the expression of the

sociative meaning is more varied. Thus, an action may be performed on more than one referent, in which case the syntactic object is a plural noun. This may be termed *object-oriented sociativity*. On the other hand, sociativity may concern the subject, and in this case it is the subject that is expressed by a plural noun: like one-place intransitives, these two-place verbs with a plural subject are *subject-oriented sociatives*. Sociativity involving both subject and object is possible if only the agent of one action is simultaneously the patient of another identical action, and vice versa (cf. *to kiss each other*, *to abuse each other*). Verbs of this type are termed reciprocal and they are typically related to two-place transitive bases. Close to these reciprocals are verbs derived from one-place intransitives which acquire a second valency along with the prefix *com-*. Consider the verb *concumbo* ‘lie together’: clearly if X is lying with Y, Y is lying with X at the same time. The underlying *cubo* ‘to lie’ has no object, but the derivative acquires a second participant performing a role analogous to the role of patient of a reciprocal verb. That is, the verb meaning ‘lie together’ differs from the verb meaning ‘to abuse each other’ in that its underlying verb is not transitive (cf. *to abuse vt*). In other words, *concumbo* differs from *confligo* ‘hit each other, collide’ (← *fligo* ‘hit’) or from *confutuo* ‘have sexual intercourse’ in that it is derived from a one-place intransitive verb while the latter two are derived from two-place transitives. However the additional valency *cum aliquo* which the verb *concumbo* has acquired is identical to the analogous valency of *confutuo*. Verbs like *concumbo* may be termed *secondary reciprocals*.

Let us consider the semantic classes of verbs with the prefix *com-* in more detail.

2. Class A: Non-spatial meanings

As has been mentioned, this is a class of verbs with the prefix *com-* indicating sociativity (in the broad sense). They may be further divided into the following subclasses:

- Verbs denoting joint action of two (or more) participants (they are subdivided into verbs of “equal” actions and verbs of “attendant” action).
- Verbs denoting an action of a single agent upon two patients (this is a small subclass).
- Verbs denoting reciprocal actions.

2.1 Joint (sociative) action: ‘Doing sth together (with another subject)’

Joint actions differ from identical actions performed by two or more persons (even if they are performed simultaneously and in the same place) in that they are conceptualized as acts of one joint action. Thus, for instance, if two persons are in the same room and each is writing his/her own paper, this does not form any joint action (unless they are writing papers for a collective monograph). On the contrary, if they are writing the same paper (if they are co-authors of the same paper, whatever the distribution of their roles), they are performing a joint action. Of course, there happen more complex situations. For instance, if a group of students is listening to a lecture together it is likely to be conceived as a joint

action, but if two groups of students listen to the same lecture at different times it is less likely to be conceived as a joint action.

A significant feature of the prefix *com-* is that it tends to indicate participation of a number of persons in the same joint action rather than in a number of identical actions performed by different participants simultaneously or by turns. Such situations are possible, though rare, cf. *compugno*₂ ‘suppress, annihilate together or simultaneously’ (e.g., *amaritudinem* ‘vexation, anger’). Note that the Greek prefix *ἀντι-* which has a set of meanings partially overlapping with that of *com-* can also denote identical actions of different participants/agents (see 4.2.2).

It should be noted, however, that the “degree” of sociativity expressed by verbs with the prefix *com-* depends on the syntactic construction. It is minimal in a clause with the subject expressed by a conjoined group or a plural noun: this type of construction generally can be understood as describing two independent actions (cf. one of the readings of the sentence *Peter and Kate went out for a smoke* = each went out on his/her own). But even when it denotes a joint action its degree of sociativity is less than in a construction with a different case frame. Thus, the verb *competo* with a plural subject means ‘strive, seek after, try to achieve sth (the same goal) together’. Moreover, this construction may have the meaning of secondary reciprocal (cf. *competo* ‘come together, rally, coincide’: *viae competunt* ‘the roads converge’; see 2.3). The degree of sociativity is somewhat higher in constructions with the comitative phrase *cum* + ABL: in this case the more likely reading is that the participants have combined their efforts while a construction with a plural subject is likely to imply separate efforts of each participant. Constructions with the (obligatory) dative case denote joint actions exclusively: thus the verb *competo* used with a dative object renders the meanings ‘to coincide/converge’ and ‘to correspond/suit’; cf.:

- (8) *tanto Othonis animo nequaquam corpus <...> competit.* (Svet.)
 ‘Othon’s body didn’t answer to such spirit of him.’

2.1.1 Participation on equal grounds (*sociative and comitative meaning*)

Verbs of “equal” actions (i.e. verbs denoting situations in which two or more participants act “on an equal footing”) may have two case frames which realize the sociative and the comitative meaning respectively: ‘X and Y do sth together’ and ‘X does sth together with Y’. They may be either transitive or intransitive and the subject may be either animate (human) or inanimate. Examples:

- (9) *coepulor* ‘feast together, share a meal with sb’ ← *epulor* ‘eat, dine, feast’
coadolesco ‘grow up, ripen together’ ← *adolesco* ‘grow up, ripen’
coaegresco ‘fall ill together’ ← *aegresco* ‘fall ill’, cf. (10)
compasco ‘tend (cattle) together’ ← *pasco* ‘tend (cattle).’
- (10) *corpus animae coaegrescit* ‘the body falls ill together with the soul.’

Within this class of verbs, the meaning of participation in some joint activity can be distinguished:

- (11) *cohonesto* ‘participate (together with others) in worship(ping)’
 ← *honesto* ‘worship/honor’
coaltercor ‘participate in an argument’ ← *altercor* ‘argue’
collaboro ‘collaborate, work together’ ← *laboro* ‘work’
colludo ‘play together’ ← *ludo* ‘play’
collugeo ‘mourn together’ ← *lugeo* ‘mourn’
commilito ‘serve in the army together’ ← *mito* ‘serve in the army.’

It is not easy to draw a borderline between these subgroups in Latin; note that in German this distinction is more consistent (see 3.3.1).

Here are a few more verbs of the latter type:

- (12) *combibo* ‘drink together’
*commorior*₁ ‘die together’
*compatior*₁ ‘suffer together’
compecco ‘sin together with sb’
competo ‘strive after sth together’
*comploro*₂ ‘mourn (over the dead) together’ (← *ploro*₂ ‘mourn’)
concado ‘fall/go down together’
*conclamo*₁ ‘shout together’
concino ‘sing together’ (← *cano* ‘to sing’)
condisco ‘learn in company with’
conspiro ‘sound/ring out together, be heard simultaneously’; cf.:
 (13) *cornua conspirant* ‘the horns sound together.’

2.1.2 “Concomitant” action (assistive meaning)

Here belong verbs with an *assistive* meaning (‘to help, assist sb in sth’). The principal agent is signified by the dative case. Compare:

- (14) a. *comitor* ‘see sb off/escort, accompany’ (← *eo* ‘go’ via *comes*, *-itis* ‘fellow-traveller’)
*concino*₂ (*alicui*) ‘join in singing, accompany’ (← *cano* ‘sing’).

The following verbs probably also belong here:

- b. *compatior*₂ (*alicui*) ‘feel compassion (for)’ (← *patior* ‘to suffer’)
*condolesco*₂ ‘suffer together’; cf.:
 (15) *animus corpori condolescit* ‘spirit suffers together with the body.’

Such verbs usually have a *sociative* meaning along with the assistive; cf.:

- (16) *concino*₁ ‘sing together (in unison, harmoniously).’

The meaning of “*attendant*” action is relatively rare. In fact, it is a modification of the previous meaning (2.1.1): the subject referent performs an attendant role while the main role (of the action named by the base verb) is performed by the object referent in an oblique case, cf. *confloreo* ‘bloom together’ in:

- (17) *conflorens mihi flore adulescentiae* (Aug. Conf.)
lit. ‘blooming with me with the blossoms of youth’, i.e.
‘being like me in the bloom of youth.’

These verbs differ from those of “equal” action in that they do not have the pattern ‘X and Y’.

2.2 Action upon two objects

This type of meaning is found in a small group of transitive verbs with a plural object expressed either by a noun in the plural, or a conjoined or comitative phrase. Here belong verbs like the following:

- (18) *coaestimo* ‘estimate sth together, include sth in the overall estimation’
compendo ‘weigh (two things) together’
compenso ‘counterbalance, compensate’, e.g. (19)
concoquo ‘boil together (one thing with another).’
- (19) *compensabatur cum summis doloribus laetitia.*
‘greatest sufferings neutralize the joy.’

2.3 Reciprocal action

The definition of these verbs contains the component ‘each other’, ‘with each other’, etc. which is determined by two factors.

In one group of verbs with the prefix *com-* the respective unprefixes have the same meaning, although it may be slightly more general, i.e., they denote actions that are usually (though not necessarily) performed together or with respect to each other, thus these actions presuppose a counteragent. The prefix *com-* on these verbs serves to narrow down the meaning: as a result, the prefixed verbs can denote reciprocal actions only. For instance, *colloquor cum aliquo* means ‘talk/converse with sb’, while *loquor aliquid* means ‘say, speak, tell sth’, although it may take a comitative object of addressee (*cum aliquo*) optionally. The verb *certo* (*cum aliquo*) has two meanings: ‘rival, compete, vie’, as in (20a), and ‘fight, struggle’, as in (20b):

- (20) a. *cives cum civibus de virtute certabant.* (Sl.)
‘citizens compete with one another in virtue.’
b. *certo cum hostibus*
‘struggle with the enemy.’

Its prefixed derivative *concerto* has the very same meanings, i.e., the prefix simply marks the semantic component already present in the underlying verb.

The following examples illustrate this type of verbs:

- (21) *loquor aliquid* ‘speak, talk, tell sth’ → *colloquor cum aliquo* ‘talk with sb’
certo [*cum aliquo*] → *concerto cum aliquo* i. ‘rival, compete’, ii. ‘struggle, fight’
*pugno*₁ → *compugno*₁ *cum aliquo* ‘fight with sb’
luctor → *colluctor cum aliquo* ‘compete, contend with sb.’

All these verbs have a reciprocal ('A competes with B') rather than a sociative ('A together with B competes (*with C*)') meaning, the object *cum aliquo* indicating the "adversary" and not an "ally".

The other group comprises verbs that acquire a reciprocal meaning due to the prefix *com-* only; cf.:

- (22) *lido* 'hit' → *collido* 'hit sth against each other, bring together'
morior 'destroy' → *commorior* 'destroy each other', cf. (23)
multiplico 'multiply' → *commultiplico* 'multiply mutually.'
- (23) *duo venena commoriuntur* 'two poisons mutually perish.'

Generally speaking, the meaning of reciprocal action is very close to the meaning of 'bringing/coming together' (i.e. *Class B*). When used with the prefix *com-*, verbs denoting motion or any dynamic action can acquire the meaning of meeting, i.e., motion that involves coming from different directions and meeting (or an action performed upon each other). The result of such motion can be metaphorically reinterpreted in two ways, as a *conflict* (meanings like 'collide', 'contradict each other', 'be in contrast/at variance with each other', etc.; cf. (24)), or, on the contrary, as *harmony* (meanings like 'coincide', 'correspond', 'tally', 'meet', 'come together', etc.; cf. (25)).

- (24) a. *fligo* 'hit' → *confligo* 'hit against each other, collide, conflict'; cf.:
 b. *leges diversae configunt* 'different laws are at variance.'
- (25) a. *curro* 'run' → *concurro* i. 'happen together' (25b), ii. 'correspond' (25c):
 b. *quae ut concurrant omnia, optabile est.* (Cic.)
 'the coincidence of all [those things] is desirable.'
 c. *concurrere cum veritas* 'agree with the truth.'

Manifestation of one or another of these two meanings is partly determined by the semantics of the underlying verbs (cf. the meaning 'correspond' of the verb *consto* derived from *sto* 'stand'); but this dependence is not rigid and one verb may have both of these meanings: thus *concurro* means not only 'coincide', but also 'collide'; cf.:

- (26) *prorae concurrunt* 'the ships collided.'

3. Class B: Spatial meanings

Besides the meaning of joint (collective) action, verbs with the prefix *com-* can also have the meaning of coming together and/or joining (sth) together. This may involve the subject referents of a one-place verb (cf. *coalesco* 'coalesce, come together and unite into one substance, group') or object referents of a two-place verb (cf. *coagmento* 'join/connect sth together'). The situation of coming together of the subject referents of a two-place verb is practically impossible: in this case a verb acquires the meaning of joint action. This distribution of the meanings is determined by the following factor: the idea of coming or bringing together implies motion, and the moving entity is either the subject referent of a one-place verb (*to run, to walk*), or the object referent of a two-place verb (*to carry sth, to*

move sth). As well as in *Class A*, there are variants of meaning: the participants of a situation may be “equal” in their involvement, i.e. perform identical roles in the situation, or they may be “unequal”, when one of the participants performs the main role and the other an auxiliary role, i.e. assisting the main participant.

The logic of the semantic development of the prefix *com-* in its second meaning is this:

coming/bringing together > linking/connecting > totality (intensity) > completion.

3.1 The objects that come/are brought together are “equal”

3.1.1 *Subject-oriented reciprocals (intransitive verbs)*

Here belong the following verbs:

- | | | | |
|------|----------------------|---|--|
| (27) | <i>alesco</i> ‘grow’ | → | <i>coalesco</i> ‘coalesce/grow together’ |
| | <i>eo</i> ‘go’ | → | <i>coeo</i> ₁ ‘meet, come together’ |
| | <i>curro</i> ‘run’ | → | <i>concurro</i> ₁ ‘gather running, come running together’ |
| | <i>fluo</i> ‘flow’ | → | <i>confluo</i> ‘flow together, join’, etc. |

When the subject referents of a one-place verb come together this meaning of coming together may be manifested in the derived verb in two ways: it either remains a one-place verb in which case it requires a plural subject, or it becomes two-place and acquires an additional valency *cum aliquo* ‘with sb/sth’ (cf. above). The choice of one or the other variant with each verb is to a large degree idiosyncratic. Thus, the verb *coalesco* is practically always used as a one-place intransitive with a plural subject:

- | | | | |
|------|----|---|---|
| (28) | a. | <i>inter se palpebrae coalescunt</i> | ‘the eyelids close (= come together).’ |
| | b. | <i>multitudo coalescit in corpus unius populi</i> | ‘multitude grows into a single people.’ |

In (28a) the subject is a noun in the plural, and in (28b) a noun in the singular is used, but it is semantically plural.

The verb *coeo* equally allows both possibilities, i.e., it may remain one-place with a plural subject or it may be two-place and take an object with the preposition *cum* ‘with’; cf. respectively:

- | | | | |
|------|----|-------------------------------|--|
| (29) | a. | <i>jam agmena coibant</i> | ‘the hordes were coming together.’ |
| | b. | <i>coire cum aliena uxore</i> | ‘take up (become intimate) with sb else’s wife.’ |

3.1.2 *Object-oriented reciprocals (transitive verbs)*

3.1.2.1 *Bringing two entities together.* The class of verbs with the prefix *com-* whose meaning contains the idea of bringing two (or more) objects together comprises the following transitives:

- | | | |
|------|---|-----------------------------------|
| (30) | <i>colligo</i> I (< <i>collegare</i>) | ‘connect / link / bind’ |
| | <i>colligo</i> II (< <i>collegere</i>) | ‘gather’ |
| | <i>commino</i> (<i>pecua</i>) | ‘drive (cattle) together’ |
| | <i>committo</i> | ‘bring together (as competitors)’ |
| | <i>compello</i> | ‘drive together / gather’ |

<i>compingo</i>	‘knock together’ (← <i>pango</i> ‘hammer in’)
<i>compono</i>	‘pile / put / join together’
<i>comporto</i>	‘bring / pile up together’
<i>comprehendo₁</i>	‘fasten / tie together’ (ships with a rope)
<i>comprimo</i>	‘shut / close (one’s eyes, eyelids)’
<i>concipio</i>	‘gather, compile’ (← <i>cipio</i> ‘to take’)
<i>condo</i>	‘erect, compose, put together’
<i>conduco</i>	‘bring together / gather, draw up’
<i>confero</i>	‘join’
<i>configo</i>	‘fasten together’, etc.

If the meaning of an unprefixed verb contains the idea of bringing/joining things together the prefix *com-* duplicates this semantic component and is thus semantically empty: in other words, it undergoes desemantization and the prefixed verb is practically identical in meaning to its unprefixed counterpart; cf.:

- (31) *connecto* ‘connect, join’ ← *necto* ‘connect, tie’
commisceo ‘mix’ ← *misceo* ‘mix, stir’, etc.

3.1.2.2 *Bringing parts of the same entity together.* A particular case of bringing two equal object referents (of a transitive verb) together is bringing together of parts of a single subject referent, the latter entity being conceptualized as consisting of a given number of constituent parts. Bringing together in this case takes shape of pressing together, condensing a single entity. Thus, the verb *comprehendo* means ‘fasten/tie (probably two entities with each other)’ and also ‘take hold (of one entity)’. Note that this semantic development is also characteristic of the Russian prefix *s-*; cf. *s-vjazat’ dva brevna drug s drugom* ‘to tie two logs together (lit. ‘with each other’)’ and *s-vjazat’ človeka* ‘to tie up a man’. Examples of this type of verbs:

- (32) *cogo₂* ‘thicken, condense’
coeo₂ ‘become thick/pressed together, congeal’ (vi!)
complector ‘clasp around, seize, embrace’
comprehendo₂ ‘take hold of sth’
comprimo₂ ‘press, squeeze’
conresco ‘harden, thicken, congeal’
concipio₃ ‘grasp, catch’, fig. ‘perceive in mind, understand’ (← *cipio* ‘take’).

3.2 The objects that come/are brought together are not “equal”

Four semantic subclasses can be distinguished here.

3.2.1 *The meaning of complete involvement, totality, intensity*

Complete involvement may be of two kinds. On the one hand, it may concern the object referent, and on the other the subject referent. Sometimes both variants can be expressed by the same verb; cf.:

- (33) a. *combibo*₂ i. 'drink up, swallow down'
 ii. 'drink one's fill'; 'imbibe, absorb'; cf.:
 b. *combibere salem* 'become saturated with salt.'

But there are also other aspects of intensification. Let us compare the verbs *lacrimo* 'cry' and *collacrimo*. The former has a broad meaning including many of the meanings of the latter. The prefix *com-* introduces the meaning of intensity which may manifest itself in two ways: it may imply copious tears, in which case the prefixed verb means 'weep hard', or it may imply that tears cover a body up, hence the rarer meaning 'beveil, deplore'. In the following example from Seneca the verb *lacrimo* is contrasted with *ploro* as weaker in meaning; of course it cannot be replaced by its prefixed derivative here:

- (34) *lacrimandum est, non plorandum.* (Sen.)
 'one may shed a few tears but one should not drown in one's tears/cry one's eyes out.'

Note that *collacrimo* has one more meaning, viz. 'weep together', which is not entered in Dvoreckij (1976) although it occurs in Latin texts; cf.:

- (35) *Simul omnes collacrimarunt.* (Pl.)
 'Simultaneously all weep together.'

The meaning of overall involvement coded by the prefix *com-* may take shape of the meaning of "covering"; cf.:

- (36) *coaedificio* 'cover (a site) with buildings/build up (a site)'
coaggero (aliquid aliqua re) 'fill up, cover up with a pile/pile up with.'

In this case the prefixed verb changes its case frame: both the underlying verb and derivative are transitive, the direct object of the unprefixed verb changing into an instrumental object in the derived construction and the underlying locative becoming a direct object (cf. analogous changes in some of the Russian verbs with the prefix *za-*; see Zaliznjak 1995: 161):

- (37) a. *On po-stroil dom-a v pol-e.*
 he built house-ACC.PL in field-LOC.SG
 'He built houses in the field.'
 b. *On za-stroil pole domami.*
 he built.up field-ACC.SG house-INST.PL
 'He built the field up with houses.'

Besides, a verb with the prefix *com-* may have more specific modifications of the meanings listed above (which may or may not involve a change of the syntactic pattern); e.g.:

- (38) *probo* 'approve' → *comprobo* i. 'approve', ii. 'confirm loyalty'

The prefix narrows and somewhat modifies the meaning of the derivative here, as the underlying verb does not have the meaning 'to confirm loyalty'. Compare also:

- (39) a. *damno* 'bring in a verdict of guilty, convict'
 → *condemno* 'sentence (in court), condemn'
 b. *pungo* 'prick, puncture'

→	<i>compungo</i>	‘prick or puncture severely; tattoo; mark’
c.	<i>puto</i>	‘ponder, consider, suppose’
→	<i>computo</i>	‘sum up, compute’, etc.

In all these instances the derived verb acquires a narrower meaning which may be regarded as a modification of the meaning of intensity.

Sometimes, prefixation with *com-* changes the actant structure of the derived construction which may be illustrated by the following examples:

- (40) a. *pugno cum* + DAT ‘struggle/argue with sb’
 → *compugno* + ACC (same)
 b. *credo* + DAT ‘trust, confide in sb’
 → *concredo* + ACC + DAT ‘trust sth to sb.’

3.2.1.1 *The meaning of intensity.* The intensive meaning proper may be acquired by both intransitives and transitives; the following verbs are an illustration of this meaning:

- (41) Intransitive verbs:

<i>commadeo</i>	‘be very moist’
<i>commarceo</i>	‘be wholly faint or inactive’
<i>colluceo</i>	‘be wholly illuminated, shine, give light on every side’
<i>collumino</i>	‘illuminate on all sides’
<i>concaleo</i>	‘become thoroughly warm’
<i>concrepo</i>	‘rattle, creak, grate, clash’ (← <i>crepo</i> ‘rattle, creak, rustle’)
<i>condeliquesco</i>	‘melt (down) entirely’
<i>condolesco</i> ₁	‘feel severe pain.’

- (42) Transitive verbs:

<i>colluo</i>	‘wash, rinse thoroughly’
<i>collustro</i>	‘illuminate, survey/examine’
<i>commanduco</i>	‘masticate, chew thoroughly’ (← <i>manduco</i> ‘masticate/chew’)
<i>commastico</i>	‘masticate, chew thoroughly’ (← <i>mastico</i> ‘masticate/chew’)
<i>commemini</i>	‘recollect in all particulars’
<i>commereo</i>	‘entirely merit, fully deserve’
<i>commetior</i> ₁	‘measure all over’ (← <i>metior</i> ‘measure’)
<i>commonstro</i>	‘show or point out fully or distinctly’
<i>commordeo</i>	‘bite all over’
<i>commoveo</i>	‘put in violent motion’
<i>communio</i>	‘fortify strongly or on all sides’
<i>commulco</i>	‘beat violently’
<i>compavesco</i>	‘be very much afraid’
<i>concalefacio</i>	‘warm thoroughly’
<i>concelebro</i>	‘do sth thoroughly/with zeal; celebrate solemnly’
<i>concelo</i>	‘hide/conceal carefully/thoroughly’
<i>conclamo</i> ₂	‘proclaim, shout loudly’
<i>conculco</i>	‘trample, crush up’ (← <i>calco</i> ‘trample’)
<i>concutio</i>	‘shake with force’ (← <i>quatio</i> ‘shake’)
<i>condecoro</i>	‘decorate in all ways possible’
<i>concaco</i>	‘foul up.’

There is a number of verbs prefixed with *com-* that are derived from adjectives and also have this meaning; cf.:

- (43) *lutulentus* ‘dirty’ → *collutulento* ‘make very muddy’
locuples ‘rich’ → *collocupletto* ‘make very rich.’

3.2.1.2 *The meaning of completion.* In some terminative verbs the meaning of totality (intensity) turns into that of completion; e.g.:

- (44) *conflagro* ‘burn up, destroy by fire’
comedo ‘eat entirely up’
commalaxo ‘soften entirely’
commitigo ‘make quite soft’
commuto ‘change entirely’
compurgo ‘purify completely’
computresco ‘become wholly putrid’
conficio ‘accomplish’
condisco₂ ‘learn well’
collino ‘besmear, cover up’ (e.g. bread with butter; ← *lino* ‘smear/spread’).

It is of course next to impossible to draw a borderline between the “pure” meaning of completion and that of completion in combination with intensity.

3.2.1.3 *“Empty” prefix.* In numerous verbs with the prefix *com-* the meaning of totality is practically lost, and as a result a prefixed verb is more or less identical in meaning to its unprefixed counterpart; here belong:

- (45) *coacesco* ‘go sour’
colloco₁ ‘lay, put, place’
commaneo ‘remain’
commemoro ‘keep in mind, mention’
commeo ‘come and go; pass backwards and forwards’
commolior ‘set in motion’
commoneo ‘remind’
commoror ‘be (somewhere), stay, remain’
commulceo ‘caress, sooth’
compalpo ‘stroke, caress’
compaciscor ‘make an agreement’
comparco ‘save, husband well’
compareo ‘appear’
comparo₁ ‘make ready’
complico ‘fold together’
comminuo ‘lessen, diminish’
complaceo ‘be pleasing’
concoquo₂ ‘digest (food)’
concupisco ‘long much for, be very desirous of, strive after’
condelector ‘delight one’s self with’, etc.

4. The Latin prefix *com-* among other prefixes

Latin, Greek, German and Russian display indisputable typological similarity of prefixed derivation, and in this respect they are clearly opposed to English and French with an entirely different system of prefixation. They share at least the following features: each possesses a considerable number of verbal prefixes (about 15); most of the latter have a spatial meaning; most of them are relatable to prepositions; verbal prefixation is an active derivational procedure. With regard to the meanings of the prefixes it may be asserted that the range of these meanings is to a large degree language-specific: in each language the prefixes may have meanings that are either absent or peripheral in the other languages). Therefore the unit of cross-linguistic comparison can be a separate meaning of a prefix, which involves, among others things, all the difficulties connected with prefix polysemy. The task of interlingual comparison is further complicated by the fact that the languages in question have influenced each other to a considerable degree (direct borrowings, loan translations, and also borrowing of prefixes with a partial change or modification of their meaning), which resulted in a kind of assimilation of the prefixation systems of the languages we are concerned with. Description of all these processes is far beyond the scope of this paper; and we shall confine ourselves to a brief description of two types of paradigmatic relations of the prefix *com-*: its place among other Latin prefixes, on the one hand, and its brief characterization in comparison with semantically similar prefixes of Greek, German and Russian, on the other.

4.1 The system of Latin prefixes

It comprises the following prefixes:

1) *a-*, *ab-*, *abs-* denotes separation, moving off/away; deviation, digression, negation; cf. the Russian prefix *ot-* ‘from’.

2) *ad-* with the meaning of approaching, being next to; addition, joining; cf. the Russian prefix *pri-*; all these meanings are similar to those of *com-*; cf.:

- (46) *ad-aequo* ‘compare’ ← *equus* ‘equal’
com-paro ‘compare’ ← *par* ‘equal.’

They seem to differ in that *ad-* establishes unequal relations, while *com-* rather implies an equal status of the participants, i.e. *ad-aequo* means ‘equate sth with sth, put on the same footing’; *ad-* may also have an inceptive meaning, cf. *ad-amo* ‘fall in love’.

3) *com-* denotes joint (sociative) action (cf. Russian *so-* in *so-suščestvovat* ‘to co-exist’, *so-glasovat* ‘to co-ordinate’), and also coming/bringing together (cf. Russian *s-/so-* in *s-dvinut* ‘to move/push together’, *so-stavit* ‘to put sth together, compile’).

4) *de-* expresses the meaning of going/moving down, separation, removal, lack/shortage of sth; cf. Russian *s-* in one of its meanings: *s-brosit* ‘to throw down’.

5) *dis-* denotes division, cf. Russian *raz-*, as in *raz-drobit* ‘to break/smash to pieces’.

6) *ex-* denotes moving out(side), cf. Russian *vy-* in *vy-bežat* ‘to run out’.

7) *in-* denotes moving in(side), cf. Russian *v-* as in *v-bežat'* 'to run in'; it is close to *com-* in verbs like *com-bibo = v-pityvat'* = 'to absorb, imbibe'.

8) *inter-* signifies moving in(side), between; cf. Russian *v-*, *pere-*.

9) *ob-* has a vague meaning 'forward, around, downwards'.

10) *per-* denotes going through, motion towards destruction (cf. *per-eo* 'perish', *per-do* 'ruin'), cf. Russian *pro-*, as in *pro-brat'sja* 'to make one's way through', *pro-past'* 'to perish'; it may also denote motion towards oneself, cf. *per-cipio* 'take in, acquire, perceive'.

11) *prae-* denotes being in front of or before sth, cf. Russian *pred-*.

12) *pro-* renders the meaning of moving forward.

13) *re-* adds the meaning of reciprocation (cf. *re-saluto* 'respond to a greeting'), repetition, counteraction, contrast; cf. Greek *ἀντι-*.

14) *sub-* denotes being under sth, latency, low degree; cf. Russian *pod-*.

15) *super-* denotes motion through or above sth, on the surface, or upwards (cf. Russian *pere-*, *pre-*), or additional action (cf. Russian *do-*).

16) *trans-* denotes motion through or across sth; cf. Russian *pere-*, *pro-*.

Among the Latin prefixes, *com-* is contiguous to *ad-* in the meaning of addition, joining sth to sth, and to the prefix *re-* in the meaning of response action (which may be identical to the underlying action, e.g. *re-saluto* 'respond to a greeting'). Latin *re-* is very much like Greek *ἀντι-* which also has the meaning of response action (see below). Among Greek prefixes, the closest to *com-* is *συν-* (moreover, it is the closest one to *com-* among all the prefixes discussed in this paper). In Russian, sometimes the prefix *s-/so-*, and also the Church Slavonic *so-* (which has no other allomorphs and occurs mostly in loan translations like *so-suščestvovat'* 'to co-exist'), corresponds to Latin *com-*. In German, there are two prefixes which can be compared with the Latin prefix under discussion: *mit-* (denoting an attendant action which is identical or not identical to the main action) and *zusammen-* (denoting joint action or coming/bringing together).

4.2 The prefix *com-* in comparison with Greek *συν-* and *ἀντι-*²

4.2.1 The meanings of *συν-* corresponding to those of *com-*

They are:

1. The sociative meaning of joint action on "equal" grounds (2.1.1). In this meaning *συν-* combines practically with any verb, either transitive or intransitive. It is clearly the prevalent meaning of this prefix.

(47) <i>σύνειμι</i>	'be, live together'
<i>συνεκθνήσκω</i>	'die together'
<i>συγελάω</i>	'laugh together'
<i>συνδακρύω</i>	'cry, bemoan together'
<i>συνάρχω</i>	'be co-governor'
<i>συγγεωργέω</i>	'cultivate land together'

2. The Greek data are collected from the *Ancient Greek-Russian dictionary* (Dvoreckij 1958) and a *Greek-Russian dictionary* (Veisman 1991).

<i>συγγιγνώσκω</i>	‘decide together, share an opinion’
<i>συγγνωρίζω</i>	‘know sth together with sb, share knowledge with sb’
<i>συγκαθαγίζω</i>	‘make a sacrifice together’
<i>συγκαθεύδω</i>	‘sleep together’
<i>συγκαθίστημι</i>	‘establish, found together / jointly’
<i>συγκαταγηράσκω</i>	‘live together into old age’
<i>συναλγέω</i>	‘suffer together, endure sth together’, etc.

2. The meaning of concomitant action (see 2.1.2):

- (48) *συνάχθομαι* ‘condole with sb’
συναλγέω₁ ‘sympathize with sb.’

3. Action upon two objects (see 2.2):

- (49) *συγκαθείργω* ‘lock (sb with sb) in together’
συνδεκάζω ‘bribe sb and sb together’ (e.g. all the judges)
συνελαύνω ‘drive together.’

4. Two subjects coming together (meaning 3.1.1):

- (50) *συνέρχομαι* ‘come together, gather, join together’
συντρέχω ‘come running together’
συρρέω ‘flow together’
συρράσσω ‘collide.’

5. Bringing two objects together (meaning 3.1.2.1):

- (51) *συνάπτω* ‘tie/bind, join/connect together’
συναναπλέκω ‘entwine (sth with sth)’
συναριθμέω ‘count up’
συναρμόζω ‘tie/bind, join/connect, erect’
συνασπιδόω ‘close shields together’
συνδέω ‘tie/bind’
συνεξομοιόω ‘liken, make similar, compare’
συνέχο ‘restrain, hold in’ (cf. Latin *conhibeo*, Russian *sderživat’*)
συνίστημι ‘compose, compile, join together’
συράπτω ‘sew together.’

6. Bringing/pressing parts of an object together (meaning 3.1.2.2):

- (52) *συναιρέω* ‘grasp, comprehend’
συσπίαω ‘bring together’
συνελαύνω ‘press, squeeze, compress, hamper.’

7. Bringing together, joining two unequal elements (meaning 3.2):

- (53) *συναρπάζω* ‘grasp, take away, carry along/away’
συναρχαιρεσιάζω ‘support sb at elections’
συνηγορέω ‘intercede for/defend sb’
συναγορέω ‘agree/consent, confirm, approve, defend’ (← *ἀγορέω* ‘speak (publicly)’).

8. The meaning of completion (rare):

- (54)
- συναποτελέω*
- 'finish up.'

4.2.2 The meanings of *ἀντι-* corresponding to those of *com-*

1. The meaning of *reciprocity* (cf. 2.3). This meaning is acquired by the prefix in question in the context of verbs denoting reciprocal actions. A prefixed verb may be synonymous to the underlying verb (if the latter is a lexical reciprocal; cf. Latin *coaltercor*):

- (55) *ἀνταγωνίζομαι* 'fight/struggle,' 'argue' (synonymous to the unprefixed counterpart in one of its meanings)
ἀνταμείβομαι 'exchange sth'
ἀντιδεξιόομαι 'shake hands, exchange handshakes.'

In other cases the reciprocal meaning is coded by the prefix alone; cf.:

- (56) *ἀντιαιδέομαι* 'show mutual respect'
ἀνταναιρέω 'destroy mutually'
ἀντευκαλέω 'accuse each other'
ἀντεπιθυμέω 'mutually strive for intimacy'
ἀντεράω₁ 'love each other'
ἀντεθνοέω 'sympathize with each other'
ἀντιβάλλω 'converse with each other', etc.

2. The meaning of *reciprocating an action* ('in response to action V of agent A, to perform action V'). It is contiguous to the reciprocal meaning proper. It is highly characteristic of the Greek prefix and less so of Latin *com-* (in this meaning, *ἀντι-* is closer to *re-* rather than to *com-*; it may be noted in passing that a similar meaning is coded by the German prefix *gegen-* but it combines with nouns only: *Gegenleistung* 'reciprocal good turn', *Gegenkraft* 'counteraction', *Gegenmaßnahme* 'countermeasure', etc.).

- (57) *ἀνταδικέω* 'repay offence with offence'
ἀνταποκτείνω 'render death for death'
ἀντιδιαβάλλω 'slander in return for slander'
ἀντικακοθργέω 'render evil for evil', etc.

3. *Other meanings.* The Greek prefix *ἀντι-* has a number of meanings absent in the Latin *com-*; e.g.:

(a) 'rivalry', cf.:

- (58) *ἀντεράω₂* 'be a rival in love'
ἀντιδημαγωγέω 'vie in demagoguery'

(b) 'substitution', cf.:

- (59) a. *ἀντικαταλαμβάνω* 'take possession of sth in one's turn.'

(c) 'in return', cf.:

- b. *ἀντικαταθνήσκω* 'be killed in return.'

4.3 The prefix *com-* in comparison with German *mit-* and *zusammen-*

Quite a number of German verbs with the prefix *mit-* have two meanings (contrasted to a larger or lesser degree): one of them involves an action performed simultaneously and in co-operation with analogous “equal” actions of other referents who are “backgrounded” (as in (60)), the other meaning describes a situation involving two “unequal” actions, the “main” and an “attendant” action, cf. (61):

- | | | |
|------|----------------------------------|--|
| (60) | <i>mit-arbeiten</i> ₁ | ‘to collaborate with sb, work somewhere’ |
| | <i>mit-spielen</i> | ‘to act together in a play, performance’ |
| (61) | <i>mit-denken</i> | i. ‘to think together with sb’ |
| | | ii. ‘to follow sb’s train of thought’ |
| | <i>mit-sprechen</i> | i. ‘to speak together with sb’ |
| | | ii. ‘to repeat after sb.’ |

The first of these meanings combines comitative and sociative, and the second meaning is assistive. These two types of meanings are not distinguished consistently in the German dictionaries.

4.3.1 *The meanings of mit- corresponding to those of com-*

These meanings are:

1. Participation on equal grounds (cf. 2.1.1):

- | | | |
|------|--|--|
| (62) | <i>mit-denken</i> ₁ | ‘to think together’ |
| | <i>mit-fliegen</i> | ‘to fly together’ |
| | <i>mit-benutzen</i> | ‘to use sth jointly’ |
| | <i>Mit-besitz</i> | ‘joint ownership/possession’ |
| | <i>mit-entscheiden</i> | ‘to take part in a joint decision’ |
| | <i>mit-erleben</i> ₁ | ‘to experience/go through sth together’ |
| | <i>mit-fahren</i> ₁ | ‘to go/travel together’ |
| | <i>mit-gehen</i> | ‘to go/walk together’ |
| | <i>mit-halten</i> ₁ (<i>eine Zeitung</i>) | ‘to subscribe (to a newspaper) together with sb’ |
| | <i>mit-helfen</i> | ‘to help sb together with others’ |
| | | (<i>Mithilfe</i> – “active” help, when several persons give help) |
| | <i>mit-kämpfen</i> | ‘to fight together’ |
| | <i>mit-klingen</i> ₁ | ‘to sound in unison’ |
| | <i>mit-kommen</i> | ‘to come together’ |
| | <i>mit-lachen</i> | ‘to laugh together with others’ |
| | <i>mit-laufen</i> | ‘to run together’ |
| | <i>mit-lesen</i> | ‘to read together’ |
| | <i>mit-schreiben</i> | ‘to write together with sb’ |
| | <i>Mit-schuld</i> | ‘co-participation’ |
| | <i>mit-singen</i> | ‘to sing together with sb’ |
| | <i>mit-tun</i> | ‘to do sth together with sb’ |
| | <i>mit-übernehmen</i> | ‘to undertake (an obligation) together’, etc. |

The meaning of numerous nouns with the prefix *mit-* contains the component ‘with respect to sb performing the same role’; cf.:

(63)	<i>Mit-autor</i>	‘co-author’
	<i>Mit-bürger</i>	‘compatriot’
	<i>Mit-begründer</i>	‘co-founder’
	<i>Mit-esser</i>	‘table-companion’
	<i>Mit-herasugeber</i>	‘co-editor’
	<i>Mit-schüler</i>	‘schoolmate’; etc.

2. The assistive meaning (cf. 2.1.2):

(64)	<i>mit-arbeiten</i> ₂	‘to cooperate, assist (the teacher in class)’
	<i>mit-denken</i> ₂	‘to follow sb’s train of thought’
	<i>mit-empfinden</i>	‘to sympathize (with sb)’
	<i>mit-erleben</i> ₂	‘to feel empathy’
	<i>mit-fahren</i> ₂	‘to be a fellow traveller’
	<i>mit-fühlen</i>	‘to sympathize (with sb)’
	<i>mit-hören</i>	‘to eavesdrop (deliberately or inintentionally)’
	<i>mit-leiden</i>	‘to feel compassion, sympathize’
	<i>mit-ziehen</i> ₂	‘to go/travel together with sb’, etc.

Contiguous to the assistive is the meaning of ‘involvement in a joint enterprise’:

(65)	<i>mit-arbeiten</i>	‘to work somewhere, be an employee’
	<i>mit-halten</i>	‘to participate in sth (together with others)’
	<i>Mit-bestimmung</i>	‘participation in making a decision’
	<i>mit-machen</i>	‘to participate in sth’
	<i>mit-mischen</i>	‘to take an active part in sth’
	<i>mit-reden</i>	‘to take part in a conversation’
	<i>mit-sprechen</i>	‘to take part in conversation’
	<i>mit-wirken</i>	‘to assist, collaborate’, etc.

3. Action upon two objects (either “equal” or “unequal” in status) (cf. 2.2):

(66)	<i>Mit-angeklagte</i>	‘co-defendant’
	<i>Mit-fahrer</i>	‘fellow-traveller’
	<i>Mit-gefangene</i>	‘fellow-prisoner’
	<i>mit-schicken</i>	‘to send together with sth else’
	<i>mit-rechnen</i>	‘to include in the bill’
	<i>mit-zählen</i>	‘to include in the bill, to add to sth’, etc.

The prefix *mit-* also has a specific meaning of handling an object accompanying the subject referent (comitative-reflexive meaning ‘with oneself’ similar to the meaning expressed by the reflexive marker in Lithuanian in verbs like *atnešti* ‘to bring sth’ → *at-si-nešti* ‘to bring sth *with oneself*’, *atvesti* ‘to bring sb’ → *at-si-vesti* ‘to bring sb *with oneself*’ (see Geniušienė 1987: 135–6)):

(67)	<i>mit-bringen</i>	‘to bring <i>with oneself</i> ’
	<i>mit-führen</i>	‘to carry <i>with oneself</i> ’
	<i>mit-bekommen</i>	‘to get in order to take <i>with oneself</i> [e.g. when travelling]’
	<i>mit-geben</i>	‘to give sth to sb to take away [e.g. when leaving]’

<i>mit-nehmen</i>	'to take away'
<i>mit-ziehen</i>	'to drag <i>behind oneself</i> '

4. The meaning of completion (rare):

- (68) *mit-stenographieren* 'to take down in shorthand.'

4.3.2 The meanings of *zusammen-* corresponding to those of *com-*

They are:

1. The sociative meaning of joint action (on "equal" grounds; see 2.1.1):

- (69) *zusammen-arbeiten*₁ 'to work together, collaborate'
zusammen-wirken 'to act jointly, interact', and probably the following:
zusammen-bleiben 'to stay/remain together'
zusammen-lassen 'to leave sth together'
zusammen-leben 'to keep house together, co-habit.'

Although *zusammen* also functions as an adverb with the meaning 'together', the meaning of joint action is not generally characteristic of verbs with this prefix.

2. The reciprocal meaning (see 2.3):

- (70) *zusammen-gehören* 'to suit each other'
zusammen-passen 'to suit each other'
*zusammen-fallen*₂ 'to coincide'
zusammen-schlagen 'to hit sth against each other'
zusammen-stoßen 'to collide, come into contact with each other', etc.

3. Coming together and bringing together (see 2.1):

- (71) *zusammen-arbeiten* 'to join/adjust sth and sth'
zusammen-backen 'to coagulate, cake together'
zusammen-bauen 'to assemble, fit sth'
zusammen-fegen 'to sweep sth into a pile'
zusammen-mischen 'to mix sth and sth'
zusammen-packen 'to pack up, fold up, put/lay together'
zusammen-tragen 'to carry into one place'
zusammen-hängen 'to be tied together.'

4. Bringing parts of an entity together (see the meaning in 3.1.2.2):

- (72) *zusammen-ballen* 'to clench [one's fists]'
zusammen-beißen 'to clench [one's teeth]'
zusammen-drehen 'to fold up, roll up.'

5. The meaning of totality, intensity (cf. 3.3):

- (73) *zusammen-brechen* 'to break out [about a war]'
zusammen-schießen 'to execute by shooting'
zusammen-stürzen 'to collapse, tumble down'
zusammen-fallen 'to tumble down'; etc.

The material considered here shows that the meanings of the Latin prefix *com-* are distributed between the German prefixes *mit-* and *zusammen-*: the former of these two prefixes expresses mostly the sociative meaning of joint action (in all its variants), and the latter the meanings of coming and bringing together, partially reciprocal action, and also that of intensity. Besides, *mit-* may render the specific (comitative-reflexive) meaning ‘with oneself’ not registered in *com-* (and in the other prefixes discussed here).

5. Conclusion

The analysis of the semantics of the Latin prefix *com-* we have undertaken here and also its comparison with the semantics of its counterparts in other languages brings us to a conclusion that expression of the meanings of “coming together” and “joint action” (“reciprocal action” is a particular case of the latter) by means of one and the same prefix is a regular enough phenomenon determined by the proximity of these two meanings. Indeed, joint activity seems to bring together and spatial proximity leads to joint activity. The issue of the direction of semantic derivation is not quite clear: direction from “the material” to the “ideal”, i.e. from spatial proximity to joint activity *a priori* seems to be the more likely, though we have no reliable evidence. In any case, an intermediate meaning is probably sociativity with regard to the object referents: an action (at least of physical nature) carried out by a single subject referent on two (or more) object referents necessarily involves bringing them into spatial proximity. The subject referents of a joint action are less bound spatially (for instance, co-authors may write a collective paper even if they live in different countries), but typically, joint activity implies spatial proximity: thus, it is hard to say whether the Latin verb *convivo* ‘to live together’ denotes joint activity or spatial proximity. This distinction is drawn by linguists and corresponds to different ways of conceptualizing reality, and sometimes to the same way.

Polysemy of reciprocal markers

Vladimir P. Nedjalkov

Institute for Linguistic Studies, St. Petersburg

1. Introductory notes. Typological investigation of the polysemy of reciprocal markers
 - 1.1 Three main types of languages with regard to the monosemy/polysemy of the reciprocal markers
 - 1.1.1 Languages with monosemous markers only
 - 1.1.2 Languages with polysemous markers only
 - 1.1.3 Languages with both polysemous and monosemous markers. Their joint use
 - 1.2 Three uses of the term 'polysemy'
 - 1.2.1 Polysemy of a given derivative
 - 1.2.2 Polysemy of all derivatives with a given marker in a given language
 - 1.2.3 Polysemy of reciprocal markers across languages
 - 1.3 Actualization of the meanings of reciprocal markers
 - 1.4 Semantic, formal and etymological relationships between the reciprocal meaning and the reflexive, sociative and iterative meanings
 - 1.4.1 Reflexive and reciprocal are anaphoric
 - 1.4.2 Sociative and reciprocal require a non-singular subject
 - 1.4.3 Iterative and reciprocal differ semantically to a greater degree than reflexive and reciprocal, and sociative and reciprocal
 - 1.4.4 Possible etymological relations between the four meanings
 - 1.4.5 Other types of polysemy
 - 1.4.6 Reflexive-based and nonreflexive-based reciprocal markers
 - 1.4.7 Comitative: Means of expression, relation to reciprocal, sociative and reflexive
2. Reflexive-reciprocal polysemy
 - 2.1 The range and distribution of typical meanings
 - 1) Subject-oriented constructions
 - 1.1) Group A (the meaning of the derivative is more complex than that of the base verb)
 - 1.1.1) Group Aa. Detransitivization
 - (a) Reflexives proper
 - (b) Reflexives in the broad sense
 - (b1) body care (grooming) and (un)dressing reflexives
 - (b2) actions (often uncontrolled and negative) upon body parts
 - (b3) body part movement reflexives
 - (b4) autocasative (change of posture, or body move) reflexives
 - (c) Reciprocals
 - 1.1.2) Group Ab. No detransitivization

- (a) Indirect reflexives
- (b) *Commodi* derivatives
- 1.2) Group B. The meaning of the derivative is (nearly) equal to that of the base verb
 - (a) Antipassive, or absolutive (unspecified object) derivatives
 - (b) Deaccusative reflexives with object demotion
- 2) Object-oriented constructions
 - 2.1) Group C. The meaning of the derivative is simpler than that of the base verb
 - (a) Anticausatives
 - (b) Resultatives
 - 2.2) Group D. (Quasi-)passive derivatives are more complex in meaning
 - (a) with a “generic” potential-passive meaning
 - (b) with a “non-generic” passive meaning of unexpected result
 - (c) with a causative-reflexive meaning
 - 2.3) Group E. In meaning, the derivatives are equal to the base verbs
 - (a) converses proper
 - (b) agentless and agentive passives
 - 2.4) Group F. Impersonal derivatives with subject deletion
- 2.2 Reflexive and reciprocal markers across languages
 - 2.2.1 The ratio of reflexive, reciprocal and reflexive-reciprocal markers (in a number of African languages)
 - 2.2.2 Ousting of reciprocal markers by reflexive ones
 - 2.2.3 “Heavy” markers – reflexive or reciprocal pronouns – compete with “light” markers or replace them
 - 2.2.4 Reflexive and reciprocal markers exchange places (“castling”). Why? (Juwajai)
 - 2.2.5 A sociative-reciprocal marker in the reflexive function on certain bases (Nunggubuyu)
 - 2.2.6 Reflexive-reciprocal, reflexive or reciprocal markers? Partial overlap (Kannada, Sinhala, Telugu, Malayalam)
 - 2.2.7 Reciprocal and resultative meanings of a middle marker (Maasai, or Maa)
- 3. Reciprocal-sociative polysemy
 - 3.1 The range and distribution of the typical meanings
 - 3.2 The sociative meaning of a reciprocal marker is productive (Tagalog, Kusaian, Halkomelem, Palauan, Rwanda, Swahili)
 - 3.3 The sociative meaning of a reciprocal marker is of low productivity (Japanese, Ainu)
 - 3.4 The assistive and the comitative meanings of a sociative-reciprocal marker (Yakut, Tuvan)
 - 3.5 A monosemous reciprocal marker and parallel reciprocal use of a sociative marker (Evenki)
 - 3.6 Interchangeable use of reciprocal and sociative markers (Khalkha Mongol, Buryat)
- 4. Iterative-reciprocal polysemy
 - 4.1 The range and distribution of the typical meanings
 - 4.2 Illustrations of iterative-reciprocal polysemy (Chinese, Hua, Samoan, Sobei, Tongan, Khmer, To’aba’ita, Bari)
- 5. Reflexive-reciprocal-sociative polysemy
 - 5.1 Mayali, Ritharngu, Djaru, Nunggubuyu
 - 5.2 East Futunan
 - 5.3 Luvale
- 6. Iterative-reciprocal-reflexive polysemy (Tagalog)

7. Iterative-reciprocal-sociative polysemy (East Futunan, Nélêmwa)
8. Non-prototypical types of polysemy
 - 8.1 Reciprocal and intensive (Mundari)
 - 8.2 Reciprocal and antipassive (To'aba'ita)
 - 8.3 Reciprocal and causative (Piro)
 - 8.4 Reciprocal and anticausative (Dulong/Rawang)
 - 8.5 Reciprocal and resultative (Muna)
9. The meanings attested with both reflexive-reciprocal and nonreflexive-reciprocal markers
 - 9.1 Anticausative
 - 9.1.1 Anticausatives with reflexive-reciprocal markers (Imbabura Quechua, German)
 - 9.1.2 Anticausatives with nonreflexive-reciprocal markers (Muna, Bolivian Quechua, Zulu)
 - 9.2 Antipassive (absolute, unspecified object, depatientive)
 - 9.2.1 Antipassives with reflexive-reciprocal markers (Russian; Swedish and Danish dialects)
 - 9.2.2 Antipassives with sociative-reciprocal markers (Swazi, Ndonga, Tatar)
 - 9.3 Potential-passive and passive
 - 9.3.1 Potential-passive and passive with reflexive-reciprocal markers (Russian, Lithuanian)
 - 9.3.2 Potential-passive and passive with nonreflexive-reciprocal markers (Bantu)
 - 9.4 Competitive
 - 9.4.1 Competitives with reflexive-reciprocal markers (Bulgarian)
 - 9.4.2 Competitives with sociative-reciprocal markers (Karachay-Balkar, Japanese)
10. Other meanings
 - 10.1 The reflexive and reciprocal markers as relativization markers (Kabardian)
 - 10.2 Response reciprocity (Cashinahua)
11. Meanings not attested among reflexive-reciprocal markers
 - 11.1 The plural meaning (Kirghiz, Samoan, Sakhalin Ainu, Ecuadorian Quechua dialects)
 - 11.2 Pseudo-reciprocal meaning (Tuvan, Boumaa Fijian, Vietnamese, Chinese, Palauan)
12. A reciprocal marker as part of a complex marker
 - 12.1 A reciprocal marker in two-component sociative markers
 - 12.1.1 Sociative as a formally reciprocal derivation from applicative (Ainu)
 - 12.1.2 Sociative as a formally reciprocal derivation from causative (Adyghe, Ainu)
 - 12.1.3 Sociative as a formally reciprocal derivation from comitative (Adyghe)
 - 12.1.4 Sociative as a formally reciprocal derivation from benefactive (Maasai)
 - 12.1.5 A sociative marker = a reciprocal marker with an added component of unknown origin (Bantu)
 - 12.2 A reciprocal marker in combination with spatial preverbs and prepositions (Kabardian, German)
 - 12.3 A reciprocal marker + a causative marker for the expression of the intensive meaning (Kirghiz, Lamba)
 - 12.4 A reciprocal marker attached to a stative (detransitivizing) marker: Intensive-stative or spatial-resultative (Bantu)
 - 12.5 Combination of a reciprocal suffix with a sociative marker, with the reciprocal meaning retained (Evenki, Buryat)
 - 12.6 A two-component reciprocal marker containing a marker of transitivity and/or causativity (East Futunan, Halkomelem, Herero, Kwanjama, Kalkatungu)

13. Reciprocal marking of kin relationships on verbs (Martuthunira)
14. Lexicalization
15. Evolution of new meanings (reflexive, autocausative, deaccusative) of sociative-reciprocal markers
16. Concluding remarks
 - 16.1 Three main polysemy patterns and prevalent types of valency change
 - 16.2 Possible etymological relations
 - 16.3 Relations between verbal sociative and reciprocal markers
 - 16.4 Extended main polysemy patterns
 - 16.5 The same additional meanings in the main polysemy patterns
 - 16.6 Extensions of the reciprocal meaning
- References

1. Introductory notes. Typological investigation of the polysemy of reciprocal markers

As is known, a study of the polysemy of grammatical markers raises the question of interrelations and possible implicational relations between meanings: some meanings may imply the existence of certain other meanings; some meanings are directly related to the reciprocal while some others have developed from the non-reciprocal meanings of the marker. Accordingly, needless to say, equally detailed descriptions of the polysemy of reciprocal markers in individual languages are needed – otherwise the differences in the range of meanings between languages may merely represent differences in the accuracy and adequacy of description. As Heine (1999: 1) asserts, “<...> the information contained in grammatical descriptions reveals only a part of the actual polysemy existing in these languages.” However, even if there are no comparable and exhaustive descriptions, a summary of the available data may be useful.

In the first place, polysemy concerns verbal reciprocal markers (i.e. morphological markers and reflexive (clitic) pronouns). In most languages, these markers are polysemous and express a number of non-reciprocal meanings. Some of these meanings may be productive. Thus, for instance, the reflexive meaning of German *sich* is more productive than reciprocal; the sociative meaning of the marker *-an-* in Rwanda is more productive than the reciprocal; in Chinese, the compound *V-lái-V-qù* is more productive in the iterative meaning than in the reciprocal. Some other non-reciprocal meanings may be rare and only occur in a few derivatives (cf. (4) in 1.2.2 below). Still, their existence may be significant if they recur across languages.

Genetically (closely) related languages or even dialects of the same language may differ markedly in the domain of the polysemy of reciprocal markers. Thus, for instance, in Tuvan the sociative and assistive meanings of the reciprocal suffix are highly productive, whereas in Kirghiz its sociative meaning is no longer productive, and in Azerbaijani the cognate suffix has no assistive meaning.

A typological study of the polysemy of reciprocal markers aims at establishing (a) the maximum range of meanings concomitant with the reciprocal, regardless of whether this

meaning is primary or secondary (or even unproductive) and (b) semantic and implicational relations between these meanings.

What is of interest is not only typical patterns established in the literature, such as reflexive-reciprocal and reciprocal-sociative, but also polysemy patterns with less common concomitant meanings, even represented merely by a few derivatives, including those found in one language only. Needless to say, typology is interested in all the peculiarities in the relations between form and meaning, even those peculiarities that are very rare, provided they occur in unrelated languages.

Finally, combinations of reciprocal markers with other markers are also of interest, as their meaning is not always the sum of the meanings of the component markers.

Polysemy of reciprocal markers also includes their use on non-verbal stems. Reciprocal derivatives from the latter stems will be briefly considered in Chapter 7.

Note that monosemy is usually typical of “young” morphological markers. As regards “old” markers (as, for instance, in some Bantu languages), their concomitant meanings are sometimes lexicalized and they are often used together with other valency-changing markers. Most “suitable” for the study of polysemy are therefore languages with “middle-aged” reciprocal markers.

Unfortunately, there are rather few detailed and reliable descriptions of reciprocals in individual languages at present. As a rule, grammars and special papers on reciprocals rarely offer substantial descriptions. It usually remains unclear whether reciprocal markers have any other meanings, whether they are productive or not, and whether a given meaning, including reciprocal, is productive or represents an instance of lexicalization.

Chapter 5 is organized as follows.

In the introductory section, general problems of the polysemy of reciprocal markers are discussed. The affinity and common features of the reciprocal meaning with three other meanings, viz. reflexive, sociative and iterative meanings, are shown. The conditions of the actualization of these and some other concomitant (comitative, assistive, etc.) meanings are considered. A calculus establishes six prototypical types of the polysemy of reciprocal markers:

- *three main types of polysemy* when a marker has only two of the four meanings in question, viz. reflexive-reciprocal, reciprocal-sociative, iterative-reciprocal (the latter two types are opposed to the first as nonreflexive to reflexive-reciprocal), and
- *three extended types of polysemy* with three main meanings of the marker, viz. reflexive-reciprocal-sociative, iterative-reciprocal-reflexive, and iterative-reciprocal-sociative polysemy.

Sections 2, 3, and 4 are concerned with the three main types of polysemy (i.e. reflexive-reciprocal, reciprocal-sociative, and iterative-reciprocal) and their distribution across languages; the secondary concomitant meanings of the markers are also discussed.

Sections 5, 6, and 7 deal with the extended (reflexive-reciprocal-sociative, iterative-reciprocal-reflexive, and iterative-reciprocal-sociative) types of polysemy and their distribution across languages, the concomitant meanings of the markers also being considered.

Section 8 concerns languages with non-prototypical types of polysemy, when a reciprocal marker can express such meanings as intensive, antipassive, causative, anticausative, etc., but not reflexive, sociative or iterative.

In Section 9, the meanings shared by reflexive-reciprocal and nonreflexive-reciprocal markers are discussed (e.g. anticausative, antipassive, potential-passive, passive, competitive).

Section 10 deals with certain unique usages of monosemous reciprocal markers (as markers of relativization or response reciprocity).

Section 11 concerns meanings attested among nonreflexive-reciprocal markers only (plural meaning, pseudo-reciprocal meaning).

In Section 12 the use of reciprocal markers within complex affixes is shown (in the markers of sociativity, spatial relation, intensity, etc.).

Sections 13, 14, and 15 deal with specific issues of polysemy, including lexicalization and development of new meanings in sociative-reciprocal markers.

1.1 Three main types of languages with regard to the monosemy/polysemy of the reciprocal markers

The following types of languages can be established:

- languages with monosemous markers only,
- languages with polysemous markers only, and
- languages with both types of reciprocal markers.

1.1.1 Languages with monosemous markers only

Monosemous reciprocal markers are typically free items (mostly pronouns and adverbs) or reduplicated clauses with reversed arguments (see Ch. 3, §§2 and 3), more rarely affixes. I have also included here languages that have parallel polysemous reciprocal markers if they are unproductive and of highly limited use. For instance, Russian can be included here because the postfix *-sja* is unproductive in the reciprocal function, the main marker being the pronoun *drug druga* ‘each other’.

Examples of monosemous syntactic markers with the meaning ‘each other’ are Vietnamese *nhau*, Bamana *ɲɔŋɲɔ*, Kashmiri *akh əkis* ‘one another’, etc. There are also languages with two or more monosemous reciprocal markers, with minimal differences between them, as, for instance, English *each other* and *one another*.

Examples of monosemous reciprocal affixes are the Kolyma Yukaghir reciprocal prefix *neʹ-* (see Maslova, Ch. 44, §1.2) and the Chukchi suffix *-wəly* (another monosemous reciprocal marker in Chukchi is the antipassive construction with the semi-pronoun *əryičyu* (it cannot take the direct object position); see §3.3 and case 1 in Ch. 3, §6.4.2.3); cf.:

Chukchi

- | | | | | |
|-----|----|----------------------------|----------------------------|------------|
| (1) | a. | <i>čičew-</i> | ‘to understand’ | |
| | b. | <i>čiček-wəly-</i> | ‘to understand each other’ | reciprocal |
| | c. | <i>əryičyu čičewə-tku-</i> | ‘to understand each other’ | reciprocal |
| | d. | <i>əryičyu čiček-wəly-</i> | ‘to understand each other’ | reciprocal |

1.1.2 Languages with polysemous markers only

There are languages without monosemous (specialized) reciprocal markers, all the reciprocal markers being used in other senses as well. This is, for instance, the case in Tagalog (which has one of the most complex systems of reciprocal devices; see (87) below; cf. also Shkarban & Rachkov, Ch. 22, §1.2); cf. also:

East Futunan (Moyses-Faurie, Ch. 35, §1.2)

- | | | | | | |
|-----|----|--------------------------|---|--|------------|
| (2) | a. | <i>alofa</i> ‘to love’ | → | <i>fe-alofa-’aki</i> ‘to love each other’ | reciprocal |
| | b. | <i>ano</i> ‘to go, walk’ | → | <i>fa-ano-’aki</i> ‘to go, walk together’ | sociative |
| | c. | <i>tapa</i> ‘to sparkle’ | → | <i>fe-tapa-’aki</i> ‘to sparkle again and again’ | iterative |

1.1.3 Languages with both polysemous and monosemous markers. Their joint use

The Yakut example (3) below illustrates three variants of a reciprocal construction: (a) with a monosemous reciprocal pronoun alone (3c), (b) with a polysemous reciprocal suffix alone (3b), and (c) with both markers used simultaneously (cf. (3d)), either pleonastically, mostly for highlighting the reciprocal meaning, or for disambiguation of the polysemous reciprocal suffix. Needless to say, a syntactic reciprocal marker cannot combine with derivatives with the meanings illustrated in (4), namely, anticausative, converse, etc.

Yakut

- | | | | | |
|-----|----|----------------------------------|--|-----------------|
| (3) | a. | <i>ölör-</i> | ‘to kill’ | (vt) |
| | b. | <i>ölör-üs-</i> | i. ‘to kill <i>each other</i> ’ | reciprocal (vi) |
| | | | ii. ‘to kill <i>sb together</i> ’ | sociative (vt) |
| | | | iii. ‘ <i>together with sb</i> to kill <i>sb</i> ’ | comitative (vb) |
| | | | iv. ‘to <i>help sb</i> to kill <i>sb</i> ’ | assistive (vb) |
| | c. | <i>beje-beje-leri-n ölör-</i> | ‘to kill each other’ | reciprocal (vt) |
| | d. | <i>beje-beje-leri-n ölör-üs-</i> | ‘to kill each other’ | reciprocal (vi) |

In (3d) the reciprocal morphological derivative is described as intransitive by analogy with (3b.i). In this case the reciprocal pronoun loses its nominal properties and functions as a kind of reciprocal specifier (see case 6 in 1.3).

While the polysemous marker has the assistive meaning the monosemous reciprocal pronoun encodes reciprocity on the assistive derivative; e.g., if the word *xardarata* is replaced by the pronoun *beje-beje-leri-n* ‘each other’ in (7b) the sentence would have the meaning ‘They help *each other* to cart hay’.¹

The pleonastic use (or the use for emphasis) of reciprocal markers is common cross-linguistically: it is not only that a polysemous marker may co-occur with a monosemous one (which is easy to explain), but two monosemous markers, e.g. both a pronoun and an affix, can be used together. Thus, in Juang there are reciprocal pronouns (reduplicated formations which take a case marker (CM) after the first or the second component: *aapein.CM.aapein* (‘self self’) or *aapein.aapein.CM*, *aaraakaa.CM.aaraakaan* or *aapein.CM.aaraakaa*, etc.) and a reciprocal prefix *ku-*. It follows from the description in

1. Note that some polysemous derivatives with a single reciprocal marker allow assistive-reciprocal meaning as well, see, for instance, (iv) in (101b) and (122d, e).

Patnaik & Subbarao (2000:844, 846) that all three variants of reciprocal expression are possible: (a) a reciprocal pronoun alone, (b) the reciprocal prefix only, and (c) a reciprocal pronoun and reciprocal prefix together (the same can be observed in (3b), (3c) and (3d); see also (1d) above).

1.2 Three uses of the term ‘polysemy’

The term *polysemy of reciprocal markers* is used in three meanings in this section.

The meanings of a polysemous marker are often defined rather loosely, namely, according to the affinity to the meanings listed in Charts (40), (85) and (111). In the literature used as sources of empirical data on individual languages, the English translations of some derivatives are sometimes ambiguous, vacillating between two meanings. In such cases I choose one of them or give my own interpretation on my own responsibility.

In many cases, the meaning of a derivative is indicated on the right, even if it is named in the preceding text.

1.2.1 Polysemy of a given derivative

Different meanings of a reciprocal affix may be (a) actualized on different verb stems or (b) expressed on the same stem; cf. (3b) where the Yakut reciprocal form *ölör-üs-* has four readings. In this case we deal with the polysemy of a given derivative.

1.2.2 Polysemy of all derivatives with a given marker in a given language

In addition to the four meanings cited in (3b) which are the principal ones and very productive, found on large numbers of verbs in Yakut, it has seven unproductive meanings (attested in a few verbs each): in (4a) the derivative is anticausative and thus its meaning becomes simpler, in (4b, c, d) the meaning is either retained or acquires an additional nuance of meaning (e.g., deaccusative involves demotion of the direct object; antipassive = unspecified object), and in (4e, f, g) the meaning becomes more complex.

Yakut

- | | | | | | |
|-----|----|-------------------------------------|---|---|---------------|
| (4) | a. | <i>xolboo-</i> ‘to join sth to sth’ | → | <i>xolbo-s-</i> ‘to join (of sth and sth) | anticausative |
| | b. | <i>atəlaa-</i> ‘to sell sth to sb’ | → | <i>atəla-s-</i> ‘to buy sth from sb’ | converse |
| | c. | <i>tut-</i> ‘to hold/grasp sb/sth’ | → | <i>tut-us-</i> ‘to hold onto sb/sth’ (vi) | deaccusative |
| | d. | <i>üöyüü-</i> ‘to scold sb’ | → | <i>üögü-s-</i> ‘to swear’ | antipassive |
| | e. | <i>maḡəraa-</i> ‘to moo’ | → | <i>maḡəra-s-</i> ‘to moo in response’ | response |
| | f. | <i>tardəlaa-</i> ‘to pull sth/sb’ | → | <i>tardəla-s-</i> ‘to pull with an effort’ | intensive |
| | g. | <i>əstanqalaa-</i> ‘to jump’ | → | <i>əstanqala-s-</i> ‘to compete in jumping’ | competitive |

These meanings, which may seem accidental for the Yakut reciprocal suffix, are not accidental typologically, as they are concomitant with the reciprocal meaning in quite a number of languages; see 9.1 for the anticausative meaning, (58) and (125f) for the converse, (52) for the deaccusative, 8.2 for the antipassive, 10.2 for response action, 8.1 for the intensive, 9.4 for the competitive (note that a meaning like ‘to outrun sb’ already implies competition).

Derivatives with the meanings listed in (4) can also have the meanings entered in (3b). Thus, for instance, *tut-us-* under (4c) may also mean (i) ‘to hold *each other*’, (ii) ‘to hold *each other’s* hands’ (= ‘to shake hands with each other’; when used with the noun *ilii* ‘hand’) (both meanings are reciprocal – “canonical” and “possessive”, respectively), (iii) ‘to hold sth *together*’ (sociative), (iv) ‘to *take part* in holding/catching sth’ (comitative), (v) ‘to *help* sb to hold sth/sb’ (assistive).

A reciprocal marker is also considered to be polysemous if its different meanings are realized on different sets of verbs; cf., for instance, Russian where derivatives with reflexive and reciprocal meanings do not overlap (with one or two exceptions),² or the prevalent use of the reciprocal marker in the sociative meaning on intransitive verbs and the reciprocal on transitive verbs in Tatar.

I take into account not only non-productive meanings of productive reciprocal markers (see (4)) but also the meanings of unproductive reciprocal markers (e.g. (119), (124), and (125)).

1.2.3 Polysemy of reciprocal markers across languages

This requires listing and study of meanings the verbs with reciprocal markers can have in the world’s languages. A cross-linguistic study of the polysemy of reciprocal markers is based of course on the study of the previous two types of polysemy. This also requires investigation of appropriate conditions of actualization of the different meanings of reciprocal markers.

A special problem is the lexicalization of reciprocals. Lexicalization may result in retaining reciprocity while there is a shift in the lexical meaning, and such shifts may be to a certain degree predictable cross-linguistically. Thus, for instance, a reciprocal verb meaning ‘to talk with each other’ (< ‘to talk’) may acquire the meaning ‘to quarrel’ as a result of lexicalization while retaining its standard meaning.

1.3 Actualization of the meanings of reciprocal markers

A given derivative with a polysemous marker may have the reciprocal meaning or another meaning as a permanent feature, or a meaning may appear in a certain context due to some conditions. I will illustrate some cases.

1. *The meaning is permanent* (the derivative is thus monosemous). This may concern an individual derivative or a class of derivatives. Thus, the Yakut derivative (*tapta-* ‘to love’ →) *tapta-s-* has the meaning ‘to love each other’ only, in contrast to *tiej-s-* in (7b) which has at least four meanings. As to classes of derivatives, in Lithuanian, as well as in Russian, true reflexives and reciprocals almost never overlap. For example, Lithuanian *ginti-s* is always reflexive with the meaning ‘to defend oneself’ (never ‘to defend each other’), and *barti-s* is reciprocal ‘to abuse each other’ (not reflexive ‘to abuse oneself’) (Geniušienė,

2. The only exception I know is the verb *streljat’-sja* (< *streljat’* ‘to shoot, fire’) with two lexicalized meanings i. ‘to shoot at oneself in order to commit suicide’, ii. ‘to fight a duel with pistols’ (this verb was suggested to me by N. Sumbatova, p.c.).

Ch. 14, §4.3), i.e. the reflexive-reciprocal polysemy of the middle markers is realized as reflexive on some bases and reciprocal on other verbs.

In the case of polysemy of a derivative, the meaning is mostly determined by the following factors.

2. *The singular or plural number of the subject noun phrase.* Thus, the four readings in (3b) are possible with a plural subject, but a singular subject allows only the assistive and comitative readings.

In the case of the reflexive-reciprocal polysemy, the reciprocal reading is prevalent if the subject is plural and it is generally impossible with a singular subject (with some special exceptions – for instance, in the discontinuous construction; cf. (26), (31a) in Ch. 1). In this case the reflexive meaning alone is realized.

Such a tendency is observed in some Australian languages; cf.: “In some languages a single suffix is used for both reflexive and reciprocal – Yolŋu, Guugu Yimidhirr and Bardi <...> are examples. If the S(ubject) NP is singular the verb is taken to be reflexive; if S has plural reference then the verb will normally have a reciprocal sense” (Dixon 1980:433).

3. *The presence or absence of a direct object.* If the syntactic structure of a transitive base construction is retained the reciprocal meaning is ruled out. Thus, the Yakut verb *kərba-s-* has the sociative meaning ‘to beat somebody together’ when used with a direct object and reciprocal ‘to beat each other’ when used intransitively. One more example:

Karango (Marconnès 1931:195)

(5) *Ti no chek-an-a [nyama].*

we *no* cut-REC-IND meat

i. ‘We shall cut the meat *together*.’ (with the object included)

sociative

ii. ‘We shall cut *each other*.’ (without the object)

reciprocal

4. *Transitivity or intransitivity of the base verb.* As a rule, one-place intransitivity of the base verb rules out the reciprocal reading of the derivative. Thus, in Yakut and some other languages, derivatives of intransitives are mostly sociative and those of transitives are mostly reciprocal.

5. *The case form of the object.* The dative object (cf. *miixe* ‘for me’ in (6a)) indicates the assistive meaning, while a comitative noun phrase (marked with a comitative affix or postposition or preposition) indicates the comitative meaning (cf. *miigin katta* ‘with me’ in (6b)). The absence of such specifying objects makes a sentence ambiguous (cf. (7b)).

Yakut (Nedjalkov & Nedjalkov, Ch. 26, §§9.2.2.2 and 9.2.3.1)

(6) a. *Aya-m miixe üleli-h-ir.*

assistive

father-my I.DAT work-REC-PRES.3SG

‘Father *helps* me to work.’

b. *Aya-m miigin katta üleli-h-ir.*

comitative

father-my I.ACC with work-REC-PRES.3SG

‘Father works *with me*.’

6. *Reciprocal specifiers.* Sometimes only the broader context, which includes adverbial specifiers, disambiguates a particular verb form (cf. the adverb *xardarəta* ‘by turns’, ‘mutually’ in (7b) and also German *gegenseitig* (cf. *Sie liebten sich [gegenseitig]*: with-

out this adverb the sentence is ambiguous as ‘They loved *themselves/each other*’, and with this adverb it is reciprocal only). As often as not, realization of the reciprocal meaning in Yakut does not need any additional lexical means, e.g. like *tapta-s-* ‘to love each other’, *öjdö-s-* ‘to understand each other’. However, sometimes, for instance, in derivatives taking an inanimate direct object (but not formed from ditransitives) the reciprocal specifier serves to express the reciprocal meaning. In its absence, the form has other meanings (cf. (7b.i, ii, iii)): or it is ungrammatical. This is the case in the following Yakut example where the reciprocal reading alone is possible in the context of the adverb *xardarata* ‘by turns’, ‘mutually’, ‘entgegen’ (I failed to find an adequate English equivalent for this German translation – V.N.). The readings of (7b) are arranged in the order of preference.

Yakut (Nedjalkov & Nedjalkov, Ch. 26, §1.2; = (54) of Ch. 1; cf. also (60) in Ch. 1)

- (7) a. *Kiniler xardarata ot tiej-el-ler.*
 they by.turns hay.NOM cart-PRES-3PL
 ‘They cart hay *by turns*.’
- b. *Kiniler [xardarata] ot tiej-s-el-ler.*
 i. ‘They *help* somebody to cart hay.’ assistive
 ii. ‘They cart hay *with somebody*.’ comitative
 iii. ‘They cart hay *together*.’ sociative
 iv. ‘They cart hay *to each other*.’ reciprocal

7. *Semantic factors.* Thus, for semantic reasons the reciprocal meaning ‘to cook each other’ is outruled for the derivative of Yakut *belemnee-* ‘to cook sth’, while the other three meanings listed in (3b) are possible: *belemne-s-* i. ‘to cook sth *together*’, ii. ‘to cook sth *with sb*’, iii. ‘to *help* sb cook sth’.

In Tuvan (8), the lexical meaning of the predicate makes the assistive reading unlikely. In (6) the assistive reading is more likely although the comitative is also possible.

Tuvan (Kuular, Ch. 27, §5.3; -ž = REC, -əp = CONV, tur- = AUX, -lar = 3PL)

- (8) a. *Olar ərla-ž-əp tur-lar.* ‘They are singing *together*.’ sociative
 b. *Ol ərla-ž-əp tur-Ø.* i. ‘He is singing *with someone else*.’ comitative
 ii. ‘He is *helping* somebody to sing.’ assistive

Tuvan (ibid., §5.4)

- (9) *Men čer aŋdar-ž-əp tur-du-m.*
 I soil plough-REC-CONV AUX-PAST-1SG
 i. ‘I *helped* somebody else to plough the soil.’ assistive
 ii. ‘I ploughed the soil *together with others*.’ comitative

The actualization of one or another meaning in the case of reflexive-reciprocal polysemy is subject to similar conditions. For instance, in (10a) the reciprocal reading is foremost and in (10b) the reflexive one is preferable:

Polish (Wiemer, Ch. 11, §5.2.2)

- (10) a. *Przyjaciele wierzyli sobie.*
 friends trusted oneselves.DAT

- | | | |
|-----|---|------------|
| i. | ‘The friends trusted <i>each other</i> .’ | reciprocal |
| ii. | ‘The friends trusted <i>themselves</i> .’ | reflexive |
| b. | <i>Przyjaciele bronili się długo.</i> | |
| | friends defended REFL.ACC for a long time | |
| i. | ‘The friends were defending <i>themselves</i> for a long time.’ | reflexive |
| ii. | ‘The friends were defending <i>each other</i> for a long time.’ | reciprocal |

The following may be relevant. The singular subject, needless to say, rules out the reciprocal meaning. If the subject is plural, both readings are possible, but in reality the reciprocal reading is more common. Thus, out of 480 derivatives with the reflexive-reciprocal marker in German:

- 76% are interpreted by native speakers as reciprocal by default (e.g. *sich umarmen* ‘to hug each other’, *sich grüßen* ‘to greet each other’, *sich necken* ‘to tease each other’, *sich jagen* ‘to chase each other’, *sich unterstützen* ‘to support each other’, etc.),
- 10% are interpreted as reflexive (*sich loben* ‘to boast’, *sich putzen* ‘to clean oneself’, *sich verletzen* ‘to hurt oneself’, *sich waschen* ‘to wash oneself’, etc.), and
- 14% allow both readings with no preference (*sich achten* i. ‘to respect oneself’, ii. ‘to respect each other’, *sich umbringen* i. ‘to ruin oneself’, ii. ‘to ruin each other’, *sich ablecken* i. ‘to lick oneself’, ii. ‘to lick each other’, *sich unterschätzen* i. ‘to underestimate oneself’, ii. ‘to underestimate each other’, etc.) (Wiemer & Nedjalkov, Ch. 10, §4.2.1).

There is a kind of asymmetry in the distribution of derivatives with the predominantly reciprocal and predominantly reflexive interpretation: any derivative with reflexive interpretation can be interpreted as reciprocal in a suitable context (one of the possible exceptions is the reflexive with the meaning ‘to hang oneself’; the corresponding reciprocal ‘to hang each other’ for two persons is pragmatically unlikely; S. Say, p.c.), but the opposite is not always true. Compare, for instance, the unnaturalness of *er grüßte sich* ‘he greeted himself’, *er umarmte sich* ‘he embraced himself’, *er neckte sich* ‘he teased himself’, etc., although even for these one could find suitable artificial situations.

1.4 Semantic, formal and etymological relationships between the reciprocal meaning and the reflexive, sociative and iterative meanings

This subsection also briefly concerns the main patterns of the polysemy of reciprocal markers. A calculus of combinability of the main meanings in polysemous markers is proposed. These issues have been considered briefly in Section 3 of Ch. 1. They will be amplified here, and each of the three types of polysemy and a number of other related matters will be considered separately. As mentioned, besides three main types, i.e. *reflexive-reciprocal*, *reciprocal-sociative* and *iterative-reciprocal*, there are three extended types of polysemy: *reflexive-reciprocal-sociative*, *iterative-reciprocal-reflexive*, and *iterative-reciprocal-sociative*. Brief comments on the relations within all these types of polysemy follow.

1.4.1 *Reflexive and reciprocal are anaphoric*

But reciprocal anaphora is further complicated by obligatory non-singular subject and cross-reference. Thus, the reciprocal meaning is more complex than reflexive; when encoded by verbal markers, both meanings may result in detransitivization. The reflexive meaning implies that the subject referent (singular or plural) is both agent and patient of its own action. The reciprocal meaning also implies two semantic roles for each referent. The definition of the reflexive meaning is broader than that of the reciprocal, i.e. it may be applied to reciprocals, but with the specification just mentioned that the subject is non-singular and the roles are cross-coreferenced.

If a reflexive and a reciprocal markers are formally similar, they may be related in two ways.

1. *Both meanings are expressed by the same marker* (a combined marker). In many languages this takes place due to the reflexive marking acquiring the reciprocal function while it retains its own meaning. For instance, in a number of Bantu languages, e.g. in Luvale, the reflexive prefix *li-* (11a) acquired the reciprocal meaning (11b), which was earlier expressed by the reciprocal suffix *-asan-*, and at the same time it took over the sociative meaning from the latter suffix (11c).

Luvale (Horton 1949: 103, 117, 101; see also Aksenova 1990: 179, 181; *-ilil* is a proximative suffix; cf. also (8) in Ch. 1)

- | | | | | |
|------|----|----------------------------|------------------------|------------|
| (11) | a. | <i>a-li-pihis-a</i> | ‘he dirtied himself’ | reflexive |
| | b. | <i>vali na-ku-li-vet-a</i> | ‘they beat each other’ | reciprocal |
| | c. | <i>-li-hah-ilil-a</i> | ‘to run together’ | sociative |

The opposite evolution, from reciprocal to reflexive, is much less common. For instance, in Juwaljai, the reflexive suffix *-lelana* is descended from a reciprocal suffix (though the “new” reciprocal suffix *lɥili-* has in its turn developed from the reflexive, i.e. a kind of exchange of markers has taken place; to cite: “... there is in Juwaljai an apparent crossing of the functions of the two suffixes: that which was reciprocal becomes reflexive and vice versa” (Capell 1956: 52; for details see 2.2.4). Across languages, besides entirely distinct reflexive and reciprocal markers and reflexive-reciprocal markers, there also exist reciprocal markers partially coincident with reflexive ones.

2. *A reflexive and a reciprocal markers share a common component.* In this case the reflexive marker is usually a part of the reciprocal one. Reflexive markers containing a reciprocal marker are highly unlikely (but cases are registered when a reflexive marker is “heavier” than the reciprocal one; cf. the reflexive suffix *-(ɲi)djiliŋa* and reciprocal *-l-ana* in Wiradjuri (Capell 1956: 75); but generally, as a rule, heavier semantic content tends to have iconically a heavier marker). This concerns both morphological and syntactic reciprocal markers.

2a. *Complex morphological markers.* There are two types of complex reciprocal markers.

(i) In a reciprocal marker, a reflexive one is pre-posed or post-posed to some other marker, and historically it is likely to have been added to the latter; cf.:

- (12) the reciprocal suffix *-ni-βa/-yβa* in Uradhi, in which *-ni* is a reflexive suffix and the form *-yβa* of the second component is used in one of the four conjugational paradigms of transitive verbs (Crowley 1983:365):

Uradhi (ibid.)

- (13) a. *ute* ‘to cut’ → *uta-ni* ‘to cut oneself’
 b. *uta-niβa* ‘to cut each other.’
- (14) The reciprocal suffix *-na-ku* (cf. *riku-na-ku* ‘to look at each other’) in Bolivian Quechua, where *-ku* is a reflexive suffix when used by itself (cf. *riku-ku* ‘to look at oneself’) and *-na* occurs without *-ku* with the causative suffix *-chi* (cf. *riku-na-chi* ‘to make sb look at each other’) (Muysken 1981:454, 464).
- (15) The reciprocal suffix *-ep-ew* in Yurok, where *-ep* is a reflexive suffix and the second component is an allomorph of a passive marker (Robins 1958:78–9, 47–8);
- (16) The reciprocal prefix *ma-ku-* in Tidore, in which *ma-* is a reflexive prefix and the second component does not seem to occur separately (van Staden 2000:115–7).

(ii) A reciprocal marker is a reduplication of a reflexive-reciprocal marker; cf.:

- (17) The reciprocal prefix *at-at-* in Apalai, *at-* being a reflexive-reciprocal marker (Koehn & Koehn 1986:44).

See also Bhat (1978:49–50).

2b. Complex syntactic markers. They are often reduplicated reflexive markers (needless to say, they do not imply two reflexive actions), the latter having usually evolved from nouns meaning ‘person’, ‘body’, ‘head’, ‘soul’, or from emphatic reflexive pronouns, or intensifiers (like German *selbst*, Russian *sam*) and the like (see, for instance, Cassirer 1923:211; Schladt 1999:103–22); e.g.:

- (18) The Yakut reflexive pronoun *bej-leri-n* <EMPH.REFL-POSS.3PL-ACC> ‘themselves’ and reciprocal *beje-beje-leri-n* <EMPH.REFL-EMPH.REFL-POSS.3PL-ACC> ‘they each other’;³ cf. also Tuvan 3PL.ACC *bot-tar-ən* ‘themselves’ and *bot-bot-tar-ən* ‘each other’.

But there are hardly any reflexive markers comprised of a reduplicated reciprocal marker.

- (19) The Juang reflexive pronoun *aapein-te* <EMPH.REFL-ACC> ‘oneself’ and *aapein-te aapein* <EMPH.REFL-ACC EMPH.REFL> ‘each other’ (Patnaik & Subbarao 2000:842–4).
- (20) The Lezgian reflexive 3PL pronoun *čeb* <EMPH.ABS> ‘themselves’ and reciprocal 3PL *čpi-čeb* <EMPH.ERG-EMPH.ABS> ‘they each other’ (Haspelmath 1993:415–6).

3. The reflexive pronoun in its turn has evolved from an emphatic pronoun, cf. *min beje-m* ‘I myself’, *kini beje-te* ‘he himself’, *kiniler beje-lere* ‘they themselves’. In Yakut, the word *beje* also means ‘one’s own’, ‘body’, ‘creature’ (Pekarskij 1959:422–3). This word is also used in languages that are or have been in areal proximity to Yakut. For instance, in Tungusic languages, e.g. Evenki *beje* means ‘person’ (Nedjalkov 1997:337). In Mongolic languages, e.g. Buryat, the word *beye* means ‘body’, ‘personality’, and it has developed into the reciprocal pronoun *beye beyee* ‘each other’ (Cheremisov 1973:129–30).

Otherwise, reciprocal pronouns are often descended from lexical reciprocal nouns meaning ‘comrade’, ‘friend’, etc.;⁴ cf., for instance, *čere* ‘friend, comrade, equal’ in Koyra Chini (Heath 1999:342–3), *daße* ‘comrade’ in Gola and *band-* ‘relative’ in Fulani (Heine 1999:21).

To sum up, if the markers of reflexivity and reciprocity in a language have a common component the latter is likely to be materially identical with the reflexive marker.⁵

1.4.2 Sociative and reciprocal require a non-singular subject

Both are linked with plurality of actions, i.e. a kind of iterativity. However, iterativity is backgrounded because the actions of plural subject referents are usually performed simultaneously. The sociative meaning does not entail valency change, while, as just mentioned, the reciprocal in most cases entails detransitivization. Therefore reciprocals do not differ syntactically from sociatives of intransitive bases (note that in some languages sociatives derive from intransitives only).⁶ The reciprocal is more complex semantically than the sociative. The definition of sociatives (plural subject referents performing the same single semantic role simultaneously in the same situation) is broader than that of reciprocals with two semantic roles for each participant.

Although the reciprocal meaning is more complex than the sociative, there are special sociative markers which include a reciprocal marker, but I have no knowledge of special reciprocal markers containing a sociative marker as a permanent component (in a way this is analogous to the relation between anticausatives and causatives, i.e. semantic complexity is not always expressed by more complex markers).

If a sociative and a reciprocal markers are formally similar, they can be related in two ways.

1. *Both meanings are expressed by the same marker.* An example of this is (5). In this case mostly a reciprocal marker acquires the sociative meaning while retaining its meaning. This path of semantic evolution is reconstructed for some Bantu languages. Doke (1938:199) points out that in the Bantu languages the sociative is derived from a limited number of verbs and is thus less productive than the reciprocal.⁷ On this basis, Dammann (1954:167) concludes that the sociative has probably developed from the reciprocal. Similarly, Gerdt (1999:133–60) regards sociativity, which she terms “collective”, as a secondary

4. But, as is known, the Russian reciprocal pronoun *drug druga* ‘each other’ has developed from the adjective *drugoj* ‘another, different’ and not from the noun *drug* ‘friend’ (Vasmer 1986:543), although today it is interpreted as ‘friend friend.ACC’.

5. A unique example, which is significant in this respect, is the meaning ‘to embrace/hug (each other)’ in Yakut which is derived from the reflexive verb meaning ‘to hug oneself’: *kuus-* ‘to embrace/hug sb’ → *kuuh-un-* ‘to hug oneself’ (*s > h* in intervocalic position; ‘to cross one’s arms on one’s breast’ as an expression of respect to a superior) → *kuus-t-us-* ‘to hug each other’ (reflexive suffix *-n- > -t-*; *-us-* is a reciprocal suffix).

6. In this connection, it is noteworthy that there is an opinion that sociatives in Bantu were initially intransitive (see Dammann 1954:168).

7. While agreeing that the sociative meaning is less frequent than reciprocal, Aksenova (1990:177) claims that in some Bantu languages, e.g. Rwanda, it is the main meaning of the reciprocal form.

meaning that has developed from the reciprocal in Halkomelem. In her book on the languages of Native North America, Mithun (1999:93) also claims: “Collective markers also often develop from reciprocals”. Lichtenberk (1985:39) views the relationship between reciprocal and “plurality, collectivity” in Oceanic languages as follows: “<...> comparative evidence makes it clear that the collective-plural marking function is not historically primary but a later innovation”⁸

2. *A sociative and a reciprocal markers share a common component.* In this case, a reciprocal marker becomes a part of a sociative marker (see also Section 12 below).

2a. *Complex morphological markers.* A reciprocal marker may be added, for instance, to an applicative marker, as is the case in Adyghe, where the sociative prefix *zə-də-* is composed of the applicative comitative prefix *-də-* and the reciprocal prefix *zə-* (marking reciprocity on two-place intransitive base verbs); cf.:

Adyghe (Rogava & Kerasheva 1966:272, 269, 277–9)

- | | | | |
|---------|-------------------|-----------------------------|-----------------------------------|
| (21) a. | <i>Iuklən</i> | ‘to meet sb’ | two-place intransitive |
| → b. | <i>zə-Iuklən</i> | ‘to meet (with) each other’ | one-place reciprocal intransitive |
| (22) a. | <i>kIon</i> | ‘to go’ | one-place intransitive |
| → b. | <i>də-kIon</i> | ‘to go together with sb’ | two-place intransitive comitative |
| → c. | <i>zə-də-kIon</i> | ‘to go together’ | one-place sociative. |

As we see, the sociative form in (22c) is in fact a reciprocal form of the comitative.

In Ainu, the situation is somewhat similar: the sociative marker *u-ko-* is composed of the reciprocal prefix *u-* and applicative *ko-*. The latter prefix denotes non-causative transitivity of base verbs resulting in a variety of semantic changes, the comitative interpretation being very rare. One of these cases is (23b) which is generally used to refer to spouses.

Ainu (Tamura 1996:471, 760; *-pa* = PL)

- | | | | |
|---------|---------------------|--------------------------------|----------------------------------|
| (23) a. | <i>onne</i> | ‘to age, grow old’ | intransitive |
| b. | <i>ko-onne-pa</i> | ‘to grow old together with sb’ | two-place transitive applicative |
| → c. | <i>u-ko-onne-pa</i> | ‘to grow old together’ | one-place sociative |

8. But the possibility of the reciprocal use of a sociative marker cannot be entirely ruled out; cf.:

- (i) *They met so near with their lips that their breaths embraced together* [= *each other* – V.N.]. (Othello, II, i, 266–7)
- (ii) *Sir, we have known together* [= *each other* – V.N.] *in Orleans*. (Cymbeline, I, iv, 38).

Nor, incidentally, can the reciprocal use of a reflexive marker be necessarily retained in a language, as was the case in the 16th century English:

- (iii) *King Henry’s peers and chief nobility / Destroy’d themselves* [= *each other* – V.N.], *and lost the realm of France!* (1 Henry VI, IV, i, 143–7);
- (iv) *We’ll hear ourselves* [= *each other* – V.N.] *again*. (Macbeth, III, iv, 31–2).

The examples from W. Shakespeare are borrowed from Potter (1953:252–3); compare also Curme (1935:159).

There are numerous sociatives in Ainu whose respective applicative forms are either nonexistent or unrelated to them in meaning. Thus, unlike in Adyghe, we observe a merging of the applicative and the reciprocal markers and the grammaticalization of *uko-*.

2b. Complex syntactic markers. The semantic derivational pattern exemplified by Adyghe (22) is also attested among syntactic sociative markers in many languages where they involve a comitative marker (preposition, postposition, etc.) and a syntactic reciprocal marker according to the pattern similar to the Russian *drug s drugom* ‘with each other’:

- (24) a. *Ivan razgovarivaet s Petrom.* ‘Ivan talks *with* Petr.’
 b. *Ivan i Petr razgovarivajut drug s drugom.* ‘Ivan and Petr talk *with each other*.’

To my knowledge, the opposite development is not reported in the literature.

To sum up: if the markers of sociativity and reciprocity share a component it is likely to be materially identical with the reciprocal marker.

1.4.3 *Iterative and reciprocal differ semantically to a greater degree than reflexive and reciprocal, and sociative and reciprocal*

Like sociative, the iterative does not entail valency change. The common component of the iterative and the reciprocal is plurality of actions. In the case of the iterative, this is a sequence of (several) actions. In the case of reciprocals, the plurality of actions is interrelated with the plural subject. The iterative is less complex semantically than the reciprocal.

There is less information about the diachronic relationship between the reciprocal and iterative meanings than in the two cases discussed in 1.4.1 and 1.4.2 above. This is probably due to the fact that the same marker is used for encoding both meanings much more rarely across languages than the reflexive-reciprocal and the reciprocal-sociative polysemy. There is at least one piece of evidence of the reciprocal meaning being secondary to the iterative: Liu (1999: 124–32) claims that the reciprocal meaning developed in the marker composed of the auxiliary verbs *lái* ‘to come’ and *qù* ‘to go’ whose primary meaning was iterative (see case 1 in 4.2 below).

If an iterative and a reciprocal markers are formally similar, they can be related in two ways.

1. Both meanings can be expressed by the same marker. An iterative marker can acquire the reciprocal meaning, while retaining its original iterative meaning in the same or other derivatives. Iterativity is regarded as the initial and the main meaning of one of the reciprocal markers in Chinese: to express reciprocity, the base verb is repeated and the auxiliary verbs *lái* ‘to come’ and *qù* ‘to go (away)’ are used, which in its own turn implies that the iterative meaning has evolved from the reciprocative (movement in opposite directions); cf.:

Modern Chinese (Liu 1999: 124–32)

- (25) a. *dǎ* ‘to hit sb’ two-place transitive
 → *dǎ-lái-dǎ-qù*
 hit-come-hit-go
 i. ‘to beat *each other*.’ one-place reciprocal
 ii. ‘to fight *several times or for some time*.’ one-place iterative/durative

Similarly, in Hua, the reciprocal form consists of the repeated base verb and the auxiliary verb *hu* (Haiman 1980:124–32). As Davies (2000:123–43) claims, in Madur, expression of the reciprocal meaning is related to the expression of iterativity by the same form. In Qiang, reduplication of a verb expresses iterativity as well as reciprocity (LaPolla 2003:121). Repetition of actions in these forms is iconically denoted by repetition of the verb.

2. *An iterative and a reciprocal markers share a component.* In this case, the iterative marker becomes a part of the reciprocal marker. This is attested among both morphological and syntactic markers. Two variants are registered.

2a. *An iterative marker within a complex marker does not denote repetition of a reciprocal situation.* However, it retains its meaning when used alone. An example is Dyrbal where the reciprocal suffix *-(n)bariy* is obligatorily combined with the reduplication of the first two syllables of the base verb, reduplication being a marker of iterativity by itself (Dixon 1972:92–3). In Bilin, the reciprocal marker *-st-əŋi* consists of the passive suffix *-st-* and frequentative suffix *-əŋi-* (Palmer 1957:132, 134, 135).

In Manam, there are two reciprocal markers, the prefix *e-* alone and the same prefix in complex with the iterative suffix *-i* which does not express repetition of the reciprocal situation (Lichtenberk 1983:211–4).

2b. *An iterative marker in a complex marker denotes repetition of a reciprocal situation.* When used alone it also retains this meaning. Thus, in this case the reciprocal meaning is obligatorily combined with the iterative. This type is represented by a limited set of Russian verbs on which reciprocity is marked by the circumfix *pere-...-sja*, and repetition of subevents by turns by the imperfective aspect marker *-iva-/-yva-* (Zaliznjak & Shmelev 2000:125–6; Knjazev, Ch. 15, §4); cf.:

- (26) a. *stuč-a-t'* 'to knock'
 → b. *pere-stuk-iva-t'-sja* 'to exchange knocks, knock to each other.'

To sum up, if the markers of iterativity and reciprocity have a common component it is likely to materially coincide with the iterative marker.

1.4.4 Possible etymological relations between the four meanings

If the markers of some of the meanings in question coincide entirely or partially, the etymological relationships between these meanings are likely to be as follows:

The arrows show the most likely direction of the semantic development of the markers. The semantic affinity indicated by the arrows and discussed above motivates the main types of polysemy patterns. This path of development has been claimed for a number of languages. The arrow between iterative and sociative signifies that they share the semantic component of plurality (see (29); cf. also Swadesh 1946:325).

As is shown in (27), the reflexive meaning is not related directly to sociative and iterative but via the reciprocal. Since these meanings do not share any obvious features. We may predict that if a marker can express both (i) the reflexive and the sociative meanings or (ii) reflexive and iterative, this same marker necessarily expresses the reciprocal meaning as well. Case (i) is illustrated in (11). Here is an example illustrating case (ii):

Tagalog (Shkarban & Rachkov, Ch. 22, §3.1.1)

- (28) a. *um-ahit* ‘to shave sb’ → *mag-ahit* ‘to shave oneself’ reflexive
 b. *k-um-ain* ‘to eat’ → *mag-kain* ‘to eat much and often’ iterative intensive
 c. *y-um-akap* ‘to hug sb’ → *mag-yakap* ‘to hug each other’ reciprocal

Iterative and sociative seem to be more akin to each other than iterative and reciprocal: neither changes the base valency and the common feature of the plurality of actions is more pronounced than in the previous case.

Note that in a number of languages verbal plural markers (=sociatives?) and iterative markers are formally identical. Similarly, the use of the same verbal marker for referring both to iterative action and “plural collective argument” is attested in Panare for the prefix *pëti-* (Payne & Payne, forthcoming) (interpretations in (29) are mine – V.N.):

Panare

- (29) *y-aw-aaná’ - pëti-n.*
 3-INTR-JOIN-ITER-NONSPEC.I
 i. ‘S/he kept visiting.’ iterative
 ii. ‘A bunch of them came to visit.’ sociative
 iii. ‘A bunch of them kept visiting.’ sociative and iterative

This type of polysemy can also be illustrated by the East Futunan circumfix *fe-...-(C)i* (formed with the unproductive reciprocal prefix *fe-*; cf. (124)) whose main meanings are sociative and iterative (cf. *fe-tagi-si* ‘to cry together, at the same time, or again and again’, *fe-sopo-i* ‘to jump several times’) and which can be reciprocal in exceptional cases (cf. *fe-alofa-ni* ‘to like each other’; the main reciprocal marker is the circumfix *fe-...-(C)aki*; cf. (126) (Moyse-Faurie, Ch. 35, §3.2).

Note also the semantic affinity between the iterative and the intensive meanings, which is why both can be expressed by the same marker; this is attested, for instance, for Supyire (Carlson 1994:14); cf. also Tagalog (125b) below. There are also attested cases of a polysemous reciprocal marker expressing the sociative and intensive meanings simultaneously; see Buryat (105).

1.4.5 Other types of polysemy

If we take into account the most prominent meanings of polysemous reciprocal markers, i.e. reflexive, sociative and iterative, and make up a calculus of their possible combinations (subject to the natural condition that each combination contains the reciprocal meaning), we obtain eight logically possible types. Here is the list (with reference to the sections where they are considered below and to the examples illustrating each type):

Type 1. The reciprocal meaning without reflexive, sociative or iterative. Note that this definition covers both (i) monosemous markers (cf. 1.1.1) and also (ii) those that express other concomitant meanings except reflexive, sociative and iterative (for instance, the meanings listed in (4) above; cf. §8 below); e.g.:

- To'aba'ita (Lichtenberk, Ch. 36, §§8.1.1; 7)
- | | | | | |
|------|----|------------------------|---------------------------------|-------------|
| (30) | a. | <i>kwai-'oli-i</i> | 'to embrace <i>each other</i> ' | reciprocal |
| | b. | <i>kwai-fa'ama'u-i</i> | 'to be frightening' | antipassive |

Type 2. Reflexive-reciprocal polysemy (Section 2; see example (10)).

Type 3. Reciprocal-sociative polysemy (Section 3; see (5)).

Type 4. Iterative-reciprocal polysemy (Section 4; see (25)).

Type 5. Reflexive-reciprocal-sociative polysemy (Section 5; see (11)).

Type 6. Iterative-reciprocal-reflexive polysemy (Section 6; see (28)).

Type 7. Iterative-reciprocal-reflexive polysemy (Section 7; see (2)).

Type 8. Reflexive-reciprocal-sociative-iterative polysemy (not attested).

All these types of polysemy are suggested as landmarks for investigating the polysemy of reciprocal markers.

As mentioned, a language may have two or more reciprocal markers with different sets of meanings, or with similar sets of meanings differing in productivity. Curiously enough, particularly rich polysemy is sometimes displayed by morphological markers that have lost their productivity and preserve the reciprocal meaning in a limited number of (highly frequent) derivatives, which are mostly "natural reciprocals" (Kemmer 1993:100–8); cf., for instance, Tagalog *mag-* (see Section 6), East Futunan *fe-* without a suffix (see case 2 in Section 5), Khmer *prv-* (see case 4 in 4.2). This may be due to the bleaching of the main meaning.

Sometimes, a language preserves the use of a reciprocal marker in a meaning that is not obviously related to the reciprocal meaning in the modern language and seems to be a remnant of a more archaic broader system of polysemy (e.g. the reciprocal marker on some numerals with the distributive meanings like 'two each', 'three each', and also with the intensifying meaning in combination with adjectives in Mundari; see Osada, Ch. 37, §9.2).

Besides the main types distinguished above there may also be less common and unclear cases of polysemy that require further study.

1.4.6 *Reflexive-based and nonreflexive-based reciprocal markers*

Reciprocal markers with Type 2 polysemy (1.4.5) can also be termed *reflexive-based* and they can be opposed to *nonreflexive-based* reciprocal markers, namely, sociative-reciprocal (Type 3) and iterative-reciprocal (Type 4). The latter two types can be combined together as *plurality-based*, because the relevant factor is the number of participants and/or actions implied by the sociative and the iterative meanings. Henceforth, in certain cases I will use these latter terms, i.e. nonreflexive-based (as an opposite to reflexive-based) and plurality-based (as a semantically motivated term), interchangeably.

The reflexive-based and nonreflexive-based reciprocal markers generally differ significantly in the range of their typical polysemy, i.e. the sets of meanings they can express cross-linguistically, though some of the meanings may be common for all the types in some languages.

In the case of *reflexive-based* reciprocal markers (most of the meanings involve de-transitivization, i.e. valency decrease; reflexivity involving anaphora), their polysemy is *in fact a polysemy of reflexive markers*, i.e. they are markers that are mostly reflexive by origin irrespective of whether they are productive in this meaning.

Plurality-based reciprocal markers, whose additional meanings entail valency increase (comitative, assistive and, rarely, causative) or retention (sociative and iterative, durative, intensive, etc.), in contrast to reflexive-based markers, do not generally seem to lend themselves to a unified classification of the type presented in (40). In different languages the meanings of nonreflexive-oriented reciprocal markers may vary considerably, and it is hard to establish any kind of hierarchy for them. Besides, as a matter of fact, their polysemy has been investigated to a lesser degree than that of reflexive-based markers.

1.4.7 *Comitative: Means of expression, relation to reciprocal, sociative and reflexive*

In this subsection, the main types of comitative expression are discussed and also possible semantic relationships with the markers of reciprocity, sociativity and reflexivity.

The comitative meaning has not been discussed above as one of the *main* meanings sometimes expressed with polysemous reciprocal markers. However, it is registered among the meanings of these markers; see, for instance (3b.iii), (6b), etc. It has also been mentioned above as a meaning expressed by specialized comitative markers which can denote sociativity when combined with reciprocal markers (22b). Semantically, the comitative meaning is closest to the sociative: in both cases the verb expresses simultaneous performance of an action (this is discussed in more detail in Ch. 1, §§8.1 and 8.2). But in the sociative situation two or more participants act jointly as a group, and all of them are named by the subject. And in the comitative situation, two participants, each single or collective, also acting jointly, are named separately, one by the subject and the other by a non-subject, i.e. by an object. The comitative meaning is essentially reciprocal, but denoted by a discontinuous construction (see Ch. 1, §7). When this meaning is expressed by a free word the latter is in fact a lexical reciprocal, like the preposition *with* in the following symmetrical constructions:

- (31) a. *Peter is working with John.*
 = b. *John is working with Peter.*
 = c. *John and Peter are working together* (\approx *with each other*).

As pointed out above, it is always a simple construction derived from a discontinuous one (cf. (Ch. 1, §16.1), as with other lexical verbal reciprocals; cf.:

- (32) a. *Peter met Mary = Mary met Peter = Mary and Peter met.*

Verbal and nominal comitatives can be distinguished: in the former the comitative marker is used on verbs and in the latter it occurs on nominals. In principle, both types of comitatives can generate similar constructions.

1. *Verbal comitatives.* The following main types are registered, which have been partially pointed out above.

1a. *The comitative may be one of the meanings of a verbal reciprocal marker.* Note that the comitative meaning increases valency by one; see (33), where comitativity is expressed twice: by the reciprocal marker *-h-* (in intervocalic position; < *-s-*) and by the postposition *kəttə* ‘with’, while the reciprocal meaning involves valency decrease, in particular detransitivization (cf. Yakut *tapta-* ‘to love sb’ → *tapta-s-* ‘to love each other’). If we omit the bracketed phrase, the sentence can also be interpreted as assistive, in the meaning ‘Father helps someone to work’. If the subject is plural and the prepositional phrase is omitted, a third interpretation, the sociative, is possible (33b). If we omit the suffix *-h-* in (33a) the comitative meaning is retained due to the prepositional phrase. Thus this meaning can be expressed in three ways: by the suffix *-h-* alone, by the postposition *kəttə* and by both together.

Yakut (Nedjalkov & Nedjalkov, Ch. 26, §2.2.2)

- (33)=(6b) a. *Aya-m [miigin kəttə] üleli-h-ir.*
 father-my I.ACC with work-REC-PRES.3SG
 ‘Father works *with me*.’
- b. *Kiniler [miigin kəttə] üleli-h-el-ler.*
 they I.ACC with work-REC-PRES-3PL
 i. ‘They work *with me*.’ (if the bracketed phrase is used)
 ii. ‘They *help* [somebody] to work.’ (without the bracketed phrase)
 iii. ‘They work [*with somebody*].’ (without the bracketed phrase)
 iv. ‘They work *together*.’ (without the bracketed phrase).

If the base verb is transitive, the derived sentence with the reciprocal marker can also have a reciprocal reading (see (7b)).

1b. *The comitative meaning is expressed by a specialized prefix.* For instance, in Adyghe, reciprocity and comitativity are expressed by different markers, the former by the prefix *zə-* (cf. *Iuklən* ‘to meet sb’ → *zə-Iuklən* ‘to meet (with) each other’) and the latter by the prefix *də-*:

Adyghe (Rogava & Kerasheva 1966:277)

- (34)=(22) a. *kIon* ‘to go’ → b. *də-kIon* ‘to go together with sb.’

The sociative meaning is expressed by the reciprocal form of a comitative derivative:

- c. *zə-də-kIon* ‘to go together’ (see also (21), (22)).

1c. *The comitative meaning is expressed by a specialized prefix very similar to a sociative-reciprocal-reflexive suffix.* (The information is from Heath 1984:392.) This is the case in Nungubuyu and concerns the prefix *-an’ji* and the suffix *-n’ji-* which are most likely etymologically related (cf. also 2.2.5 below). The vast majority of comitatives involve in-

transitive stems (the subject can be singular and the second participant, if it is overt, is nominative). Examples of comitative derivatives:

Nunggubuyu (ibid., p. 392)

- | | | | |
|---------|---------------------------------|-----------------|------------|
| (35) a. | -an^yji-wunma- | ‘to fly with’ | comitative |
| | -an^yji-yi- | ‘to sleep with’ | comitative |

Examples of derivatives with the suffix **-n^yji-** (reflexivity is usually expressed by the suffix **-i-**, but on monosyllabic stems **-n^yji-** is used for this purpose):

- | | | | |
|----|---|--------------------------------|-------------|
| b. | -n^sandardi-n^yji- | ‘to snore together’ | sociative |
| | -ri-n^yji- | i. ‘to spear each other’ | reciprocal |
| | | ii. ‘to spear self’ | reflexive |
| | -lharma-n^yji- | i. ‘to chase each other’ | reciprocal |
| | | ii. ‘to be engaged in a chase’ | antipassive |

A derivative with both affixes in question is registered; in contrast to purely reciprocal derivatives, this one can be used with the singular subject:

- | | | |
|----|--|--|
| c. | -an^yji-lharma-n^yji- | ‘to be engaged in a chase with (the other party).’ |
|----|--|--|

1d. The comitative meaning is expressed by a suffix materially similar to the reflexive marker. For instance, in Takelma the comitative suffix **-(a)gw-**, reflexive **-gwi-** and indirect reflexive **-gwa-** nearly coincide (indirect reflexive – “reference to sth belonging to one’s self, not action in behalf one’s self”). Note in passing that the reciprocal suffix is **-an** and the causative suffix is **-(a)n** (Sapir 1922: 135–7, 148–9, 152–3). Sapir defines the comitative in Takelma as follows (the capitals are Sapir’s):

Comitatives, i.e., transitive forms with the general meaning of TO DO SOME ACTION (expressed by verb-stem) TOGETHER WITH, ATTENDED BY, HAVING SOMETHING (expressed by object of verb) may be formed only from intransitives by the suffix **-gw-<...>** (ibid., p. 137)

Here are examples of comitative and reflexive derivatives:

Takelma (ibid., pp. 137, 148; segmentation and bold type are mine – V.N.)

- | | | | |
|---------|--|----------------------------------|------------|
| (36) a. | lohoy-agw- | ‘die together with.’ | comitative |
| b. | ī-gaxgaga’x-gwa-^εn | ‘I scratch myself, i.e. my own.’ | reflexive |
| c. | se^εla’mt’-gwi-de^ε | ‘I shall paint myself.’ | reflexive |

There is no obvious semantic connection between the meanings of these two examples. But one of the components of the comitative meanings distinguished by Sapir, namely, HAVING SOMETHING, links both comitative and reflexive via the reflexive-possessive meaning of the suffix **-gwa-** illustrated by (36c). Thus there is an indirect semantic link between them.

- | | | | |
|----|---|-----------------|----------------------|
| c. | gini(g)- | ‘go to’ | |
| → | gimī^l-gwa-^εn | ‘I take it to.’ | reflexive-possessive |
| | (lit. ‘I go to (some place) having sth’ – V.N.) | | |

A typological parallel to this usage may be Lithuanian transitive reflexives derived from verbs meaning ‘to carry sth’, ‘to bring sth/sb’, ‘to bear sth’, ‘to take sth/sb away’, etc.; reflexives of this type acquire the meaning ‘with oneself, for oneself’ (see Geniušienė 1987:135–6); cf.:

- (37) a. *Petras at-si-ved-ė vaik-q i darb-q.*
 Peter PREF-REF-bring-PAST.3 child-ACC.SG to work
 ‘Peter brought the child to his office.’
 lit. ‘Peter brought *with himself* the child to his office.’ possessive-reflexive
- cf.: b. *Petras pri-si-vert-ė dirb-ti.*
 Peter PREF-REF-force-PAST.3 work-INF
 ‘Peter forced himself to work.’ reflexive

2. *Nominal comitatives.* In the literature, phonetic (and obvious semantic) similarity of reflexive, reflexive-reciprocal and reciprocal markers with a comitative marker on nouns in some languages has been established. There is an opinion that such coincidences are due to the etymological relations between these markers, although it is hard to trace the evolution of comitative affixes or comitative prepositions into a verbal affix and prove it convincingly.

2a. Nominal comitative affix and verbal reflexive affix. This case is described by Dixon (1980:433) in Yidiny:

There are a few languages in which the reflexive suffix to a verb has the same, or almost the same, form as the comitative derivational affix ‘with’ onto a nominal. In Yidiny nominal comitative is *-ji~yi* <...> and reflexive is *-Vji-n* <...>.

2b. Nominal suffix of “having” and verbal reflexive-reciprocal suffix. This coincidence is attested in Dhuwala/Dhuwal in Dixon (ibid.):

In Dhuwala/Dhuwal the reflexive-reciprocal verbal suffix is *-mi* (which takes future inflection *-rri*) and the ‘having’ suffix on nouns is *-mi* in some dialects, *-mirri* in others.

2c. Nominal comitative suffix and verbal reciprocal suffix. This coincidence is attested in Thargari and Yinggarda in Dixon (ibid.)

In Thargari and Yinggarda both reciprocal suffix to verbs and comitative suffix to nouns have the form *-parri*.

However, further on, Dixon expresses doubt about the etymological relatedness of the markers in all the three cases:

Interestingly, in Rembarrnga verbal reflexive-reciprocal is *-ttə*, identical to the privative suffix (‘without’) on nominals. The significance of these correspondences is not at present understood; indeed, they may be quite accidental.

Relations of type 2c are attested not only in Australian languages but also in a number of other unrelated languages: Yukaghir (Jochelson 1934:175), some Bantu languages, e.g. Nkore-Kiga (Taylor 1985:68), Eastern Pomo (McLendon 1975:84). These relations in a number of languages, including Venda and Kolyma Yukaghir, are analysed in depth

in Maslova (1999:161–78). In Venda, a comitative preposition *na* is used as a nominal comitative marker, and in Yukaghir it is a comitative postposition *-n'e*. The following examples borrowed from Maslova (*ibid.*, p. 161) show the formal identity of comitative and reciprocal markers:

Venda (Poulos 1990:188)

- (38) *Musidzana u-khou-rw-ana na mutukana.*
 girl 3SG-PRES.CONT-hit-REC COM boy
 'The girl and the boy are hitting each other.'
 lit. 'The girl is hitting each other with the boy.'

Kolyma Yukaghir (field notes of I. Nikolaeva; cited from Maslova, Ch. 44, ex. (29))

- (39) *Odu-pe kukujerd'i-pe-n'e n'e-nuk-telle n'e-lejtej-ngi.*
 Yukaghir-PL Even-PL-COM REC-find-SS.PFV REC-learn-3PL.INTR
 'Yukaghirs and Evens met each other and got to know each other.'

2. Reflexive-reciprocal polysemy

2.1 The range and distribution of typical meanings

Two main cases can be distinguished here:

- A reflexive-based marker has two meanings only, reflexive and reciprocal, thus performing anaphoric functions only; this type is represented by the Polish reflexive pronoun *sobie* in (10a). Markers of this type may be termed anaphoric.
- A marker has not only the reflexive and the reciprocal meanings but also a number of other meanings which are usually regarded as the meanings of middle forms and have developed on the basis of detransitivization. Traditionally, these markers are referred to as middle markers (see Kemmer 1993:15–40).

This section is concerned with the meanings which middle markers may have alongside the reflexive proper and the reciprocal. These meanings have been investigated in depth both in individual languages and cross-linguistically (Hatcher 1942; Janko-Trinickaja 1962; Geniušienė 1987; Kemmer 1993, etc.). Note that some of these meanings can also be expressed by nonreflexive-based reciprocal markers (see Section 9). The classification is based on Geniušienė (1987:65–177); most of the examples are from Lithuanian, where the polysemous reflexive marker is the morpheme *-si-/s-*.⁹ Most of the functions of middle markers have detransitivization in common. In fact, however, languages crucially differ in the patterns of intransitive derivations, the productivity of the different functions and their mapping onto the verbal lexicon (for the sake of simplicity, some types of reflexives are neglected). The cognitive characteristics of derivatives with middle markers are pre-

9. Both allomorphs are used in the final position on unprefixed verbs, with a complex system of the rules of distribution (see Geniušienė 1987:19), and *-si-* alone is used on prefixed verbs where it is placed between prefix and root.

sented in depth in Kemmer (1993:201–47). Below, I suggest a description of derivatives according to three features:

1. Valency changes, viz. detransitivization (decrease in all the groups of Chart (40), except groups 1.1.2 and 2.4) which retain the transitivity of the base verb (in group 2.4 the subject valency is lost); valency increase is not attested).

2. The type of semantic change (addition of a component of meaning in groups 1.1 and 2.2); subtraction of a semantic component in 2.1; retention of the meaning of the base verb in groups 1.2 and 2.3).

3. The derived meanings: within groups sharing the above two features, different finite semantic classes are distinguished, like anticausatives and resultatives in group 2.1, etc.

The chart shows the place of each type of derivatives among other types.

(40) The meanings of <i>middle</i> markers ¹⁰ (the numbers refer to the examples)		
1. Subject-oriented ¹¹		2. Object-oriented
<i>(Detransitivization in all cases except 1.1.2 and 2.4)</i>		
1.1. Group A (the meaning of the derivative is more complex)	1.2. Group B (intr.) (the meaning of the derivative is equal to that of the base) typical meanings: antipassive, deaccusative (51)–(52)	2.1. Group C (the meaning of the derivative is simpler): anticausative, resultative ¹² (53)–(54)
1.1.1. Group Aa (intr.): meanings: reflexive proper, partitive-reflexive, autocausative, reciprocal, etc. (41)–(46)		2.2. Group D (intr.) (the derived meaning is more complex); typical meanings: potential-passive, causative-reflexive, etc. (55), (57)
1.1.2. Group Ab (usu. tr.): indirect reflexives; typical meanings: reflexive-benefactive (47), reflexive-possessive (48), reflexive <i>commodi</i> (49)–(50)		2.3. Group E (intr.) (the meaning of the derivative is equal to that of the base): typical meaning passive proper (agentless or agentive) (59)
		2.4. Group F (tr. and intr.): impersonal ¹³ (60)

10. Between some of the listed meanings, implicational relations can be established: “1) If derivatives with a reflexive marker can have the passive meaning they (not necessarily of the same stem) also have the anticausative meaning, but not the other way round. 2) If derivatives with a reflexive marker have the antipassive meaning these same derivatives can most frequently have the reciprocal meaning” (Nedjalkov 1975:32). For a more detailed system of implicational relations see Geniušienė (1987:344–52).

11. The terms “subject-oriented” and “object-oriented” are not used here in the sense of diathesis types: here “subject-oriented” denotes subject retention in the derived construction and “object-oriented” denotes that the derived subject is identical with the underlying object.

12. I have in mind the principal type of resultatives, viz. object-oriented resultatives – forms expressing the state of the object of a prior action (Nedjalkov & Yakhontov 1988:6).

13. Impersonal derivatives can be regarded as object-oriented even though the direct object is not promoted to subject. This is supported by the fact that from the viewpoint of the syntactic word order the preserved direct object kind of substitutes for the deleted subject.

The following is meant to explain and illustrate the chart.

1) *Subject-oriented constructions*. Depending on whether the underlying subject is retained or deleted, two types are distinguished: subject-oriented and object-oriented reflexives. In subject-oriented constructions the subject coincides with that of the underlying construction.

1.1) *Group A*. The meaning of the derivative is more complex than that of the base verb. It contains an additional semantic component (e.g., reflexive, reciprocal, implication of the relevant body part, etc.). They express either *the reflexive proper or meanings directly related to it*.

1.1.1) *Group Aa*. *Detransitivization*. Here belong derivatives with object deletion or demotion.

(a) *Reflexives proper*. Compare Lithuanian:

- (41) a. *Jis privertė kaimyną dirbti*. 'He forced his neighbour to work.'
 b. *Jis pri-si-vertė dirbti*. 'He forced himself to work.'

(b) *Reflexives in the broad sense*. Unlike reflexives proper, they express meanings which can be expressed by verbs without reflexive marking in many languages. They fall into *partitive reflexives* denoting actions of the subject referent upon or with his body parts (subgroups (b1), (b2) and (b3)) and *autocausatives* denoting motion or change of posture (subgroup (b4)):

(b1) *Body care (grooming) and (un)dressing reflexives*, e.g.:

- (42) a. *Ji maudo vaik-ą* (ACC). 'She washes the child.'
 → b. *Ji maudo-si*. 'She washes herself.'

(b2) *Actions (often uncontrolled and negative) upon body parts*, e.g.:

- (43) a. *Jis sužeidė ranką*. 'He hurt his hand.'
 → b. *Jis su-si-žeidė*. 'He hurt himself.'

(b3) *Body part motion reflexives*, e.g.:

- (44) a. *Jis užmerkė ak-is* (ACC). 'He closed his eyes.'
 → b. *Jis už-si-merkė*. (same).

(b4) *Autocausative (motion or change of posture, or body move) reflexives*:

- (45) a. *Jis metė akmen-į* (ACC). 'He threw a stone.'
 → b. *Jis metė-si į priekį*. 'He threw himself forward.'¹⁴

(c) *Reciprocals*, e.g.:

- (46) a. *Jis erzina ją* (ACC). 'He teases her.'
 → b. *Jiedu erzina-si*. 'They-two tease each other.'

14. This example is not an individual lexicalised case, as it is registered in over 10 genetically unrelated languages of my list. It is a typologically predictable change of meaning.

1.1.2) Group Ab. No detransitivization.

(a) *Indirect reflexives*.¹⁵ Syntactic change involves indirect (dative) object deletion, the direct object being retained. The deleted indirect object is either *benefactive* (47) or *possessive* (48).

- (47) a. *Jis nupirko man* (DAT) *knyg-q* (ACC). 'He bought me a book.'
 → b. *Jis nu-si-pirko knyg-q* (ACC). 'He bought himself a book.'
- (48) a. *Motina prausia vaik-ui* (DAT) *veid-q* (ACC). 'Mother washes the child's face.'
 → b. *Motina prausia-si veid-q* (ACC). 'Mother washes her face.'

(b) *Commodi derivatives*. These derivatives differ from the previous type in that the reflexive morpheme does not mark any change in the syntactic structure of the base construction. The component 'for one's own benefit, pleasure', etc. is added, or the lexical meaning of the verb is emphasized (when translated into some other languages this sense is often omitted). Examples of transitive- and intransitive-based *-si*-derivatives are:

- (49) a. *Jis įkvėpė oro*. 'He inhaled (some) air.'
 → b. *Jis į-si-kvėpė oro*. (same translation).
- (50) a. *Svečiai suvažiavo*. 'The guests have gathered/arrived.'
 = b. *Svečiai su-si-važiavo*. (same translation).

1.2) Group B. The meaning of the derivative is (nearly) equal to that of the base verb. The derivatives (sometimes termed '*antipassives*'), like Group Aa above, undergo detransitivization, namely object deletion or demotion.

(a) *Antipassive, or absolutive (unspecified object) derivatives*, with object deletion (this type is also termed *depatientive*; see Lichtenberk, Ch. 36, §8.11):

- (51) a. *Vaikas muša kit-us* (ACC). 'The child beats others.'
 → b. *Vaikas muša-si*. 'The child is pugnacious.'

(b) *Deaccusative reflexives* with object demotion:

- (52) a. *Jis svaido akmen-is* (ACC). 'He throws stones.'
 → b. *Jis svaido-si akmen-imis* (INST). (same translation).

2) Object-oriented constructions. The subject of the derived construction corresponds to the object of the base construction, the underlying subject being deleted or demoted.

2.1) Group C. The meaning of the derivative is simpler than that of the base verb.

(a) *Anticausatives* (see also 9.1):

- (53) a. *Jis atidarė dur-is* (ACC). 'He opened the door.'
 → b. *Durys at-si-darė*. 'The door opened.'

15. Note that transitive reflexives comprise the largest class among *-si*-verbs in Lithuanian – over 1,000 out of 3,700 derivatives registered in the dictionaries.

(b) *Resultatives*, e.g.:

Maasai (Tucker & Mpaayei 1955: 135–6; *e-* = 3SG and 3PL)

- (54) a. *e-ik-a* ‘it is suspended, it hangs’ (*-a* = middle marker)
 cf.: b. *e-ik-i* ‘it is hung up by sb’ (*-i* = IMPR) (cf. also 2.2.4 below).

The main distinction between resultatives and anticausatives is that the former denote resultant states, and the latter processes. Both meanings differ from the passive in that the agent of the base construction is not retained in their semantic role structure. The passive denotes an action, which distinguishes it from resultatives but not from anticausatives.

2.2) *Group D. (Quasi-)passive derivatives are more complex in meaning*: they acquire additional *modal* or *causative* semantic components:

(a) *with a “generic” potential-passive meaning*; e.g.:

- (55) a. *Jis sudeda dviratj.* ‘He folds the bicycle.’
 → b. *Dviratis su-si-deda.* ‘The bicycle folds’ = ‘can be folded.’

(b) *With a “non-generic” passive meaning of unexpected result*:

- (56) a. *Mes suvalgėme vis-q duon-q* (ACC). ‘We have eaten all the bread.’
 → b. *Visa duon-a* (NOM) *su-si-valgė.* ‘All the bread got eaten up.’ (unexpected result)

(c) *With a causative-reflexive meaning*:

- (57) a. *Ji* (ACC) *gydo geras gydytojas* (NOM). ‘A good doctor treats him.’
 → b. *Jis gydo-si pas gerą gydytoją* (ACC). ‘He has himself treated by a good doctor.’

2.3) *Group E. In meaning, the derivatives are equal to the base verbs.*(a) *Converses proper* (with reversed arguments); cf.:

- (58) a. *Mane* (ACC) *žavi muzika* (NOM). ‘Music enchants me.’
 → b. *Aš* (NOM) *žaviuo-si muzika* (INST). ‘I am enchanted with music.’

(b) *Agentless and agentive passives* (in Lithuanian, the marker *-si/-s* is not used to mark the passive voice):

Danish (Hendriksen 1948: 73)

- (59) a. *Hus-et bygge-s* [*av murere*]. ‘The house is (being) built [by bricklayers].’

For some less common meanings (namely, sociative and competitive) of derivatives with markers of reflexives and reciprocals, see §§5 and 9.2 respectively.

2.4) *Group F. Impersonal derivatives with subject deletion* (encoding unspecified subject) and direct object retention, like Serbo-Croatian:

- (60) a. *On prodaje konj-a* (ACC). ‘He sells a horse.’
 → b. *Prodaje se konj-a* (ACC). ‘One sells a horse’, or ‘A horse is on sale.’

2.2 Reflexive and reciprocal markers across languages

The range of meanings presented in 2.1 reflects the polysemy of two types of markers: (a) reflexive-reciprocal markers only, and (b) (reflexive-)middle markers, i.e. markers of “general detransitivization”. This type of polysemy is widespread across languages.

As is seen from the list of languages below, reflexive-reciprocal polysemy occurs world-wide, especially in the European part of Eurasia. In the rest of Eurasia, with few exceptions, it seems (cf. the Mizo prefix cited below), non-reflexive reciprocals are prevalent. This is also observed in the Pacific area, the main exception being many Australian languages (see also Maslova & Nedjalkov 2005: 430–3).

Almost no language of the list has morphological sociatives.

- Indo-European languages; e.g. German *sich*, French *se*, Surselvan prefix *se-* (Stimm 1973: 11), Polish *się* and *siebie*, etc., and also Celtic prefixes (Welsh *ym-*, Breton *en em-*; see (67) and (68) in Ch. 3) and Ancient and Modern Greek middle inflection (Joseph & Philippaki-Warbuton 1987: 84–5), etc.
- Adyghe (Circassian) languages; e.g. the Adyghe and Kabardian reflexive and reciprocal prefix *z-*. In both languages there is also a complex reciprocal prefix *zə-rə-/zə-rə-* in complementary distribution with the reciprocal prefix *z-* (Kumaxov 1989: 244–5, 237–9; Kazenin, Ch. 17, §1.2).
- Finno-Ugric languages; e.g. the Mansi suffix *-xat/-axt* (Rombandeeva 1973: 148–52), Vepsian reflexive inflection (Zajceva 1981: 275–83), Mari suffix *-alt* (Kovedjaeva 1966: 234), Udmurt suffix *-s'k/-sk* (Tepljashina 1966: 273), Hungarian suffix *-kod/-koz/...* (Majtinskaja 1959: 106), etc.
- Semitic languages; e.g. the Amharic prefix *t(-ə)-* (Amberber 2000: 314–7, 325–7), etc.
- Dravidian languages; e.g. the Tamil reflexive pronoun *taanga* ‘self(PL)’ with reflexive-reciprocal reading on verbs with middle inflexion (so-called “verbal reflexive”); there are also reflexive only (*avan*) and reciprocal only (*oruttareoruttar*) pronouns (Annamalai 2000: 171, 176–7), etc. A similar set of means is attested in the areally adjacent Indo-European language Sinhala (cf. (80) below).
- Tibeto-Burman languages; e.g. the Mizo prefix *in-* (Lalitha & Subbarao 2000: 783, 787); Limbu suffixes *-siŋ* (for SG and PL) and *-nê* (for DU) (van Driem 1987: 86–8, 375–6).
- African languages; e.g. the Acooli suffix *-é* (Crazzolaro 1938: 106), Maasai suffix *-a* (Tucker & Mpaayei 1955: 134, 136), Kisi suffix *-nüŋ* (Tucker Childs 1995: 184–90), Somali clitic pronoun *is* (Saeed 1999: 77–9), Supyire pronoun *pi-yé* ‘themselves / they each other’ (Carlson 1994: 416–7), Luo (Dholuo) suffix *-re* (Tucker 1994: 428–31), etc.
- Australian languages; e.g. the Kalkatungu suffix *-ti* (Blake 1979: 86), Pittapitta suffix *-mali* (Capell 1956: 75), Guugu Yimidhirr suffix *-dhi* (Haviland 1979: 121–34), Walmatjari suffix *-nyanu* (Blake 1987: 113); see also Dixon (1980: 433).
- Polynesian languages; e.g. Maori reflexive-reciprocal pronoun consisting of personal pronouns *raaua* (3DU)/*raatou* (3PL) and *anoo* ‘again’ or related possessive pronouns (Bauer 1993: 186).

- North Amerindian; e.g. the Uto-Aztecan prefix *na-* (Langacker 1976:9, 12, 14ff.), Wikchamni suffix *-iwša-* (Gamble 1978:49), Yavapai suffix *-v-* (Kendall 1976:127–34), Klamath prefix *se-* (Barker 1964:112), Maricopa/Mojave particle-prefix *mat-* (Gordon 1986:65–6; Munro 1976:45–8), Jebero prefix *in-* (Bendor-Samuel 1961:85), Oneida suffix *-atat* (Lounsbury 1953:72), Athapaskan prefix *d-* (Rice 2000:178–81), K'iche' relational noun *-i:b'* (Campbell 2000:274–7), etc.
- South Amerindian languages; cf. the Hixkaryana prefix *e-/os-/ot-/...* (Derbyshire 1979:62–3, 66–7), Wayampi A prefix *ji-* (Jensen 1998:534–5), Warekena suffix *-na* (Aikhenvald, Ch. 20), Bare suffix *-tini* and Baniwa of Içana *-wa* (Aikhenvald, Ch. 20).

With a few exceptions, these languages display sets of meanings within the range shown in chart (48): reflexive, reciprocal, autocausative, anticausative, agentless passive, etc. As pointed out above, productivity of the reciprocal meaning may differ significantly in related languages, cf., for instance, the numbers for Russian, Latvian and Lithuanian, which possess about 40, 80 and 160 reciprocal derivatives respectively and where no new items are generally derived.

Semantic affinity of reflexive and reciprocal situations has brought about a number of cases of rather complicated and sometimes unexpected interrelations between the means of their expression. Below, the reader will find some fragmentary observations concerning some such cases across languages, which amplify the data presented in 2.1.

2.2.1 *The ratio of reflexive, reciprocal and reflexive-reciprocal markers (in a number of African languages)*

In this section, the counts are based on Heine (1999:1–29), where the polysemy of 78 reflexive and/or reciprocal markers in 62 African languages (Niger-Cordofanian, Nilo-Saharan, Afro-Asiatic and Khoisan families) is investigated. Although the number of the languages may seem insufficient for statistical analysis, the significant differences in the quantitative characteristics, it seems, may be indicative of the general tendencies (the figures refer to the number of languages for each meaning).

(61)	Meanings of the marker	
1.	reflexive without reciprocal	38
2.	reciprocal without reflexive	11
3.	reflexive and reciprocal	29
	Total	78

It is obvious that the overwhelming predominance of the reflexive-only and reflexive-reciprocal markers over reciprocal-only shows that in the reflexive-reciprocal polysemy the reflexive meaning is typically the primary one. This is probably determined by the prevalence of reflexive situations over reciprocal ones in reality.

The more than three-fold predominance of languages with reflexive markers (without the reciprocal function) over languages with reciprocal markers (without the reflexive meaning) correlates more or less with the predominance of the reflexive meaning over the reciprocal among derivatives with reflexive-reciprocal markers. In the table below, reflex-

ive and reciprocal derivatives do not overlap (cf. Russian *umyvát'-sja* 'to wash oneself (= one's face)' and *obnimát'-sja* 'to hug each other'); these meanings are not productive in the languages in question and they are represented by limited sets of verbs (the data are borrowed from Korolev (1968: 4, 10) and Geniušienė (1987: 75)).

(62)		Russian	Latvian	Lithuanian
	Reflexive	200	190	290
	Reciprocal	40	80	160

2.2.2 Ousting of reciprocal markers by reflexive ones

Two language groups can be mentioned here.

1. *Bantu languages*. As mentioned in Ch. 1, §3.2, the reciprocal suffix with sociative-reciprocal polysemy has been ousted by a reflexive-based reciprocal prefix in some Bantu languages. Aksenova (1990: 179–81) lists over ten such languages from different zones of the Bantu area: Bolia, Mongo-Nkundu (some of the dialects); Sukuma, Bungu, Rimi (= Nyaturu); Hehe; Holu, Chokwe, Luvale; Bangubangu, Kaonde. Here are illustrations from one of these languages (for Kimbundu cf. also Chatelain 1889/90: 190–1):

Shisumbwa (Capus 1898:64; *-i-* = REFL)

- (63) a. *-shima* 'to love' → *-i-shima* i. 'to love oneself' ii. 'to love each other'
 b. *-ihaga* 'to kill' → *-i-ihaga* i. 'to kill oneself' ii. 'to kill each other'
 c. *-gaya* 'to hate' → *-i-gaya* i. 'to hate oneself' ii. 'to hate each other'
 d. *-tema* 'to cut' → *-i-tema* i. 'to cut oneself' ii. 'to cut each other.'

But a certain number of relic derivatives with the suffix *-an-*, which are mostly lexical reciprocals, are still preserved:

- (64) a. *-tuk-an-a* 'to insult each other'
 b. *-gomb-an-a* 'to quarrel'
 c. *-tag-an-a* 'to part'
 d. *-lag-an-a* 'to promise to each other.'

2. *Tupi-Guarani languages*. In some Tupi-Guarani languages, the reflexive marker was originally a prefix *je-* and the reciprocal marker was *jo-*. In most of the 13 languages studied in Jensen (1998:593) these markers are retained, although some have changed their phonetic form. In three of them (Wayampi A, Wayampi J, Guajajára) the reflexive marker has come to be used reciprocally, too, and the former reciprocal prefix was lost; cf.:

Wayampi A (ibid., p. 534-5; *ji-* < *je-*)

- (65) *o-ji-nupā kupa*.
 3-REFL-hit PL
 i. 'They hit themselves', ii. 'They hit each other.'

And only in one of the languages (Urubú-Kapor; Jensen 1998:593; *ju-* < *jo-*) the descendant form of the reciprocal marker, when used alone, occurs in the reflexive meaning only; however, it retains reciprocity on reduplicated verb stems (cf. (66b); Kakumasu 1986: 340):

Urubú-Kaapor

- (66) a. *ju-mu'e* 'He learns/he teaches himself.'
 b. *ju-tuka-tuka* 'to bump each other.'

These data may serve as an example of the expansion of reflexive markers or meaning.

2.2.3 “Heavy” markers – reflexive or reciprocal pronouns – compete with “light” markers or replace them

Two language groups may serve as examples.

1. *West Slavic languages (Polish, Czech, Slovak)*. The relations between “heavy” and “light” markers are discussed here on the basis of Polish (the data are borrowed from Wiemer, Ch. 11; some information I owe to Anna Zielinska). The three West Slavic languages are typologically similar in this respect (see Ch. 1, §3.2).

In Polish, there are three main markers of reciprocity of which two are of reflexive origin, none of them marked for person. I will discuss the main cases of relations between them (for more details see Wiemer 1999: 300–12; see also Frajzyngier 1999: 130–5).

A. The highly polysemous reflexive clitic *się* is productive in both *the reflexive and reciprocal meanings*; although in most cases one or the other reading may be preferable or the only one possible due to the lexical meaning of the base and related pragmatic factors. For instance, in (67a) the reflexive reading is uppermost.

- (67) a. *Przyjaciele bronili się długo.* (= (10b))
 i. ‘The friends were defending *themselves* for a long time.’
 ii. ‘The friends were defending *each other* for a long time.’

One or the other reading is determined by the context, including adverbials. Thus, for instance, the reciprocal meaning may be supported by the reciprocal adverb *nawzajem* ‘mutually’ and the reflexive interpretation by the pronoun *sami* ‘themselves’ (which implies the sense ‘without outside help’). Beside the reflexive and reciprocal meanings, this clitic encodes most of the meanings listed in chart (40), e.g. autocausative, partitive-reciprocal, deaccusative, converse, anticausative (cf. (69a) below), reflexive-causative, potential-passive, agentless passive, impersonal, etc.

B. The orthotonic (“heavy”) reflexive pronoun *siebie*(ACC)/*sobie*(DAT)/*sobą*(INST) has only two meanings, *reflexive* (including reflexive-possessive and reflexive-benefactive) and *reciprocal*. When used instead of the clitic *się*, this pronoun makes the reflexive meaning come to the fore. Thus, in Polish a rivalry concerning the encoding of the two meanings has developed between the two – “light” and “heavy” – reflexive pronouns (although *się*, I repeat, has no significant restrictions on reciprocal usage); cf. (67a) and (67b). Incidentally, the preferable reading of (67b) is, in the opinion of some informants, reciprocal.

- (67) b. *Przyjaciele bronili siebie długo.*
 i. ‘The friends were defending *themselves* for a long time.’
 ii. ‘The friends were defending *each other* for a long time.’

On some bases, however, both readings of the pronoun *siebie* are equally possible, as in (68a), although the reciprocal reading is the first to come to the mind, while *się* on the same bases is reciprocal only (68b).

- (68) a. *Magda i Marta lubiły siebie* ...
 i. 'Magda and Marta liked *themselves*.'
 ii. 'Magda and Marta liked *each other*.'
 b. *Magda i Marta lubiły się* ...
 i. *'Magda and Marta liked *themselves*.'
 ii. 'Magda and Marta liked *each other*.'

Contrary to (68b), (69a) with *się* is neither reflexive nor reciprocal in meaning, the former meaning being impossible for pragmatic reasons (same with (69b) with *siebie*) and the latter is impossible because this verb is established as anticausative:

- (69) a. *Przyjaciele obudzili się*.
 i. 'The friends woke up.' anticausative
 ii. *'The friends woke *themselves* up.'
 iii. *'The friends woke *each other* up.'
 b. *Przyjaciele obudzili siebie*.
 i. *'The friends woke *themselves* up.'
 ii. 'The friends woke *each other* up (e.g., by snoring).' reciprocal

These are cases of reciprocalization of the accusative object. When reciprocalization involves a dative object the "heavy" reflexive pronoun alone can be used because the "light" dative reflexive pronoun *se* has gone out of use (in contrast to dative *si* in Czech and Slovak; cf. Czech *si říkt* 'to tell sth to *each other*') and *się* is not used with prepositions at all. The "heavy" pronoun can be either unambiguously reciprocal (70) or retain the reflexive-reciprocal polysemy (71):

- (70) *Oni pomogali sobie/*se* [odrobić zadania]. 'They helped each other [to do exercises].'
*Oni wierzyli sobie/*se*. 'They trusted each other.'
 (71) *Piotr i Paweł myli sobie twarz*.
 'Peter and Paul washed their faces' = i. 'each *his own* face', ii. '*each other's* face.'

The "heavy" reflexive pronoun alone is used with prepositions:

- (72) *Oni mrugali do siebie/*do się*. 'They winked to each other.'
*Oni czekali na siebie/*na się*. 'They waited for each other.'

C. The reciprocal pronoun *jeden drugiego* lit. 'one another' is less frequent in usage than the above two markers; it can replace them but does not co-occur with them (i.e. the state of things is typologically similar to that in German with *sich* and *einander*); in (73b) it is grammatical but slightly unnatural:

- (73) a. *Magda i Marta lubiły się*.
 'Magda and Marta liked each other.'
 b. *Magda i Marta lubiły jedna drugą*.
 'Magda and Marta liked each other.'

These Polish data show the process of ousting of a highly polysemous “light” marker in the reflexive and reciprocal functions by a “heavy” pronoun which has these two meanings only.

2. *North Germanic* (= *Scandinavian*) languages (*Danish, Faroese, Icelandic, Norwegian, Swedish*). (Most of the data are borrowed from Berkov 1985:56–74.) In the Scandinavian languages, there are three markers formally roughly corresponding to the relevant Polish markers. Two of them, the postfix *-s/-st* and reflexive pronoun *sig/seg/...*, are also of reflexive origin. To a certain degree, the Scandinavian system of the markers in question is similar to the Polish one formally but not always semantically, the main difference being the non-productivity of the postfix¹⁶ in the reciprocal meaning and the absence of this meaning in the reflexive pronoun.

A. The postfix *-s* (in Bokmål, Swedish and Danish) or *-st* (in Icelandic, Faroese and New Norse) is descended from the accusative case of the reflexive pronoun *sik* (this postfix is spelt together with the stem). The postfix is invariable for person. It has no cognates in other Germanic languages, the nearest analogy being Baltic *-si-/s* and East Slavic *-sja/s’*. As regards its meanings,

(a) *this postfix has practically lost the reflexive and the reciprocal meanings* (this may be due to the passive use of the postfix); the reciprocal meaning is retained by a few items, e.g. Bokmål *håndilse-s* ‘to shake hands’, *se-s* ‘to meet’, *kysse-s* ‘to kiss (each other)’, *bite-s* ‘to bite each other’, *snakke-s ved* ‘to talk with each other’, *hilse-s* ‘to greet each other’; Icelandic *kalla-st* ‘to shout at each other’; Faroese *bíta-st* ‘to bite each other’, etc.;

(b) a few derivatives have retained *the antipassive (absolutive) meaning* in some of the Scandinavian dialects; cf. Swedish dialectal *nässlan bränn-s* ‘nettle stings’ (see also (156) below);

(c) *it has retained the potential-passive meaning* (e.g. Danish *glas bøje-s ikke* ‘glass does not bend’; Icelandic *bletturinn þvæ-st ekki úr* ‘the spot does not wash out’) and

(d) *it is used as a passive marker*, cf. Swedish or Bokmål *porten stenge-s kl. 10 om aftenen* ‘the gates are closed at 10 o’clock’, which cannot be expressed by the reflexive pronoun.

B. The reflexive pronoun *seg* (Bokmål and New Norse) or *sig* (Swedish, Danish) or *ser* (DAT)/*sig* (ACC) (Icelandic) or *seg* (ACC)/*sær* (DAT) (Faroese) is used in the 3rd person only, the personal pronouns being used in the 1st and 2nd persons instead, as in German (cf. Swedish *jag glädjar mig* ‘I rejoice’, *du glädjar dig* ‘you rejoice’, *han glädjar sig* ‘he rejoices’). As mentioned, this pronoun cannot express the reciprocal meaning.

Its main meaning is reflexive, cf. Bokmål *verge seg* ‘to defend oneself’, *calte seg* ‘to call oneself’, *henge seg* ‘to hang oneself’.

The distribution of the other meanings of both markers varies across these languages: in Icelandic, Faroese and New Norse, the postfix is more widely used than in the other Scandinavian languages; some stems are used with either marker as synonyms. Both markers can also express the following meanings:

16. This term is used here to refer to markers with meanings which may be expressed by affixes in other languages and which always take the final position on the verb and can be separated from the stem by an ending.

(a) *partitive-reflexive* (e.g. Swedish *vaska-s* ‘to wash oneself’, New Norse *vaska-st* ‘to wash oneself’, Icelandic *klæða sig* / *klæða-st* ‘to dress oneself’, Faroese *raka sær* ‘to shave oneself’);

(b) *autocausative* (e.g. Bokmål *sette seg* ‘to sit down’, Swedish *sätte sig* ‘to sit down’, *resa sig* ‘to lift/raise oneself, stand up’, Icelandic *setja-st* ‘to sit down’, Faroese *seta-st* / *seta seg* ‘to sit down’, *røra seg* ‘to stir, move’);

(c) *anticausative* (e.g. New Norse *opna seg* ‘to open’ (vi), Danish *abne sig* / *abne-s* ‘to open’ (vi), Icelandic and Faroese *opna-st* ‘to open’ (vi), Swedish *glädja sig* / *glädja-st* ‘to rejoice’, Icelandic *ględja-st* and Faroese *glęđa-st* ‘to rejoice’); etc.

C. The reciprocal pronouns: Swedish *varandra* and *varann*, Norwegian *hverandre* and *hinannen*, Icelandic *hver annan* ‘each other’, Danish *hinanden* and *hverandre*. This is the main reciprocal marker in the Scandinavian languages. Among other Germanic languages, Dutch uses the pronouns *elkaar*, *elkander* (*malkaar*, *malkander*) as the main reciprocal markers, not to mention English *each other* and *one another*.¹⁷

Some postfixed derivatives with the reciprocal meaning have become bookish and are replaced by constructions with the reciprocal pronoun in spoken language, e.g. Bokmål *kysse hverandre* instead of *kysse*; cf. also *de hater/elsker hverandre* ‘they hate/love each other’. The forms *hates* and *elskes* are possible but their meaning is passive.

The logic of encoding reciprocity in Scandinavian languages differs from Polish where one productive reciprocal marker (the clitic *się*) is rivalled by the “heavy” pronoun *siebie*, the reciprocal pronoun *jeden drugiego* being very rarely used. The Scandinavian reflexive pronoun has failed to develop the reciprocal meaning and take the place of the postfix when the latter lost this meaning, the reciprocal pronoun being used instead.¹⁸ Typologically, the Scandinavian languages show a different path of the evolution of reciprocalizers in the sense that a “heavy” monosemous marker takes the place of a “lighter” and polysemous marker. The same state of things is observed in the Baltic and East Slavic languages where the main reciprocal markers are also reciprocal pronouns.

17. Thus, in the Germanic languages, with the exception of German, we observe the replacement of verbal reciprocal markers by syntactic – reciprocal pronouns. This is a tendency also attested outside the Germanic languages. The opposite development is less likely, although replacement of one syntactic marker by another is common enough; cf. Latin *inter se* ‘between/among themselves’, *invicem* ‘in turn’, *mutuo* ‘mutually’, *virum vir* ‘man to man’, *alius alium* lit. ‘another another’, etc. and French *l’un l’autre*, Italian *l’un l’altro*, Spanish *unos a otros* Surselvan *in l’auter* with the meaning ‘each other’.

18. Typologically, this development of the meanings of the reflexive pronoun *seg* and its cognates corresponds to the implicational path of semantic evolution of markers with the primary reflexive meaning proposed in Geniušienė (1987). For subject-oriented meanings the following path is proposed: (the meanings which *seg* has not developed are in square brackets): semantic reflexivity > ‘partitive object’ > and/or ‘autocausative’ [> antipassive and/or reciprocal] (ibid., p. 347); for object-oriented meanings: anticausative [> passive > impersonal] (ibid., p. 350).

2.2.4 Reflexive and reciprocal markers exchange places (“castling”). Why? (Juwajai)

As a quaint curiosity, the change in Juwaljai can be mentioned: in this language there occurred a diachronic alternation of reciprocal and reflexive markers.

The relations between the forms of expression of reciprocity and reflexivity in Australian languages are particularly interesting. Thus, Capell (1956:75) claims:

In point of fact, there is considerable confusion between reflexive and reciprocal over Australia as a whole. In some languages no inflectional form of reciprocal is found: Aranda is one such. In others, reflexive and reciprocal are identical: Durga is a case in point. The reflexive suffix in one language will appear as the reciprocal suffix in another, and vice versa: see examples from central New South Wales on p. 52. (a part of the chart from p. 52 is cited below as (74) – V.N.) The Dieri *-mali-* is reciprocal, Pittapitta *-mali-* is both reciprocal and reflexive, but Dieri has the quite isolated *-dari-* as reflexive.

As regards the chart a part of which is shown in (74), Capell writes:

<...> there is in Juwaljai an apparent crossing of the functions of the two suffixes: that which was reciprocal becomes reflexive, and vice versa. (ibid., p. 52)

(74)	Reciprocal	Reflexive
Wongaibon	<i>-l-ina</i>	<i>-djiliŋa-</i>
Gawambarai	<i>-l-ela-</i>	<i>-iŋili-</i>
Kamilaroi	<i>-l-ela-</i>	<i>-iŋili-</i>
Juwaljai	<i>-l-ŋili-</i>	<i>-lelana-</i>

(historically, *-l-* is not part of the marker and therefore it is hyphenated).

The table in (74) reflects the original state of things in the first three languages. On the whole, reciprocal markers seem to be more often ousted by reflexive markers than *vice versa*. The alternation in Juwaljai seems quite a riddle.

2.2.5 A sociative-reciprocal marker in the reflexive function on certain bases (Nunggubuyu)

In Nunggubuyu, the situation is complicated: the suffix *-nʷji-* has a reciprocal and sociative (in Heath’s terms, ‘joint involvement’) meanings; cf.:

	Nunggubuyu (Heath 1984:392, 398, 399; cf. (35) above)		
(75) a.	<i>-na-nʷji-</i>	‘to see each other’	reciprocal
b.	<i>-nʷandardi-nʷji-</i>	‘to snore together’	sociative
	<i>-lhagarari-nʷji-</i>	‘(group) to make noises together’	sociative
	<i>-millhs-nʷji-</i>	‘to shine together’	sociative

Derivatives with the suffix *-nʷji-* can also have a specific anticausative function with the optional additional sense ‘together’¹⁹ (76a). Heath comments on the derivative (76b): “<...> this form seems to be used even with singular referent”.

19. A similar type of anticausatives occurs in other languages; see Ainu examples (105)–(108) in 3.3.

(76) a.	<i>-bujbuj</i>	'withered, dried'	
→	<i>bujbuj-ga-</i>	'to wither sth'	causative
→	<i>-bujbuj-ga-nʸji-</i>	'to become withered together'	anticausative-sociative
b.	<i>-didi</i>	'tight, firm'	
→	<i>-didi-ga-</i>	'to make [it] tight, firm'	causative
→	<i>-didi-ga-nʸji-</i>	'to become tight, firm.'	anticausative

As mentioned, there is a special productive reflexive suffix *-i*; cf.:

(77) a.	<i>-balhu-</i>	'to cut'	→	<i>-balh-i-</i>	'to cut <i>self</i> up.'	(ibid., p. 390).
---------	----------------	----------	---	-----------------	--------------------------	------------------

But some verbs, mostly monosyllabic roots, seem to avoid the reflexive suffix and take the suffix *-nʸji*, the derivatives acquiring a reflexive and a reciprocal meaning (and passive); cf.:

(78) a.	<i>-ra-</i>	'to spear sb'	(ibid., p. 391)	
→ b.	<i>-ri-nʸji-</i>	i.	'to spear <i>self</i> '	reflexive
		ii.	'to spear <i>each other</i> ' (usual meaning)	reciprocal
		iii.	'to be speared'	passive

The reflexive meaning of (78b) may be due either to the original reflexive or reflexive-reciprocal meaning of the suffix *-nʸji* or to the semantic expansion of this suffix (note also that the monosyllabic reflexive suffix *-i* may be difficult to distinguish in monosyllabic words with a final vowel). The first explanation is supported by the fact that in most languages of the Nyulnyulan group the suffix *-nyji* and its cognates in complex with the prefix *ma-* function as regular reflexive and reciprocal markers, and this complex serves to mark solely the reciprocal meaning only in one of these languages (McGregor 1999: 89–91).

2.2.6 Reflexive-reciprocal, reflexive, or reciprocal markers? Partial overlap (Kannada, Sinhala, Telugu, Malayalam)

In these languages, the appropriate pronouns (or adverbs) and/or a middle marker are used for the expression of the meanings in question. There are specialized reflexive and reciprocal pronouns, rarely reflexive-reciprocal pronouns, and a polysemous middle marker is used to encode each of the meaning either by itself or in combination with a pronoun. On the whole, the situation is somewhat similar to that in the Indo-European languages of Europe but it is more varied.

1. *Kannada*. In a number of Dravidian languages, the reflex of the Proto-Dravidian verb *koL* (*koN* in the past tense) with the general meaning 'to take, receive' has become a suffix which is added to the past participial form of the verb which agrees with the subject and inflects for tense (Gair et al. 2000: 23; Sridhar 1990: 118; Lidz 1995: 706–7). Its primary meaning was reflexive and at present it has a number of concomitant meanings caused by detransitivization (Amritavalli 2000: 50–112), cf. reflexive-benefactive *ogi-* 'to wash (clothes)' → *oge-du-koL-* 'to wash (clothes) for oneself', autocausative (i.e. reflexive in the broad sense) *bacchiD* 'to hide' (vt) → *bacchiTTu-koL-* 'to hide' (vi), anticausative *mucch* 'to close' (vt) → *mucchi-koL-* 'to close' (vi), etc. (ibid., p. 55). These formations are called "verbal reflexives" in the literature. Their meanings are similar to those of the reflexive-middle markers in many Indo-European languages and they do not generally

exceed the range of meanings in chart (40). To quote Amritavalli (2000:53), “The verbal reflexive element *koLLu* exhibits a range of related functions which (interestingly) parallel functions noted in the literature for the Romance reflexive clitic *se* (French) and *si* (Italian)”.

In Kannada, there is one reflexive marking and three markings for reciprocity. These expressions are related as follows:

(79) Meaning	Means of expression		
	Pronoun		Middle marker
i. reflexive	<i>tannu</i> (SG), <i>taavu</i> (PL)*	+	<i>V-koL-^{**}</i>
ii. reciprocal	a. –		<i>V-koL^{***}</i>
	b. <i>obbaranna obbaru</i>	+	<i>V</i>
	c. <i>obbaranna obbaru^{****}</i>	+	<i>V-koL-</i>

Explanations:

* This reflexive pronoun inflected for person and case is used only with the 3rd p. subject; for the 1st and 2nd persons personal pronouns are used. With this pronoun, a verbal reflexive is obligatory (Amritavalli 2000: 53).

** The middle marker cannot occur on verbs used in the so-called dative subject construction (mostly with the dative of experiencer), i.e. on verbs with meanings like ‘to be angry’ (ibid., p. 54).

*** This type of marking is used with a small class of transitives like ‘to embrace’, ‘to meet’, ‘to kiss’, ‘to marry’, ‘to collide’, ‘to hug’, i.e. with verbs whose lexical meaning normally or mostly implies the same response action (Bhat 1978:38). These are verbs which Haiman (1985:168) calls introverted predicates as opposed to extraverted ones, like ‘to love’, which require a reciprocal pronoun for encoding the reciprocal meaning.

**** The reciprocal pronoun *obbaranna obbaru* <one.ACC one.NOM> + verb may be used both with a verbal reflexive or without it (ibid., p. 86). In the first case, as is claimed by Amritavalli (ibid., p. 85), the meaning of mutuality and simultaneity is emphasized. Thus, in this latter case the markers of reflexivity and reciprocity overlap as both include “verbal reflexives”. If there is no antecedent, the pronoun takes the Instrumental case ending and does not express any reciprocal meaning. Rather the meaning is “one of sequential actions” (Sridhar 1990:125–6), i.e. a distributive meaning like ‘from one to the other’ or ‘each one’ (the latter meaning occurs when the pronoun is in subject position).

2. *Sinhala*. The relationship between reflexive and reciprocal markers is more complex here than in Kannada. There are three reflexive, three reciprocal markers and one common marker (see (80); Gair & Karunatillake 2000:715–73). “Verbal reflexives”, which are parallel to the Kannada derivatives, are composed of the “auxiliary” *gan-nəwa* ‘to take’ and the perfect participle of the main verb. These compounds have arisen under the influence of the Dravidian (Tamil) compounds with *koLu*. The meaning of the auxiliary is generally defined as “subject-directed”, i.e. as ‘do sth for oneself’ or ‘to affect oneself’ (ibid., pp. 725, 727).

(80)	Means of expression		
	Meaning	Pronoun	Middle marker
i. reflexive	a.	<i>eyaa-wə</i> 'her/him'	+ V- <i>gan-nəwa</i>
	b.	<i>taman-wə</i> 'oneself' (generally 3rd p. in reference)	+ V
	c.	<i>eyaa-wə-mə</i> 'her/him', 'herself/himself'	+ V
ii. reciprocal	a.	–	+ V- <i>gan-nəwa</i>
	b.	<i>ek-ekke-na-Tə</i> 'one by one'	+ V- <i>gan-nəwa</i>
	c.	<i>den-na-Tə+den-na</i> 'each other' (of two)	+ V
iii. refl./recipr.		<i>tama-taman-Tə</i> 'themselves', 'each other'	+ V (see (81))

Morphological notes:

(1) The suffix *-wə* = ACC; *-mə* = emphatic clitic, *-Tə* = DAT; *-naa/-na-* = ANIM; *-nəwa* = INF.

(2) This type of reciprocal marking, i.e. without a reciprocal pronoun, is used only "with specific verbs" (ibid., p. 726). The range of "specific verbs" remains unclear. The authors cite only two examples with verbs of hostile actions: *gaha-gannəwa* 'to fight, hit each other' and *hapaa-gan-nəwa* 'to bite each other'.

(3) The distributive pronoun *ek-ekke-naa-Tə* <one + one-ANIM-DAT> 'one by one', when used with verbal reflexives, has the meaning 'each other' (ibid., pp. 722, 726).

(4) The reduplicated numerals like *den-na-Tə+den-na* <two-ANIM-DAT + two-ANIM.NOM> 'each other' (of two) indicate the number of the participants (ibid., p. 723).

Thus, only one of the seven markings for the reflexive and reciprocal meanings, namely the reduplicated pronoun *tama-taman-Tə* <self-self-DAT>, has both meanings (ibid., p. 722):

- (81) *siri-yi_i gunapaalə-yi_j tama-taman-Tə_{i+j/i,j} aadareyi.*
 S.-NOM-CONJ G.-NOM-CONJ self-self-DAT love-PRED
 'Siri_i and Gunapala_j love each other_{i+j} / themselves_{i,j}.' (ibid., p. 722)

3. *Telugu, Malayalam.* In Telugu, in contrast to the previous cases, the reciprocal pronoun *okaLLa-ni okaLLu* <one.PL-ACC one.PL>, as well as the reflexive pronoun *tana-ni* <self.SG-ACC>, *tama-ni* <self.PL-ACC> (both 3rd p.; personal pronouns are used in the 1st and 2nd persons, as in German, cf. *sich* and *mich, dich* ...), are as a rule accompanied by the middle marking on the verb. At least the reflexive meaning can be encoded by the middle marking alone, the reflexive pronoun being optional; cf. *Vanaja [tana-ni] tiTTu-kon-di* 'Vanaja scolded herself' and *WaaLLu okaLLa-ni okaLLu tiTTu-konn-aaru* 'They scolded each other' (Subbarao & Lalitha 2000: 219, 226, 228, 233). Thus, this marking is typologically similar to French where the pronoun *l'un l'autre* is usually coupled with the reflexive clitic *se*. Exceptions in both languages are comparable and they concern certain groups of verbs. In Telugu, like in Kannada, these are verbs with the dative subject (see Note ** beneath (79)), and in French they are verbs taking a prepositional object, i.e. in both cases the base verb takes no direct object that might be reciprocalized.

In contrast to the languages considered in this section, the Malayalam reflexive and reciprocal markers have no common components, as there is no middle marker and the reciprocal meaning is expressed by six reciprocal pronouns and five adverbs (see (17) and §3.4 in Ch. 3), e.g. by the pronoun *oraal-e oraal* <one person.PL-ACC one person.PL> (Jayaseelan 2000: 119), the reflexive meaning being expressed by the reflexive pronoun

tann-e <self.SG-ACC>, *taṅṅal-e* <self.PL-ACC>. Thus, in this language there is no overlap of the marking and no reflexive-reciprocal polysemy. Typologically, Malayalam is similar to English in this respect, the difference being that English has reflexive pronouns in all three persons, while Malayalam, like Telugu, employs personal pronouns in the 1st and 2nd persons instead of the reflexive.

With regard to the material of this section, I think that there is a tendency for the number of syntactic reciprocal markers to exceed the number of reflexive syntactic markers more often than the other way round.

2.2.7 Reciprocal and resultative meanings of a middle marker (Maasai, or Maa)

The polysemy of the Maa middle form, earlier called *neuter*, corresponds to the polysemy shown in 2.1. It is illustrated by (82)–(84) (my thanks to Doris Payne who provided me with important additional information concerning the Maasai middle – V.N.). The markers of this form are the suffixes *-a/-o* for the non-perfect(ive) aspect (82), (83), (84a, d), *-e* for the perfect(ive) and *-a(y)-u / -a(y)-o* (where *-u/-o* is inceptive, *-y-* is epenthetic) for the future and subjunctive (84c, f). Here are examples of the reflexive and reciprocal meanings of this form:

Maasai (Tucker & Mpaayei 1955: 134, 136; prefix *e-* = 3SG and 3PL)

- | | | | |
|------|-----------------|--|------------|
| (82) | <i>e-isuj-a</i> | (1) 'he gets washed without outside help, hence he washes <i>himself</i> ' | reflexive |
| | | (2) i. 'they wash <i>themselves</i> ' | reflexive |
| | | ii. 'they wash <i>each other</i> ' | reciprocal |
| (83) | <i>e-ar-a</i> | i. 'they beat <i>themselves</i> ' | |
| | | ii. 'they beat <i>each other</i> ', hence 'they fight.' | |

This form is nearly always intransitive and can be employed not only as reflexive, reciprocal, anticausative and potential, i.e. in the meanings common for middle markers cross-linguistically, but also as resultative/stative (84d), which is rather rare for middle markers (and probably presupposes the existence of the anticausative meaning). This meaning may be the end-point of the semantic evolution of reflexive-middle markers. There is no special passive proper form in Maasai, the form with the suffix *-i* (cf. (84b, e)) is most probably impersonal since the derived construction retains the direct object of the base construction, the subject being eliminated.

Maasai

- | | | | | | |
|------|--------|----------------|---|------------------------------------|--------------------|
| (84) | a. | <i>e-gil-a</i> | 'it gets broken <i>by itself</i> ', 'it breaks' | <i>anticausative</i> | |
| | cf. b. | <i>e-gil-i</i> | 'it is broken by someone' | impersonal | |
| | | c. | <i>k-e-gil-a(y)-u</i> | 'it is fragile', 'it is breakable' | potential |
| | | d. | <i>e-ik-a</i> | 'it is suspended, it hangs' | <i>resultative</i> |
| | cf. e. | <i>e-ik-i</i> | 'it is hung up <i>by someone</i> ' | impersonal | |
| | | f. | <i>e-ik-a(y)-u</i> | 'it can be hung up.' | potential |

The middle form has no antipassive (unspecified object) meaning, which is expressed by the suffix *-isho*.²⁰

3. Reciprocal-sociative polysemy

This type of polysemy is attested in Turkic, Mongolian, Tungusic languages, also in Japanese, Ainu, Tagalog, Indonesian, Palauan, Kusaiean, Halkomelem and in a number of Bantu languages, though with a different degree of productivity of the sociative meaning. Languages with this type of polysemy cover a significant part of Asia.

About half of the languages with sociative-reciprocal polysemy have a morphological reflexive marker (e.g., Turkic, Ainu, some Bantu languages, Halkomelem).

3.1 The range and distribution of the typical meanings

This type of polysemy covers meanings which involve an increase in the number of participants, (sociative), and/or an increase of valency (comitative, assistive). The competitive meaning involves an increase in the number of participants and/or of valency (depending on the use in the simple or discontinuous construction). The chart in (85) contains a description of derivatives according to three features:

- valency changes (increase, decrease and retention of the syntactic structure);
- addition or subtraction of a semantic component;
- the derived meanings: within groups sharing the above two features, different finite semantic classes are distinguished, like anticausatives and resultatives in Group A'.

In contrast to the derivatives with reflexive-reciprocal markers, detransitivization is less common here. On the other hand, addition of meaning is more common, and no cases of retention of meaning are attested.

20. A similar system of meanings of a middle marker including both reciprocal and resultative is attested in one more language, viz. Kisi (Tucker Childs 1995: 184–90). The middle marker here is the suffix *-nüŋ/-üŋ/-ŋ/...*; examples (the labelling of the meanings is partially my responsibility – V.N.): *dü* 'to kill' → *dü-nüŋ* 'to kill oneself' (reflexive) (p. 184), *tɔ* 'to wash sth/sb' → *tɔ-nüŋ* i. 'to wash oneself' (reflexive), ii. 'to wash sth for oneself' (reflexive-benefactive) (p. 188), *kààl* 'to love' → *kààl-iàŋ* 'to love each other' (reciprocal) (p. 190), *faanda* 'to throw' → *faanda-ŋ* 'to throw oneself' (autocausative) (p. 186), *hau* 'to stick sth' → *hau-nõŋ* 'to get stuck' (anticausative) (p. 186), *boli* 'to hurt sb' → *boli-ŋ* 'to be hurt/injured' (passive) (p. 187). The following derivatives have a resultative/stative meaning: *tei* 'to spread in the sun to dry' → *tei-ŋ* 'to be spread in the sun to dry' (cf. (167) below), *landu* 'to hang, be hanging' → *landu-ŋ* 'to be hanging' (ibid., p. 187; cf. (24a) above), *liwa* 'to be wet' → *liwa-ŋ* 'to be wet' (ibid., p. 189).

- (85) The meanings of reciprocal-sociative markers
(the numbers refer to the respective examples or sections)

<i>Valency reduction</i> (mostly detransitivization)	<i>No valency change</i> (increase of the number of the participants; the mean- ing is more complex)	<i>Valency increase</i> (the meaning is more complex)
Group A (the meaning is more complex) reciprocal (87b), (89c)	Group B sociative (87a), (89b) competitive* (86b), (84b), (87c) attendant action (108) alternative (89d), (96)	Group C comitative (3b), (95), (107) competitive (86c)
Group A' (the meaning is simpler) anticausative (§9.1) resultative (136)	Group B' 'many' (105) plural (§11.1)	Group C' assistive (7b), (3b), (6a)
Group A'' (no detransitivization) spatial transitive reciprocal*** (93), (103)		[Group D] [causative]**

The following comments may be useful.

* The presence of the competitive meaning in two columns requires explanation. Competitive derivatives are often highly heterogeneous and usually comprise a limited group of verbs denoting sport activities or other kinds of traditional contests; they can be formed from both transitives and intransitives; semantically they are intermediate between reciprocals and sociatives. The syntactic behaviour of the competitiveness in columns B and C follows the pattern of sociatives and comitatives.

Yakut (-*ar* = 3SG.PRES; -*s-* = REC; -*al* = PRES; -*lar* = PL; *kætta* = 'with')

- (86) a. *kini kələj-ar* 'he is jumping on one foot'
 b. *kiniler kələj-s-al-lar* 'they compete in jumping on one foot' B
 c. *kini aya-tən kætta kələj-s-ar* 'he competes in jumping with his father.' C

** The causative meaning is illustrated by a marker with causative-reciprocal polysemy in 8.3 and also by a marker with causative-reciprocal-iterative polysemy in 4.2 (see (119g), (122)). The absence of markers with sociative-reciprocal-causative polysemy is probably accidental, therefore this meaning is included in chart (85), although with reservations.

*** This meaning transforms a potential *discontinuous* reciprocal object-oriented construction into a *simple* one, as in (a) *He tied horse A to horse B* \approx (b) *He tied horse B to horse A* \approx (c) *He tied horses A and B together*. The three sentences are semantically identical because the verb is a lexical reciprocal (cf. *He led horse A to horse B* \neq *He led horse B to horse A* where the verb is not a lexical reciprocal) and the object referents belong to the same semantic class (cf. *He tied horse A to the fence* with object referents of different semantic classes). If we replace *to tie* by the verb *to lead*, the meaning of the third sentence *He led horses A and B together* becomes entirely different from (c). Probably, Pawley (1973:151) had in mind case (c) above when he used the phrase "unification of objects". For details see Ch. 1, §§5.2 and 13.

Further on in this section, the following issues are discussed:

- types of relationships between the sociative and the reciprocal meanings of the same marker; see 3.2–3.3.4;
- relationships between these meanings when they are expressed by different markers; see 3.5–3.6;
- the other meanings of reciprocal-sociative markers (e.g. assistive, etc.); see 3.4.

3.2 The sociative meaning of a reciprocal marker is productive (Tagalog, Kusaiean, Halkomelem, Palauan, Rwanda, Swahili)

Judging by the literature, the productive use of a reciprocal marker in the sociative sense is probably the most common case among languages with sociative-reciprocal polysemy. Sometimes, a marker with these two meanings may have a number of other, less productive meanings, e.g. competitive in Tagalog and alternative in Kusaiean (cf. (87c), (89d)). The reciprocal and the sociative meanings may differ in distribution on verbal stems, the sociative often being limited to intransitive stems. This seems to be the case in Halkomelem, judging by the attested derivatives (90a) and (90b); in this case sociatives do not differ syntactically from reciprocals derived from transitives. Or a derivative can have both meanings (88).

In the examples below the lexical meaning of the base verbs is recoverable from that of the derivatives.

Tagalog (Shkarban & Rachkov, Ch. 22, §4)

- | | | | | |
|------|----|---------------------|--|-----------------|
| (87) | a. | <i>mag-awit-an</i> | ‘to think <i>collectively</i> ’ | sociative |
| | b. | <i>mag-ibig-an</i> | ‘to love <i>each other</i> ’ | reciprocal |
| | c. | <i>mag-panah-an</i> | ‘to shoot arrows <i>in contest</i> .’ | competitive |
| (88) | | <i>mag-tulak-an</i> | i. ‘to push <i>each other</i> ’ | reciprocal (vi) |
| | | | ii. ‘to push sb <i>collectively</i> .’ | sociative (vt) |

Kusaiean (Lee 1975:202–4)

- | | | | | |
|------|----|--------------------------|--------------------------------------|-------------|
| (89) | a. | <i>Kuht a-pwacr-i</i> | ‘We are <i>all happy</i> ’ | sociative |
| | b. | <i>Eltahl a-pwacpa-i</i> | ‘They discuss <i>together</i> ’ | sociative |
| | c. | <i>Kuht a-etuh-i</i> | ‘We know <i>each other</i> ’ | reciprocal |
| | d. | <i>Eltahl a-rit-i</i> | ‘They <i>take turns</i> in reading.’ | alternative |

Halkomelem (Gerds 1999:133, 155)

- | | | | | |
|------|----|------------------------------|-----------------------------------|------------|
| (90) | a. | <i>ʔəlltən-təl</i> | ‘to eat <i>together</i> ’ | sociative |
| | | <i>ya:ys-təl</i> | ‘to work <i>together</i> ’ | sociative |
| | | <i>ʔiməs-təl</i> | ‘to walk <i>together</i> ’ | sociative |
| | | <i>ʔiyəs-təl</i> | ‘to be happy <i>together</i> ’ | sociative |
| | b. | <i>áawə-təl</i> | ‘to help <i>each other</i> ’ | reciprocal |
| | | <i>hičə-təl</i> | ‘to cut <i>each other</i> ’ | reciprocal |
| | | <i>maləq^w-təl</i> | ‘to mix with <i>each other</i> .’ | reciprocal |

Palauan (Josephs 1975: 221, 228)

- (91) a. *kai-d̥erurt* 'to run *together*' sociative
 ka-d̥er̥borb 'to sit *together*' sociative
 b. *kai-ng̥seu* 'to help *each other*.' reciprocal

Rwanda ((a)–(b) from Coupez (1985: 15); (c)–(e) from Aksenova (1994: 160, 177); in (b) and (d) *n'*- (before vowels; < *na-*) = 'with')

- (92) a. *-guh̄ng-an-a umurimá* 'to till the field *together*' sociative
 b. *-guh̄ng-an-a númwána* 'to till *together with* the child
 (who is also doing the tilling)' comitative
 c. *tu-kor-an-a* 'they work *together*' sociative
 d. *n-kor-an-a n'úmukoóbwa* 'I work *with* the girl' comitative
 e. *tu-reb-an-a* 'they look at *each other*.' reciprocal

Swahili (Ovir 1896: 258, 265)

- (93) a. *-shon-an-a* 'to sew *together*' sociative
 b. *-ng'o-an-a* 'to root out *together*' sociative
 c. *-pig-an-a* 'to hit *each other*' reciprocal
 d. *-fung-an-a* 'to tie sth and sth *together*' spatial-tr. reciprocal
 (< *-fung-a* 'to join sth with sth').

3.3 The sociative meaning of a reciprocal marker is of low productivity (Japanese, Ainu)

Two subtypes are attested: (a) there is no special sociative marker (Japanese); (b) there is a special sociative marker (Ainu).

1. *Japanese*. Although the sociative meaning of the reciprocal marker *-a/-aw/-at-* is registered in the literature and sometimes turns up in the informants' evaluations, it seems to be of low productivity (see Alpatov & Nedjalkov, Ch. 25, §5.1). Thus, in a corpus-based list of 285 forms with the reciprocal suffix *-a*, there are only 19 sociatives, mostly from intransitives; cf. *hibiki-a-u* 'to sound together', *kui-a-u* 'to eat together', *nomi-a-u* 'to drink together', *kaziri-a-u* 'to gnaw sth together' (Hasselberg 1996: 37–46). There are no derivatives **sini-a-u* with the intended meaning 'to die together', **tobi-a-u* 'to fly together'. It is hard to generalize the conditions when a derived form is sociative in meaning. Nevertheless, even if a derivative allows two or more readings the sociative reading is suggested by some (not all!) informants. Thus, the derivative in (94) allows both sociative and reciprocal interpretations: the interpretation is sociative (confirmed by three informants) if the bracketed words are used and it is reciprocal if they are omitted:

Japanese (ibid., §1.2, ex. (1h))

- (94) *Taroo to Akiko wa [zibun-tati no kodomo o] hagemasi-at-te-ta.*
 T. and A. TOP REFL-PL GEN child ACC encourage-REC-CONT-PAST
 i. 'Taro and Akiko were encouraging their own child(ren) *together*.'
 ii. 'Taro and Akiko were encouraging *each other*' (if the bracketed words are omitted).

The *competitive* meaning seems to be more productive, and it is sometimes the only meaning of a reciprocal form (ibid., §5.2). Example (95b) illustrates both meanings. It can also be interpreted as reciprocal ‘The students laughed at each other’, which is the most natural interpretation and is thus related to the meaning ‘to laugh at sb’ of the transitive base verb. The competitive meaning refers to laughing contests held annually in certain localities of Japan (T. Tsunoda, p.c.).

- (95) a. *Gakusei wa warait-ta.*
 student TOP laugh(vi)-PAST
 ‘The student(s) laughed.’
- b. *Gakusei wa warai-at-ta.*
 student TOP laugh(vi)-REC-PAST
- i. ?‘The students laughed *together*.’ sociative
- ii. ‘The students *competed* in laughing.’ competitive

Another example of a polysemous derivative:

- (96) *A ga B to inu o daki-a-u.*
- i. ‘A and B hold the dog in their arms *by turns*.’ alternative
- ii. ‘A and B embrace *each other’s* dogs.’ reciprocal
- iii. ‘A and B embraced the dog *together*.’ (ibid., ex. (87)) sociative

2. *Ainu*. The reciprocal prefix *u-* encodes sociativity in a limited number of fossilized derivatives. About ten such derivatives are attested of which only one is derived from an intransitive verb (98), the others being intransitive derivations from transitives. Sometimes, the meaning of a sociative derivative changes significantly (see (99) and (ii) in (100b) which are a kind of anticausatives or resultatives). Occasionally, the form may be reciprocal in meaning (see (i) in (100b)) (these data are borrowed from Alpatov et al., Ch. 42, §4.1.1).

- Ainu
- (97) a. *ciskar* ‘to cry about sb/sth’ (vt)
 b. *u-ciskar-pa* ‘to cry together’ (*-pa* = PL). sociative
- (98) a. *sipiras-pa* ‘to widen, enlarge’ (vi)
 b. *u-sipiras-pa* ‘for all to be spread out.’ sociative
- (99) a. *cip-e-kusa* ‘to take sth/sb across a river in a boat’ (*cip* ‘boat’; *-e-* = APPL)
 b. *u-cip-e-kusa* ‘to cross a river/sea together in a boat.’ sociative
- (100) a. *ronnu* ‘to kill (two or more people/animals)’
 b. *u-ronnu* i. ‘to kill *each other*’ reciprocal
 ii. ‘(of a lot of people) to be killed/die.’ sociative-anticausative?

The main sociative markers are the complex prefixes *u-ko-* and *u-e-* composed of the reciprocal marker and one of the two applicative prefixes (cf. 12.1.1 below). Unproductivity of the prefix *u-* as a sociative marker may be accounted for by the use of the specialized sociative markers.

3.4 The assistive and the comitative meanings of a reciprocal-sociative marker (Yakut, Tuvan)

The use of the same marker only for three meanings – assistives, comitatives and sociatives – is attested in some languages, e.g. in Ancient Greek (see (52), (53) in Ch. 1, §8.3). The four meanings, reciprocal, sociative, comitative and assistive, of the Yakut and Tuvan reciprocal suffix illustrated in (3b), (7b) and (101b) are closely related semantically: *all of them suggest at least two participants acting together in the same situation*. Their productivity varies across the Turkic languages, and some meanings are absent in some languages. The productivity of the Turkic reciprocal suffixes and their range of polysemy seems to diminish from east to west. Thus, in Yakut (Nedjalkov & Nedjalkov, Ch. 26) and Tuvan (Kuular, Ch. 27), the reciprocal suffix has all the four meanings.

Tuvan (ibid., ex. (2))

- (101) a. *Bis sigen kez-ip tur bis.*
 we hay mow-CONV AUX.PRES 1PL (= PRES.PROGR)
 ‘We are making hay.’
- b. *Bis sigen kes-č-ip tur bis.*
 we hay mow-REC-CONV AUX.PRES 1PL
- i. ‘We are making hay *together*.’ sociative
 - ii. ‘We are making hay *with somebody else*.’ comitative
 - iii. ‘We *help* somebody to make hay.’ assistive
 - iv. ‘We are making hay *together helping each other*.’ assistive-recipr.-sociative(!)

(iv) is a translation suggested by a native speaker – author of the sentence.

The assistive meaning can be explicated by the benefactive auxiliary verb *ber-* ‘to give’:

- c. *Bis sigen kes-č-ip ber-ip tur bis.*
 we hay mow-REC-CONV O.BEN-CONV AUX.PRES 1PL
 ‘We help [someone] to make hay.’ assistive

In Kirghiz, the reciprocal suffix has practically no sociative meaning (there are only isolated instances in the imperative mood; Nedjalkov, Ch. 28, §9.3), probably due to the use of the reciprocal suffix as an optional 3PL marker on verbs (see 11.1 below; the reciprocal suffix is also used as a 3PL marker in Kazakh and Uzbek). The assistive meaning is very productive in Yakut, Tuvan, Kirghiz and Tatar and practically absent in Azerbaijani, Turkish, Gagauz and Karachay-Balkar (see, for instance, Sevortjan 1962: 532, 539).²¹

21. The development of the assistive meaning (sharing semantic properties with the comitative and causative) on the reciprocal marker in the Turkic languages is not accidental. It is semantically motivated. It may be noted in passing that it can be expressed not only by a special marker, like the Ajmara suffix *-jaya/-jaa* (Middendorff 1891: 145; note that this suffix seems to contain the causative suffix *-ya/-aa*; cf. ibid., p. 148), but also by markers with such meanings as comitative (cf. the suffix *-ysi-* in Bolivian Quechua; van de Kerke, Ch. 31, §§2.6.1.2 and 2.6.1.3; of course, its meaning ‘to accompany sb’ is not a pure comitative meaning, but it implies the sense ‘for the purpose of giving assistance’, see Bills et al. 1969: 306–7), or causative (cf. the circumfix *a-...-in-* in Georgian (see Gecadze et al. 1969: 149–50) and suffix *-idz-* in Shona (Aksenova 1990: 172)). Cf. also the assistive meaning of the suffix *-lca-* (and its cognate *-lsa-*) in Mongolic languages (see 3.3.6).

I will note in passing that in the languages without the assistive meaning, the productivity of the reciprocal suffix in the other three meanings is weakened. Thus, in Karachay-Balkar (see Nedjalkov & Nedjalkov, Ch. 24) derivatives with the reciprocal meaning are not highly productive (maximum 80 derivatiöss) and they form a closed set; similarly in Turkish: "... this suffix is not very productive; there are only a certain number of <...> reciprocal verbs" (Kornfilt 1997: 159). The sociative meaning is very common in Yakut and Tuvan, but it is unproductive in Karachay-Balkar, where it occurs mostly on intransitives, as in Tatar.

3.5 A monosemous reciprocal marker and parallel reciprocal use of a sociative marker (Evenki)

In Evenki, there are specialized reciprocal and sociative markers. The reciprocal marker *-maat* is monosemous (102a)). The suffix *-lda/-ldə* generally has a sociative meaning (102b):

- (102) a. *Bu ana-maat-ta-p.* reciprocal
 we push-REC-NFUT-1PL
 'We push each other.'
- b. *Bu tatkit-tula ηene-ldə-re-p.* sociative
 we school-ALL.1 go-SOC-NFUT-1PL
 'We go to school together.'

If the subject is singular and the second participant is expressed by a comitative noun phrase or omitted but implied by the suffix *-ldə*, the meaning is unambiguously comitative (i.e. semantically akin to sociative, rather than to reciprocal):

- c. *Nuŋan tatkit-tula ηene-ldə-re-n.* comitative
 he school-ALL.1 go-SOC-NFUT-3SG
 'He goes to school with someone else.'

If the subject is plural, the sentence may be interpreted both as sociative and as comitative. Thus, (102b) may also be interpreted as 'We go to school with someone else'.

The sociative suffix *-lda/-ldə* can encode reciprocity as well, although much less commonly than *-maat*. (Note that historically *-lda/-ldə* seems to go back to a reciprocal marker which acquired the sociative function at a later date.) In some Evenki dialects it still serves as a productive reciprocal marker. For instance, in (102d) it has a reciprocal reading only if used without a direct object (which is parenthesized), and a sociative reading if used with the direct object.

- d. *Bu [kuŋaka-r-ve] ana-ldə-re-p.*
 we child-PL-ACC push-SOC-NFUT-1PL
- i. 'We pushed *each other*.' reciprocal
 ii. 'We *together* push the children.' sociative

There is a third reciprocal marker *-ldə-maat* composed of both suffixes (the opposite sequence of the suffixes is ungrammatical).

- e. *Bu ana-ldə-maat-ta-p.*
 we push-SOC-REC-NFUT-1PL
 ‘We push each other.’

reciprocal

Finally, note the optional use of *-lda/-ldə* on (approximately 10) three-place transitives in spatial object-oriented constructions:

- (103) *Tar beje mooka-r-we təpke-[ldə]-re-n.*
 that man stick-PL-ACC fix-SOC-NFUT-3SG
 ‘That man fixed the sticks (together).’

spatial reciprocal (vt)

3.6 Interchangeable use of reciprocal and sociative markers (Khalkha Mongol, Buryat)

(The data are from Nedjalkov et al., Ch. 29). The markers *-lda* and *-lca* (Buryat *-lsa*) labelled in the literature in both closely related Mongolian languages as reciprocal and sociative, respectively, are often used interchangeably, i.e. the reciprocal *-lda* is often used in the *sociative* meaning, and sociative *-lca* (*-lsa*) as a *reciprocal* marker. The rules of their interchangeability are unclear. Both markers can also express a number of other meanings: they differ in the sets of meanings and in productivity with respect to the same meanings; thus, for instance, *-lca* (*-lsa*) is highly productive in the *assistive* meaning and *-lda* is productive in the meaning ‘(of) many’. On the whole, the polysemy of the suffix *-lca* (*-lsa*) is richer than that of *-lda*. Below, case 1 concerns the sociative and reciprocal polysemy, and 2 the other meanings.

1. *Two main meanings of -lda and -lca (-lsa)*. As mentioned, each of these markers is used both in the reciprocal and the sociative meanings.

1a. Reciprocal meaning. The reciprocal use of both suffixes is registered in the dictionaries, e.g. *asuu-* ‘to ask sb’ → *asuu-lda-* ‘to ask each other’, *asuu-lsa-* (same meaning) (Cheremisov 1973:63). In Buryat (104), the reciprocal meaning is expressed on four verbs, twice by *-lda* and twice by *-lsa*:

Buryat

- (104) *Tani-lsa-aar tata-lda-xa, xara-lsa-aar xaza-lda-xa bolo-xo-mnai*
 recognize-SOC-CONV pull-REC-PART look-SOC-CONV bite-REC-PART AUX-PART-OUT

gü, übgen?

Q old.man

‘Why is it, old boy, as soon as we meet we start fighting, as soon as we see each other we start biting each other?’

1b. Sociative meaning. The sociative use of both suffixes is registered in the dictionaries, e.g. *oro-* ‘to enter’ → *oro-ldo-* ‘to enter together’, *oro-lso-* (same meaning) (Cheremisov 1973:363). More often, however, derivatives of the same stem differ in the types of sociative meaning, derivatives in *-lda* being translated with the help of the word ‘many’ (joint action is implied), e.g. *xašgara-* ‘to shout’ → *xašgara-lda-* ‘to shout (of many)’, *xašgara-lca-* ‘to shout (together)’. The former meaning is akin to the *intensive*:

Buryat

- (105) *Udabašyegüi ende tende xün-üüd xurxira-lda-ba.*
 soon here there man-PL snore-REC-PAST
 ‘Soon here and there (many) people snored (loudly).’ sociative, intensive

2. Other meanings of the suffixes *-lda* and *-lca(-lsa)*.

2a. Judging by the explications of sociatives with the suffix *-lca(-lsa)* in the literature, it seems that these forms have the *sociative* meaning less frequently than the comitative.

Buryat

- (106) *Axa-nar-iny gaixa-lsa-ba.* (Bur3. 340)
 older.brother-PL-his be.surprised-SOC-PAST
 ‘His older brothers were surprised.’

The *comitative* meaning is actualized when the second participant is expressed by a comitative noun phrase, as in (107a), or by a personal-possessive marker on the postposition, as in (107b), or this participant may be entirely suppressed, as in (107c). Quite often, the subject referent does not act simultaneously with the co-agent but repeats the action already performed by the latter (cf. ‘after him’ in the translation of (107b)).

Buryat

- (107) a. *Dorži esege-tei gaza gara-lsa-ba.* comitative
 D. father-COM outside go.out-SOC-PAST
 ‘Dorji together with his father went out into the street.’
 b. *Parxae ... xoino-hoo-ny gara-lsa-ba.* comitative
 P. behind-ABL-his go.out-SOC-PAST
 ‘Parxaj went out after him.’
 c. *Bi ošo-žo huu-lsa-xa-m.* comitative
 I go-CONV sit-REC-FUT-1SG
 ‘I’ll go and sit (together with them).’

Note especially the meaning of “attendant” action performed simultaneously with the main action in (108) and which is closely related to the comitative. It has not been attested for reciprocal or sociative markers in any other language.²²

Khalkha-Mongol

- (108) *Bat ter gutl-aa awa-lca-w.* “attendant” action
 B. those boots-ABL take-SOC-PAST
 ‘Bat took (bought) boots *together with other boots*’, or ‘Bat *also* took those boots.’

The assistive is one of the most common meanings of the suffix *-lca(-lsa)*, while *-lda* rarely has it. This meaning is very often given in the dictionaries either as the only one (e.g. *tee*- ‘to load sth’ → *tee-lse*- ‘to help load sth’; Chermisov 1973:460) or alongside a comita-

22. Note that the meaning of ‘attendant action’ can be expressed by the applicative suffix *-ut* in Eskimo along with the *sociative*, *comitative*, *benefactive*, and *assistive* meanings; cf. *kipute*- ‘to buy’ → *kipuy-ut-aa* i. ‘he is buying sth for her’, or ii. ‘he is buying it *along with other things*’. Applicative constructions are always transitive. When detransitivized, *-ut*- derivatives are mostly reciprocal in meaning (cf. 6.2.1.4 in Ch. 1; see also Jacobson 1984:571).

tive or sociative meaning (e.g. *elirüüle-* ‘to find out’ → *elirüüle-lse-* ‘to help find out’, ‘to find out together’, ‘to take part in finding out’; *ibid.*, p. 762). A sentential example of the assistive meaning follows.

- (109) *Düü min, či ax-iin-xaa adžl-aas xiy-lc-eeč.*
 younger.brother my you elder.brother-GEN-REFL work-ABL do-SOC-IMP
 ‘My younger brother, help (our) eldest brother to do work!’ assistive

2b. The reciprocal and sociative meanings and the meaning ‘many’ of the suffix *-lda* are illustrated above. It is rarely used in the other meanings, such as assistive, competitive, comitative, anticausative, etc. It derives anticausatives from three-place verbs of joining; cf. the following Khalkha example:

- (110) *xolyo-* ‘to mix sth and sth’ → *xolyo-ldo-* ‘to get mixed.’ anticausative

To conclude, in Yakut, Tuvan and also Khalkha-Mongol and Buryat, alongside the main reciprocal, sociative, comitative and assistive meanings, the reciprocal markers also have a number of other meanings, mostly unproductive or of low productivity, represented by a few (from two or three to a dozen) derivatives: reflexive, autocausative, converse, competitive, etc. (for Yakut see ex. (4) above).

4. Iterative-reciprocal polysemy

This type of polysemy is attested in Chinese, Hua, Bari, Khmer and otherwise mostly in Austronesian languages: Samoan, Tongan, Sobei.

4.1 The range and distribution of the typical meanings

The iterative meaning and meanings immediately connected with it, viz. durative, habitual, intensive, and reciprocative, differ from the reciprocal in that they can occur with a singular subject naming a single participant, and this sets them apart from the sociative-reciprocal polysemy. The dispersive, alternative and distributive meanings imply a multiple subject referent and in this respect they are close to the sociative meaning. All these meanings are common on intransitive stems and less common on transitive stems. Some of the meanings are restricted to special lexical classes of intransitives, viz. verbs of motion and location.

I will specify some of the meanings, to avoid misunderstanding possible because of different uses of the terms in the literature (the first four meanings do not need any clarification):

(1) *reciprocative* refers to iterativity of motion in opposite directions, such as ‘hither and thither’, ‘to and fro’, ‘here and there’ (see Churchward 1953:255);

(2) *alternative* denotes iterative actions with different participants repeating the same action by turns;

(3) *distributive* denotes iterative actions with two or more participants acting one after another, each act being performed by a different participant (sometimes this meaning is hard to distinguish from the alternative meaning);

(4) *dispersive* refers to motion ‘from one point in different/all directions’;

(5) ‘*aimless action*’ – the reciprocative and dispersive meanings can change into the meaning ‘quick, intensive action’ and next into that of ‘purposeless, disorderly action’. The meanings covered by the iterative polysemy are the domain of aspectology. (With respect to this feature this type of polysemy differs from reflexive-reciprocal polysemy, the latter being mostly intransitivizing).

Above, the meanings which are expressed by markers with the main iterative meaning with a greater or lesser degree of motivation, due to associative relations are listed at random.

Here is a chart of this range of meanings. It contains two characteristics of derivatives: (a) syntactic valency changes (decrease or retention); (b) the type of derivational meaning.

(111) The meanings of iterative-reciprocal markers (the numbers refer to the respective examples)		
(The meaning of all the derivatives is more complex than that of the bases)		
Plural subject only		
<i>Valency decrease</i>	<i>Valency retention</i>	<i>Valency retention</i>
reciprocal (113c), (116e, f), (117c)	alternative (116c) distributive (126e) dispersive (121a)	iterative (113b), (114), (116a) durative (113b), (117b) habitual (126d) intensive (119b), (122c, f) reciprocative (118), (116a) ‘aimless’ action (127j).

Most of the meanings entered in (111) occur to a greater or lesser degree on polysemous markers with the main distributive meaning. In this connection it seems reasonable to show the full range of polysemy of one of such affixes, viz. the distributive suffix in Cashinahua. The meanings associated with the iterative directly or indirectly are closely interrelated and they are often expressed by the same marker, which may lack the reciprocal meaning entirely *or* have it in isolated derivatives (cf. case 5) in (112) below); cf. the following Cashinahua examples (borrowed from Camargo, Ch. 45, §8.2) with the distributive suffix *-aki-aki-* (reduplication is iconic here). Most of the meanings contain the iterative component, but this suffix does not express “pure” iterativity. The distributive meaning seems to be more general than the alternative: the latter contains the former and an additional sense of alternation of the same participants. Both meanings share the plurality of participants. To a certain degree, both are similar to those reciprocals which cannot denote simultaneous actions, in situations like ‘They visited each other’, ‘They borrowed money from each other’, ‘They helped each other’ and the like. According to the additional component and other factors, the following classes of derivatives with this suffix can be distinguished:

- (112) 1. Derivatives with the meanings requiring two or more participants.
- 1.1. Distributive; the participants are chain-related:
 - a. subject-distributive, e.g. *mawa-akiaki-* ‘to die one after another’;
 - b. object-distributive, e.g. *diti-akiaki-* ‘to hit sb(PL) one after another’;
 - 1.2. alternative; the participants exchange roles, e.g. *daja-akiaki-* ‘to work by turns.’
 2. Derivatives with the meanings which may be termed reciprocative in the broad sense; they do not require two or more participants; the additional spatial feature divides them into the following subclasses:
 - 2.1. Directional-reciprocative, e.g. *ka-akiaki-* ‘to wander, go from one place to another.’
 - 2.2. Stative-reciprocative, e.g. *daja-akiaki-* ‘to work here and there.’
 - 2.3. Rotational-reciprocative, e.g. *i-akiaki-* ‘to roll over repeatedly.’
 3. Derivatives denoting aimless/indifferent actions; they easily associate with non-directional meanings like ‘here and there’, ‘from one place to another’, ‘everywhere’, cf.:
 - a. *uša-akiaki-* ‘to sleep here and there (wherever night finds one)’
 - b. *hiwi-akiaki-* ‘to live here and there (one doesn’t care where).’
 4. Derivatives with spatial reciprocal meanings (denoting spatial contact of subject or object referents; the iterative meaning may be absent):
 - 4.1. Spatial-intransitive, e.g. *tsau-akiaki-* ‘to sit next to each other.’
 - 4.2. Spatial-transitive, e.g. *macin-akiaki-* ‘to pile sth one on top of another.’
 5. Derivatives with reciprocal meanings (two cases are attested among lexical reciprocals):
 - a. *hanca-akiaki-* ‘to talk to one another’;
 - b. *cici-akiaki-* ‘to divide sth among oneself.’

The suffix can be added to suffixed reciprocals and retain its meaning (but reciprocals cannot be formed from derivatives in *-akiaki-*), e.g. *mia-nami-akiaki-* ‘to touch each other by turns’.

Some derivatives can have two meanings, depending on the lexical meaning of the stem and singular or plural subject; thus, *daja-akiaki-* with the singular subject means ‘to work here and there’ (reciprocative) and with a non-singular subject it can also mean ‘to work by turns’; the derivative *bijun-akiaki-* allows three readings:

- | | |
|---------------------------------------|------------------------|
| i. ‘to swing together here and there’ | reciprocative |
| ii. ‘to swing by turns’ | alternative |
| iii. ‘to swing each other by turns.’ | reciprocal-alternative |

4.2 Illustrations of iterative-reciprocal polysemy (Chinese, Hua, Samoan, Sobei, Tongan, Khmer, To’aba’ita, Bari)

I. Chinese. The following information is obtained from Liu (1999: 124–32) which is the first description of the reciprocal meaning of the compound pattern composed of a repeated monosyllabic lexical verb and the verbs *lái* ‘to come’ and *qù* ‘to go’. Notably, these two verbs denote repeated motion in opposite directions. The most prominent meaning of this pattern is iterative-durative, and it is the only possible meaning if the subject is singular. The reciprocal meaning of this compound seems to be a very recent development. The verbs in the attested examples are usually intransitive. The following examples show

the direction of semantic evolution of this pattern from the meaning ‘back and forth’ via the iterative/durative towards the reciprocal.

Chinese (Liu 1999: 124–6)

- (113) a. *Tā zài wūzi-lǐ zǒu-lái-zǒu-qù.*
 he at room-inside walk-come-walk-go
 ‘He’s walking back and forth in the room.’ reciprocal
- b. *Tā xiǎng-lái-xiǎng-qù...*
 he think-come-think-go
 ‘He thought and thought (for quite a while), and ...’ iterative/durative
- c. *Wǒmen/nǐmen/tāmen dǎ-lái-dǎ-qù.*
 we/you/they hit-come-hit-go
 ‘We/you/they fought with each other.’ reciprocal

2. *Hua*. In this language, one of the reciprocal markers (for another case see Ch. 3, §2.2.1) is composed of symmetrically conjoined verbs followed by the auxiliary verb *hu* and denotes “hectic, repeated or reciprocal activity” (Haiman 1980: 121–2); cf.:

Hua (ibid., p. 123; the stems are followed by *ro*, *ro’* or *ri’*)

- (114) a. *ri+na e+e* ‘he took it and came (= he brought it).’
 b. *rina o+ri’ rina o+ri’ hi+e* ‘he kept on bringing things.’ iterative
- (115) a. *habo +ne* ‘we helped (him).’
 b. *habo+ro habo+ro hu+ne* ‘we helped each other.’ reciprocal

3. *Oceanic languages*. Here are examples, mostly from Oceanic languages, of reciprocal and non-reciprocal (mostly aspectual) meanings of markers with the principal reciprocal meaning:

Samoan (Mosel & Hovdhaugen 1992: 180–3)

- (116) a. *a’a* ‘to kick’ → *fe-a’a* ‘to kick sth again and again’ iterative
 b. *gāsolo* ‘to run, flow’ → *fe-gāsolo-a’i* ‘to move to and fro’ reciprocal
 c. *tofu* ‘to dive’ → *fe-tofu-i* ‘dive in turn, one after another’ alternative
 d. *’eli* ‘to dig, paddle’ → *fe-’eli* ‘to paddle hard’ intensive
 e. *sogi* ‘to kiss’ → *fe-sogi* ‘to kiss each other’ reciprocal
 f. *mata* ‘to look’ → *fe-māta-a’i* ‘to look at each other.’ reciprocal

Sobei (Sterner 1987: 53; *re-* = ‘they’)

- (117) a. *re-fedfadnar* ‘they jump’ → *re-f-re-fadnar* ‘they jump repeatedly’ iterative
 b. *re-semsim* ‘they call’ → *re-s-re-msim* ‘they call repeatedly’ iterative
 c. *re-soro* ‘they help’ → *re-s-ro-ro* ‘they help each other.’ reciprocal

Tongan (Churchward 1953: 256)

- (118) a. *tafe* ‘to flow’ → *fe-tafe-aki* ‘to flow hither and thither’ reciprocal
 b. *’ofa* ‘to love’ → *fe-’ofa-’aki* ‘to love each other.’ reciprocal

4. *Khmer*. With a degree of uncertainty, I cite here examples with the marker of the relic reciprocal prefix *pru-*. This prefix is preserved on approximately 90 highly lexicalized

verbal stems many of which have retained a reciprocal or similar meaning. In a few cases, the iterative (in the broad sense) meaning is more or less obvious. Unfortunately, this interesting material is scantily represented in the dictionary.

Khmer (Gorgoniev 1984:440–57)

- | | | | | |
|----------|-----------------------------------|---|--|----------------|
| (119) a. | <i>beh</i> ‘to pick (e.g. fruit)’ | → | <i>prv-beh</i> ‘pick sth one after another’ | iterative |
| | <i>bvoc</i> ‘to pluck, nibble’ | → | <i>prv-bvoc</i> ‘pluck one after another’ | iterative |
| b. | <i>huə</i> ‘to peck’ | → | <i>prv-huə</i> ‘peck sth as if vying’ | intensive |
| c. | <i>dət</i> ‘to follow’ | → | <i>prv-dət</i> ‘walk one behind another’ | reciprocal |
| | <i>cap</i> ‘to grasp’ | → | <i>prv-cap</i> ‘wrestle, fight with each other’ | reciprocal |
| | <i>aop</i> ‘to embrace sb’ | → | <i>prv-aop</i> ‘embrace (each other)’ | reciprocal |
| | <i>biət</i> ‘to be next to’ | → | <i>prv-biət</i> ‘snuggle up to each other’ | reciprocal |
| | <i>kap</i> ‘to slash, cut’ | → | <i>prv-kap</i> ‘slash each other, fight’ | reciprocal |
| | <i>kham</i> ‘to bite’ | → | <i>prv-kham</i> ‘bite each other’ | reciprocal |
| d. | <i>tvp</i> ‘to fist’ | → | <i>prv-tvp</i> ‘reciprocate fist blows’ | response |
| e. | <i>ce:η</i> ‘to overcome’ | → | <i>prv-ce:η</i> ‘to compete’ | competitive |
| f. | <i>kvh</i> ‘to call sb up’ | → | <i>prv-kvp</i> ‘to pass sth from one to another’ | lexicalization |

Curiously enough, the *causative* meaning may be perceived in the first three derivatives in (119g) alongside the spatial meaning, the valency (at least semantic) being increased, as in the opposition ‘to lie across sth’ – ‘to put sth together crosswise’.

- | | | | | |
|----|-------------------------------------|---|--|-----------------------|
| g. | <i>douc</i> ‘to be like sb/sth’ | → | <i>prv-douc</i> ‘to compare sth with sth’ | causative |
| | <i>thuən</i> ‘to correspond’ | → | <i>prv-thuən</i> ‘to adjust, fit sth to sth’ | causative |
| | <i>təh</i> ‘to lie across sth’ | → | <i>prv-təh</i> ‘to put sth together crosswise’ | causative |
| h. | <i>kəη</i> ‘to put sth on sth’ | → | <i>prv-kəη</i> ‘to put one upon another’ | spatial recipr. |
| | <i>peak</i> ‘to thread, string sth’ | → | <i>prv-peak</i> ‘to hang sth one upon another’ | spatial
reciprocal |

5. *To’aba’ita*. In this language, reciprocity can be expressed by an affix, personal pronoun, and by two adverbs (Lichtenberk, Ch. 36, §8.2). The primary meaning of these adverbs is reciprocative and dispersive, respectively. The reciprocal adverb *oli-li* is a reduplication of the verb *oli* ‘to return, move back’. The adverb *kwai-liu* consists of *kwai-* = REC and *liu* = ‘to walk past/around’).

- | | | | | |
|----------|--------------------------|---|---|-------------------------------|
| (120) a. | <i>lae</i> ‘to go’ | → | <i>lae olili</i> ‘to go back and forth’ | reciprocative (ibid., §8.2.2) |
| cf.: b. | <i>fale</i> ‘to give’ | → | <i>fale olili</i> ‘to give (presents) to each other’ | reciprocal (ibid., §6) |
| (121) a. | <i>oli</i> ‘to return’ | → | <i>oli kwailiu</i> ‘to go back to (their) own places’ | dispersive |
| cf.: b. | <i>’oli</i> ‘to embrace’ | → | <i>’oli kwailiu</i> ‘to embrace each other.’ | reciprocal |

6. *Bari*. In this language, the only verbal prefix is *tə-*. Its main meanings are causative and reciprocal, and it can also encode the intensive²³ and frequentative meanings (or multiplication of agents and objects). Unfortunately, the author of the Bari grammar Spagnolo (1933) does not give any examples of the frequentative meaning. The other meanings

23. Causative-intensive polysemy is observed in other languages as well, e.g. in Zulu: *enza* ‘to work’ → *enz-isa-* i. ‘to make sb work’ (if the Causee is named), ii. ‘to work intensively’ (if there is no Causee); cf. also Mwera *pal-a* ‘to scratch’ → *pal-iy-a* i. ‘to cause to scratch’, ii. ‘to scratch hard’ (Harries 1950:72); see also (206) and (207).

named can be expressed by the same derivative. As regards (122d) and (122e) with the assistive-reciprocal meaning, this syncretic expression seems to be a pragmatic interpretation of the benefactive-reciprocal meaning ‘for each other’ (see, however, the meaning (101b.iv) above).²⁴ Reduplication of the first syllable (122e, f) denotes continuous action or plural subject (*ibid.*, p. 105).

24. The expression of the reciprocal and causative meanings by the same affix may be surprising, but such cases are attested in a number of other languages as well: in some cases, as, for instance, in Nakanai, Johnston (1980: 136; with reference to A. Pawley, p.c.) explains it by a merger of originally different Proto-Oceanic affixes **paka-* and **paRi-* into the resultant prefix *vi-/va-* due to the loss of **k* and **R*. The author claims that these meanings are mutually exclusive because causatives derive mainly from intransitive verbs and reciprocals from transitives; thus there are no polysemous derivatives (a similar situation is observed in Tanga related to Nakanai; see Capell 1977: xiv). Note that the assistive meaning also appears here.

Nakanai (*ibid.*, pp. 136–7)

- | | | | | |
|-----|----|------------------------------------|---|---|
| (i) | a. | <i>ubi-a</i> ‘to shoot him/her/it’ | → | <i>va-ubi</i> ‘to shoot each other’ |
| | b. | <i>lolo</i> ‘to hear’ | → | <i>va-lolo</i> ‘to cause to hear’ |
| | c. | <i>sae</i> ‘to climb up’ | → | <i>vi-sae-a</i> ‘to help sb up into a raised position.’ |

The use of the same marker (though unproductive) for the reciprocal and causative meanings, among others, is illustrated by Khmer (119c, g) and Tagalog (125c, d).

The second case of reciprocal-causative polysemy is claimed for the Maipuran Arawakan languages. Although very little data are published establishing a common marker for the reciprocal and causative meanings, I will cite these data because two specialists give evidence. In spite of scarcity, the data are worth mentioning. Wise (1990: 110) asserts: “I have glossed proto **-k^hak^h* as ‘reciprocal’ since that is its meaning in a wide range of (Maipuran – V.N.) languages. In others the meaning is ‘comitative’ which is clearly semantically related to ‘reciprocal’. In the Campa languages, the meaning changed from reciprocal to comitative to causative (in the sense of causing by enabling or helping). Thus, although causative and reciprocal normally are valence-changing opposites, the series of changes proposed could account for a reciprocal suffix in one language being cognate with a causative in another”. Even if we accept that there existed a common marker for the reciprocal and causative meanings in Proto-Maipuran, this type of polysemy is not steady. Therefore some Maipuran languages have retained this marker or its alleged cognates only as causative-comitative (cf. *-ag/-akak/-ak* (Nomatsiguenga), *-akag* (Caquinte), *-akaa* (Ashaninca), *-akag* (Pajonal Ashéninca), and reciprocity is expressed by other suffixes), while in other languages the alleged cognate suffixes have retained the reciprocal meaning only, having a different marker for the causative (cf. *-koko* (Baure), *-kaka* (Apurinã) *-koko/-kaka* (Terena), etc. (Wise 1990: 104). As we see, the suffixes with the reciprocal meaning are more similar in shape than the suffixes with the comitative-causative meaning. It is not unlikely that the similarity between the two sets of suffixes is accidental. However, there are two languages where, judging by the examples cited, the reciprocal and the causative suffixes seem identical in shape. These are Piro with the suffix *-kaka* (see §8.3 below) and Guajiro with the suffix *-hira* (*ibid.*, p. 93). Both of these causative-reciprocal suffixes are shown, among others, in Tables 2 and 3 (*ibid.*, pp. 104, 105). Note that in Piro there is also a reciprocal suffix *-wa* and a distant-causative suffix *-xitxa*, and Guajiro has a suffix *-wa* with reflexive, reciprocal and passive meanings and also a causative suffix *-t/-it/-ir* (*ibid.*, pp. 103–5).

On affixes with reciprocal and causative meanings see also Li (1991: 347–51).

Bari (ibid., pp. 157–9)

(122)		Reciprocal	Causative or intensive
a.	<i>met</i> ‘to see’ → <i>tɔ-met</i>	i. ‘to look at each other’	ii. ‘to <i>cause</i> to see’
b.	<i>rem</i> ‘to stab’ → <i>tɔ-rem</i>	i. ‘to stab each other’	ii. ‘to <i>cause</i> to stab’
c.	<i>mor</i> ‘to insult’ → <i>tɔ-mor</i>	i. ‘to insult each other’	ii. ‘to abuse <i>violently</i> ’
d.	<i>kor</i> ‘to till’ → <i>tɔ-kor</i>	‘to help each other with the tilling’ assistive-recipr.	
e.	<i>der</i> ‘to cook’ → <i>tɔ-tɔ-der</i>	‘to help each other to cook sth’ assistive-recipr.	
f.	<i>rem</i> ‘to stab’ → <i>tɔ-tɔ-rem</i>	‘to stab wildly at each other.’ intensive-recipr.	

Above, types of polysemy with two main meanings were considered. Below, I will discuss the types of polysemy with three main meanings. They are represented in a smaller number of languages than the above.

5. Reflexive-reciprocal-sociative polysemy

It is frequently pointed out that reciprocal markers often have either an additional reflexive or an additional sociative (collective) meaning, but not both. The explanation is obvious: the reciprocal and the reflexive meanings share one common feature, viz. the subject denotes both the agent(s) and the patient(s), and the reciprocal and the sociative share plurality of the subject, while the reflexive and the sociative do not have any common features. Therefore the existence of a common marker for all of these three meanings is rather unlikely. According to Kemmer (1993: 100), “The direct reflexive and the collective prototypes <...> are semantically distinct from one another, this making a three-way polysemy among these types unlikely” (see also Nedjalkov 1991: 280). Nevertheless, in the literature on more than two hundred languages and in the material of this collective monograph I have found some instances of such three-way polysemy.

Probably, as mentioned above, when the reflexive and the sociative are expressed by the same marker, the latter must have a reciprocal meaning as well (unless it has been lost in the course of time), because it is intermediate between them and has common features with both.

In two languages, viz. East Futunan and Tagalog, the reflexive-reciprocal-sociative polysemy is marked by unproductive markers, and it is not clear whether these meanings have ever been productive, or they are a result of lexicalization, and whether this polysemy has ever been regular.

5.1 Mayali, Ritharngu, Djaru, Nunggubuyu

The reflexive-reciprocal-sociative polysemy is confidently registered in Australian languages only; according to Evans (1995: 219–20), “Extension from reflexive/reciprocal to collective [= sociative – V.N.] is frequent in Australian languages”. In Mayali cited below, there is also a specialized sociative prefix *djarrk-* ‘all; all together’, but the reflexive-

reciprocal suffix *-rr* can be used instead of it in the meaning ‘all’ with reference to the plural subject “in situations where *djarrk-* would be inappropriate” (Evans 1995:217).

Mayali (ibid., pp. 219, 214)

- (123) a. ... *warkga-rr-*
hide-REC-
‘hide oneself.’ [p.214] reflexive
- b. *Barri-dowe-rr-inj*
they.PL-die-REC-PP
‘They all died.’ sociative
- c. ... *ani-bu-rre-ni*
we.two-hit-REC-PL
‘(... watched)... us fighting each other.’ [p. 219] reciprocal

This type of polysemy is also attested in at least two more Australian languages, viz. in Djaru (Tsunoda, Ch. 21, examples (1), (43)) and Ritharngu (Heath 1980:612, 183; see ex. (20) in Ch. 1). With reservations, we might add Nunggubuyu to these languages (see 2.2.5 above): in this language the sociative-reciprocal marker forms reflexive verbs from monosyllabic bases although there is a specialized reflexive suffix.

5.2 East Futunan

In this language (Moyses-Faurie, Ch. 35, §3.1.1), one of the three means of marking reciprocity is the prefix *fe-* (two other affixes contain this prefix and a suffix; they are not attested in the reflexive meaning; see Section 7 below). This prefix expresses a number of meanings: reciprocal involving only two participants (a dozen of verbs), sociative, reflexive and intensive.

East Futunan (Moyses-Faurie, Ch. 35, §3.1.1)

- (124) a. *'umo* ‘to pinch’ → *fe-'umo* ‘to pinch oneself’ reflexive
lomi ‘to massage’ → *fe-lomi* ‘to massage oneself’ reflexive
- b. *taki* ‘to carry’ → *fe-taki* ‘to carry sth together’ sociative
kapu ‘to run after sth’ → *fe-kapu* ‘to run after sth together’ sociative
- c. *sogi* ‘to kiss’ → *fe-sogi* ‘to kiss each other’ reciprocal
tuli ‘to chase’ → *fe-tuli* ‘to chase each other’ reciprocal
- d. *taki* ‘to carry’ → *fe-taki* ‘to carry with difficulty’ intensive
fai ‘to do’ → *fe-fai* ‘to do one’s best.’ intensive

The form *fe-taki* is sociative if the subject is non-singular (124b) and it is intensive if the subject is singular (124d).

5.3 Luvale

In this language, as well as in a number of other Bantu languages, the sociative-reciprocal suffix was replaced by a reflexive prefix (cf. case 1 in 2.2.2), which in some languages

resulted in the type of polysemy we are discussing (see Horton 1949:117); this case is pointed out in Ch. 1 (see ex. (16)).

6. Iterative-reciprocal-reflexive polysemy (Tagalog)

This type of polysemy is attested in one language so far. The Tagalog prefix *mag-* forms about 30 reciprocals (Shkarban & Rachkov, Ch. 22, §3.1.1). It also expresses the reflexive, iterative-intensive and a number of other meanings, e.g. anticausative, causative, converse, etc. All these meanings of the prefix are unproductive. It has no sociative meaning (the main reciprocal marker is the complex affix *mag-...-an* which also has a sociative function; cf. (87)). The derived meaning is mostly determined by the lexical meaning of the base.

Tagalog (ibid., §3.1.1)

- (125)
- | | | |
|----|--|--|
| | a. Reflexive | |
| a. | <i>um-ahit</i> ‘to shave sb’ | → <i>mag-ahit</i> ‘to shave oneself’ |
| | <i>p-um-igil</i> ‘to restrain sb’ | → <i>mag-pigil</i> ‘to restrain oneself’ |
| | <i>b-um-igti</i> ‘to kill sb by hanging’ | → <i>mag-bigti</i> ‘to kill oneself by hanging.’ |
| | b. Iterative/intensive | |
| b. | <i>s-um-ulat</i> ‘to write’ | → <i>mag-sulat</i> ‘to write much and often’ |
| | <i>k-um-ain</i> ‘to eat’ | → <i>mag-kain</i> ‘to eat much and often’ |
| | <i>b-um-asa</i> ‘to read’ | → <i>mag-basa</i> ‘to read much and often.’ |
| | c. Reciprocal | |
| c. | <i>y-um-akap</i> ‘to embrace’ | → <i>mag-yakap</i> ‘to embrace each other’ |
| | <i>s-um-unod</i> ‘to follow sb’ | → <i>mag-sunod</i> ‘to follow each other’ |
| | <i>d-um-ikit</i> ‘to stick to sth’ | → <i>mag-dikit</i> ‘to stick, get glued to one another.’ |
| | d. Anticausative, causative, converse respectively | |
| d. | <i>s-um-ugat</i> ‘to wound’ | → <i>mag-sugat</i> ‘to develop into a wound’ |
| e. | <i>um-alis</i> ‘to go away’ | → <i>mag-alis</i> ‘to remove’ |
| f. | <i>b-um-ili</i> ‘to buy’ | → <i>mag-bili</i> ‘to sell.’ |

7. Iterative-reciprocal-sociative polysemy (East Futunan, Nêlêmwa)

This type of polysemy is attested in two Oceanic languages. Thus, Pawley (1973:151) writes that, alongside the reciprocal meaning of derivatives with the prefixes descended from the Proto-Oceanic **paRi-*, “In many Oceanic languages <...> such verbs sometimes refer to unified or combined action by a plural subject, or repeated action by a singular subject, or unification of objects rather than the subject of the verb”. The meaning of “unification of objects” corresponds, it seems, to my term “meaning of joining or separating of objects”, i.e. “spatial reciprocal meaning” (127i).

1. *East Futunan*. A good example of this type in our corpus is the East Futunan reciprocal confix *fe-... (C)aki* with a surprising range of meanings (Moyse-Faurie, Ch. 35, §3.3). It is the main reciprocal marker (when used singly, the second component may

be comitative, causative and applicative; see Ch. 35, §2.7.1.3); it expresses the following meanings, with a different degree of productivity, some of them shading into one another (evaluations of the meanings are partially mine - V.N.)

East Futunan (ibid., §3.3)

- | | | | | |
|-------|----|----------------------|--|------------------------|
| (126) | a. | <i>fe-ligi-'aki</i> | 'to pour <i>several times</i> from one container into another' | iterative |
| | b. | <i>fe-ano-'aki</i> | 'to go <i>back and forth</i> ' | reciprocal |
| | c. | <i>fe-taka-'aki</i> | 'to go around <i>often</i> ' | habitual |
| | d. | <i>fe-koti-'aki</i> | 'to cut (with scissors) <i>together</i> ' | sociative |
| | e. | <i>fe-sulu-'aki</i> | 'to put on (clothing) <i>one after another</i> ' | distributive |
| | f. | <i>fe-lele-'aki</i> | 'to fly off <i>in all directions</i> ' | dispersive |
| | g. | <i>fe-pū-'aki</i> | 'to be perforated <i>all over</i> ' | diversative, intensive |
| | h. | <i>fe-tali-'aki</i> | 'to answer <i>each other</i> ' | reciprocal |
| | i. | <i>fe-sola-taki</i> | 'to help sb to flee' (unique case) | assistive |
| | j. | <i>fe-opoti-'aki</i> | 'to be piled <i>one on top of another</i> ' | spatial resultative |

The latter anticausative spatial resultative verb is derived from the three-place transitive *opoti* 'to put together' (cf. 9.1.2).

East Futunan has two more reciprocal markers operating on the verb and differing in the second component, also polysemous (about derivatives with *fe-* only see 5.2 above); the confix *fe-...-(C)i* which is practically unproductive in the (a) reciprocal meaning (see Ch. 35, §2.7.1.2) and productive in the (b) sociative and (c) iterative meanings (see (38)–(40)) and (41), (42) respectively in Ch. 16).

2. *Nêlêmwa*. In this language the prefix *pe-* (sometimes combined with the suffix *-i*) has the following meanings (Bril, Ch. 34; evaluations of the meanings are partially mine – V.N.):

- | | | | | |
|-------|----|------------------|--|-------------|
| (127) | a. | <i>pe-thalic</i> | 'to stumble <i>over and over again</i> ' (ibid., §8.3) | iterative |
| | b. | <i>pe-khuwo</i> | 'to eat <i>together</i> ' (ibid., 8.1.1) | sociative |
| | c. | <i>pe-hâgee</i> | 'to fish <i>together</i> ' (ibid., 8.4.2) | sociative |
| | d. | <i>pe-shaya</i> | 'to work, move <i>together</i> ' (ibid., 8.4.3) | sociative |
| | e. | <i>pe-hâgee</i> | 'to fish <i>here and there</i> ' (ibid., 8.4.2) | reciprocal |
| | f. | <i>pe-shaya</i> | 'to work, move <i>fast</i> ' (ibid., 8.3) | intensive |
| | g. | <i>pe-yage-i</i> | 'to help <i>each other</i> ' (ibid., 3.1.1.1.1) | reciprocal |
| | h. | <i>pe-khaaxa</i> | 'to <i>compete</i> in assagai throwing' (ibid., 8.2). | competitive |

Here is an example of the reciprocal prefix in the spatial reciprocal meaning:

- | | | | | | | |
|----|-----------|---------------------|---|--------------|-------------------------------|--------------------|
| i. | <i>na</i> | 'to put sth on sth' | → | <i>pe-na</i> | 'to pile sth up' (ibid., 3.2) | spatial transitive |
|----|-----------|---------------------|---|--------------|-------------------------------|--------------------|

In conclusion, note that the reciprocal marker *pe-* has a meaning which might tentatively be called "aimless action". To quote Bril (Ch. 34, §8.4.1): "With human agents, verbs such as *diya* 'to do', *pe-* denote a tentative undertaking done without any clear project, without any effort or specific intention, listlessly <...>":

- | | | | | |
|----|-----------|---|---------------------|------------------|
| j. | <i>va</i> | <i>pe-diya</i> | <i>fagau mwa</i> . | "aimless" action |
| | | 1PL.EXC | REC-make body house | |
| | | 'We have tried to build the wall of the house.' (as might be, without any preconceived plan or idea). | | |

8. Non-prototypical types of polysemy

By this I mean reciprocal markers whose polysemy does not contain a reflexive, sociative, or iterative meaning, although it contains some other meanings named in charts (40), (85) and (111), and a few more. It is not unlikely that some of the meanings that might be intermediate between these and reciprocal have disappeared. Thus, for Mundari (8.1 below) the expected intermediate meaning might be sociative and for Piro (8.3) it might be comitative and/or assistive. In some other languages these meanings (intensive, antipassive, etc.) are attested in reflexive-reciprocal and reciprocal-sociative markers (cf. 9.2, 9.1, etc.).

8.1 Reciprocal and intensive (Mundari)

The Mundari infix *-pa-/-pe-/-pi-/....* encodes the reciprocal meaning on verbs, and on adjectives it expresses the intensive meaning (see Osada, Ch. 37). As Osada puts it, verbs and adjectives comprise one word class covering two semantically different subclasses.

Mundari (ibid., §§9.2.1; 3.1.1)

- | | | | | | |
|-------|--------|-----------------------------|---|--------------------------------------|--------------------------|
| (128) | a. | <i>marang</i> ‘(to be) big’ | → | <i>ma-pa-rang</i> ‘(to be) very big’ | intensive |
| | cf. b. | <i>dal</i> ‘to hit’ | → | <i>da-pa-l</i> ‘to hit each other.’ | reciprocal ²⁵ |

8.2 Reciprocal and antipassive (To’aba’ita)

The To’aba’ita prefix *kwai-* encodes reciprocity but not, as Lichtenberk (Ch. 36, §8.1.1) stresses, the reflexive meaning; nevertheless it can express reflexive-related meanings, such as antipassive, or absolutive, or of unspecified object (depatientive in Lichtenberk’s (1991: 171–183) terminology). As the translation of (129a) shows, the meaning is modified to denote a property (rather than an action ‘to scare’):

To’aba’ita (ibid., §§8.1.1; 7; cf. also Lichtenberk 1999: 31–61)

- | | | | | |
|-------|--------|------------------------|-------------------------|-------------|
| (129) | a. | <i>kwai-fa’ama’u-i</i> | ‘to be frightening’ | antipassive |
| | cf. b. | <i>kwai’oli-i</i> | ‘to embrace each other’ | reciprocal |

I might as well mention the following fact: in contrast to these cases when object deletion entails a change of meaning, the reciprocal suffix *-var-* in Tolai (cf. *var-boboi* ‘to see each other’, *var-ubu* ‘to hit each other’) also has a detransitivizing function of deleting the object, but it is a purely syntactic operation which does not involve any change of meaning (Mosel 1984: 156); it is probably an antipassive function; cf.:

25. In Tschiluba, the suffix *-ánán-* is attested both in the reciprocal and intensive-durative meanings. Since neither Dammann (1954: 165) nor Burssens (1946: 74) give any derivatives with the sociative meaning, the type in question can be illustrated by the following derivatives with reservations: *-dim-a* ‘to hoe, dig’ → *-dim-ánán-a* ‘to hoe everywhere, all the time’, *mən-a* ‘to see’ → *mən-ánán-a* ‘to see each other’ (Dammann 1954: 165).

Tolai (ibid.; bold type mine – V.N.)

- (130) a. ..., *di ga va=ruk ia tai tika na pal.*
 they.DU TA CAUS=enter him in one C house
 ‘... they brought him into another house.’
 b. ..., *ma dia ga ubu-var=va=ruk.*
 and they.PL TA hit-INTR=CAUS=enter
 ‘... and they made (them) enter by force.’

8.3 Reciprocal and causative (Piro)

Matteson (1965:78) describes the Piro suffix *-kaka* as causative and reciprocal (it also derives collective nouns like *mhenoklu-n-kak-lu-ko* ‘jaguars among themselves’ and has the meaning ‘each’; ibid., p. 108). Her only example of the reciprocal use of *-kaka* and the other two examples of the causative meaning are given below. The author does not mention any other meanings of this suffix, therefore this language is placed here.

Piro (ibid., pp. 39, 41; *-na* = 3PL; *n-* = ‘I’, *-lu* = ‘him’)

- (131) a. *xepha ... -na* ‘they deloused.’
 → b. *xepha-kak-na* ‘they deloused *each other*.’ reciprocal
 (132) a. *yohlota* ‘to spear’
 → b. *n-yohlot-kak-lu* ‘I *cause* him to spear (sth).’ causative
 (133) a. *himleka* ‘to boil’ (vi)
 → b. *n-himle-kak-lu* ‘I *caused* it to boil.’ causative

8.4 Reciprocal and anticausative (Dulong/Rawang)

These meanings are expressed by the prefix *v-*, and the reflexive meaning by the suffix *-shi* termed reflexive-middle marker (LaPolla 2000:288–96). The main function of the prefix *v-* is intransitivization (ibid., p. 288); cf. (the verb forms are simplified and the evaluations added – V.N.):

- (134) a. *ngaq-* ‘push over’ → *v-ngaq-* ‘fall over’ anticausative
 b. *shvt-* ‘hit, kill’ → *v-shvt-* ‘argue, fight’ reciprocal
 cf. c. *kup-* ‘cover’ → *kup-shi-* ‘cover oneself.’ reflexive

Judging by the data cited in Crowley (1981:177–82), a similar picture is observed in Mpakwithi; cf.:

- (135) a. *bwa-* ‘to break sth’ → *bwa-pji-* ‘to break’ (vi) anticausative
 b. *bwi-* ‘to kill’ → *bwi-pji-* ‘to kill each other’ reciprocal
 cf. c. *?a-* ‘to cover sth’ → *?a-ti-* ‘to cover oneself.’ reflexive

8.5 Reciprocal and resultative (Muna)

In Muna, the standard reciprocal markers, the prefix *po-* for two participants and *po-* with simultaneous root reduplication for more than two, are also used to express the mean-

ings of separating and joining or, as the author puts it, “Meaning: ‘in parts, broken’; or: ‘connected’” (van den Berg 1989:314). The spatial meanings of joining and separating are dealt with in §13 of Ch. 1 on object-oriented reciprocals, i.e. transitive constructions of the type ‘He tied A *and* B *together*’ (cf. (93d), (119h), (127i) above) derived from constructions like ‘He tied A *with* B’. In contrast to this derivation, the Muna derivatives are detransitivized and seem to become anticausatives or resultatives (such derivations with spatial characteristics have been mentioned in case 2 in 12.4 below). Compare (examples from van den Berg (1989:314); the evaluations on the right are mine – V.N.):

- (136) a. (the reference is dual)
tai ‘to stick’ → *-po-tai* ‘to be connected, bound *together*’ spatial resultative
sobho ‘to mix’ → *-po-sobho* ‘to be mixed with’ spatial resultative
kuta ‘to break’ → *-po-kuta* ‘to be broken *into two pieces*’ spatial resultative
gunti ‘to cut’ → *-po-gunti* ‘to be cut *in two*’ spatial resultative
 cf. *intara* ‘to hold’ → *-po-intara* ‘to hold *each other*’ proper reciprocal
 b. (the reference is non-dual plural)
tai ‘to stick’ → *-po-tai-tai* ‘to be connected, bound *together*’ spatial resultative
 cf. *tumbu* ‘to hit’ → *-po-tumbu-tumbu* ‘to hit *each other*’ proper reciprocal

In Ewondo, the reciprocal suffix *-an-* “is used to form locative-stative verbs from action verbs and it means *be in a state/condition*” (Redden 1979:108). Judging by this characteristic, the derivatives in (137a) can be regarded as resultatives:

Ewondo (ibid., p. 108)

- (137) a. *kúb-* ‘to pour, spill (out)’ → *kúb-an-* ‘to be spilled (out)’ resultative
súm- ‘to stick into the ground’ → *súm-an-* ‘to be stuck into the ground’ resultative
 b. *láb-* ‘to plunge’ (vt) → *láb-an-* ‘to plunge’ (vi) anticausative
 cf. c. *sín-* ‘to hate’ → *sín-an-* ‘to hate each other’ reciprocal

9. The meanings attested with both reflexive-reciprocal and nonreflexive-reciprocal markers

The meanings of these two types of markers may overlap to a limited degree. Let us consider two interesting cases, anticausative and competitive meanings.

9.1 Anticausative

These derivations are also dealt with in Section 14 of Ch. 1 as one of the diathesis types.

9.1.1 Anticausatives with reflexive-reciprocal markers (Imbabura Quechua, German)

The anticausative function is characteristic of these markers in many languages; examples (see also (53) above):

Imbabura Quechua (Cole 1982:135, 90–1)

- (138) a. *vicha-* ‘to close sth’ → *vicha-ri-* ‘to close’ (vi) anticausative

- cf. b. *riku-* ‘to see sb’ → *riku-ri-* i. ‘to see *each other*’
 ii. ‘to see *oneselves*.’ reciprocal reflexive

German

- (139) a. *Er öffnete das Fenster* ‘He opened the window.’
 b. *Das Fenster öffnete sich* ‘The window opened.’ anticausative

The number of thus marked anticausatives may be considerable in a language, and it is likely that between the productivity of anticausatives and that of reciprocals there is a reverse relation; in any case, in the four languages in (140) this is obvious enough (the figures are approximate):

(140)	Russian	Lithuanian	Latvian	German
Number of anticausatives	1400	800	810	400
Number of reciprocals	40	160	80	480 ²⁶

Anticausatives are also attested with reflexive-sociative-reciprocal markers; e.g.:

Ritharngu (Heath 1980:61, 207; *-n(a)* = augment before derivational suffixes)

- (141) a. *manapa-* ‘to join, link, mix sth’
 → *manapa-n-mi-* ‘to get linked, mixed’ anticausative
 b. *dak-u-* ‘to cut sth/sb’
 → *dak-u-n-mi-* i. ‘to cut *each other*’ reciprocal
 ii. ‘to cut *oneself*’ reflexive
 c. *wa:ni-* ‘to go’
 → *wa:ni-na-mi-* ‘to go *together*’ sociative

9.1.2 Anticausatives with nonreflexive-reciprocal markers (*Muna*, Bolivian Quechua, Zulu)

In languages with these markers, the anticausative meaning is acquired by a limited number of derivatives, usually but not always from three-place lexical reciprocals of joining (actions with symmetrical objects), less commonly separating (resulting in symmetrical objects). Such usage may be accounted for by “mutual attraction” of the lexical and the grammatical reciprocal meanings. Note that in (142a) both lexical meanings are represented.

In languages which possess a reflexive marker alongside a reciprocal one, the synonymy of reflexively and reciprocally marked anticausatives is possible; cf. the Yakut reflexively marked anticausative in (147) (here *-n/-un/...* = REFL). In other languages, one of the anticausative synonyms may have mediopassive marking; cf. Krongo *àsárán-í* ‘to get torn, tear’ (*-í-* is a mediopassive suffix) and *àsárán-áncá-* ‘to get torn’ in (145).

26. The data for Russian are borrowed from Korolev (1968:10, 21), for Lithuanian and Latvian from Geniušienė (1987:97, 75); the number of reciprocals for German is borrowed from Wiemer & Nedjalkov (Ch. 10, §4.2) and that of anticausatives is my approximate count.

Muna (van den Berg 1989:206, 314)

- (142) a. *sobho* ‘to mix sth’ → *-po-sobho* ‘to be mixed with’ cf. (136a)
 kuta ‘to break sth’ → *-po-kuta* ‘to be broken into two pieces’ cf. (136a)
 cf. b. *intara* ‘to hold sth/sb’ → *-po-intara* ‘to hold each other’ reciprocal

Bolivian Quechua (van de Kerke, Ch. 31, §4.1.2.3)

- (143) a. *chaqru-* ‘to mix sth’ → *chaqru-naku-* ‘to get mixed’ anticausative
 cf. b. *qunqa-* ‘to forget sb’ → *qunqa-naku-* ‘to forget each other’ reciprocal

Zulu (Dammann 1954:164)

- (144) a. *æuba* ‘to mix sth’ → *æub-an-a* ‘to be/get mixed’ anticausative
 cf. b. *zonda* ‘to hate sb’ → *zond-an-a* ‘to hate each other’ reciprocal

Krongo (Reh 1985:230–2)

- (145) a. *àsáránà* ‘to tear sth’ → *àsárán-áncá-* ‘to get torn’ anticausative
 àbànà ‘to break sth’ → *àbàn-áncá-* ‘to get broken’ anticausative
 cf. c. *òcùsí* ‘to steal sth’ → *òcùs-òncá-* ‘to steal from each other.’

Yakut (Ch. 26, §§10.2.1, 2.7)

- (146) a. *bulkuj-* ‘to mix sth and sth’ → *bulku-s-* ‘to get mixed’ anticausative
 tüm- ‘to tie/gather sth’ → *tüm-üs-* ‘to gather’ (vi) anticausative
 cf. b. *ölör-* ‘to kill’ → *ölör-üs-* ‘to kill each other’ reciprocal
- (147) *silimnee-* ‘to stick sth and sth together’
 → *silimne-s-* ‘to get stuck together’ anticausative
 cf. *silimne-n-* ‘to get stuck together’ anticausative

The anticausative use of a reciprocal marker can expand to include verbs denoting actions that result in the object becoming denser or thicker or wrinkled (interaction between parts of an object rather than between separate objects), etc. In (148a) standard anticausatives and in (148b) “extended” anticausatives are cited:

Khalkha-Mongol (Nedjalkov et al., Ch. 29, §§12.2, 4.2)

- (148) a. *ani-* ‘to close (eyes)’ → *ani-lda* ‘to close (of eyes)’ anticausative
 oroo- ‘to wind sth around sth’ → *oroo-ldo-* ‘to get intertwined’ anticausative
 owoolo- ‘to pile sth in a heap’ → *owoolo-ldo-* ‘to (be) pile(d) up’ anticausative
 xolyo- ‘to mix sth with sth’ → *xolyo-ldo-* ‘to mix, be mixed’ anticausative
 b. *büre-* ‘to make (milk) sour’ → *büre-lde-* ‘to become sour’ anticausative
 ünge- ‘to rumple/crumple sth’ → *ünge-lde-* ‘to become crumpled’ anticausative
 cf. c. *dzodo-* ‘to beat sb’ → *dzodo-ldo-* ‘to beat each other’ reciprocal

Tatar (Zinnatullina 1969:194)

- (149) a. *bör-* ‘to wrinkle sth’ → *bör-eš-* ‘to wrinkle’ (vi) anticausative
 cf. b. *üb-* ‘to kiss sb’ → *üb-eš-* ‘to kiss each other’ reciprocal

Lexicalization of the form with a reciprocal marker derived from an intransitive verb in (150a) does not seem accidental when compared with (149a).

Ainu (Alpatov et al., Ch. 42, ex. (112f), (21))

- | | | | | | |
|-------|--------|---------------------------|---|-----------------------------------|----------------|
| (150) | a. | <i>kay</i> ‘to be broken’ | → | <i>u-kay</i> ‘to be wrinkled’ | lexicalization |
| | cf. b. | <i>e-</i> ‘to eat’ | → | <i>u-e</i> ‘to devour each other’ | reciprocal |

The above also explains the existence of parallel synonymous forms like the following:

Yakut (Kharitonov 1963:42)

- (151) *bölüö-* ‘to get dense(r)’ → *bölüö-s-* ‘to get dense(r)’

The endpoint of the semantic sequence ‘to become crumpled > wrinkled > dense’ expressed by a reciprocal marker is likely to be the Lambda derivative

- (152) *pap-akan-a* ‘to be smooth’ ← *pap-a* ‘to shrink’ (Doke 1938:198).

Similar oppositions involving two simultaneous derivational operations, viz. detransitivisation and addition of the spatial meaning ‘together’, can be marked by a reciprocal marker alone in other languages; an example may be the Mbay invariable reciprocal pronoun *nāā* which also has the meaning ‘together’ on intransitives (Keegan 1997:65); cf. (some of the diacritics are omitted for technical reasons):

- | | | | | |
|-------|----|------------------|----------------------------------|------------|
| (153) | a. | <i>tōl-n nāā</i> | ‘they killed <i>each other</i> ’ | reciprocal |
| | b. | <i>gō-n nāā</i> | ‘they laughed <i>together</i> ’ | sociative |

Keegan (1997:66) goes on to say that “With certain verbs which are both transitive and intransitive the reciprocal pronoun changes the meaning to ‘become’”. This is in fact an inchoative meaning, and derivatives from transitive bases are thus anticausative. Unfortunately, the author does not specify the meaning and valency of the base verbs for the derivatives he cites:

- | | | | | |
|-------|----|-------------------|---------------------------|---------------|
| (154) | a. | <i>dō-n nāā</i> | ‘become tied together’ | anticausative |
| | b. | <i>bīndā nāā</i> | ‘become entangled’ | anticausative |
| | c. | <i>dūlō-n nāā</i> | ‘become twisted together’ | anticausative |
| | d. | <i>tūtā-n nāā</i> | ‘become loose, untied’ | anticausative |

Semantically, the anticausative meaning of these derivatives is supplemented by the spatial meaning of joining (154a, b, c) or separating (154d), although, judging by the translations, the base verbs ought to have lexical spatial meanings. The first three derivatives roughly correspond to (148a), and the last one to (208b).

9.2 Antipassive (unspecified object, depatientive)

This meaning is attested in a number of reflexive-reciprocal and sociative-reciprocal markers (cf. also 8.2). This meaning often changes into that of habitual action, and the latter may become a permanent characteristic of the subject referent.

9.2.1 *Antipassives with reflexive-reciprocal markers (Russian; Swedish and Danish dialects)*

With respect to this meaning, it should be noted that in a number of languages, the lists of derivatives with reciprocal and antipassive meanings coincide or overlap to a significant degree. Thus, in Russian practically any reciprocal derivative (out of 40) can be used in the antipassive meaning; cf.:

Russian (Korolev 1968: 12; see also Knjazev 1992: 9–10)

- | | | | | |
|-------|----|---------------------------|---|-------------|
| (155) | a. | <i>Petuxi kljujut-sja</i> | ‘The cocks are pecking <i>each other</i> .’ | reciprocal |
| | b. | <i>Petux kljuet-sja</i> | i. ‘The cock is pecking (just now).’ | antipassive |
| | | | ii. ‘The cock <i>is in the habit</i> of pecking.’ | habitual |

A similar overlap of reciprocal and antipassive *-si-* derivatives is observed in Lithuanian (Geniušienė 1987: 92). As is seen from the example, the antipassive use can acquire a habitual sense. Note that in languages that have practically no restrictions on reciprocal derivation by means of reflexive markers, antipassive derivatives with the same marking are practically non-existent, as is the case, for instance, in German and French. In certain groups of dialects of Swedish and Danish there are a few antipassive derivatives (note that in these languages the marker *-s* has lost its productivity); e.g.:

Danish dialectal (Berkov 1985: 62)

- | | | | |
|-------|-----------------------|-------------------|--------------------------------|
| (156) | <i>hesten bid-s</i> | ‘the horse bites’ | antipassive, habitual |
| | <i>tidslen stik-s</i> | ‘thistle pricks’ | antipassive, permanent feature |

9.2.2 *Antipassives with sociative-reciprocal markers (Swazi, Ndonga, Tatar)*

In Swazi and Ndonga, antipassive derivatives with these markers can also acquire a habitual meaning, like in the Russian example just cited. They can also have an intensive meaning. Antipassives with both reflexive-reciprocal and reciprocal-sociative markers often denote negative actions or characteristics.²⁷

Swazi (Ziervogel 1952: 73)

- | | | Antipassive | Intensive |
|-------|----|----------------------|--|
| (157) | a. | <i>-lum-an-a</i> | i. ‘to be fierce’
ii. ‘to bite severely’ |
| | b. | <i>-hlab-an-a</i> | i. ‘to have the habit to gore’
ii. ‘to gore severely’ |
| | c. | <i>-khahlel-an-a</i> | i. ‘to have the habit to kick’
ii. ‘to kick severely’ |
| | d. | <i>-bulal-an-a</i> | ‘to be of a very severe nature’ |
| | e. | <i>-em-an-a</i> | ‘to be stingy.’ |

27. It is rather remarkable that in Vietnamese, the monosemous marker *nhau* ‘each other’ is registered in the antipassive sense on the base *đánh* ‘to hit’; cf. *Họ đánh nhau* ‘they fight’ and *Em không đùa+nghech, không đánh nhau* < I not naughty not hit REC > ‘I am not naughty and I do not fight’ (Bystrov & Stankevich, Ch. 47, §3.3). Most likely, of the same type is the derivative with the reciprocal marker in Tolai cited in Mosel (1984: 147): ‘The prefix *var-* does not exclusively mean reciprocity, but is also used to derive non-reciprocal intransitive verbs, e.g. *karat* ‘to bite’ (tr) – *var-karat* ‘to bite’ (intr) (cf. also (130) above). Note the negative character of this and Tanga antipassives *kais* ‘to bite’ → *pusi i fa-kais* ‘the cat bites’, *en* ‘to eat, cut’ → *pukfis i fa-en* ‘the knife cuts’; cf. reciprocal *fen* ‘to give’ → *fa-fen* ‘to give to each other’ (Capell 1977: xiv).

Ndonga (Dammann 1954: 174)

- | | | |
|-------|--------------------------------|--|
| | | Antipassive |
| (158) | a. <i>-ts-a</i> ‘to butt sb’ | → <i>-ts-an-a</i> ‘to be given to butting’ |
| | b. <i>-tuk-a</i> ‘to scold sb’ | → <i>-tuk-an-a</i> ‘to be querulous.’ |

Tatar (Zinnatullina 1969: 192–3; verbs with negative colouring are prevalent, as is the case in 9.2.1)

- | | | |
|-------|--|---|
| | | Antipassive |
| (159) | a. <i>jaz-</i> ‘to write’ | → <i>jaz-əš-</i> ‘to be engaged in writing’ |
| | b. <i>jun-</i> ‘to hew, trim’ | → <i>jun-əš-</i> ‘to be engaged in hewing’ |
| | c. <i>urla-</i> ‘to steal’ | → <i>urla-š-</i> ‘to be engaged in stealing, be a thief’ |
| | d. <i>alda-</i> ‘to deceive sb’ | → <i>alda-š-</i> ‘to deceive’ |
| | e. <i>könlə-</i> ‘to be jealous of sb’ | → <i>könlə-š-</i> ‘to be jealous, envious’ |
| | f. <i>əklə-</i> ‘to inform on sb’ | → <i>əklə-š-</i> ‘to inform on, sneak on sb.’ ²⁸ |

9.3 Potential-passive and passive

These meanings seem to be much more widespread among reflexive-reciprocal markers than among nonreflexive-reciprocal markers.

9.3.1 *Potential-passive and passive with reflexive-reciprocal markers (Russian, Lithuanian)*

Passive and potential-passive forms in Russian and potential-passive forms in Lithuanian are represented by numerous derivatives, e.g. at least 4,300 passive and more than 100 potential-passive forms in Russian (Korolev 1969: 17, 26), and 50 potential-passive forms in Lithuanian (Geniušienė 1987: 97). An example:

- Lithuanian (-*ti* = INF, -*s* = REFL)
- | | | | | | |
|-------|-------------------------|---|------------------|-------------------------------|-------------------|
| (160) | <i>maty-ti</i> ‘to see’ | → | <i>maty-ti-s</i> | i. ‘to be visible’ | potential-passive |
| | | | | ii. ‘to see each other, meet’ | reciprocal |

9.3.2 *Potential-passive and passive with nonreflexive-reciprocal markers (Bantu)*

In Bantu languages, the potential-passive meaning is usually expressed by the suffix *-ik* and its cognates. Sometimes both this suffix and the reciprocal marker are used simultaneously (see 12.4 below) but the latter can also occur with this meaning by itself.

- Noho (Dammann 1954: 173; -*en* = REC)
- | | | | | | |
|-------|-----------------------|---|-----------------|-------------------------|-------------------|
| (161) | <i>hen-e</i> ‘to see’ | → | <i>hen-en-e</i> | i. ‘to be visible’ | potential-passive |
| | | | | ii. ‘to see each other’ | reciprocal |

In some of the Bantu languages the reciprocal suffix occurs as a passive marker; cf.:

28. N.F. Katanov (1894: 31) explains the origin of this meaning by the fact that the suffix *-š-* which in most of its uses expresses identical actions of several agents, at the same time encodes repetition of the same action. The antipassive use is based on repetition of an action, hence the meaning of its habitual permanence as a characteristic of the agent.

Zulu (Dammann 1954: 164)

- (162) *vimb-a* ‘to close, stop’ → *vimb-an-a* i. ‘to be closed, blocked’ passive
 ii. ‘to stop each other’ reciprocal

9.4 Competitive

Anticausatives can be productive enough, but to a different degree, both with reflexive-reciprocal and nonreflexive-reciprocal markers, while the competitive meaning is rarely productive with both types of markers. It is productive in three languages of our list only, Bulgarian, Karachay-Balkar and Japanese, in the other instances competitiveness being closed sets of two to ten derivatives.

The competitive meaning can be defined as follows: ‘to try to surpass each other in some activity’. As we see, it contains the reciprocal component of meaning.

9.4.1 *Competitives with reflexive-reciprocal markers (Bulgarian)*

Bulgarian is probably the only Indo-European language where the reflexive-reciprocal marker forms a large enough group of derivatives (at least 25 verbs) with the competitive meaning. Nearly all the underlying verbs contain the prefix *nad-* meaning ‘surpass, outdo sb in V’ (cf. Yakut *kuot-* ‘to outrun sb’ → *kuot-us-* ‘to compete [in running]’). The competitive meaning is obviously a result of interaction of the prefixal meaning ‘surpass’ and the reciprocal meaning of the clitic *se*. But the meaning of competition is not purely compositional, otherwise the meaning of these derivatives would be ‘to surpass each other in sth’ and not ‘to compete in sth’.

However, the meaning ‘to surpass’ is not entirely ousted by the meaning of competition in the derivatives, therefore some derivatives may sound somewhat unnatural in the aorist of the perfective aspect (due to a kind of revival of the meaning ‘overcome’ of the base verb), as both contestants cannot win in the same event (Penchev, Ch. 13, §10). But sentences denoting uncompleted actions and sentences like ‘They wanted to surpass each other’ may be more natural. Competitives denote both sporting activities and other actions; cf.:

Bulgarian (ibid.)

- (163) a. *A nadbjagva B* ‘A outruns B.’
 → b. *A i B se nadbjagva* ‘A and B compete in running.’] (not ‘A and B outrun each other!’)

Bulgarian (Ivanova 1973: 171–9)

- (164) *Te se nadpluvat* ‘They compete in swimming.’
Te se nadvikvat ‘They compete in shouting.’
Te se nadrabotvat ‘They compete in working.’
Te se nadpivat ‘They compete in drinking.’

Derivatives with the competitive meaning of this type are attested in two more Slavic languages, Serbian (also a South Slavic language), where at least ten such derivatives, also with the prefix *nad-*, are registered in Tolstoy (1970: 274–6), and in Czech where two such

synonymous derivatives with the prefix *před-* are found (Melnikov et al. 1968:586); cf. Serbian *nadlagivati* ‘to overcome in lying (slandering)’ → *nadlagivati se* ‘to compete in lying’ and *bigati* ‘to run’ → *předbigati* ‘to outrun’ → *předbigati se* ‘to race with one another (about children)’.

9.4.2 *Competitives with sociative-reciprocal markers (Karachay-Balkar, Japanese)*

Two languages are considered here.

1. *Karachay-Balkar*. In languages with nonreflexive-reciprocal markers, derivatives with the competitive meaning are registered often enough, which seems rather natural, because this meaning is close to the reciprocal and sociative meanings. But, as mentioned, these derivatives are usually very few in number and relate mostly to verbs of sporting activities; cf. Yakut *kuot-* ‘to outrun sb’ → *kuot-us-* ‘to compete (in running)’. Among numerous Turkic languages, competitives are highly productive only in Karachay-Balkar²⁹ where they can also be derived from verbs denoting actions far removed from sports (occasional derivations are also common).

Karachay-Balkar (Nedjalkov & Nedjalkov, Ch. 24, §5.3)

- | | | | |
|-------|----------------------------------|---|---|
| (165) | <i>čab-</i> ‘to run’ | → | <i>čab-aš-</i> ‘to compete in running’ |
| | <i>səzgər-</i> ‘to whistle’ | → | <i>səzgər-aš-</i> ‘to compete in whistling’ |
| | <i>art-</i> ‘to peel (potatoes)’ | → | <i>art-aš-</i> ‘to compete in peeling potatoes’ |
| | <i>tig-</i> ‘to sew’ | → | <i>tig-iš-</i> ‘to compete in sewing.’ |

2. *Japanese*. This is another language with a productive competitive meaning of the sociative-reciprocal marker *-a-/-aw-/-at-*. Moreover, in many derivatives it is often the only or preferable meaning. Note that in both Japanese and Karachay-Balkar the sociative meaning is weakly developed. Some Japanese verbs with the reciprocal suffix, encountered in the studies where they are used to illustrate the sociative sense, are sometimes interpreted by the informants as competitive rather than sociative. Thus, in (166) the competitive reading seems to be the most acceptable; the reciprocal reading is marginally acceptable, and the sociative reading ‘The students wrote the letter together’ did not occur to the native speaker.

Japanese (T. Tsunoda, p.c.; cf. also 3.3 above)

- (166) *Gakusei wa tegami o kaki-at-ta.*
 students TOP letter ACC write-REC-PAST
 i. ‘The students *competed* in writing letters.’
 ii. ?‘The students wrote letters (in order to send) *to each other*.’

29. As we see, Bulgarian is the only Indo-European language among those with a reflexive-reciprocal marker which has a competitive meaning, just as Karachay-Balkar is the only Turkic language with a productive class of competitives. Curiously enough, both peoples, according to some opinions, are partially genetically related, being descended from the ancient Turkic Bulgar tribes.

10. Other meanings

I have in mind two idiosyncratic functions which most likely do not belong to the polysemy of reciprocal markers because they are very close to the reciprocal function and may be regarded as an extension of the reciprocal use. These functions are attested on affixes that may be regarded as monosemous for the said reason.

10.1 The reflexive and reciprocal markers as relativization markers (Kabardian)

In Kabardian (Kazenin, Ch. 17, §7), reciprocals and reflexives are derived with the same marker *z-*, with possible positional variants *zə-* and *zə-*. This marker is also used to mark participles employed in the formation of relative constructions, when they occur in the agreement slot of certain types of relativized NPs. Objects, subjects and certain adjuncts can be relativized. For example, *-zə-* is placed in the agreement slot of a *relativized indirect object*:

- (167) a. *sə šə s-Ø-o-plə-ə.*
 I horse 1SG.ABS-3SG.OBL-DYN-look-PRES
 ‘I am looking at a horse.’
 b. *sə-zə-pləa-r* *šə-r.*
 1SG.ABS-REL-look-PART horse-ABS
 ‘The horse [which] I am looking at.’
 cf. c. *tə-zə-pləə-žbə-gə.*
 we-REC-look-ITER-PAST
 ‘We looked at each other.’

See also 6.2.1.1 in Ch. 3, and Rogava & Kerasheva (1966:314–27).

10.2 Response reciprocity (Cashinahua)

Camargo (Ch. 45) claims that in Cashinahua reciprocal constructions may denote not only standard reciprocal situations but also rather unexpected situations with an odd temporal sequence of the subevents. The second reciprocant is unspecified in these constructions. This meaning may be clarified by a comparison of the following examples (see also Ch. 45, ex. (55); these reciprocals are also considered in 9.7 of Ch. 1 in the context of discontinuous constructions):

- (168) a. *paku-n haidu diti-mis-ki.* b. *paku-n Ø diti-mis-ki.*
 P.-ERG H. hit-HAB-ASS P.-ERG 3p hit-HAB-ASS
 ‘Paco hits *Jairo*.’ ‘Paco hits *someone*.’
 c. *paku ~~diti-~~nami-mis.*
 P. hit-REC-HAB
 lit. ‘Paco hits mutually’, which means
 ‘Paco hits someone who (i) has hit him first (ii) will hit him (later).’

In (168c), the (non-ergative) subject is singular, the co-participant is not named (and cannot be added), and the verb has no plural marker, but the construction is perceived as complete formally and semantically. According to the explanation of the informants, Paco hits someone who either does not want to hit him right now but will do so later; or who has already hit him at an earlier time (i.e. in this case the response action is performed by the first participant). This interpretation is not unique to type (168b) constructions; it is also possible as one of the readings if two participants are named by the subject. In this case they may be perceived as a single collective reciprocant opposed to another implied party.

- d. *paku inun ha-dan, diti nami-mis-bu.*
 P. and he-*dan* hit-REC-HAB-PL
 lit. ‘Paco and him, (i) they hit *each other*; (ii) they hit *someone/him* who ...’

11. Meanings not attested among reflexive-reciprocal markers

The two meanings discussed below are related to the semantic component of plurality (‘two or more’) of the reciprocal marker.

11.1 The plural meaning (Kirghiz, Samoan, Sakhalin Ainu, Ecuadorian Quechua dialects)

Most probably, this meaning is genetically related to the sociative but this question requires special study. Encoding of plurality by a reciprocal marker is attested in four languages of our sample.

1. *Kirghiz*. The plural meaning can be optionally expressed by the reciprocal marker *-š-* on 3rd person verb forms in Kirghiz (Nedjalkov, Ch. 28, §9.2). As a matter of fact, the 1st and 2nd persons have distinct markers for the singular and plural, while the 3rd person of both numbers is usually zero-marked, hence the development of this meaning in the reciprocal marker in the 3rd person (unlike the 1st and 2nd p. markers, this suffix is used on converbs as well). The loss of the sociative meaning in Kirghiz may be related to this development. It is not clear whether this use of the reciprocal suffix as a plural marker is new in Kirghiz or inherited from Proto-Turkic. The suffix *-š-* with the plural meaning can be viewed as a homonym of the reciprocal suffix because it has a special slot in the verb form and can be used on reciprocal forms with the reciprocal or assistive meaning. Thus in (169d) the suffix *-š* occurs twice, as a reciprocal and a plural marker. Such usage is very rare, because the context, including the lexical meaning of the predicate, usually points to the reciprocal or 3PL meaning.

Kirghiz (ibid., §9.2)

- | | |
|---|--|
| (169) a. <i>Biz dušman-də at-tə-k.</i>
we enemy-ACC shoot-PAST-1PL
‘We fired at the enemy.’ | b. <i>Biz at-əš-tə-k.</i>
we shoot-REC-PAST-1PL
‘We exchanged fire.’ |
| c. <i>Alar dušman-də at-əš-tə.</i>
they enemy-ACC shoot-3PL-PAST.3
‘They fired at the enemy.’ | d. <i>Alar at-əš-əš-tə.</i>
they shoot-REC-3PL-PAST.3
‘They exchanged fire.’ |

2. *Samoan*. According to Churchward (1951:77), there are three groups of verbs in Samoan differing in the formation of plural: (a) verbs on which the plural number is not marked, (b) verbs with a reduplication of the accented syllable as a plural marker, and (c) verbs with the plural number marked by the reciprocal prefix *fe-*, with or without a suffix *-i*, *-si*, *-ni*, or *-fi*. The suffix *-a'i* has also occurred once on a plural form (170b). The confix *fe-...-a'i* is the main reciprocal marker (170c). Thus there is no clear-cut distinction between the reciprocal and plural usages of the prefix *fe-*, although in general, these usages are formally differentiated by suffixes.

Samoan (Churchward 1951:77, 78)

- (170) a. *inu* 'to drink (SG)' → *fe-inu* 'to drink (PL)'
 'au 'to swim (SG)' → *fe-'au-si* 'to swim (PL)'
 lele 'to fly (SG)' → *fe-lele-i* 'to fly (PL)'
 b. *gagana* 'to speak (SG)' → *fe-gaganav-a'i* 'to speak (PL)'
 cf. c. *ilo* 'to see' → *fe-ilo-a'i* 'to see each other'.

3. *Sakhalin Ainu*. According to Chiri (1973:510), in the Sakhalin dialect of Ainu the reciprocal-causative confix functions as a marker of the plain plural number. In non-Sakhalin Ainu, this confix may serve to express the sociative meaning (cf. case 2 in 12.1.2 below).

Sakhalin Ainu (ibid., p. 510); *-re*, *-te*=CAUS

- (171) a. *mokor* 'to sleep' → *utara u-mokon-te* 'The people slept',
 cf. *mokon-re* 'to cause to sleep'
 b. *ariki* (PL) 'to come (of two or more)' → *u-ariki-re* 'They came',
 cf. *ariki-re* 'to cause to come sb (two or more)'.

4. *Ecuadorian Quechua dialects*. With reference to Muysken (1977:54) and Cerrón Palomino (1987:283), van de Kerke (Ch. 31, §8) asserts that in many Ecuadorian dialects the suffix *-naku* (or an allomorphic form) "can be used as a reciprocal marker, but *-naku* may also have a sociative interpretation: 'together'. It can even be used as a verbal plural marker". As Cole (1982:93) claims, in Imbabura-Quechua, "<...> *-naju* is often used as a kind of emphatic verbal pluralizer".

11.2 Pseudo-reciprocal meaning (Tuvan, Boumaa Fijian, Vietnamese, Chinese, Palauan)

In this case the patient is made subject alongside the agent and thus also topicalized and presented as a kind of agent, without being one. This meaning which stands apart from the other meanings is attested so far in five languages. Generally, the participants of such situations are relatives of different ages or persons of different social status, co-villagers, etc., i.e. whose different semantic roles are obvious to the speaker. This meaning is attested among both polysemous and monosemous affixal reciprocal markers, the latter even, surprisingly, in (two) isolating languages.

1. *Tuvan* (Kuular, Ch. 27). In all the registered instances, the participants are relatives (of different "status", e.g. Tuvan *ava* 'mother' and *ava-škə(-lar)* 'mother and child' in

(172c) below) or otherwise related persons; despite the reciprocal form of the predicate, the action is performed by one of the participants (“mother” in (172c)) while the other (“the baby” in (172c)) is not passive but performs an action (*em-* ‘to suck the breast’) that may be denoted by the non-causative counterpart of the non-reciprocal causative base verb (*em-zir-* ‘to suckle’; cf. the entire derivational chain: *em-zir-ž-* ‘to suckle each other’ ← *em-zir-* ‘to suckle sb’ ← *em-* ‘to suck (the breast)’).

In reality, in (172c) the mother suckles the baby and the baby sucks the breast. But if the speaker’s intention is not to mention the baby as a separate object and to describe the customary situation without stressing either of the participants, he then uses the standard reciprocal construction in the pseudo-reciprocal sense. Here the situation is the same as in (172b), but it is presented in a compressed form.

Tuvan (Kuular, Ch. 27, §5.5.8)

- (172) a. *Bičii urug [emi-in] daka ür em-gen.*
 little child breast-ACC very long.time suck-PERF
 ‘The baby has been sucking [the breast] for a long time.’
- b. *Ava-zi uru-u-n daka ür em-zir-gen.*
 mother-her child-her-ACC very long.time suck-CAUS-PERF
 ‘Mother has suckled the baby for a long time.’
- c. *Ava-škə-lar em-zir-ž-ip olur-gan-nar.*
 mother-COLL-PL suck-CAUS-REC-CONV AUX-PERF-3PL
 ‘Mother has suckled the baby’, lit. ‘Mother and baby suckled each other.’

2. *Boumaa Fijian*. Analogous cases are attested in Boumaa Fijian where they are described as “involvement in an activity” (Dixon 1988: 177–80): “*Vei-* can similarly be used to avoid topicalizing either participant with all types of verbs. Consider *eve(-ta)* ‘carry (baby) on hip or in arms, nurse (baby)’. It is common to hear:”

- (173) *erau vei.-’eve-ti ti’o o Mere vata `ei+na vua-na.*
 3DU COLL-NURSE-TR MDF ART M. together with+ART grandchild-ART
 ‘Mary and her grandchild are involved in an activity of nursing.’ (lit. ‘... are nursing each other?’ – V.N.; I owe the glossing of (173) to R.M.W. Dixon. p.c.; I would prefer to gloss *vei-* as REC, as in (174), rather than as COLL(ective).)

“Here one would infer that it is Mary who is nursing the grandchild (*vua-*) and not *vice versa*, simply because grandchildren are nursed more often than are grandmothers” (Dixon 1988: 180). Compare the standard reciprocal reading:

Pawley (1973: 150)

- (174) *eda sa vei-loma-ni.*
 we INC REC-love-TR
 ‘We love each other.’

3. *Vietnamese, Chinese*. An analogous development of the usage of a reciprocal marker is also attested on markers which can be generally considered as monosemous. I have in mind the reciprocal markers in Vietnamese and Chinese.

Vietnamese (Bystrov & Stankevich, Ch. 47, ex. (35c))

- (175) *mẹ con bế nhau đi dạo.*
 mother child carry REC go walk
 ‘The mother carrying the child in her arms goes for a walk.’
 lit. ‘Mother and child *carrying each other* in their arms go for a walk.’³⁰

Ancient Chinese (Yakhontov, Ch. 48, ex. (52))

- (176) *Yàn quí ... zǐ mǔ xiāng bǔ yě.*
 ‘Swallows and sparrows ... children and mothers *feed each other*’ (It is but natural that it is only mothers that feed their younglings).

4. *Palauan*. L. Josephs (1975:228) suggests the following explanation of the usage of reciprocal markers we are discussing: “... extended function of the reciprocal prefix is to weaken certain commands or suggestions, or make them more polite. In this usage, the reciprocal prefix *ka-/kai* is added directly to the hypothetical forms of verbs. Its presence suggests that the speaker and the person addressed are somehow mutually involved in the decision at hand; often there is a strong sense of the speaker’s concern or sympathy”. This case differs somewhat from the previous one, because this is a situation of dialogue and the speaker here is not a real agent: he offers himself as a co-participant out of empathy. (For other meanings of *ka-/kai* see also (91).)

Josephs (ibid., p. 229)

- (177) a. *Molim a kɛrum!* ‘Take your medicine!’
 b. *Ka-molim a kɛrum* ‘Let *us* take *your* medicine.’ (bold italics mine – V.N.).

5. *A reciprocal marker used as a pronoun (Ancient Chinese)*. This case is in fact a variety of the previous one, as the patient does not appear as object either. (Note that it is a kind of development from more abstract to less abstract.) According to Yakhontov (1965:61–3), the Ancient Chinese reciprocal marker *xiāng* acquired a new function in the 3rd century CE: in dialogue it came to be used to denote both communicants as participants of the action expressed by the predicate: ‘*I* (verb) *you*’ or, somewhat less commonly, ‘*you* (verb) *me*’ (in these cases a kind of converse relations between the 1st and 2nd persons can be discerned). This usage is characteristic of polite speech (Yakhontov, Ch. 48, §12).

- (178) *Gōng yǒu xiāng shā yì.*
 lord have REC kill intention
 ‘Sir, you intend to kill me’, lit. ‘... (and now) we intend to kill each other.’

30. Somewhat similar to this type are constructions considered above in Ch. 1, §10, like Swahili (*fuat-a* ‘to follow sb’ →) *fuat-an-a* ‘to see each other off’ (Ovir 1896:258).

12. A reciprocal marker as part of a complex marker

This section deals with the changes of the reciprocal meaning when the marker is combined with another marker.

12.1 A reciprocal marker in two-component sociative markers

As is shown above, the following cases are attested with respect to the expressions of reciprocity and sociativity.

1. There are languages that have a reciprocal marker (without a sociative meaning) and no sociative marker (e.g. Chukchi reciprocal suffix *-waly*).

2. There are languages that have a reciprocal and a sociative markers (cf. the Fula reciprocal suffixes *-ootir*, *-indir* and sociative *-d*; see Arnott 1970:334–46, 357–60, 361–2; Wolof reciprocal suffix *-ante* and sociative *-andoo*; see Church 1981:253, 254, 289, 292, 298).

3. There are also languages that have a common reciprocal-sociative marker (cf. Yakut *-s*; see (3b) in 1.1.3 above).

4. There are languages that have different markers for reciprocals and sociatives but in certain cases one of the markers can be used instead of the other; this is the case in Khalkha Mongol and Buryat with the suffixes *-lda* and *-lca/-lsa* (see §3.6 above)

5. I have not encountered any cases of a more or less productive reciprocal marker formed with the help of a sociative marker or descended from it (the evolution of the Latin type from *bibo* ‘drink’ – *combibo* ‘drink together’ (sociative) to *fligo* ‘hit, knock together’ – *confligo* ‘collide’ (reciprocal; cf. (207) in Ch. 1, §15.3) is due to the lexical meaning of the base verb). But the opposite cases do occur.

6. There are languages where a sociative marker contains a reciprocal marker. This section is concerned with these languages.

Below, cases of obvious derivation of sociative markers with the help of a reciprocal marker are considered.

In all the five cases considered below the sociative marker is phonologically “heavier” than the reciprocal one, and this clearly points to the derived nature of the sociative marker. In the first four cases, the reciprocal marker is attached to one of the valency-increasing markers (applicative, causative, comitative, or benefactive). In the fifth case the meaning of the non-reciprocal component of a complex marker is not clearly established.

12.1.1 *Sociative as a formally reciprocal derivation from applicative (Ainu)*

This case is attested in Ainu where the reciprocal prefix *u-* can appear in the complex sociative marker *uko-*, where *ko-* is formally identical with the applicative marker (applicative is a transitivizer without a causativizing function and therefore it retains the underlying subject; as a rule, this Ainu form does not mark a comitative or a benefactive meaning). The combination has four principal usages: in the first two cases it functions as *u-ko-*, each component retaining its meaning, while in two more cases it functions as a single

complex *uko-*. The information is from Alpatov et al. (Ch. 42, §§3.1.1.2, 3.7.1.3, examples (66f), (66j)).

1. The base verb in the triplet under (179) can in principle combine with a postpositional complement (i.e. the base verbs are (potentially) two-place intransitives). This complement does not trigger verb agreement, and the reciprocal prefix can occupy the slot of the agreement marker only. The second member of the triplet, i.e. the *ko-* applicative, is transitive and therefore allows reciprocal derivation. With the applicative form, the complement appears as a human direct object (which may alternate with an inanimate object on some applicatives). In the following example a reciprocal is derived from an applicative, i.e. there is no sociative meaning here.

- (179) *apkas* ‘to go’ (vi)
 → *ko-apkas* ‘to go on a visit to sb’ (vt)
 → *u-ko-apkas* ‘to visit each other’ (vi).

2. In this case the sociative meaning results from the comitative meaning of the applicative, i.e. it is a reciprocal of a comitative; thus the meaning of the applicative is retained in the reciprocal form. Such instances are extremely rare in Ainu.

- (180) *rewsi* ‘to stay somewhere overnight’ (vi)
 → *ko-rewsi* ‘to stay the night *with sb*’ (vt)
 → *u-ko-rewsi* ‘to stay the night *together*’, lit. ‘*with each other*’ (vi).³¹

3. There is an applicative form but its meaning is not retained in the derived sociative, i.e. the sociative form is built by adding the complex prefix *uko-*; thus we observe grammaticalization here, as well as in the last case.

- (181) *nepki* ‘to work’ (vi)
 → *uko-nepki* ‘to work together’ (vi)
 cf. *ko-nepki* ‘to work for/instead of sb’ (vt).

4. There is no applicative form and, as in the previous case, the complex prefix *uko-* is used (*-pa* = PL):

- (182) *uko-etorotur-pa* ‘to snore together’
uko-ipe ‘to eat together’
uko-kirirse-pa ‘to scream together.’

5. There is an applicative form but its meaning is not retained in the derived sociative, i.e. the sociative form is built by adding the complex prefix *uko-*; thus we observe grammaticalization here, as well as in the last case.

31. Compare the analogous opposition in a language where one of the regular meanings of the applicative suffix *-el/-il* is the comitative meaning:

- Haya (Dammann 1954: 168)
 (i) *-nyw-el-a* ‘to drink with sb’ → *-nyw-el-an-a* ‘to drink with each other’
-e-il-a ‘to eat with sb’ → *-e-il-an-a* ‘to eat with each other.’

- (181) *nepki* 'to work' (vi)
 → *uko-nepki* 'to work together' (vi)
 cf. *ko-nepki* 'to work for/instead of sb' (vt).

12.1.2 Sociative as a formally reciprocal derivation from causative (Adyghe, Ainu)

1. *Adyghe*. The rationale for the shift in meaning is not quite clear: apart from an increase in the number of the participants, there seems to be no immediate connection between the causative and the sociative meanings. In Adyghe, the attested derivatives mostly denote either manifestation of emotions or actions motivated by emotions. The underlying causatives are derived from verbs with meanings like 'laugh', 'worry', 'shout', 'play'. In other cases the meaning of reciprocal causatives may be standard, i.e. 'to cause each other to do sth'. In this case one can see weak manifestation of causativization: a person showing his emotions kind of induces other people to show theirs. As we know, laughter is contagious.³²

(Rogava & Kerasheva 1966:273)

- (183) a. *Axər Ø-šbχə-gbə-x.*
 they.ABS 3SG/PL-laugh-PAST-3PL
 'They laughed.'
 → b. *Klālə-m ar Ø-ə-gbə-šbχə-gb.*
 boy-ERG s/he.ABS 3SG-3SG-CAUS-laugh-PAST
 'The boy made him laugh.' (Ø-ə- are object and subject markers)
 → c. *Axər Ø-zrə-gbə-šbχə-gbə-x.*
 they.ABS 3SG/PL-REC-CAUS-laugh-PAST-3PL
 'They laughed (started laughing)', lit. 'They made each other laugh.'

2. *Ainu*. A typological parallel is attested in Ainu (see Alpatov et al., Ch. 42, §7), where sociatives are most commonly derived by a prefix composed of the reciprocal and applicative markers (see 12.1.1 above); there is also a second sociative marker, viz. a circumfix composed of the reciprocal prefix *u-* and causative suffix *-re/-te*. Almost all of the attested sociatives in *u-...-re/-te* are derived from intransitive bases (the literal meaning of the derivatives is 'to make each other do sth', as in the previous case, i.e. in (183c)). In addition to the regular sociative meaning 'together', this combination of affixes may also acquire a more expanded reading 'all (together) [do sth] at once' (see Nakagawa 1995:51; I owe this information to A. Bugaeva). Since the prefix *u-* can occupy the object agreement slot, an intransitive verb must be transitivized first, by means of the applicative prefix, as in (179), or by a causative suffix. In the latter case, it seems, the sociative meaning con-

32. The prominent specialist in and native speaker of Adyghe Z. Kerasheva sees in the situation described in (183c) a causative component. In a letter to me (dated 24 March 1991; translation mine – V.N.) she explained this situation as follows: "Two or three (persons) met. One said something funny and made the other(s) laugh. Another added to it or in his turn told a funny story. And they all laughed: they made each other laugh. Both or three of them, or a group were laughing <...> – there is both reciprocity ('each other') and causativity here." Although in this explanation the events are described as a chain, Z. Kerasheva wrote that the adverb *čəzəu-čəzəukIə* 'by turns' could not be added, but the adverb *ščəgəbəx* 'simultaneously' was possible. I am grateful to her for this explanation.

tains an emotive colouring. It may be not accidental that the informant (the late Ito Oda, a 93-year old Ainu, one of the two or three persons who still spoke Ainu; she died in 2001. I owe this information to A. Bugaeva) did not accept some forms with the sociative prefix *uko-*, e.g. *uko-mina* and *uko-kira* with the intended meanings ‘to laugh together’ and ‘to run together’, respectively, parallel to *u-kira-re* and *u-mina-re* in (184) which are more customary (the two latter forms are registered in the dictionaries and occur in texts). In other cases the informant accepts both sociative forms as correct.

Ainu (Alpatov et. al., Ch. 42, §7)

- (184) a. *kira* ‘to run away, flee’ (vi) → *u-kira-re* ‘for all to run away together’ (vi),
 cf. *kira-re* ‘to cause to run away, to chase’ (vt)
 b. *mina* ‘to laugh’ (vi) → *u-mina-re* ‘to laugh together’ (vi),
 cf. *mina-re* ‘to cause to laugh’ (vt).

This form acquired the plural meaning in Sakhalin Ainu (see (171) above).

12.1.3 Sociative as a formally reciprocal derivation from comitative

Two cases of marking of the derivations named in the heading are registered.

1. *Affixes (Adyghe)*. In Adyghe, there are two reciprocal markers, *zə-rə-* for subject-direct object cross-coreference and *zə-* for subject and non-direct object cross-coreference. The comitative meaning, i.e. the addition of a non-direct object with the meaning ‘with’, is marked with the preverb *də-* with locative meanings like ‘into’, ‘towards’, ‘to’, ‘out of’, ‘on’, etc. The sociative form is derived by means of the complex prefix *zə-də-*. This is the principal means of encoding sociativity in Adyghe. In this case we observe a “sum” of the comitative and the reciprocal meanings; cf.:

Adyghe (Rogava & Kerasheva 1966:277)

- (185) a. *Ar* Ø-*bəna-gə*.
 he.ABS 3SG/PL-wrestle-PAST.3
 ‘He wrestled/fought.’
 → b. *Ar* *klalə-m* Ø-*də-bəna-gə*. comitative
 he.ABS boy-OBL 3-COM-wrestle-PAST.3
 ‘He wrestled *with* the boy.’
 → c. *Axər* *zə-də-bəna-gəə-x*. sociative
 they.ABS REC-COM-wrestle-PAST-3PL
 ‘They wrestled *together*.’

Similar forms are attested in one of the Bantu languages where the reciprocal marker is attached to an applicative form with the comitative meaning; cf.:

Haya (Dammann 1954:168)

- (186) a. *-nyw-a* ‘drink’ → *-nyw-el-a* ‘drink with sb’ → *-nyw-el-an-a* ‘drink together’
 b. *-l-a* ‘eat’ → *-l-il-a* ‘eat with sb’ → *-l-il-an-a* ‘eat together’.

2. *A free item + comitative marker* (English, Russian, Ancient Chinese, Vietnamese, Bamana, Basque). This combination is the “sum” of the meanings of both components. It is attested in a large number of languages (cf. English with *each other* and its equivalents

German *miteinander*, Russian *drug s drugom*, Basque *elkar-ekin*). A reciprocal marker co-occurs with a comitative preposition or postposition or comitative affix. Here are examples from a number of languages.

Vietnamese (Bystrov & Stankevich, Ch. 47, ex. (5); *n hau* = REC; the comitative meaning can be encoded by one of two prepositions or their combination: *v ới* ‘with’, *c ùng* ‘together’, ‘in the company of’)

- (187) a. *Lan đ i+ chơi v ới (c ùng / c ùng v ới) An.*
 ‘Lan strolls *with* An.’
 b. *Lan và An đ i + chơi v ới nhau (c ùng nhau / c ùng v ới nhau).*
 ‘Lan and An stroll *together*.’

Bamana (Vydrine, Ch. 46, §§1.2, 6.3; *ɲ ɔŋ* ‘each other’, *f ɛ* ‘with’, *ɲ ɔŋ f ɛ* ‘with each other’; (188) allows three readings)

- (188) *F ɔla-w bé m ɪsɪ-w g ɛn ɲ ɔŋ f ɛ.*
 i. ‘Fulbe, being *together*, drive cows.’
 ii. ‘Fulbe drive cows (keeping them) *together*.’
 iii. ‘Fulbe, being *together*, drive cows *together*.’

Ancient Chinese (Yakhontov, Ch. 48, ex. (59); in Modern Chinese the reciprocal adverb *h ǔxiāng* does not occur with comitative prepositions)

- (189) a. *xiāng* ‘each other’, *y ǔ* ‘with’ → *xiāng y ǔ* ‘with each other’, ‘together’
 b. *xiāng y ǔ y ǒu* ‘take a walk *together*’
xiāng y ǔ huán ‘returned *together*’
xiāng y ǔ l è zh ī ‘All [of them] rejoice in it.’
xiāng y ǔ xiào zh ī ‘All [of them] laugh at it.’

Not infrequently, this means of coding the sociative meaning is attested alongside a “non-derived” sociative adverb, cf. English *with each other – together*, German *miteinander – zusammen*, Russian *drug s drugom – vmeste*, etc. These parallel means may differ semantically to a greater or lesser degree, depending on the language. For instance, in Kemmer’s opinion (1997:236–7), the Basque *elkar-rekin* <each.other-with> and *batera* ‘together’ are used in synonymous constructions with the verb meaning ‘to go’, but the difference between them is that the former implies a closer interaction between the participants, e.g. when talking or performing some other action.

12.1.4 Sociative as a formally reciprocal derivation from benefactive (Maasai)

In this language, the middle form can be built from derived verbs, e.g. benefactives, and this form in the plural “often conveys reflexive or reciprocal action, or contemporary actions” (Tucker & Mpaayei 1955:152). The authors probably have in mind the sociative meaning when speaking of “contemporary actions”; cf.:

Maasai (ibid., p. 153)

- (190) *ki-as-aki-no.*
 we-work-BEN-NEUTER

- i. 'We work *for each other*.'
- ii. 'We work *together*.'

12.1.5 A sociative marker = a reciprocal marker with an added component of unknown origin (Bantu)

This is observed in those Bantu languages where there is a tendency to formally isolate a sociative marker from the reciprocal, by making the sociative (= associative) marker more complex than the latter, cf. Dabida: *-kund-a* 'to love' → *-kund-an-a* 'to love *each other*' and *-sel-a* 'to take a walk' → *-sel-any-a* 'to take a walk *together*' (Rjabova 1989: 111). In contrast to the four cases considered above, where a reciprocal component is added to a non-reciprocal component (e.g. to an applicative marker), here an additional component is more likely to be added to a reciprocal marker (note that the reciprocal suffix *-an* in many Bantu languages can also express sociativity by itself; cf., for instance, (92), (93)). Characteristically, the attached component is in most cases preposed to the reciprocal marker. There is an opinion that this additional component "is probably the remnant of a lost separate derivative for the Associative form of the verb" (Harries 1950: 73–4). The sociative meaning may probably be ascribed to (206b) and (207b), although a different interpretation seems to be preferable. Here are the reciprocal and sociative markers of four Bantu languages (borrowed from Aksenova 1990: 176; Doke 1938: 198–200; Harries 1950: 73–6):

(191)	Language	Reciprocal marker	Sociative marker
	Dabida	<i>-an</i>	<i>-an-y</i>
	Sotho S.	<i>-an</i>	<i>-ah-an</i>
	Lamba	<i>-an</i>	<i>-ak-an/aŋk-an</i>
	Mwera	<i>-an</i>	<i>-eg-an/-aŋg-an</i> ³³

The Lamba suffix *-ak-an/aŋk-an*, like the Mwera suffix *-eg-an/-aŋg-an*, is, in Dammann's opinion (1954: 168), a failed attempt to create a specialized sociative marker. According to Harries (1950: 73–4), "a degenerated form of an older associative ending <...> has almost entirely merged with the ordinary reciprocal"; cf.:

Mwera

- (192) *gon-a* 'to sleep' → *gon-egan-a* 'to sleep together'
lol-a 'to look' → *lol-egan-a* 'to look at each other.'

On the whole, this problem is not clear and there are no reliable data. It should be added that alongside the prevalent suffix *-an*, extended reciprocal markers like *-any*, *-ane*, *-egan*,

33. Note in this connection that in Delaware the formerly reciprocal suffix *-tī* (cf. *nhil-tō-wak* 'they kill each other') can be discerned in the "emphatic or collective plural" suffix *-ahə-tī* (cf. *kəntk-ahtō-wak* 'they (many) dance'). All the cited examples with this suffix are derivatives from intransitives, which is characteristic of sociative derivatives. This is also supported by the fact that "in the northeasternmost of Eastern Algonquian languages it is used as the ordinary AI plural" (in the non-easternmost languages the suffix *-ahə-tī* functions as sociative – V.N.) (Goddard 1979: 43–5). Compare 11.1 above.

-asan, *-ahan*, *-anġan*, are also cited in the catalogue of reciprocal suffixes in various Bantu languages in Guthrie (1970:215), without any mention of their sociative meaning.

12.2 A reciprocal marker in combination with locative preverbs and prepositions (Kabardian, German)

These combinations are considered in Ch. 1 (see 10.2 and case 2b in 12.1.1.2) in connection with other issues. In a number of languages there is a tendency to closely “associate” a reciprocal marker with locative preverbs and/or locative prepositions or postpositions (denoting joining or separating) and thus build complex preverbs and adverbs, respectively. The latter adverbs in their turn may tend to make up complexes with verbs. Semantically, these complexes can be a trivial summing up of the meaning of the components, and sometimes the interaction of two meanings can be very complicated when the joint meaning is not related to the base without a reciprocal marker. Such complexes become independent items and develop meanings more or less related to the reciprocal.

1. *Kabardian* (after Kazenin, Ch. 17, §9). In this language there are numerous locative preverbs. When used on verbs they increase their valency by adding an indirect object. In order to cross-reference the indirect object and subject or the indirect and direct objects, the reciprocal marker *zə-* is used. As a rule, such derivations denote putting an object together with another or separating it from a surface or a mass or a group of objects. One of such derivations is cited in (193c) which is an object-oriented reciprocal (an extensive list of these derivatives is provided in Ch. 1, §13.1.6).

Kabardian (Kazenin, Ch. 17, ex. (98); the preverb *xə-* introduces an IO of location, direction, or source of movement)

- (193) a. *gəvən* ‘to boil sth’
 b. *xə-gəvən* ‘to boil sth (DO) in sth (water, etc.) (IO)’ vb
 c. *zə-xə-gəvən* ‘to boil several things (DO) together.’ spatial reciprocal vt

The preverb *pə-* may also encode (a) a reverse action, like ‘back’, (b) an action in front of sth. Example (194) illustrates the standard use.

Kabardian (Kazenin, Ch. 17, ex. (79), (81))

- (194) a. *tIəsən* ‘to sit down’ (vi)
 b. *pə-tIəsən* ‘to sit down in front of sth’ (IO) (vi)
 c. *zə-pə-tIəsən* ‘to sit down in front of each other.’ spatial reciprocal vi

On some verbs, however, the combination *zə-pə-* functions as a single morpheme with the meaning of intensity, stressing the sense ‘on all sides or on the whole surface of an object’ (sometimes a verb with *zə-pə-* also acquires the suffix *-xəð-*). There may be no corresponding verb without *zə-*.

- (195) a. *ləðšbI-ən* ‘to clean, dust sth’ (DO) (vt)
 b. **pə-ləðšbI-ən*
 c. *zə-pə-ləðšbI-xəð-n* ‘to clean, dust sth (DO) on all sides.’ (cf. (126g)) diversative/intensive

The list of complex preverbs of the latter type is to be found in Ch. 1, §13.1.5.

2. *German* (for details see Wiemer & Nedjalkov, Ch. 10, §5). As is known, there are two main reciprocal devices in German. One of them is the set composed of the reflexive pronoun *sich* for the 3rd p. and personal pronouns *uns* and *euch* for the 1st and 2nd persons. This marker is used in subject-oriented constructions only. The second marker is the reciprocal pronoun *einander* unmarked for person. The first marker is more widely used. In contrast to the reciprocal *sich*, *einander* can be used with prepositions and constitutes complex combinations with them spelt together. These resultant reciprocal adverbs make up tight combinations with verbs, especially with verbs of spatial relations (like *join*, *separate*). They function as free items, of which the following two adverbs have generally deviated from the meaning of the base prepositions, as their meaning is not the sum of the meanings of the preposition and *einander*:

- (196) *auseinander* 'in different directions, separately', lit. 'one from another'
durcheinander 'pell-mell, in a jumble', lit. 'one through another.'

(197) below contains a few "fixed" collocations of these adverbs with verbs. Usually, dictionaries recommended (before the new rules were introduced) spelling them as one word if the meaning is spatial and separately if the meaning is not spatial (cf. examples in Berger et al. 1972:50, 80, 275, 478, 655, 715, 758). Reciprocals of three-place transitives are predominant among them. We find no proper reciprocal meaning connected with actions or relations of persons who act as agents and patients with respect to each other (i.e. type 'to kill/love each other'). Here is a typical derivation: German *Er fügte einen Stein an den anderen* 'He fitted a stone to another' → *Er fügte Steine aneinander* 'He fixed the stones together'. The derivatives cited below are transitive spatial (they are object-oriented reciprocals and as such they are discussed in §§2.2.4, 5.2, and 13 of Ch. 1).

German (see Wiemer & Nedjalkov, Ch. 10, §5)

- | | | | | |
|-------|----|------------------------------|--------------------------------------|-----------------------|
| (197) | a. | <i>etwas aneinanderfügen</i> | 'to fasten together' | spatial reciprocal vt |
| | | <i>aufeinanderpressen</i> | 'to press together' | spatial reciprocal vt |
| | | <i>übereinanderstapeln</i> | 'to pile, heap sth one upon another' | spatial reciprocal vt |
| | b. | <i>auseinanderdrücken</i> | 'to release, unclasp, unclench' | spatial reciprocal vt |
| | | <i>durcheinanderwerfen</i> | 'to scatter sth around.' | spatial reciprocal vt |

12.3 A reciprocal marker + causative marker for the expression of the intensive meaning (Kirghiz, Lamba)

In Kirghiz, the complex *-š-tər-* is a combination of the reciprocal and causative suffixes, and in the derivatives below it functions as a single marker with the meaning of intensive and/or repeated action (Abdiev 1995:97–8). The respective verbs with the reciprocal suffix alone, i.e. (198b) and (199b), are not immediately related semantically to these derivatives, i.e. to (198c) and (199c). As regards (198a) and (199a), they constitute the standard reciprocal opposition with (198b) and (199b), respectively. (In other cases, type (198c) and (199c) derivatives (with meanings like 'to cause sb to look at each other') can be causative counterparts of the respective reciprocal derivatives.) The cognate complex suffix occurs in

some other Turkic languages (e.g. the suffix *-(i)ş-tir* in Turkish (Lewis 1967: 148), *-ş-tur-* in Uyghur (Kibirov 1989: 296)) and it is unproductive in all of them.

Kirghiz (Nedjalkov, Ch. 28, §10.2)

- | | | | | |
|-------|-----|--------------|--------------------|---------------------------------------|
| (198) | a. | <i>kara-</i> | 'to look at sb' | |
| | → | b. | <i>kara-š-</i> | 'to look at <i>each other</i> ' |
| | but | c. | <i>kara-š-tər-</i> | 'to look for sth <i>intensively</i> ' |
| | | | | reciprocal
intensive |
| (199) | a. | <i>sura-</i> | 'to ask, question' | |
| | → | b. | <i>sura-š-</i> | 'to question <i>each other</i> ' |
| | but | c. | <i>sura-š-tər-</i> | 'to question <i>again and again</i> ' |
| | | | | reciprocal
intensive |

Note that the homonymous complex suffix *-štər-* is also used to mark object-oriented reciprocals (see (181), (182) in Ch. 1).

A similar meaning can be observed in the combination of reciprocal and causative markers in one of the Bantu languages: in a grammar of Lamba (Doke 1938: 196ff.) a distinction is drawn between simple and complex reciprocals: in the former case the reciprocants are two persons or groups and in the latter the reciprocants are many persons or groups; e.g.:

- (200) *pama* 'to hit' → a. *pam-an-a* 'to hit *each other*' (of two reciprocants).
 b. *pam-ansjanj-a* 'to hit *each other indiscriminately in a crowd*'.

The suffix *-ansjanj-* on other stems, e.g. on verbs meaning 'to love', 'to hate', is plain reciprocal and does not correspond to its meaning in (200b) which may be a case of lexicalization; anyway, this meaning does not seem to be productive enough.

- (201) a. *temw-a* 'to love' → *temw-ansjanj-a* 'to love each other', 'to live in harmony'
 (ibid., p. 197)
 b. *fitilw-a* 'to hate' → *fitilw-ansjanj-a* 'to hate each other' (ibid.).

Dammann (1954: 167) relates the suffix *-ansjanj-* to the sequence *-an-k-y-an-y-* which he analyses as reciprocal-intransitive-causative-reciprocal-causative (intransitive = stative – V.N.).³⁴

34. Note that in some of the Bantu languages the causative suffix can also have an intensive meaning. Dammann (ibid.) points out that in Kikongo the combination of the causative and reciprocal suffixes has resulted in the iterative meaning. In separate cases (individual development?) the intensive meaning can be added by the reciprocal suffix alone, as, for instance, in Tsonga (see (i.a)) and Nyiha (see (i.b)).

- | | | | | |
|-----|----|---------------------------------------|--|-----------|
| (i) | a. | <i>quoz-a</i> 'to go bad', 'to rot' → | <i>quoz-an-a</i> 'to become rotten <i>throughout</i> ' | intensive |
| | b. | <i>lamb-a</i> 'to run' → | <i>lamb-an-a</i> 'to run <i>fast</i> ' | intensive |

Curiously enough, a complex suffix *-an-y-an-* in Tonga and Ronga resembling the Lamba suffix *-an-s-j-an-j-* in example (i.b) is used in the diminutive meaning (Doke 1938: 195):

- | | | | | |
|------|----|------------------------------|--|------------|
| (ii) | a. | <i>tal-a</i> 'be abundant' → | <i>tal-anyan-a</i> 'be fairly numerous' | diminutive |
| | b. | <i>famb-a</i> 'walk' → | <i>famb-anyan-a</i> 'travel somewhat (a little? – V.N.)' | diminutive |

Note in this respect that reduplication of *-an per se* need not involve the reciprocal meaning, as is the case in derivatives from monosyllabic bases, e.g.:

12.4 A reciprocal marker attached to a stative (detransitivizing) marker: intensive-stative or spatial-resultative (Bantu)

These two meanings are marked on intransitive stems derived from transitive bases by means of a stative marker *-ik/-ek, -ak/...*. Judging by the examples cited in the literature, the latter derives mostly anticausatives (*vunj-a* ‘to break sth’ → *vunj-ik-a* ‘to break’ (vi)) and potential passives from transitives (203a), (204a)); see Aksenova 1990: 174–6).

1. The following examples illustrate the intensive-stative meaning:

Shambala (Roehl 1911: 192)

- | | | | | |
|-------|----|---------------------|-----------------------------|-----------|
| (202) | a. | <i>tail-ik-a</i> | ‘to be known’ | |
| | b. | <i>tail-ik-an-a</i> | ‘to be very well-known’ | intensive |
| (203) | a. | <i>jil-ik-a</i> | ‘to be edible’ | |
| | b. | <i>jil-ik-an-a</i> | ‘to be quite (very) edible’ | intensive |
| (204) | a. | <i>on-ek-a</i> | ‘to be/become visible’ | |
| | b. | <i>on-ek-an-a</i> | ‘to become quite visible’ | intensive |

In some Bantu languages, type (204a) stative forms of some verbs are not used. Instead, forms with the complex suffix are employed, and the intensive meaning is absent, e.g.:

Swahili (Dammann 1954: 169)

- | | | | | |
|-------|----|--------------------|-----------------|-------------------|
| (205) | a. | <i>on-ek-an-a</i> | ‘to be visible’ | potential-passive |
| | b. | <i>jul-ik-an-a</i> | ‘to be known’ | |

The complex suffix *-ik-an/-ek-an* can also have a habitual meaning in Swahili (Meinhof 1928: 53) which is very closely related to the iterative meaning, the latter in turn related to the intensive.

2. The spatial-resultative meaning, in particular joining (206) and separating (208), can be perceived in the examples, although the authors (Doke 1938: 11; Dammann 1954: 166) see the sociative (associative in their terminology) meaning. True, with regard to inactive objects the sociative meaning is akin to spatial, because the sociative meaning presupposes spatial proximity of the participants. In cases with inactive objects a kind of semantic neutralization between the sociative and the spatial reciprocal meanings seems to take place (although in (208b) it is hard to perceive the sociative meaning). The derivatives below are formed from transitives and undergo detransitivization; therefore Dammann (*ibid.*, pp. 166–7) interprets the derivatives as containing two suffixes rather than one joint suffix, the stative suffix being the detransitivizer. Nevertheless, neither Doke nor Dammann cite the possible intermediate forms, i.e. one-place intransitive statives with the suffix *-ak* (with meanings like ‘to be buried’) and/or two-place transitive spatial or object-oriented sociative forms with the suffix *-an* (with meanings like ‘to bury sb and sb together’). As was mentioned above, we observe here a kind of “skipping one deriva-

-
- | | | | | |
|-------|----|-------------------|--|------------|
| (iii) | a. | <i>ba</i> ‘beat’ | → <i>b-an-an-a</i> ‘beat each other’ | reciprocal |
| | b. | <i>zwa</i> ‘hear’ | → <i>zw-an-an-a</i> ‘hear each other’ (<i>ibid.</i>) | reciprocal |

tional step” (see (136)). The final forms in these chains are one-place intransitives but their meaning is more complex than that of the two-place transitive bases. This meaning can be regarded as spatial resultative, because the meaning of joining is absent in the base verbs and it appears in the resultative form. Unfortunately, this exotic case is represented by too few examples.

Lamba (Doke 1938: 198–9)

(206)	a.	<i>sika</i>	‘to bury sb’	
	b.	<i>sik-akan-a</i>	‘to be buried together’	spatial resultative
(207)	a.	<i>penda</i>	‘to count sb’	
	b.	<i>pend-anʒkan-a</i>	‘to be counted together’	spatial resultative
(208)	a.	<i>pūt-a</i>	‘to cover sb/sth’	
	b.	<i>pūt-akan-a</i>	‘to be spread abroad’	spatial resultative

12.5 Combination of a reciprocal suffix with a sociative marker, with the reciprocal meaning retained (Evenki, Buryat)

This case is attested in a few languages.

1. *Evenki*. In this language the sociative marker is used in the reciprocal sense as well, and in some dialects there is a strong tendency to use sociative forms (the suffix *-ldə-*) instead of reciprocals (the suffix *-maat-/-meet-*). Most probably, these dialects have retained the primary meaning of *-ldə-* better than other dialects. These suffixes can also be used jointly, as *-ldə-meet-*. Therefore, the reciprocal meaning can be expressed on the same stem in three ways (cf. also 3.3.5 where this material is considered from a different angle):

Evenki (Nedjalkov & Nedjalkov, Ch. 38, §§4 and 6)

(209)	<i>kik-</i> ‘to bite’	→	<i>kik-meet-</i> ‘to bite each other’	reciprocal
			<i>kik-ldə-</i> (same)	reciprocal
			<i>kik-ldə-meet-</i> (same)	reciprocal

2. *Buryat*. In this language, as well as in its close relative Khalkha-Mongol, the reciprocal and sociative markers are often used in either sense.

Buryat (Nedjalkov et al., Ch. 29, ex. (26d))

(210)	<i>hubaa-</i>	‘to divide/distribute sth among sb, share’	lexical reciprocal
	<i>hubaa-lda-</i>	‘to divide among oneself, take part in sharing sth’	reciprocal
	<i>hubaa-isa-</i>	(same meaning)	reciprocal
	<i>hubaa-lda-isa-</i>	(same meaning)	reciprocal

12.6 A two-component reciprocal marker containing a marker of transitivity and/or causativity (East Futunan, Halkomelem, Herero, Kwanjama, Kalkatungu)

The cause of such paradoxical combinations is not clear (cf. the combination of the reciprocal and causative markers for expressing the sociative meaning in 12.1.2 above). The causative meaning is not felt.

1. *East Futunan* (Moysse-Faurie, Ch. 35, §§3.2, 3.3). In this language, there are two circumfixes with a reciprocal function, *fe-...-(C)aki* and *fe-...-(C)i* where the suffixes are transitivity or causative when used alone:

East Futunan (ibid., ex. (14))

(211) *sōsō* ‘to move (oneself)’ → *sōsō-’aki* ‘to push sb’ causative

Despite the transitivity and causativizing components, derivations with these circumfixes are intransitive:

East Futunan (ibid., ex. (49))

(212) *alofa* ‘to love’ → *fe-alofa-’aki* ‘to love each other’ reciprocal

2. *Halkomelem* (Gerdts 1999: 138, 136, 151; see also (90) above). Although the combinations of affixes in East Futunan look rather odd and idiosyncratic, similar combinations are attested in Halkomelem. In this language a transitive marker *-t-* always precedes not only the reciprocal marker but both reflexive markers and even the passive marker. According to Gerdts, these combinations have been reanalyzed as single suffixes. Thus, reciprocal *-təl* is historically composed of the transitive component *-t-* and reciprocal component *-əl* which is not used separately at present, while *-t-* is. The suffix *-t-* is also a part of the passive and reflexive markers.

3. *Herero*, *Kwanjama* (Dammann 1954: 167). In these languages, the complex suffixes *-as-an-* (Herero) and *-af-an-* (Kwanjama) composed of the causative and reciprocal suffixes (where the components *-as-* and *-af-* have lost their causative meaning) have ousted the old reciprocal suffix *-an*.

4. *Kalkatungu* (Blake 1979: 43). There is a reflexive-reciprocal suffix *-ti*, but it operates on transitive verbs only. From two-place intransitive verbs with a dative or locative object, reciprocals are derived by means of the transitivity suffix *-(y)cama* in combination with *-ti*; cf. *nanti-* ‘to bark at’ → *nanti-kama-ti* ‘to bark at one another’, *luṅa-* ‘to cry for sb’ → *luṅa-ntiti-cama-ti* ‘to cry for one another’ (*-ntiti-* = PL). This may be one of the ways a two-component reciprocal marker develops with a causative or transitivity marker included, as in the previous three cases.

13. Reciprocal marking of kin relationships on verbs (Martuthunira)

Dench (1995: 153; see also Dench 1987: 326–7) claims that alongside the reciprocal and sociative (termed collective by Dench) meanings, the suffix *-marri-/yarri-/...* can be used in the meaning he terms kin group “<...> to emphasize the existence of a particular kin relationship in the clause. Specifically, the suffix indicates that the participants are in the same alternating generation set”; cf. (the derivatives are extracted from clauses; bold type mine – V.N.):

Martuthunira (ibid., p. 154)

- (213) a. *parrungka-marri-* ‘to look at each other’ reciprocal
 b. *karwa-marri-* ‘to get up together’ sociative
 c. *Ngawu, ngayu kangku-layi kartungu.*
 yes 1SG.NOM tak-FUT 2SG.ACC
nhawu-yarri-waa nyinu-malyura-ngu. kin relationship
 see-COLL-PURPS=O brother.in.law-2POSS-ACC
 ‘Okay, I’ll take you to see your brother-in-law.’

This case where kin relations between the participants are marked on the verb is an intermediate link between marking of reciprocal actions and marking of kin relations on nouns, the latter being the subject matter of Nedjalkov (Ch. 7); cf.:

Adyghe (Rogava & Kerasheva 1966:276–7)

- (214) a. *kɔoʃ* ‘brother’ → *zɔ-kɔoʃ* ‘brothers to each other’ (= brothers by the same father)
 cf. b. *Iučlən* ‘to meet sb’ → *zɔ-Iučlən* ‘to meet each other’

14. Lexicalization

There are two formal types of lexicalized reciprocals: (a) verbs formally relatable to non-reciprocal bases, but without a standard semantic relation (cf. Yakut *et-* ‘to say, speak’ → *et-is-* ‘to quarrel’), and (b) *reciproca tantum*, or *deponentia*, which have no non-reciprocal counterpart (cf. Yakut *tubu-s-* ‘to make peace with sb’ ← **tubu-*). In many languages, lexicalization of reciprocals is a common enough phenomenon, and in some, e.g. Chukchi, it is practically non-existent. Given a non-standard, individual semantic shift, the resultant meaning can be either reciprocal or non-reciprocal. However, the two meanings are not always based on the standard reciprocal opposition, e.g. the Tatar reciprocal *sug-əʃ-* (← *sug-* ‘to hit’) has two meanings: regular reciprocal (i) ‘to hit each other’ and lexicalized meaning (ii) ‘to fight’ clearly relatable to (i) (Zinnatullina 1969:196). But the Kirghiz *agar-əʃ-* ‘to forgive the past to each other’ is not semantically relatable to the base *agar-* ‘to glitter, look white’ from which a standard reciprocal cannot be derived at all. Generally, lexicalization does not include the sociative, comitative, assistive and some other meanings as they are a result of regular semantic changes.

Lexicalized items constitute a considerable part of lexical reciprocals. Commonly, lexicalized reciprocals have meanings like ‘to quarrel’, ‘to fight’, ‘to agree’, ‘to meet’, ‘to share’, ‘to compete’, ‘to have sexual intercourse’, etc. (see Ch. 1, case (ii) in §2.3 and also §16). They can be subdivided as follows: (a) semantically reciprocal lexicalizations, falling into predictable and idiosyncratic, and (b) non-reciprocal lexicalizations, denoting either response actions or non-response actions.

1. The meaning of a lexicalized derivative is/remains reciprocal; in this case we observe:

1a. Predictable lexicalizations with an expected transparent associative shift of meaning recurrent across languages; a typical example is the meaning ‘to fight’ of reciprocally marked derivatives from the base meaning ‘to beat, hit, kill’.³⁵ Another typical case is the meaning ‘to quarrel’ of derivatives from bases meaning ‘to say, speak’. Some derivatives have two meanings, a lexicalized and retained standard reciprocal meaning. Compare:

Ainu (Alpatov et al., Ch. 42, §8)

- (215) a. *rayke* ‘to kill’ → *u-rayke* ‘to fight, have a duel’
 b. *yee* ‘to say’ → *u-yee* ‘to quarrel, argue.’

Swahili (Loogman 1965: 141; Ovir 1896: 258; Loogman 1965: 140)

- (216) a. *-pig-a* ‘to strike’ → *-pig-an-a* i. ‘to fight’, ii. ‘to put forth great effort’
 b. *-nen-a* ‘to speak’ → *-nen-an-a* i. ‘to argue’, ii. ‘to talk to each other’
 c. *-sikiz-a* ‘to listen’ → *sikiz-an-a* ‘to agree together.’

Yakut (Kharitonov 1963: 46)

- (217) *et-* ‘to say, talk’ → *et-is-* i. ‘to quarrel, argue’, ii. ‘to say to each other.’

Japanese (Alpatov & Nedjalkov, Ch. 25, §7)

- (218) *i-u* ‘to say, speak, tell’ → *ii-a-u* ‘to dispute with each other.’

1b. Unpredictable lexicalizations which are unique and idiosyncratic; cf.:

Japanese (ibid.)

- (219) *kam-u* ‘to bite’ → *kam-a-u* ‘to be harmonious’
toke-ru ‘to melt, dissolve’ (vi) → *toke-a-u* ‘to be reconciled with each other.’

2. The lexicalized meaning of a derivative is not reciprocal. Two types of derivatives can be distinguished here:

2a. The meaning of the derivative implies a response action (e.g. ‘to enquire’) or is a response action itself (e.g. ‘to persist’), this meaning being close to the reciprocal:

Yakut (Pekarskij 1959: 431, 2360, 2361)

- (220) *bečigennee-* ‘to be stubborn, resist’ → *bečigenne-s-* ‘to persist’
suraa- ‘to inquire’ → *sura-s-* ‘to inquire’;³⁶

35. In general, derivatives from bases with this meaning occupy a special place among reciprocals. Interestingly, in the Australian Gumbaynggir language the verb with this meaning is the only one taking overt reciprocal marking, cf.: *bu(m)-* ‘to hit, kill’ → *bum-iri* ‘to fight’. As the author notes, this base “is probably semantically the verb most likely to be used in a reciprocal sense” (Eades 1979: 314–5). She also notes that “<...> in Yidiny (Dixon 1977: 282), the verb ‘hit’ is the only verb which when reduplicated forms an intransitive reciprocal” (ibid., p. 315).

36. Note in passing that the relationship ‘to inquire’ – ‘to answer’ is similar to the converse meaning of the reciprocal suffix in (2b), namely, *atəlaa-* ‘to sell’ → *atəla-s-* ‘to buy from sb’. This interesting opposition can also be marked by a causative morpheme, cf. Muna *ada* ‘to borrow’ (cf. ‘to sell’ – V.N.) → *-fo-ada* ‘to lend’ (lit. ‘to cause to borrow’; cf. ‘to buy’ – V.N.) (van den Berg 1989: 282). In Ancient Greek, this semantic opposition is encoded by

b. The meaning of the derivative does not imply any response action and is not a response action itself:

Kirghiz (ibid.)

(221) *kir-* ‘to enter’ → *kir-iš-* ‘to begin with.’

Ainu (Alpatov et al., Ch. 42, §8)

(222) *nukar* ‘to see’ → *u-nukar-e* ‘to peep at sb.’

15. Evolution of new meanings (reflexive, autocausative, deaccusative) of sociative-reciprocal markers

Most commonly, these meanings are encoded by reflexive-reciprocal markers, which is quite natural due to their reflexive origin. Nevertheless, in some Turkic languages these meanings are occasionally marked by a sociative-reciprocal marker. I will try to show the connection between the situations denoted by the derivatives cited below and reciprocal situations and the possible path of the evolution of these meanings. Examples:

1. Reflexive

Tuvan (Kuular, Ch. 27, §5.5.4)

(223) *Siler xünnün-*ne* xavan-nar aškaš malgaš-ka bora-ž-r ulus-tur siler.*
 you every.day-INTS pig-PL like dirt-DAT smear-REC-PART people-be 2PL
 ‘You, like pigs, smear yourselves with mud (from the lake).’

2. Autocausative (body move)

Tuvan (ibid., §5.5.5)

(224) *Čalan terek-ke oraa-ž-ə ber-gen.*
 snake tree-DAT coil(vt)-REC-CONV AUX-PERF.3
 ‘The snake has coiled round a tree.’

3. Deaccusative

Yakut (Nedjalkov & Nedjalkov, Ch. 26, §10.2.4)

(225) *Ba-ttan tut-us!*
 rope-ABL hold-REC.IMP.2SG
 ‘Get hold of the rope!’

The common feature of all the three cases is that all base verbs denote contact, which makes it possible to use a detransitivizing reciprocal marker: the derivatives denote spatial contact or interaction between two entities, and this meaning is akin to the meaning of reciprocal spatial contact (cf. object-oriented reciprocal spatial *C mixed A and B* or subject-oriented reciprocal spatial *A and B got mixed*), the difference being the semantic

middle inflection, cf. *δανεϊζω* ‘to lend money at an interest rate’ – *δανεϊζομαι* ‘to borrow money’. Cf. also Tagalog (92f).

status of the participants: in the case of reciprocals they belong to the same semantic class and perform identical double roles, while in (223)–(225) the participants belong to different semantic classes (animate and inanimate, viz. ‘(with) mud’, ‘(round) a tree’, ‘(of) the rope’) and perform different roles, but this difference is outweighed by the meaning of spatial contact or interaction.

16. Concluding remarks

In view of the fact that the aim of the typology of the polysemy of reciprocal constructions is a discussion of the meanings that can be compatible with the reciprocal meaning in the same marker cross-linguistically, in an attempt to find out the typical patterns of polysemy, the following should be stressed.

Polysemy of reciprocal markers is highly complicated and reveals an extraordinary scope of meanings and immense differences between languages in this domain. Note in the first place that, as pointed out above, there are languages with only monosemous reciprocal markers, only polysemous markers and also with both types of markers which may enter into complicated relations (see 1.1.1).

16.1 Three main polysemy patterns and prevalent types of valency change

In the polysemy of reciprocal markers, diverse meanings can be present, but the closest and most frequent meanings concomitant with the reciprocal are, as is established in the literature, reflexive, sociative and iterative. A polysemous reciprocal marker can express one of these meanings alongside the reciprocal (and possibly some other meanings not named here). Accordingly, three main types of polysemy are distinguished here: *reflexive-reciprocal* (with shared anaphoric function), *reciprocal-sociative* (with shared plurality (= more than one) of the participants), and *iterative-reciprocal* (shared plurality of actions performed in reciprocal situations either simultaneously or in succession). The reciprocal meaning generally entails detransitivization (with the exception of two diathesis types, “indirect” and “possessive” of verbal reciprocal markers, and pronominal reciprocal markers as they retain their nominal properties). Each of the three main types of polysemy patterns of reciprocal markers is characterized by the prevalent type of valency change in the non-reciprocal meanings. These types of polysemy are represented in many diverse languages of the world:

1. *The reflexive-reciprocal polysemy* is attested in many Indo-European, Australian, Nilo-Saharan, West-Atlantic, Semitic, Uto-Aztecan and other languages (see Section 2). This type involves detransitivization (cf. the reflexive, autocausive, anticausive, antipassive, deaccusative, potential-passive and other meanings typical of middle markers) or at least valency decrease (cf. impersonal) (see (40)).

2. *The reciprocal-sociative polysemy* is characteristic of Altaic, Tungusic languages, Tagalog, Indonesian, some of the Bantu languages (see Section 3). In this type, valency

retention (as in sociatives) or increase (cf. alternative, competitive, comitative, assistive, causative and other attendant meanings) are common, and the number of the participants mostly increases (cf. (85)).

3. *The iterative-reciprocal polysemy* is characteristic of many Austronesian, in particular Oceanic languages (Section 4). In this type of polysemy, valency retention is predominant (cf. the iterative, durative, habitual, reciprocal and other meanings – they do not obligatorily require non-singular participants; see (111)).

The reflexive-reciprocal polysemy is opposed to the other two types as reflexive-oriented to nonreflexive-oriented (= plurality-oriented), as the latter two patterns share the feature of plurality absent in the first type. Some of the meanings are attested only among nonreflexive-oriented reciprocal markers, viz. pseudo-reciprocal (see 11.2), plural (see 11.1), assistive (see Bari (122d, e), Tuvan (101b, c)), spatial-reciprocal (see Khmer (119h), Evenki (103) and Swahili (93d)).

16.2 Possible etymological relations

From the semantic and etymological viewpoints, the reciprocal meaning relates in a different way to the reflexive, sociative and iterative meanings (they are listed in order of assumed affinity to the reciprocal): a reflexive marker can acquire the reciprocal function, a reciprocal marker can acquire the sociative meaning and an iterative marker can acquire the reciprocal with a greater degree of probability than the other way round.

When acquiring a new function, the markers named can either retain their form (cf. German *sich lieben* ‘to love oneself/each other’) or become a part of a more complex marker. In the latter case, the shared part is likely to be

1. *A reflexive marker* in the case of a reflexive and a reciprocal markers (see, for instance, Yurok (15) above).

2. *A reciprocal marker* in the case of a reciprocal and a sociative markers (see, for instance, Adyghe (22) above).

3. *An iterative marker* in the case of an iterative and a reciprocal markers (cf., for instance, Bilin in case 2a, §1.4.3).

In case 2, the second part of the sociative marker may be such valency-increasing markers as applicative (cf. Ainu in 12.1.1), causative (cf. Adyghe and Ainu in 12.1.2), comitative (cf. Adyghe in 12.1.3) and even benefactive (cf. Maasai in 12.1.4).

16.3 Relations between verbal sociative and reciprocal markers

With respect to the relations between the expressions of sociativity and reciprocity, and also productivity of these meanings (when their expression is the same), at least the following five types can be distinguished:

1. *The sociative marker is different from the reciprocal marker* (or includes it, as noted above); cf. the sociative suffix *-d* and reciprocal suffix *-onndir* in Fula (Koval’ & Gnàlibouli 1997: 161, 167).

2. *The sociative and the reciprocal share a marker*, both meanings being productive; cf. the Tagalog circumfix *mag-...-an*; see 3.2.

3. *The sociative and the reciprocal share a marker*, which is of low productivity in the sociative meaning; cf. the Japanese suffix *-a*; see 3.3.

4. *The sociative and the reciprocal have different markers* but the sociative marker (alone or fused with the reciprocal marker) is sometimes used in the reciprocal sense; cf. the suffixes *-maat* and *-lda* respectively in Evenki; see 3.5.

5. *The sociative and the reciprocal have different markers* (according to grammars), but each of the markers can be used in the other sense, reciprocal or sociative respectively, the choice and interchangeability being not clear; cf. the Buryat reciprocal suffix *-lda* and sociative *-lsa*; see 3.6.

Relations analogous to these five types can also occur in the other two polysemy patterns, i.e. reflexive-reciprocal and iterative-reciprocal. Thus, for instance, the situation in Appalai is similar to case 4, as the prefix *at-* is both reflexive and reciprocal, and the prefix *at-at-* is reciprocal only (see (17) above). Case 5 seems to have existed in Juwaljai where the reciprocal marker *l-ŋili* and reflexive *-iŋili* exchanged functions (see (74) above), which seems to indicate that each of the markers had both meaning.

16.4 Extended main polysemy patterns

As mentioned, each of the three main polysemy patterns may include a number of other attendant meanings. Each of them may be extended by a third meaning out of the three main meanings concomitant with the reciprocal, and thus we obtain three extended types of polysemy, each a combination of the reciprocal meaning with two other main meanings (cf. 1.4.5). They are:

1. *Reflexive-reciprocal-sociative polysemy*; attested in some Australian languages (see Section 5).

2. *Iterative-reciprocal-reflexive polysemy*; the only attested case is the non-productive prefix *mag-* in Tagalog (see Section 6).

3. *Iterative-reciprocal-sociative polysemy*; attested in Oceanic languages (see Section 7).

A combination of all the four meanings, i.e. a marker with the reciprocal-reflexive-sociative-iterative polysemy, is not attested so far.

These extended types, both with and without any additional meanings, are much less common across languages than the above three (non-extended) main types with or without any other additional secondary meanings.

Curiously enough, some of the unproductive markers display rare and even unexpected polysemy patterns. For instance, case 2 is illustrated by the Tagalog prefix *mag-* (about 30 derivatives all in all; see Shkarban & Rachkov, Ch. 22, §3.1) but not by the productive Tagalog sociative-reciprocal marker *mag-...-an* which does not have the reflexive meaning. Case 1 can be illustrated by the unproductive East-Futunan prefix *fe-* (about a dozen derivatives; Moyses-Faurie, Ch. 35, §3.1) but not by the productive marker *fe-...-ʼaki* which has no reflexive meaning (see (124)). In Khmer, the unproductive prefix *prv-* (about 60 derivatives attested in *Dictionnaire* 1962:611) has, among others, meanings like

the reciprocal, iterative, causative and spatial (119). It is not clear whether some of the meanings are relics of productive meanings of the earlier period or an individual evolution caused by the semantic bleaching of the markers in question. On the other hand, a bleached marker may come to express a meaning which is pragmatically the most likely (especially if the base verb allows polysemy of the derivative). For instance, the derivative from a verb meaning ‘to push’ is likely to mean ‘to push each other’ and the derivative of ‘to run’ is likely to be sociative ‘to run together’ (which is natural for productive markers with reciprocal-reflexive polysemy), but the derivative from a verb meaning ‘to scratch’ is more likely to acquire the reflexive meaning ‘to scratch oneself’ rather than the reciprocal ‘to scratch each other’ because pragmatically the former is likely to be more common.

The reflexive-sociative and reflexive-iterative polysemy have occurred among markers which also have a reciprocal meaning, which is natural since these pairs of meanings do not share any common features, while the reciprocal meaning is contiguous to all the other three meanings and thus it is kind of intermediate between them and serves as a semantic bridge between them. As concerns the iterative-sociative polysemy, i.e. a polysemy without the reciprocal meaning, this type of polysemy has been registered more than once (see, for instance, Panare (29)).

16.5 The same additional meanings in the main polysemy patterns

Although generally each of the three main types of markers displays a characteristic set of meanings (simplified charts are shown in (40), (85) and (111)), sometimes the meanings characteristic of one type of polysemous markers appear in another type of markers, e.g. the anticausative, antipassive, potential-passive and passive, and competitive (see Section 9). These meanings may differ in productivity when expressed by the markers with different polysemy. For instance, the anticausative meaning highly characteristic of reflexive-reciprocal markers (e.g. 1400 items in Russian) is unproductive in the non-reflexive reciprocal markers (e.g. not more than 20 in Yakut; being limited to three-place transitives, mostly lexical reciprocals) (see 9.1). An additional (secondary) meaning may be more productive in genetically unrelated languages with different types of polysemy than in closely related languages with the same type of polysemy. For instance, the competitive meaning of the marker with sociative-reciprocal polysemy in Karachay-Balkar is productive (competitives can be formed from all verbs whose meaning allows it – about 40 registered items), while in other Turkic languages the number of competitives does not exceed 5–10 items (e.g. in Kirghiz and Yakut) and they are non-existent in some (e.g. in Azerbaijani). A rather numerous group of derivatives with the competitive meaning (about 25 items) exists in Bulgarian. In other Slavic languages (Serbian and Czech) competitives are minimally attested (see 9.4).

16.6 Extensions of the reciprocal meaning

This may concern both polysemous and monosemous reciprocal markers. These markers, when used in the reciprocal sense, may differ in combinability, syntactic and lexical

contexts across languages. For instance, they may combine with two-place transitives only or with two-place intransitives, or they may have individual restrictions on combinability. And there are even more idiosyncratic cases, such as the following. Note that these meanings stand apart from all those considered in the polysemy patterns, and it is rather hard to explicate any features common to them.

1. *Relativizing function.* In Kabardian (case 1 in 10.1), the reflexive and reciprocal markers are used on participles in the agreement slots of certain types of the relativized noun phrases, i.e. in syntactic structures like ‘The horse I am looking at’ (with the underlying structure ‘I am looking at the horse’).

2. *Pseudo-reciprocity.* This is the use of a reciprocal construction instead of the underlying non-reciprocal one, namely, with the pattern ‘Mother suckles the baby’ – ‘Mother and baby suckle each other’, as in Tuvan, Boumaa Fijian, Vietnamese, Chinese (see 11.2).

3. *Converse-reciprocal meaning.* This is the meaning of derivatives used in clauses like

(a) ‘A and B and C follow each other’, from verbs of joint motion meaning ‘to follow’, ‘precede’, ‘chase’, and the like (see Ch. 1, §10), or

(b) ‘X piled A, B and C one upon another’, from verbs like ‘to heap up’, ‘to pile up’ and the like (cf. (119h)).

The relations between the participants are usually shown as $A - \nu - B - \nu - C$, where B is related to A as C is to B , i.e. one object which lies upon another is under a third one at the same time. As a rule, cases like (a) and (b) are marked by reciprocal markers across languages.

Type (b) is only one of the sets of spatial reciprocals, another set being comprised of reciprocal derivatives with meanings like ‘to join two objects together’ (see (113), (114), (116) in Ch. 1), with symmetrical relations between the objects (in type (b) the relation between the objects is not symmetrical but converse).

4. *Response and anticipatory reciprocity.* In Cashinahua, a reciprocal sentence based on the verb meaning ‘to kill’ may have the following readings: i. ‘X and Y killed each other’ if the subject denotes two reciprocants, but if there is one collective participant and the second one is not named but implied two more readings are possible: ii. ‘X killed Y whose relatives had killed X’s relative in the past’, iii. ‘X killed Y and expects to be killed by Y’s relatives’ (see 10.2).

In connection with the last case, it should be noted that the problem of simultaneity or succession is relevant for the standard reciprocal meaning, though to a lesser degree. Depending mostly on the lexical meaning of the base verb (and, to a lesser degree, on the choice of construction), the reciprocal form can denote either simultaneous or successive subevents. The successive reading is characteristic of verbs with lexical meanings like ‘to visit’, ‘to help’, ‘to borrow’, ‘to accompany’, etc. (cf. (144)–(147) and the relevant text in §10.7 of Ch. 3).

1. Introduction

The reciprocal event structure constitutes a significant coding problem for languages: the reciprocity implies *symmetry*, in contrast with the inherent *asymmetry* of event construal in natural languages (Langacker 1990:222; Croft 1994:90). The problem resides so deeply in the nature of grammar that it persists even in artificial meta-languages of linguistics, so that in order to render the reciprocal semantics linguists would resort to a combination of *two* converse propositions (or their equivalent in another meta-language), as roughly represented by the following scheme:

* I am very grateful to Vladimir Nedjalkov, Leon Stassen, Masayoshi Shibatani and Christian Lehmann for interesting comments and encouraging discussion. Vladimir Nedjalkov helped me a lot by providing me with his data base on Bantu, as well as with information on other languages which might be of particular interest in the context of the research reported in this paper.

$$(1) \quad [A \text{ AND } B] V_{+REC} = (A \text{ V } B) \text{ AND } (B \text{ V } A).$$

In contrast with this, many natural languages do encode a reciprocal situation by means of a single clause, or, in other words, as a single event.¹ This means that they succeed in finding a solution for the coding problem posed by the contradiction between reciprocity and asymmetrical event construal.

Basically, this solution is very simple: the reciprocal participants are just treated as a single whole, that is, instead of encoding symmetry, languages encode role identity between the reciprocal participants. In a sense, this is true for any language: if a language has a mono-clausal reciprocal construction, all reciprocal participants can or must be represented by a single constituent (“simple” reciprocal construction in terms of Chapter 1), the relation between these participants being signaled by some overt marker elsewhere in the clause. In some languages, however, the essence of this coding solution is also reflected in the choice of the reciprocal marker, that is, the reciprocal encoding can be viewed as one of the functions of a more abstract grammatical device signifying role identity between separate participants. This phenomenon is interesting, since the reciprocal markers are commonly thought of as expressions signifying co-reference between participants serving different roles in the situation, a notion which reflects only one of the available typological options. The strategy to be discussed in this paper is precisely opposite: what is marked is not that two roles are performed by a same referent, but rather that that two (or more) referents are assigned the same type of participation in the event.

2. Polyadic roles and participant sets: A summary of cross-linguistic evidence

The reciprocal belongs to a wide range of complex event structures that assign the same type of participation in the event to multiple participants. Apart from the reciprocal, this type of event structure subsumes the sociative (collective), the distributive, the converse (chaining), the competitive, etc. This event type will be referred to below as *polyadic*, cf. the following definition:

- (2) *Definition.* Some type of participation in an event constitutes a *polyadic participant role* if it must be shared by minimally two separate participants. An event structure counts as *polyadic* if it involves such a role.

The cross-linguistic relevance of the polyadic event type is manifested by a recurrent marking pattern whereby one morpheme is used to encode a range of semantically very different polyadic structures (Lichtenberk 1985, 1999; Kemmer 1993:98–9). This marking pattern has been attested in a variety of non-related languages (e.g. Bantu, Turkic, and Oceanic) and is extensively exemplified in many chapters of this monograph. A few representative examples are given below:

1. This paper discusses only mono-clausal reciprocal constructions.

Kinyamwezi (Maganga & Shadeberg 1992: 164).

- (3) *chim-ana* ‘to fight with knives’
 -ikal-ana ‘to live together.’

Yakut (Nedjalkov & Nedjalkov, Ch. 26, §§9.2.1.1, 9.2.1.2)

- (4) *tapta-s-* ‘to love each other’
 kös-üs- ‘to fly together.’

Nêlêmwa (Bril, Ch. 34, §§3.1.1.1.1, 8.4.2)

- (5) *pe-yage-i* ‘to help each other’
 pe-hâgee ‘to fish together’; ‘to fish in different localities.’

Tuvan (Kuular, Ch. 27, §5.5.2)

- (6) *toolda-š-* ‘to tell fairytales to each other’, ‘to compete in telling fairytales.’

The polyadic participant role is a manifestation of a more abstract notion of *participant set*, which covers all cases where two or more separate individuals are ascribed the same type of participation in the event, including NP-conjunction (Maslova 1999). However different these phenomena may seem, they are encoded by means of formally identical morphemes in a number of languages. For example, the Yukaghir morpheme *n'e* renders the reciprocal meaning if prefixed to a verb and serves as an NP conjunction marker if suffixed to a noun:

Kolyma Yukaghir (field notes)

- (7) *odu-pe* *kukujerd'i-pe-n'e* *n'e-nuk-telle* *n'e-lejtej-ngi*.
 Yukaghir-PL Even-PL-CONJ REC-find-SS:PFV REC-learn-3PL.INTR
 ‘The Yukaghir and the Even met each other and got to know each other.’

Similar marking patterns are attested in Riau Indonesian (David Gil, p.c.), Thargari and Yinggarda (Dixon 1980: 433), and in Bantu (see 3.2-3.3). Another manifestation of the intrinsic link between the two major types of participant sets is the following implicational universal:

- (8) If a language has a reciprocal construction, it also has NP-coordination.

The cross-linguistic data collected in this volume shows that the simple reciprocal diathesis is a typologically unmarked option, that is, a language has the discontinuous reciprocal construction only if it also has the simple one, but not vice versa. In other words, if a language has a reciprocal construction, it must allow the reciprocal participants to be represented by one constituent (the same generalization apparently applies to other polyadic structures). Yet the only universal strategy of NP-conjunction is the *comitative* marking, whereby the conjoined NPs are not parts of the same constituent (Mithun 1988: 337–9; Stassen 2003). Thus, the comitative strategy could only give rise to a discontinuous reciprocal construction, which seems to be impossible in absence of a simple construction. This implies that the *NP-coordination* is a necessary prerequisite for the development of a

reciprocal construction, and, indeed, there seems to be no language that has a reciprocal construction but no NP-coordination (V.P. Nedjalkov, p.c.).

3. Reciprocal, polyadic and participant set across Bantu

Most Bantu languages instantiate the polyadic strategy of reciprocal marking, i.e. the reciprocal and sociative event types are subsumed under a single verbal category (cf. Dammann (1954) for an extensive exemplification and discussion). The polyadic suffix is rendered in grammars of various Bantu languages as *-an-*, *-na-*, *-ne* or *-ana-* (sometimes, different forms are given in different grammars of one language). The NP-conjunction is signaled by a formally similar adnominal morpheme, *n(a)*, which can serve either as a comitative marker or as a coordinate conjunction.

3.1 Event-structure marking in Bantu: An overview

The Bantu verb has an obligatory subject marker and, in some languages, an object marker. Other obligatorily marked categories are tense/aspect and a verb-final modal marker (“final vowel”) (Wald 1992: 159). The Bantu languages have a rather wide range of verbal suffixes modifying the event structure (so called “verbal extensions”). Most widely attested are passive, causative, anticausative, applicative, and reciprocal/polyadic. Other (less frequent and/or less productive) derivational meanings are reversive, introversive (absolutive), and a set of aspectual and quantificational meanings (e.g., extensive). The markers of event structure can be easily combined within one verb stem, cf.:

Kinande (Hyman 1993:3)

- (9) *-imb-ir-an-isi-bu-a*
 -sing-APPL-REC-CAUS-PASS-FV
 ‘be caused to sing for each other.’

The major valence-changing operations are illustrated by the following examples:

Passive: Swahili (Vitale 1981: 116)

- (10) a. *nyoka a-li-mw-uma Halima.*
 snake 3SG-PAST-3SG-bite H.
 ‘A snake bit Halima.’
 b. *Halima a-li-um-wa na nyoka.*
 H. 3SG-PAST-bite-PASS AG snake
 ‘Halima was bitten by a snake.’

Causative: Swahili (Vitale 1981: 116)

- (11) a. *Halima a-li-ki-pika chakula.*
 H._i 3SG_i-PAST-3SG_j-cook food_j
 ‘Halima cooked the food.’

- b. *Juma a-li-m-pik-isha Halima chakula.*
 J_k 3SG_k-PAST-3SG_i-COOK-CAUS H_i food_j
 ‘Juma caused Halima to cook the food.’

Anticausative: Lamba (Doke 1938:182)

- (12) *Amapili aa-won-eka.*
 mountains 3PL-see-ACAUS
 ‘Mountains have appeared / become visible.’

Anticausative constructions may render stative, inchoative, or potential meaning.

Applicative: Kinyarwanda (Kimenyi 1988:370)

- (13) a. *Umugóre a-kora akazi ku amafaraanga máke.*
 woman 3SG-work work for money few
 ‘The woman does the work for a small amount of money.’
 b. *Umugóre a-kor-era akazi amafaraanga máke.*
 woman 3SG-work-APPL work money few
 ‘The woman does the work for a small amount of money.’

Reciprocal: Swahili (Vitale 1981:147)

- (14) a. *Juma a-na-m-penda Halima.*
 J_i 3SG_i-PRES-3SG_j-love H_j
 ‘Juma loves Halima.’
 b. *Juma na Halima wa-na-pend-ana.*
 J_i COM H_j 3PL_{i+j}-PRES-love-REC
 ‘Juma and Halima love each other.’

Reflexive is signified by a verbal prefix which replaces the object agreement marker, cf.:

Reflexive: Swahili (Vitale 1981:137)

- (15) a. *Ahmed a-na-m-penda Halima.*
 A_i 3SG_i-PRES-3SG_j-love H_j
 ‘Ahmed loves Halima.’
 b. *Ahmed a-na-ji-penda.*
 A_i 3SG_i-PRES-REFL-love
 ‘Ahmed loves himself.’

Thus, in accordance with the general cross-linguistic tendency (Kemmer 1993:100), the polyadic reciprocal-encoding strategy precludes the formal affinity between the reciprocal and reflexive meanings. On the other hand, some Bantu languages have developed (presumably new) reflexive-based reciprocal constructions (see Section 5).

3.2 Distribution of the polyadic meanings

The semantic impact of the regular *-(a)n(a)*-marking is to subsume the underlying simple event under the polyadic event structure. All polyadic constructions in Bantu are

subject-oriented. Presumably, all the reciprocal constructions can be subsumed under the “canonical” reciprocal type, cf. (14) and (16):²

Babungo (Schaub 1985:209–10)

- (16) a. *mè táa báa yé ghô mbisii.*
 I FUT again see you tomorrow
 ‘I shall see you again tomorrow.’
 b. *sì táa báa yé-né mbisii.*
 we.DU FUT again see-REC tomorrow
 ‘We shall see each other again tomorrow.’

Thus, the reciprocal use of the polyadic suffix entails detransitivization (cf. 3.4 for a significant exception). In particular, if a language has object agreement on the verb, the reciprocal interpretation and the object agreement marker are mutually exclusive (Vitale 1981:150), cf. (14a) and (14b). Hence, the reciprocal and sociative meanings are clearly distinguished by the de-transitive effect associated with the former, cf. (17).

KinyaRwanda (Coupez 1985:15)

- (17) a. *-kurèba umugabo* → *kurèb-ana*
 look man look-REC
 ‘to look at a man’ ‘to look at *one another*’
 b. *-guhînga umurimá* → *-guhîng-ana umurimá*
 cultivate field cultivate-soc field
 ‘to cultivate a field’ ‘to cultivate a field *together*.’

Generally, the reciprocal interpretation of *-(a)n(a)-* seems to be preferred over the sociative one. This preference manifests itself in various ways. Cross-linguistically, there are Bantu languages where this suffix can render only the reciprocal meaning. This is the case, e.g. in Venda (Poulos 1990:188–9) and Babungo (Schaub 1985:209–10). In some other languages, the reciprocal meaning seems to be more frequent in texts (cf., e.g. (Shepardson 1986) for Swahili) and/or it is the only possible interpretation in all cases where the reciprocal meaning is compatible with the lexical meaning of the basic verb, that is, the sociative interpretation of the polyadic suffix is available only if the reciprocal one is precluded by the lexical context. Unfortunately, the available data on most Bantu languages is controversial as to whether this tendency is manifested only by the relative frequencies of the alternative interpretations of identical forms, or the meaning of the suffix is pre-determined by the verb stem. For example, for Swahili Shepardson (1986) obviously adopts the former hypothesis, whereas Dammann (1954:164) mentions only few cases

2. It should be noted that the direct object in the Bantu languages is not rigidly opposed to other object types; a sentence may contain two or three bare NPs which appear to be plausible candidates for this syntactic role (cf., for example, Kimenyi 1988:366). Hence, this constraint may be less strong than in languages with a more strict distinction between the direct object and more peripheral syntactic roles. What is essential, however, is that the reciprocal construction always involves the primary participant (subject) and another syntactically prominent (secondary) participant of the underlying role-oriented event, and the latter participant slot is absent from the reciprocal construction.

where one verb form can have either meaning and considers them as exceptions produced by neutralization of the morphological distinction between a sociative verb derived from a simple stem and the corresponding reciprocal derived from the applicative stem, cf.:

Swahili (Dammann 1954:164)

- (18) *furah-i-ana* i. [be.happy-APPL-REC] ‘to be rejoiced by *each other*.’
 ii. [be.happy-0-REC] ‘to be happy *together*.’³

In some Bantu languages, the polyadic suffix can be used as a verbal comitative marker, so that the comitative participant occupies the object slot, cf.:

Nkore-Kiga (Taylor 1985:67)

- (19) *y-a-ija-na embwa.*
 3SG-TP-COME-COM dog
 ‘He came with/brought a dog.’

In Duala (Ittmann 1939:141) the comitative is marked by a suffix which is tonally distinct from the genuine polyadic one, yet this distinction is neutralized in some forms and/or contexts:

Duala (Ittman 1939:140–1)

- (20) *dípà* ‘to beat’ → *dípà-ne* ‘to beat *each other*’
 ‘to beat *with*’
énè ‘to see’ → *énè-ne* ‘to see *each other*’
 ‘to see *with*’
topo ‘to speak’ → *topo-ne* ‘to discuss *each other*’
 ‘to speak *with*, scold’
ipe ‘to cook’ → *ip-ane* ‘to cook with *each other, together*’
 ‘to cook *with/in*.’

Generally, the comitative function of *-(a)n(a)-* appears to be significantly less frequent across the Bantu languages than the reciprocal and sociative functions; this meaning is more commonly encoded by means of the nominal comitative marker (cf. 3.3).

Apart from the regular polyadic marking, the polyadic suffix is commonly present in *lexical reciprocals*:

Tswana (Cole 1955:210)

- (21) *-tšhwana* ‘to resemble, be like each other’
-kôpana ‘to meet, meet one another’
-tlhakana ‘to mix, mix with each other’
-lekana ‘to be equal, be equal to each other.’

Venda (Poulos 1990:188–9)

- (22) *-fan-* ‘to resemble, be like each other’
-lingan- ‘to be equal’

3. The distinction is neutralized because in Swahili vowel-final loan words take an element *-(l)e-/(l)i-* when the reciprocal suffix is attached, and the former is identical in shape to the applicative suffix.

<i>-kuvhangan-</i>	'to collect, gather'
<i>-tangan-</i>	'to meet'
<i>-vangan-</i>	'to become mixed up'
<i>-vhumban-</i>	'to become interlocked, stuck together'
<i>-thalangan-</i>	'to be a distance away from someone.'

The corresponding simple stem may exist, but the meaning of the lexical reciprocal is not semantically predictable:

Swahili (Mjachina 1966)

- (23)
- | | | |
|--------------------------|---|--|
| <i>-sem-a</i> 'to say' | → | <i>sem-ana</i> 'to insult each other' |
| <i>-shik-a</i> 'to grab' | → | <i>-shik-ana</i> 'to be friends' |
| <i>-on-a</i> 'to see' | → | <i>-on-ana</i> 'to see each other, meet' |
| <i>-shind-a</i> 'to win' | → | <i>-shind-ana</i> 'to compete.' |

Fossilized instances of the polyadic suffix seem to exist in virtually all Bantu languages. In some languages, the polyadic marking is fully lexicalized, whereas the reciprocal meaning is expressed by a non-polyadic construction (e.g. in Luvale and Babungo, cf. Section 5).

To sum up, the distribution of various functions of the polyadic suffix across Bantu can be represented by means of the following hierarchy, where these functions are ordered from the most widely-spread down, see

- (24) lexical reciprocal \supset reciprocal \supset sociative \supset comitative.

Thus, the meanings associated with the polyadic suffix in various Bantu languages range from a general set-introducing function to the symmetrical event structure conceived of as an inherent property of a closed class of events.

3.3 NP-conjunction

The Bantu languages have a single NP-conjunction marker, *n(a)*, which functions both as a comitative marker and as a coordinate conjunction. If the conjoined NPs are associated with the subject, the coordination and the comitative are distinguished by the linear position of the NP introduced by *n(a)* and by the verb agreement: the coordinated NPs take the subject (pre-verbal) linear position and control the plural agreement marker; the comitative phrase takes the post-verbal position, the verb agreement being controlled by the pre-verbal NP alone:

Venda (Poulos 1990:403)

- (25)
- a. *Vele na khotsi anga vha khou shuma giratshi-ni.*
V_i COM father_j my 3_{PLi+j} PRES.CONT work garage-LOC
 'Vele and my father are working in the garage.'
- b. *Vele u khou shuma na khotsi anga giratshi-ni.*
V_i 3S_i PRES.CONT work COM father_j my garage-LOC
 'Vele is working in the garage with my father.'

Thus, Bantu can be assumed to instantiate the widely attested development of the NP-coordination on the basis of the comitative (Mithun 1988:337–9).

In contrast with the NP-coordination, the comitative use of the NP-conjunction marker does not necessarily imply the conceptual identity between the roles assigned to the comitative and the primary participant. As a result, the comitative marking can be employed, at least in some Bantu languages, as a sort of role-marker which serves to introduce a participant *without* identifying its role with that of the primary participant; for example, Kimenyi (1988:369) describes the comitative *n(a)* as a marker of *manner* (cf. (26)). A clear distinction between the roles assigned to the primary and the comitative participant is particularly common for the comitative applicative construction, which is marked by the polyadic suffix (see 4.1).

It can be easily observed the NP-conjunction and the polyadic are signified by formally similar morphological items, *-n(a)-* and *-(a)n(a)-* respectively (in fact, depending on the morphological analysis adopted by a grammar, these items can turn out formally identical).⁴ The similarity between these items, hence, the possibility of an etymological relation, is commonly mentioned in grammars of Bantu languages (cf., e.g., Taylor 1985:67). The comitative function constitutes a clear semantic overlap between these morphemes, cf. the following pair of examples:

KinyaRwanda (Kimenyi 1988:369)

- (26) a. *umugóre a-ra-kôr-a akazi n'úmweète.*
 woman 3SG-PRES-DO-FV work COM-enthusiasm
 'The woman is working with enthusiasm.'
- b. *umugóre a-ra-kôr-an-a akazi úmweète.*
 woman 3SG-PRES-do-COM-FV work enthusiasm
 'The woman is working with enthusiasm.'

Such examples suggest that the polyadic suffix and the NP-conjunction marker represent different functions of essentially the same set-introducing device. Generally, these functions are associated with different grammatical contexts: the verbal suffix signals the polyadic event structure, while the adnominal morpheme signals NP-conjunction. The verbal comitative violates this iconic correlation, thereby showing that a morpheme can occur in both grammatical contexts.⁵

4. Schladt (1996) summarizes evidence indicating that the reciprocal (i.e., polyadic) suffix across Bantu has the form *-na* (rather than *-an-*, as suggested by many authors on the basis of the obligatory grammatical status of the final vowel). For him, this point is a crucial prerequisite for establishing a grammaticalization path leading from a free ad-nominal marker to the verbal reciprocal suffix.

5. A piece of the family-internal evidence in favor of this account is given by the fact that some other Bantu morphemes can also be employed as both pre-nominal and verbal (applicative) markers, with a slight formal modification. For example, in KinyaRwanda, the locative prepositions *mu*, *ku* and *i* can be suffixed to the verb in the form *-mo*, *-ko* and *-yo* respectively (Kimenyi 1988:368).

3.4 Syntactic types of the polyadic constructions

The comitative variant of the NP-conjunction is regularly employed to create the discontinuous variant of the polyadic construction, where two participants with the polyadic role take different syntactic positions; sentence (14c) illustrates this option for the reciprocal sub-type (cf. (14b)), sentence (27), for the sociative sub-type.

Swahili (Vitale 1981:147)

- (14) c. *Juma a-na-penda-ana na Halima.*
 J. 3SG.SB-PRES-love-REC CONJ H.
 ‘Juma and Halima love each other’, lit. ‘Juma loves each other with Halima.’

KinyaRwanda

- (27) *umubyeyi a-O-kor-ana n-umwaana we.*
 parent 3SG-PRES-work-SOC CONJ-child her
 ‘The mother is working with the child (who is also working).’

In particular, the comitative marker is employed to introduce the secondary participant of lexical reciprocals:

Venda (Poulos 1990:440)

- (28) a. *murathu wanga u fana na inwi.*
 brother my 3SG look.like CONJ you
 ‘My brother looks like you.’
 b. *Vele o malana na khaladzi anga.*
 Vele 3SG be.married CONJ sister my
 ‘Vele is married to my sister.’

The existence of the discontinuous polyadic option in Bantu can be viewed as an implication of the general properties of the NP-conjunction, i.e. of the very fact that a single marker is able to create both the coordinate NP structure (hence, the “simple” construction) and the comitative (hence, “discontinuous”) construction, cf. absolutely parallel pairs of examples in (25) and (29).

Venda (Poulos 1990:189)

- (29) a. *musidzana na mutukana vha khou rw-an-a.*
 girl CONJ boy 3PL PRES.CONT hit-REC-FV
 ‘The girl and the boy are hitting each other.’
 b. *musidzana u khou rw-an-a na mutukana.*
 girl 3SG PRES.CONT hit-REC-FV CONJ boy
 lit. ‘The girl is hitting each other with the boy.’

A less trivial phenomenon is the existence of *transitive* polyadic constructions, whereby one polyadic participants takes the object position. In the reciprocal construction, the identity of the roles assigned to the reciprocal participants is indicated by the plural subject agreement on the verb (like in the simple reciprocal construction, cf. (30a) and (30b)):

Tonga (Collins 1962:74)

- (30) a. *bana ba-la-yand-ana.*
 children 3PL-PRES-LOVE-REC
 ‘The children love each other.’
 b. *Joni ba-la-yand-ana amukaintu wakwe.*
 J. 3PL-PRES-LOVE-REC wife his
 ‘John and his wife love each other’, lit. ‘John mutually loves his wife.’

The sociative variant of the transitive polyadic construction is represented by the comitative applicative (see (19)).

Thus, the *(a)n(a)*-marked constructions in Bantu exhibit the following three-way contrast:

- (31) Syntactic types of *(a)n(a)*-marked constructions
1. Simple construction.
 2. Discontinuous construction with a secondary participant represented by a comitative NP.
 3. Discontinuous constructions with a secondary participant represented by a bare NP.

The Bantu languages appear to draw the major semantic borderline between the former two types on the one hand, and the transitive type on the other, rather than between simple and discontinuous constructions.

4. Interaction of the polyadic with other event structure categories

4.1 Transitivity

Generally, there is no correlation between the transitivity and the concept of participant set: the integration of a participant set into the event structure can involve adding a valence slot (comitative), reducing a participant slot (reciprocal) or leaving the valence pattern intact (sociative). As a result, if the polyadic marker is eventually employed as a valence-changing device, it can, in principle, acquire both valence-increasing and valence-decreasing function. Precisely this situation is attested in Bantu:

In some Bantu languages the *(a)n(a)*-marking can be used as a non-reciprocal de-transitivizer, although this phenomenon is very rare and highly lexically constrained. Both agent-suppressing and patient-suppressing instances are attested. For example, in Babungo, the reciprocal suffix *-ne* (cf. (16)) can render the *anticausative* (32) meaning:

Babungo (Schaub 1985:209–10)

- (32) a. *mè ngà' shúufwè.*
 I open.PFV door
 ‘I opened the door.’
 b. *shúufwè ngà'-nè.*
 door open-ACAUS.PFV
 ‘The door opened.’

KinyaRwanda has a relatively rare *introversive* suffix (i.e., a patient-suppressing detransitivizer), which is identical in form with the reciprocal one, cf. *-érek-* ‘to show sb sth’ → *-érek-an-* [-show-INTRV-] ‘to show (sth)’ (Coupez 1985:19). The suffix sometimes implies a habitual meaning.⁶ Notice that the formally identical suffix, in the same language, can create the comitative applicative construction (cf. (26b)). In other words, one suffix is applied to suppress and to add the direct object. A similar situation is found in Dula, where the comitative suffix (see (20)) also functions as the anticausative marker, e.g., *énè-ne* ‘to become visible, appear’ vs. ‘to see with’: if a verb containing this suffix is used intransitively, only the anticausative interpretation is possible (Ittmann 1939:141).

4.2 Applicative

If the polyadic suffix is immediately preceded by an applicative one, the resulting meaning is most frequently rendered as reciprocity in the sense ‘for one another’, i.e. the reciprocal relation is established between the primary participant and the benefactive participant introduced by means of the applicative suffix. The effect can be described as mutual resolving of ambiguity: on the one hand, the applicative suffix can assign the direct object function to a benefactive, locative, or causal participant, whereas the polyadic “selects” the meaning appropriate for the reciprocal relation, cf. the following examples from Kinande: *-imb-* ‘sing’ → *-imb-ir-* ‘to sing to/for (person); at (place); for (reason)’ → *-imb-ir-an-* ‘to sing for each other’ (Hyman 1993:8). On the other hand, the applicative suffix determines the reciprocal (rather than the sociative) interpretation of the polyadic.

In an apparent contradiction with this interpretation, some Bantu languages have a compound *sociative* marker analyzable as a frozen combination of the applicative and the polyadic. For example, in Haya the simple reciprocal marker is non-productive; it is replaced by two compound markers: a sociative marker *-elan(a)/-ilan(a)* (e.g., *nyw-elana* ‘to drink together (with each other)’, *l-ilana* ‘to eat together (with each other)’) and a reciprocal marker *-angan(a)* (cf. *bon-angana* ‘to see each other’). The former is analyzed as a frozen [APPLICATIVE + POLYADIC] combination, the latter, as [EXTENSIVE + POLYADIC] combination (Dammann 1954:165, 168–9). However, this contradiction is illusive; in fact, the reciprocal differs from the sociative in that its polyadic role represents a combination of two roles of the underlying event. If a combination of the applicative and the polyadic is free, the underlying event is thought of as the one signified by the applicative stem, hence the reciprocal reading of the polyadic suffix. Once such a combination is frozen, the underlying event is signified by the simple (intransitive) stem, hence its sociative reading.

6. Coupez (1985:19) describes this suffix as homonymous to the polyadic one. A piece of evidence in favor of this interpretation is given by the fact that the suffixes can be combined within one verb form, cf. *-érek-an-an* [-show-INTRV-SOC-] ‘to show together’. Yet the reciprocal suffix itself can be doubled in some other languages, cf. the following example from Xhosa: *-buz-an-él-an-* [-ask-REC-APPL-REC-] ‘to ask exclusively for one another’ (Hyman 1993:11). Be it as it may, this formal overlap seems worth mentioning in the context of this paper.

4.3 Anticausative

A combination [ANTICAUSATIVE + POLYADIC] can produce two quite different semantic outputs. The first option does not involve any deviations from the polyadic semantics and can thus be considered predictable: the polyadic is interpreted as the “patient-oriented” sociative, cf. Swahili *-somesh-* ‘to teach’ → *-somesh-ek(a)* ‘to get taught’ → *-someshek-an(a)* ‘to get taught together’. This situation is illustrated in (33) for Tswana (the anticausative suffix is *-êg(a)*, the anticausative+reciprocal complex form is *-agan(a)*, by assimilation from **-êg-an(a)*).

Tswana (Cole 1955:211)

- (33) a. *-mena* ‘to fold’
 → *-men-êga* ‘to become folded’
 → *-men-ag-ana* ‘to become folded together’
 b. *-roka* ‘to sew’
 → *-rok-êga* ‘to become sewn’
 → *-rok-ag-ana* ‘to become sewn together’
 c. *-pitla* ‘to crush, squeeze’
 → *-pitl-êga* ‘to become crushed’
 → *-pitl-ag-ana* ‘to become crushed together’
 d. *-bopa* ‘to mould’
 → *-bop-êga* ‘to become moulded’
 → *-bop-ag-ana* ‘to become moulded or fused together.’

The resulting verbs are intransitive (like the corresponding anticausative forms) and denote that several inactive participants are associated in a joint state (getting into a joint state), whereby the active initiator of this state is eliminated from the case frame. The latter can then be introduced again by means of the causative suffix, but remains outside the scope of the polyadic marker, cf. *-men-ag-an-ya* ‘to fold together’, *-rok-ag-an-ya* ‘to sew together’, *-pitl-ag-an-ya* ‘to crush together’. Given that the primary participant is eliminated by the anticausative, the patient-oriented sociative is the only semantically predictable output of the combination.

However, in some cases the polyadic suffix apparently simply loses its meaning in the context of the anticausative suffix. Swahili seems to give the most striking example of this effect: the [ANTICAUSATIVE + POLYADIC] combination tends to have just the anticausative meaning, cf. *-on-ik-an(a)* ‘to be visible’ (*on-a* ‘to see’, *on-ik(a)* ‘to be visible’), *-pat-ik-an(a)* ‘to be obtainable’ (*-pat(a)* ‘to get, obtain’, *pat-ik(a)* ‘to be obtainable’), etc. According to Dammann (1954:169), there is no semantic distinction between simple anticausative forms and the corresponding anticausative polyadic forms; he mentions, however, that the latter might have had an additional habitual meaning (1954:170). On the other hand, the complex forms seem to replace the simple anticausative forms, at least for some verbs. The latter observation is supported by the results of text counts in (Shepardson 1986), which show that the [ANTICAUSATIVE + POLYADIC] combination occurs much more frequently than the anticausative suffix alone.

In some other Bantu languages, there is a clearer semantic distinction between the anticausative suffix and the [ANTICAUSATIVE + POLYADIC] combination. For example, in Shambala this distinction seems to be associated with the intensification of property, cf.: *tail-ik(a)* ‘to be known, knowable’ vs. *tail-ik-an(a)* ‘to be well-known, widely known’, *jil-ik(a)* ‘to be eatable’ vs. *jil-ik-an(a)* ‘to be good to eat’, *on-ek(a)* ‘to be or become visible’ vs. *on-ek-an(a)* ‘to become well visible’ (Dammann 1954: 169). That is, the polyadic suffix marks a higher degree of the property denoted by the anticausative verb. It seems that this phenomenon can be viewed as a rather predictable result of the combination of a polyadic event structure and a single-entity primary participant. If a polyadic predicate is applied to a single entity, the latter is construed as a whole consisting of some parts (due to the idea of participant set inherent in the polyadic semantics). The resulting meaning would then be, roughly: ‘each part of this whole has this property’. Now, an assertion like ‘Each part of X is (becomes) visible’ is clearly “stronger” than just ‘X is (becomes) visible’ (inasmuch as that the latter can mean ‘Some parts of X are (become) visible’ as well). That is, the polyadic predicate denotes a higher degree of the property than the non-polyadic one. This tentative explanation can presumably account for the “loss” of the polyadic meaning (as in Swahili) as well: if a language provides two constructional options to express the meaning like ‘X has/gets a property P’, one of which implies that each part of X has/gets this property, and the other is vague with respect to whether “the whole X” or only some part of it has this property, it seems highly probable that the first option would be used more frequently.

4.4 Quantification of situations

The interaction between the polyadic and quantification of situations (cf. Lichtenberk 1999; Kemmer 1997) plays a rather marginal role in the Bantu languages. Generally, the simple polyadic marking *-(a)n(a)-* appears to imply that the event is conceived as a single whole; the complex internal structure of reciprocal events is reflected only in the compound suffixes that resolve the ambiguity of the polyadic semantics. The resulting reciprocal suffixes can be associated with the multiplicity of sub-events.

For example, in Kikongo the compound reciprocal marker *(-asan(a))* used to have an additional *iterative* meaning (a series of separable sub-events), in contrast with the non-iterative simple marker (a single event); this distinction is now neutralized, and the simple marker is losing its productivity in favor of the phonologically “heavier” one (Dammann 1954: 165–6). Luba-Kasai has only a complex reciprocal marker, *-ángán(á)*, which can have either the reciprocal meaning (e.g. *-kwata* ‘to take, catch’ → *-kwat-ángáná* ‘to catch, grasp each other’, *-mona* ‘see’ → *-mon-ángáná* ‘to see each other, visit each other’), or the *extensive* meaning, cf. *-dima* ‘to cultivate’ → *-dím-ángáná* ‘to cultivate always, everywhere’ (Burssens 1946: 74).

On the other hand, some compound suffixes containing the polyadic morph appear to have *only* a quantificational meaning. For example, Luba-Kasai has still another compound suffix, *-akan(a)*, which never expresses the reciprocal meaning and is described in (Burssens 1946: 76) as *extensive* (intensive); its use is illustrated by the following examples:

-énd-ákáná ‘aller de côte et d’autre, se promener’, *-tamb-ákáná* ‘passer et repasser, aller et venir’.⁷

5. Reciprocal without polyadic

Some Bantu languages have reflexive-based reciprocal constructions. The reflexive-based reciprocals appear to occur in those languages where the polyadic marking is highly lexically constrained (see 3.2).

In Luvale, for example, the compound reciprocal and sociative suffixes can be attached only to a few verb stems:

Luvale (Horton 1949: 102–3)

- (34) a. *-íw-asana* ‘to consult, agree’; lit. ‘hear each other’
-séþ-asana ‘to cross one another (as sticks)’
-hùng-asana ‘to annul one another (as counter-accusations).’
 b. *-pâl-akana* ‘to press or squeeze together’
-xind-akana ‘to press, squeeze, crowd’
-ly-ángana ‘to eat together, i.e., at each other’s place.’

The regular means of expressing the reciprocal meaning is the reflexive prefix:

Luvale (Horton 1949: 117)

- (35) a. *Vali na-ku-li-veta.*
 they FUT-3PL-REFL-beat
 ‘They are beating one another.’
 b. *Vyuma vi-na-li-fwane.*
 things 3PL-PERF-REFL-resemble
 ‘The things resemble each other.’

The reflexive prefix can be combined with the old reciprocal suffix *-asana*, cf. *-li-iw-asana* ‘to come to an agreement with one another’, *-li-sèl-asana* ‘to pass by one another’ (Horton 1949: 103). Both simple and discontinuous reciprocal constructions with *li-* are attested:

Luvale (Horton 1949: 117)

- (36) a. *Na-va-li-pangila vyama.*
 FUT-3PL-REFL-divide things
 ‘They will divide things among themselves.’
 b. *Mwa-ka-li-pangila vikumba na-masepa jenyi.*
 3SG-FUT-REFL-divide goods COM-friends his
 ‘He will divide goods with his friends.’⁸

7. On the basis of these examples, the meaning of the suffix could be more precisely described as *alternative* (motion in different directions).

8. The verb *divide* is certainly somewhat suspicious, as far as the reciprocal meaning is concerned. Unfortunately, however, the examples provided by Horton give no better possibility to illustrate this distinction.

Another formal type of a reflexive-based reciprocal construction is attested in Babungo (Schaub 1985:113), where the polyadic suffix is also highly lexicalized. The reciprocal meaning is regularly expressed by means of a reduplicated pronoun which refers to the whole group of reciprocal participants. This pronoun phrase is added at the end of the sentence (i.e., it occupies the position which is characteristic of adverbial). The non-subject constituent involved into the reciprocal relation is represented by a pronoun co-referent with the subject (i.e., identical with that within the final pronominal phrase), sometimes accompanied by the word ‘body’ (common for the Babungo reflexive constructions as well):

Babungo (Schaub 1985:113)

(37) *Làmbí nè Ndúlá gântè yínwáa vëng, vëng vëng.*
L. and N. help.PFV body their they they
‘Lambi and Ndula helped each other.’

(38) *vìng bíng nú bwee tí vìng, vìng vìng.*
you.PL agree thing bad to you.PL you.PL you.PL
‘Confess your sins to each other.’

(39) *yia túngmè ngò’sèe máa yíngwáa yíia, yia yia.*
we.EXCL shoot-PFV stones at bodies our.EXCL we.EXCL we.EXCL
‘We shot stones at each other.’

The underlying idea is to indicate the coreference of the (group of) participants in a non-primary role to that in the primary role (exactly as in the reflexive construction). However, the final pronominal phrase distinguishes the reciprocal construction from the reflexive one. It seems worth noting that (in contrast with the polyadic reciprocals), the new reflexive-based reciprocal constructions are not restricted to the “canonical” type (cf. sentences (36), (39)), i.e. these reciprocal constructions apparently cover a wider range of imaginable reciprocal situations.

6. Conclusion

The possible functions of the $(a)n(a)$ - ~ $n(a)$ - marking in Bantu are summarized in the following scheme:

(40) Reciprocal \supset Sociative \supset V-comitative \supset N-comitative \supset NP-coordination,

where “V-comitative” and “N-comitative” denote verbal and nominal instances of the comitative marking, “ \supset ” is intended to reflect the degree of integration of the participant set into the event structure. Each pair of neighboring functions on this scale represents a clearly semantically motivated and typologically recurrent marking pattern and can be safely assumed to be expressed by the same morpheme (if not synchronically, then diachronically), see 3.2–3.3. What is interesting about the Bantu languages is that one morpheme is employed in *every* context which requires integration of a participant set into the clause structure.

Interestingly, the central part of scale (40) (i.e. the verbal comitative and, to a lesser degree, the sociative) represents the least frequent functions of the $(a)n(a)$ - \sim $n(a)$ - marking across the Bantu languages (see 3.2), i.e. the central part of the semantic network associated with participant sets seems to be most easily lost in the course of diachronic evolution. This hypothesis is supported by typological evidence: as mentioned in Section 2, some languages exhibit the marking pattern that subsumes only the reciprocal meaning and the NP-conjunction, i.e. the “central” functions which would provide the semantic motivation of this marking pattern are missing at the synchronic level. This suggests that the semantic interpretation of such a general set-introducing device tends to be determined by the grammatical context: the verbal instances favor the interpretations associated with a higher degree of integration of the participant set into the event structure. As a result, the verbal instances of the set-introducing marker tend to be interpreted as polyadic, and, ultimately, as reciprocal.

Schladt (1996) suggests that the Bantu reciprocal results from grammaticalization of the comitative preposition. However, if such a development did take place, it could hardly be interpreted as grammaticalization. From the semantic point of view, it is a precisely opposite process: the NP-conjunction, that is, a clearly grammatical item evolves into a very semantically specific marker of event structure.⁹ Accordingly, the hypothesized development imposes strong lexical constraints on the verb stem, in contrast to what should happen in the course of genuine grammaticalization. As it seems, the Bantu data reveals a phenomenon essentially different from grammaticalization: a grammatical item is recruited by a language to solve the coding problem posed by some specific meaning, in this case, the reciprocal event structure.

1. Introduction

So far, I have discussed reciprocal markers on verbs, of the type as in (1a). As it happens, some reciprocal markers in some of the languages, can occur on words of other classes, while expressing a reciprocal or some contiguous meanings; cf. Ainu (Alpatov et al., Ch. 42, ex. (126), (128f)):

- (1) a. *nukar* ‘to see’ → *u-nukar* ‘to see *each other*’
 b. *irwak* ‘brother’ → *u-irwak* ‘*both* brothers’
 c. *arke* ‘half, part’ → *u-arke* ‘half *for each*.’

Note that non-verbal bases can combine with both polysemous (e.g. Tagalog *mag-*, Nélémwa *pe-*) and monosemous reciprocal markers (e.g. the Chukchi suffix *-wəly-*, Ainu prefix *u-*, Kolyma Yukaghir *n’e-*). There are markers used reciprocally in non-verbal derivation only. These cases are of interest if semantically analogous derivatives are formed by reciprocal markers as well, when used in both intra-verbal and non-verbal reciprocal derivation. One of similar cases (though belonging outside the limits of the subject-matter of Chapter 7 is considered below to illustrate what I mean; see (2d) and (36), (35)). In general, the use of reciprocal markers in derivation involving non-verbs is less widespread cross-linguistically than verbal reciprocal derivation proper. Some derivations are highly restricted lexically. Nevertheless, it may be interesting to try and find out how an original function may be adapted for other, usually less productive functions (cf. ex. (1a) with (1b) and (1c)).

It is rather difficult to give a semantic definition for non-verbal reciprocals. Below, the reader will find practically all the cases attested so far across languages and their tentative semantic classification. The overall picture of non-verbal reciprocal derivation is quite complex and variegated, but some general tendencies can be traced. The semantic range of these derivatives, and as often as not of their bases, coincides mostly with that of *lexical reciprocals*, i.e. words (that may function as predicates) containing the reciprocal component in their lexical meaning and with the arguments related reciprocally. For instance, if John is Peter’s brother, Peter is naturally John’s brother, and if John argues with Peter it means that Peter argues with John at the same time. Lexical reciprocals, both verbal and non-verbal, fall into three main lexical groups:

1. Reciprocals denoting *spatial* actions or states, most commonly verbs of joining and separating, e.g. ‘to come/draw together’, ‘to collide’, ‘to get pasted together’, ‘to come/tear apart’, ‘next to’, ‘a heap’,¹ etc.

2. Reciprocals denoting *equality* or *non-equality*, e.g. ‘to compare’, ‘to differentiate’, ‘the same’, ‘similar’, ‘alike’, ‘different’, etc.

3. Reciprocals denoting *social relations*, e.g. ‘friend’, ‘to be friends’, ‘to marry’, ‘to fight’, etc.

Semantically close to reciprocal relations are converse relations (i.e. relations when one of the paired members presupposes another member with a certain meaning), such as ‘parents – children’, ‘aunt – nephew’, ‘husband – wife’, ‘elder brother – younger brother’, ‘in front of – behind’, ‘at the top – below’, ‘far away – nearby’, ‘to follow – to precede’, etc. (On lexical reciprocals see Ch. 1, §16).

1.1 Four main types of reciprocal markers encountered on non-verbal bases

Below, both derivatives with intraverbal reciprocal markers and those with other markers used in the reciprocal sense are considered. Four types of logical relations are possible between intraverbal and non-intraverbal reciprocal markers; they may be shown graphically as follows (the intraverbal markers are signified as X and non-intraverbal markers as Y):

(2)	Intraverbal		Non-intraverbal
a.	X	=	Y
b.	X	⊃	Y
c.	X	⊂	Y
d.	X	≠	Y

The following is meant to explain these relations.

(2a) The same reciprocal marker is used both for intraverbal and non-intraverbal derivation (cf. Adyghe *zə-ləəkʲlon* ‘to visit each other’ and *ə-kəoʃ* ‘his-brother’ → *zə-kəoʃ* ‘brothers to each other (= brothers having the same father)’; ‘cf. also (1a) and (1b, c) above). In my material this is the most common type.

(2b) The intraverbal marker can partially coincide with the non-intraverbal marker, being a part of it (cf. Yakut *tarbaa-* ‘to scratch sb’ → *tarba-s-* ‘to scratch each other’ and *küres* ‘competition’ → *küres-te-s-* ‘to compete’; Ainu *e* ‘to eat, devour’ → *u-e* ‘to devour each other’ and *ona* ‘father’ → *u-ona-kor* ‘to be related as father and son’).

(2c) The non-intraverbal marker can be a part of an intraverbal reciprocal marker (cf. Tagalog *ibig* ‘love’ [→ *ibig-an* ‘mutual love’] → *mag-ibig-an* ‘to love each other’). This is an exotic case, and so far it is attested in Tagalog only. Note that the prefix *mag-* can also derive reciprocals from a limited number of non-derived verbs, mostly lexical (quasi-) reciprocals (cf.: *s-um-unod* ‘to follow sb’ → *mag-sunod* ‘to follow one after another’).

1. The noun phrase ‘heap’ is a spatial lexical reciprocal because it denotes a result of collecting (or joining, gathering from various directions) of homogeneous objects in the same place.

(2d) The markers in question are entirely different (cf. Indonesian *me-mandang* ‘to look at sb’ → *ber-pandang-an* = *pandang-me-mandang* = *saling me-mandang* ‘to look at each other’ and *ayah* ‘father’ → *se-ayah* ‘to have the same father’). This is usually observed on derivatives denoting similarity with respect to the feature denoted by the base. Non-intraverbal markers may reveal phonetic similarity with the intraverbal marker, which may show their genetic relatedness, but they are not segmentable in contrast to the Yakut *-te-s* above); cf. the Even suffix *-lta/-lte* marking reciprocal adverbs and the intraverbal suffix *-lda/-lde* (see (53) below).

Case (2b) needs some amplification. An additional component of an intraverbal marker may be of different types.

- It may be an affix that derives verbs from words of other classes, especially nouns; so far, this case is attested in the Turkic languages; the Yakut suffix *-la-s/-ta-s/...* contains the verbalizing suffix with numerous positional variants *-laa/-taa/-daa/-dee/-la-/-da- /...*; cf. *xaartā* ‘cards’ → *xaartā-laa-* ‘to play cards’, *aadārās* ‘address’ → *aadārās-taa-* ‘to address sth to sb’, *aat* ‘name’ → *aat-taa-* ‘to name’. The complex suffix *-la-s/-ta-s/...* derives verbs which have no respective forms without *-s-*, this complex being perceived as a single item. Thus, for instance, there is an opposition *tuspa* ‘difference’ → *tuspa-la-s-* ‘to differ’, but **tuspa-la-*. From some transitives in *-laa/-taa*, reciprocals can be derived in a regular way, each component expressing its own meaning (cf. *aadārās-taa-* ‘to address sth to sb’ → *aadārās-ta-s-* ‘to address sth to each other’).
- It may be a possessive marker, as in the Ainu derivative *u-ona-kor* cited in (2b) above (see also §4.3). Since a reciprocal situation presupposes at least two participants, reciprocal nouns of some languages can either contain an obligatory marker of possessivity or be used in the plural number (see (4d) above). In some languages, the reciprocal marker takes the position of a possessive marker; cf. Adyghe *ə-kəoš* ‘his-brother’ → *zə-kəoš* ‘brothers to each other’.
- It may be either an ancient plural marker or of recent origin, or a combination of both. This plural marker can be attached not only to derivatives with the meaning of collective plurality (cf. Tundra Yukaghir *-jil’-pe* where the suffix *-jil’* is an ancient plural marker and *-pe* is a recent one; see (21) below; the current South Sierra Miwok suffix *-HmetiH-* in (22)), but also to derivatives with the meaning of duality (cf. the Southern Paiute suffix *-ŋwī* in (6) and (14); the Tuvan suffix *-lar* in (12)).

1.2 Three main types of semantic relations in derivational pairs

The relations between the meaning of a (non-derived) base and that of the (quasi-)reciprocal derivative can be of the following three types:

- The reciprocal meaning of the derivative is inherited from the base word (lexeme); cf. (3a) below.
- The reciprocal meaning of the derivative is added by the derivational marker; cf. (3b).
- The reciprocal meaning of the derivative is inherited from the base word (lexeme), but the marker in question adds a new meaning related to the reciprocal; cf. (3c):

- (3) a. Kirghiz *araz* ‘quarrel’ → *araz-daš-* ‘to quarrel’
 b. Kirghiz *n’uur* ‘face’ → *n’uur-daš-* ‘to stand face to face’
 c. Tagalog *pinsan* ‘cousin’ → *mag-pinsan* ‘two cousins.’

Note that mostly lexical reciprocals or converses function as derivational bases, for instance, noun phrases like ‘two cousins’, ‘two brothers’, ‘two feet’, ‘mother and child’, etc., but not noun phrases meaning ‘two soldiers’, ‘two butchers’, ‘soldier and child’.

Some of the semantic oppositions discussed here are unique, being registered in one language only. For instance, the opposition ‘foot/feet’ → ‘both feet’ is attested in Ainu only (see 3.1.3), ‘left’ → ‘left-handed’ in Kammu (see 3.1.4), ‘one’ → ‘one each’ in Mundari (4.7.1), ‘three’ → ‘two times three’ (= ‘six’) in Southern Paiute (4.7.2), ‘love’ → ‘mutual love’ in Tagalog (4.6), ‘they’ → ‘they mutually’ in Chukchi (3.2.2), etc. This may be due to the limited number of languages investigated and possibly to the inadequacy of available publications. Note that some of the meanings, e.g. (‘brother’ →) ‘both brothers’, (‘brother’ →) ‘all the brothers to each other’, (‘mother’ →) ‘mother and child’, are attested in more than one languages. But in all the oppositions listed here the meaning is either reciprocal or related to it in one way or another. The available data show extreme complexity and variety of the latter meanings adjacent to reciprocity. Establishing the uses of a marker in the meanings that do not seem to be logically related to its main meaning is of special typological interest.

Semantic relations between the derivative and the base are not always transparent, and, besides, they may be lexicalized to a greater or lesser degree.

1.3 Five main derivational types

With respect to the word classes the base and the derivative with a reciprocal marker belong to, derivational pairs can be subdivided, in the first place, into numerically unequal groups: *verbal-nominal* and *adverbial* groups.

The *verbal-nominal* group comprises pairs with the bases and/or derivatives that are nouns and/or verbs. They may be related in four possible ways listed here in the diminishing order of productivity:

- (4) a. *Verb* → *Verb* (see Section 2 below); e.g. Chukchi:
lɪu- ‘to see’ → *lɪu-waly-* ‘to see each other’
 b. *Noun* → *Noun* (see Section 3); e.g. Southern Paiute:
t̪iyiv^w-i- ‘friend’ → *na-ri’χiv^w-i-ηwi* ‘two friends’
 c. *Noun* → *Verb* (see Section 4); e.g. Muna:
sabhangka ‘friend’ → *-po-sabhangka* ‘to be friends’
 d. *Verb* → *Noun* (see Section 5); e.g. Bamana:
sìgí ‘to live’ → i. *à sìgi-ɲɔ̀gɔ̀n`* ‘his neighbour’
 ii. *sìgi-ɲɔ̀gɔ̀n-w* ‘neighbours.’

In cases (4b) and (4c) the term *noun* is used as a kind of a cover term: sometimes, numerals and adjectives occur here instead of a noun proper.

In the *adverbial* group the bases may vary: reciprocal adverbs may be derived from prepositions, postpositions, adverbs and auxiliary nouns with locative meanings. This type of derivatives expresses mostly spatial meanings and may include as many as 10 to 20 items; cf.:

- (4) e. Adverb, postposition, etc. → adverb (Section 6); e.g. Nivkh:
laya ‘next to sth/sb’ → *u-laya* ‘next to each other.’

2. Derivational pairs “Verb → Verb”

This type of derivation is discussed in Chapters 1, 3 and 5. In (5) below, intraverbal derivation in 28 languages is illustrated. A number of genetically related languages display similar derivations with both verbal and non-verbal bases (Adyghe and Abaza; Kirghiz, Tuvan and Yakut of the Turkic family). Therefore we may assume that in the material subjected to analysis 24 idiomatic types of derivation are registered. In these 28 languages the reciprocal markers illustrated below are also attested on non-verbal derivatives, which are considered in Sections 3–6. Prior to these, examples of reciprocal verbs with the same marker are cited, the languages being arranged in alphabetical order, to enable the reader to compare the use of the same markers on non-verbal derivatives. The meanings of the bases are obvious from the translations.

- (5) Abaza *ai-čvažvara* ‘to speak with each other’
 Abkhaz *ai-šbtra* ‘to follow each other’
 Adyghe *zə-ləəklon* ‘to visit each other’
 Ainu *u-e* ‘to devour each other’
 Bamana *ɲɔɡɔn bɔɡɔ* ‘to beat each other’
 Chukchi *llu-waly-* ‘to see each other’
 East Futunan *fe-tamate-’aki* ‘to kill each other’
 Even *baka-mat-* ‘to find each other’
baka-lda- ‘to meet’
 Evenki *iče-meet-* ‘to see each other’
 Fijian *vei-loma-ni* ‘to love each other’
 German *sich/einander lieben* ‘to love each other’
 Indonesian *ber-pandang-an* ‘to look at each other’
 Kammu *t̄r-pók* ‘to bite each other’
 Kirghiz *körsöt-üş-* ‘to show sth to each other’
 Kolyma Yukaghir *n’e-juö-* ‘to see each other’
 Khalkha-Mongol *ala-lda-* ‘to kill each other’
 Mono *na’na-’waqa* ‘to talk with each other’
 Muna *-po-lobhi* ‘to hit each other’ (of two participants)
 Mundari *da-pa-l-* ‘to hit each other’ (-*pa-* = infix)
 Nêlêmwa *pe-boima* ‘to kiss each other’
 Nivkh *u-y-* ‘to kill each other’
 Southern Paiute *na-γwi’pa-* ‘to hit each other’
 Southern Sjerra Mywok *ʔelɲe-mhi-* ‘to leave each other’
 Tagalog *mag-yakap* ‘to embrace each other’

Tigak	<i>e-vis</i> ‘to fight with each other’
Tlingit	<i>wùtc hàs wùdzit’in</i> ‘they tell the truth to each other’
Tundra Yukaghir	<i>n’iŋ-aināni</i> ‘to fire at each other’
Tuvan	<i>aalda-š-</i> ‘to visit each other’
Wàrrungu	<i>paja-wa-</i> ‘to bite each other’
Yakut	<i>tarba-s-</i> ‘to scratch each other.’

With three exceptions, the reciprocal markers in (5) are affixes (suffixes, prefixes, infixes and circumfixes). The Bamana marker *ɲɔɡɔn* and Tlingit *wùtc* (which changes into *wùt* in nouns) are the only reciprocal pronouns in the list. They are used to derive reciprocal nouns from verbs, these nouns being compounds. The third exception is the German pronoun *einander* which tends to turn into locative preverbs in combination with prepositions.

3. Derivational pairs “Noun → Noun”

The following meanings are registered in this derivational type.

3.1 Duality

The derivative denotes two persons, usually relatives, or inanimate objects in reciprocal or converse relations. This concerns *natural pairs* of objects which are connected by certain relations denotatively. Thus, *one* word contains the meaning of *two* words. The word ‘stranger’ is included here as a kind of antonym of ‘relative’. I include here also instances when one of the participants is a group of relatives. Sapir (1930:110) notes: “The idea of reciprocity leads naturally to that of duality of terms involving mutual relationship”. He refers to the formations considered below as “dual reciprocals”. Even if duality is not explicated, two participants are usually meant.

Number ‘two’ turns out to be intimately related with reciprocity. This can be shown, among others, by the following

- In Muna, the reciprocal prefix *po-* is used only for situations with two participants (though the verb agreement marker has the plural form). If a situation with more than two participants is described the base must be reduplicated (van den Berg 1989:206; see also Ch. 1, §6).
- In Awtuw, the reciprocal prefix is always accompanied by the marker of the dual number even if the number of participants exceeds two; at the same time, the verb contains a plural marker, though in non-reciprocal constructions the dual and plural markers do not co-occur in the same form (Feldman 1986:67; see also Ch. 3, §6.3.2.4).
- In Vedic, the (unproductive) reciprocal preverb *vi* is descended from the adverb *dvīs* ‘twice’ (L. Kulikov, p.c.).

3.1.1 Type 'brother' → 'two brothers'

Illustrations follow:

Southern Paiute (Sapir 1930: 109–10; *-ŋwī* = PL)

- (6) a. *tiyiv^wi* 'friend' → *na-ri'χiv^wi-ŋwī* 'two friends'
pavi 'elder brother' → *na-va'vi-ŋwī* 'two brothers'
qimantsi 'stranger' → *na-yī'mantsi-ŋwī* 'two who are strangers to each other.'

Although these formations contain the plural suffix, the plural number on them is marked by reduplicating *na*-:

- b. *na-va'vi-ŋwī* 'two brothers' → *na-na'-vavi-ŋwī* 'three or more brothers.'

Ainu (Alpatov et al., Ch. 42, §11.2)

- (7) a. *anun* 'stranger' → *u-anun* 'mutual strangers.'

In the following adjacent case, two derivational processes take place at the same time: reciprocal prefixation and compounding of two nouns which may be regarded as converses. Morphologically, this type is different from the previous ones but it is entered here due to the shared feature of one word being used instead of two.²

- b. *tus* 'mistress', *mat* 'wife' → *u-tus-mat* 'mistress and wife.'

In Tagalog, the reciprocal prefix *mag-* forms derivatives of this type from unmarked lexical reciprocals (see (8a)) and also from derived reciprocal nouns with the prefix *ka-* (see (8b)) considered in 3.3 below.

Tagalog (Shkarban & Rachkov, Ch. 22, §§3.3.2, 5.2.1; *-um-* = active voice marker)

- (8) a. *kapit-bahay* 'neighbour' → *mag-kapit-bahay* 'two neighbours'
pinsan 'cousin' → *mag-pinsan* 'two cousins'
ka-patid 'brother/sister' → *mag-ka-patid* 'two brothers/sisters,
brother and sister'
b. *ka-klase* 'classmate' → *mag-ka-klase* 'two classmates'
ka-pangalan 'namesake' → *mag-ka-pangalan* 'two namesakes'
ka-sing-taas 'one of equal height with sb' → *mag-ka-sing-taas* 'two of equal height.'

3.1.2 Type 'aunt' → 'aunt and nephew'

The nouns in such pairs denote persons, mostly relatives in converse relations. There are over 20 such reciprocals in Tagalog. Characteristically, in Tagalog, "... these forms derive from the names of socially more important or superior members" (Shkarban & Rachkov, Ch. 22, §3.3.2). In the other languages, e.g. in Ainu, this is not observed (see (37)); in Tagalog, the only exception is *anak* 'child' → *mag-anak* 'family'.

2. The pair 'mistress and wife' is not of course a purely converse pair but the word 'mistress' is often enough associated with and opposed to 'wife'.

Tagalog (ibid.)

- (9) *ina* ‘mother’ → *mag-ina* ‘mother and child’
ama ‘father’ → *mag-ama* ‘father and child’
ale ‘aunt’ → *mag-ale* ‘aunt and nephew’
ginoo ‘master’ → *mag-ginoo* ‘master and servant’
asawa ‘spouse’ → *mag-asawa* ‘a married couple’, i.e. ‘husband and wife.’

Fijian (Milner 1972: 163, 113; Dixon 1988: 176–7)

- (10) *tina* ‘mother’ → *vei-tina-ni* ‘mother and her child’
wati ‘spouse’ → *vei-wati-ni* ‘married couple’
tama ‘father’ → *vei-tama-ni* ‘father(s) and child(ren).’

Dixon (1988: 175) characterizes the Fijian prefix *vei-* as collective and he considers derivatives of the type cited in (10) as collective, as well as the following derivatives with the meaning of plurality, including distributivity:

- (11) *'oro* ‘village’ → *vei-'oro* ‘every village’
tamata ‘person’ → *vei-tamata* ‘everybody’
'aa ‘thing’ → *vei-'aa* ‘many things, everything’
kau ‘tree’ → *vei-kau* ‘forest’, etc. (see also (36b)).

In this connection, it may be useful to mention the hypothesis (for another hypothesis see the text and note beneath (31b)) that the reciprocal suffix of the Turkic languages is descended from the Common Turkic suffix of (collective) plurality *-š (cf. Sevortjan 1962: 138; Serebrennikov 1974: 10–1). An argument in favour of this hypothesis is the use of -š in oppositions of the type cited in (12); cf.:

Tuvan (Isxakov & Pal'mbakh 1961: 171; *-lar* = PL, *-kə* may also function as a marker of relative adjectives)

- (12) *ava* ‘mother’ → *ava-š-kə-lar* ‘mother and her child(ren)’
ugba ‘elder sister’ → *ugba-š-kə-lar* ‘sisters’ (the elder and younger sisters).

Tigak (Beaumont 1979: 93–4)

- (13) *tama* ‘father’ → *rek e-tama* ‘they are father and son.’

Southern Paiute (Sapir 1930: 109–10)

- (14) *moa(tsi)* ‘father’ → *na'-ŋ'w'tst-ŋwī* ‘father and son’
pia- ‘mother’ → *na-vi'a-ŋwī* ‘mother and daughter.’

Mono (Langacker 1976: 11)

- (15) *peti* ‘daughter’ → *na'na-peti* ‘parent and daughter.’

In connection with the data presented in 3.1, it may be useful to mention the following. In Udehe, there is a comitative postposition *mule* which “indicates that the two participants are related by a close (family) association and consitute a natural pair: a husband and wife, a mother and son, and so on” (Nikolaeva, Ch. 23, §3.5.2). This postposition is also used

in reciprocal constructions to denote the reciprocal participants if they are relatives. The suffix *-mule* which is naturally related to this postposition derives “plural” forms from a limited list of lexical reciprocals which can also take the common plural and case markers:

- (16) *xa:-* ‘sibling’ → *xa:-mule-ziga* ‘brothers’,

where *-ziga* is a plural marker, e.g. *-mule-* is not a plain plural marker but something more. This usage can be compared with the use of a plural marker alongside a reciprocal marker with the meaning ‘two’ (cf. Southern Paiute *na-...ŋwī* in (6a, b) and Southern Sierra Miwok *-mhi-HmetiH* in (22), Tundra Yukaghir *n’iŋ...-jil’-pe* in (21)). The nouns taking the suffix *-mule-* have meanings like ‘elder brother’, ‘friend’, ‘comrade’. This suffix refers to an inanimate unity in the derivative *tie-mule* ‘pair’. Compare also 3.1.3 where the word meaning ‘pair’ contains a reciprocal marker.

3.1.3 Type ‘foot’ → ‘both feet’

In Ainu, the reciprocal prefix *u-* occurs on names of *paired* body parts, the derivatives acquiring the meaning ‘both’, and also on the word with the meaning ‘pair’; cf. *u-mure* ‘pair’ (it is probably not accidental that the only numeral which contains the vowel /u/ is *tu* ‘two’). Six such forms are registered; e.g.:

Ainu (Alpatov et al., Ch. 42, §10)

- (17) *kema* ‘foot’, ‘feet’ → *u-kema* ‘both feet’
tap ‘shoulder’ → *u-tap* ‘both shoulders’
sik ‘eye’ → *u-sik* ‘both eyes’
tek ‘hand’ → *u-tek* ‘both hands.’

3.1.4 Type ‘left’ → ‘left-handed’

In Kammu, the reciprocal prefix *tř-* occurs on two adjectives and adds the meaning shown in (18); though unique, the use of this suffix here seems to be due to the fact that the derived adjectives apply to paired objects: the left hand presupposes the right hand and *vice versa*, which amounts to a converse relation. The derivatives retain this relation.

Kammu (Svantesson 1983: 113, 112)

- (18) *wěř-* ‘left’ → *tř-wěř* ‘left-handed’
hám ‘right’ → *tř-hám* ‘right-handed.’

3.2 Collective plurality

These derivatives have meanings like ‘(all) relatives, neighbours (and the like) between themselves, in relation to each other’.

3.2.1 Type ‘brother’ → ‘all the brothers [to each other]’

A noun, often in the plural form, may denote a group of people (usually relatives) as opposed to another group.

The reciprocal prefix *zə-* in Adyghe indicating coreference with a non-direct object is also used on nouns which can express mutual relationship between persons, i.e. on

two-place nouns like ‘brother’, ‘sister’, ‘person of the same age’, ‘neighbour’, ‘comrade’, etc. rather than on personal nouns like ‘worker’, ‘student’, ‘passerby’, etc.; e.g.:

Adyghe (Rogava & Kerasheva 1966:274, 276–7).

- (19) *kəoš* ‘brother’ → *zə-kəoš* ‘brothers to each other’
šəpxəu ‘sister’ → *zə-šəpxəu* ‘sisters between themselves’
gəunəgəu ‘neighbour’ → *zə-gəunəgəu* ‘neighbours of each other’
nəluasə ‘acquaintance’ → *zə-nəluasə* ‘acquaintances between themselves’
ləgəu ‘person of the same age’ → *zə-ləgəu* ‘persons of the same age between themselves.’

Tlingit (Boas 1917:65–6; *wùtc* → *wùc-* when used attributively)

- (20) *wùc-kik’yán* ‘brothers between themselves, to each other.’

Tundra Yukaghir (Maslova, Ch. 44, §6.2; *n’iŋ-/n’i* = REC; *-jil’-* = ancient PL marker; *-pe-* = regular PL marker)

- (21) *aka* ‘elder brother’ → *n’iŋ-aka-jil’-pe* ‘all elder brothers together’
n’uge ‘cousin’ → *n’i-n’uge-jil’-pe* ‘(all) cousins’
eki ‘elder sister’ → *n’i-n’uge-jil’-pe* ‘(all) elder sisters.’

Southern Sierra Miwok (Broadbent 1964:109–10, 74; *-HmetiH-* = PL)

- (22) a. *pace-* ‘relative, kinsman’ → *pace-mhi-HmetiH-* ‘relatives to each other’
 b. *ta.ciH-* ‘older brother’ → *ta.ciH-mhi-HmetiH* ‘brothers to each other.’

On the use of the suffix *-mhi-* in cases like (22a), Broadbent (ibid.) writes: “It is not common, but it is probably productive. Its meaning is reciprocal, ‘to each other’ ”.

3.2.2 Derivatives from [*pro*]nouns; type ‘they’ → ‘they mutually’

This rare phenomenon is registered in Chukchi and it is included here with reselections. The reciprocal marker seems to stress spatial proximity and joint actions of the participants.

Chukchi (Nedjalkov, Ch. 40, §3.5; the suffix *-e* = INSTR)

- (23) *ətri* ‘they’ → *ə-ək-wəly-e* (*ačyəta*) <they-LOC-REC-INSTR (next to)> ‘with each other (next to)’ (situation: the reciprocants-fighters approach the enemy shoulder to shoulder in an attack)
uwik ‘body’ → *činit uwik-wəly-ək* <oneself body-REC-LOC> ‘with their own bodies’ (situation: the reciprocants try to warm up by pressing to each other).

3.3 Type ‘class’ → ‘person of the same class’

This group corresponds semantically to the verbal derivatives in 4.2. In both groups, in contrast to most other groups, the bases need not be lexical reciprocals. Incidentally, in both languages cited below the derivatives are formed by means of non-intraverbal markers.

Tagalog (Shkarban & Rachkov, Ch. 22, §5.2.1; *sing-* ‘equal in sth’)

- (24) *klase* ‘class’ → *ka-klase* ‘classmate’
pangalan ‘name’ → *ka-pangalan* ‘namesake’
sing-taas ‘equal height’ → *ka-sing-taas* ‘one of equal height with sb.’

In Kirghiz, there are about 100 nominal derivatives with the suffix *-laš/-taš/-daš/...* (= Jakut *-las/-tas/...*), the same one that derives verbal reciprocals from nouns (see case 2b in 1.1 and (29)). Sometimes, the relationship between the base and the derivative is based on metaphor. These derivatives fall into lexical groups denoting persons sharing a spiritual or physical feature, of the same age, also class membership, kinship, blood relations, personal relations or common origin, partnership in an activity, or persons or things in spatial proximity, while the bases may vary in meaning.

Kirghiz (Nedjalkov, Ch. 28, §12.3)

- (25) *aj* ‘moon’ → *aj-la-š* ‘women in the same month of pregnancy’
ata ‘father’ → *ata-la-š* ‘born of the same father’
boj ‘height’ → *boj-lo-š* ‘(persons) of the same height, age’
suu ‘water, river’ → *suu-la-š* ‘(settlement) situated on the same river’
bikir ‘thought’ → *bikir-de-š* ‘like-minded person’
ešik ‘door’ → *ešik-te-š* ‘next door neighbour’
klass ‘class’ → *klass-ta-š* ‘class-mate’
žol ‘road, way’ → *žol-do-š* ‘fellow-traveller, comrade’
bötölkö ‘bottle’ → *bötölkö-le-š* ‘boon-companion’
zaman ‘time, epoch’ → *zaman-da-š* ‘contemporary.’

4. Derivational pairs “Noun → Verb”

4.1 Plain verbalization and related cases; type ‘friend’ → ‘to be friends with’

The base nouns are mostly lexical reciprocals (instances with a predictable slight shift of meaning are also included here). They typically denote the following:

- reciprocal relations (like ‘peace’, ‘agreement’) or actions (like ‘game’, ‘quarrel’, ‘exchange’, ‘struggle’, ‘talk’), or
- participants of reciprocal situations (like ‘friend’, ‘fellow-traveller’, ‘neighbour’, ‘family’, ‘collaborator’, ‘relative’).

Most of the derivatives are two-place (at least semantically) intransitives. Lexical reciprocals are also two-place, as a rule (although this is sometimes hard to see); cf. *peace between A and B* → *A made peace with B*; *A is B’s friend* → *A and B became friends*.

Evenki (Nedjalkov & Nedjalkov, Ch. 38, §13)

- (26) *turen* ‘word’, ‘language’ → *turet-meet-* ‘to talk with each other.’

Khalkha Mongol (Nedjalkov et al., Ch. 29, §13)

- (27) *xuuwy* ‘advice’ → *xuuwya-lda-* ‘to come to an agreement’
nüür- ‘face’ → *nüüre-lde-* ‘to meet in confrontation.’

Warrungu (Tsunoda, Ch. 32, §3 and 8.2)

- (28) *kuku* ‘speech’ → *kuku-wa-* ‘to argue, quarrel with each other.’

As just noted (see case 2b in 1.1), the Yakut suffix *-la-s-/-le-s-/-te-s-/. . .* does not derive common reciprocal verbs, the regular reciprocal marker being the suffix *-s-* (see Yakut in (5)).

Yakut (Nedjalkov & Nedjalkov, Ch. 26, §§12.2.1–12.2.3)

- (29) *tuspa* ‘difference’ → *tuspa-la-s-* ‘to differ, be distinct from sb/sth’
atas ‘friend’ → *atas-ta-s-* ‘to become/make friends’
il ‘peace, concord’ → *il-le-s-* ‘to make peace with sb’
küres ‘competition’ → *küres-te-s-* ‘to compete with sb’
ajax ‘relatives, kinsfolk’ → *ajax-ta-s-* ‘to become relatives’
djukaax ‘neighbour’ → *djukaax-ta-s-* ‘to share a room/house’
ös ‘enmity’ → *ös-tö-s-* ‘to quarrel, to be at war.’

The following Yakut derivatives with the meaning of assistance or resistance do not express reciprocity proper: they denote actions performed in response to or implying another action.

- (30) *utarə* ‘opposite, against’ → *utarə-la-s-* ‘to contradict, counteract’
kömö ‘help, assistance’ → *kömö-lö-s-* ‘to help, assist sb.’

Plain verbalization is also attested in Muna:

Muna (van den Berg 1989: 56, 314–5)

- (31) a. *sabhangka* ‘friend’ → *-po-sabhangka* ‘to be friends with’
bhai ‘companion’ → *-po-bhai* ‘to accompany sb’
kantawu ‘heap’ → *-po-kantawu* ‘to be gathered together.’

The prefix *po-* is also attested as an unproductive marker of deverbal nouns, *nomina actionis* among them; cf.:

- b. *wura* ‘to see’ → *po-wura* ‘vision, view, sight’
fetingke ‘to feel’ → *po-fetingke* ‘hearing’
tandai ‘to remember’ → *po-tandai* ‘memory’ (van den Berg 1989: 316).

This fact is worth mentioning because reciprocal markers in a number of languages, e.g. Turkic, are used in similar derivations. There is an opinion that the material coincidence of the suffix *-š* of deverbal *nomina actionis* and reciprocals in the Turkic languages is not accidental and reveals their common origin; cf.:

- (32) Uzbek a. *ur-* ‘to hit’ → *ur-iš* ‘to hit each other’
b. *kir-* ‘to enter’ → *kir-iš* ‘entering.’

- (33) Kirghiz
- | | | | |
|----|--------------------------|---|---|
| a. | <i>körsöt-</i> ‘to show’ | → | <i>körsöt-üš-</i> ‘to show to each other’ |
| b. | <i>körsöt-</i> ‘to show’ | → | <i>körsöt-üš</i> ‘showing, a show’ |
| c. | <i>kara-</i> ‘to see’ | → | <i>kara-š-</i> ‘look at each other’ |
| d. | <i>kara-</i> ‘to see’ | → | <i>kara-š</i> ‘sight.’ |

It should be noted that *nomina actionis* display common features with collective nouns in that they are not usually used in the plural number either. The genetic proximity between the reciprocal suffix and that of nouns of action in Turkic languages was pointed out by Radloff (1897: 57–8) (see also Clauson 1967: 6–7). The reciprocal use of the marker of nouns of action can be tentatively explained as follows: in these nouns the object valency is weakened, and as a result the agent expression connected semantically with a noun of action can be interpreted as both agent and patient (an approximate illustration: *I love her* – *I am in love with her* – *We are in love* i. ‘We are in love with someone else’, also ii. ‘We love each other’; cf. also: **We mutually love*, but *our mutual love*). Compare in this connection the possible reciprocal interpretation of the phrases *the shooting of the soldiers* and *the touching of the knees*; see Uhlenbeck (1967: 271).

4.2 Derivatives of similarity and identity; type ‘year’ → ‘to be of the same year’

These derivatives denote similarity or identity with respect to the feature named by the base.

Nêlêmwa (Bril, Ch, 34, §9.1; *-n* = 3SG.POSS for human possessor, *-t* for inanimate or collective inanimate possessor)

- (34) *ka* ‘year’ → *pe-kau-n* ‘to be of the same year’
thala-t ‘side, flank, width’ → *pe-rala-t* ‘to be the same width.’

East Futunan (Moyses-Faurie, Ch. 35, §3.3.4)

- (35) *taka* ‘shoe (also ‘to walk’)’ → *fe-taka-’aki* ‘to take the same size in shoes’
’uluga ‘pillow (also ‘to rest one’s head on a pillow’)’ → *fe-’uluga-’aki* ‘to share the same pillow.’

Example (35) requires a justification, because the base words function both as nouns and verbs; as Moyses-Faurie explains (ibid.), “These derivatives are often semantically closer to the nominal than to the verbal sense of the base term.”

The reciprocal marker *se-* in (36) does not coincide with any of the Indonesian in-traverbal reciprocal markers mentioned in case 2d in 1.1:

Indonesian (Ogloblin & Nedjalkov, Ch. 33, §11)

- (36) *nasib* ‘fate’ → *se-nasib* ‘to have the same fate’
sekolah ‘school’ → *se-sekolah* ‘to go to the same school’
pendapat ‘opinion’ → *se-pendapat* ‘to be of the same opinion.’

A similar semantic group of derivatives is attested among derived nouns (see 3.3). When the latter are used predicatively, both groups practically coincide formally and syntactically.

4.3 Derivatives denoting converse relations between relatives; type ‘mother’ → ‘to be related as mother and child’

So far, I have encountered derivatives of this type in Ainu only. There are about 15 such derivatives in Ainu. Besides the reciprocal prefix *u-*, the derivatives also contain the verb *kor* ‘to have’. Omission of the reciprocal prefix results in the ungrammaticality of the remaining part; cf. **ona-kor* with the intended meaning ‘to have a father’. This meaning can be rendered not by means of incorporating *ona-kor* but by means of a free collocation *ona kor* ‘to have a father’. These two differ in that some prefixed agreement markers are preposed to verbal formations with incorporation and in free collocations they are placed on the verb.

Ainu (Alpatov et al., Ch. 42, §11; *-i-* = POSS; cf. *sut* ‘grandmother’ → *suc-i* ‘the grandmother of sb’)

- (37) *ona* ‘father’ → *u-ona-kor* lit. ‘to have a father-child relationship’
po ‘son, child’ → *u-po-kor* ‘to have a son-parent relationship’
sa ‘older sister’ → *u-sa-kor* ‘to have an older sister – younger sister or older sister – younger brother relationship’
matapa ‘younger sister (for an older brother)’ → *u-matapa-kor* ‘to have a younger sister – older brother relationship’
ak ‘younger brother’ → *u-ak-i-kor* ‘to have a younger brother – older brother or younger brother – older sister relationship’
irwak ‘brothers and sisters’ → *u-irwak-i-kor* ‘to have, be brothers/sisters, brothers and sisters.’

The last pair in (37) shows a tendency of Ainu kinship terms to acquire the reciprocal marker. As a matter of fact, the term *irwak* itself contains a reciprocal marker as it is descended from *ir-u-ak* where *-ak* means ‘younger brother’ which itself has a derivative with the reciprocal marker *u-ak-i-kor* (see above), and *ir-* is a bound noun stem meaning ‘brothers and sisters’; it has also been preserved with the reciprocal marker as *u-ir* ‘to be brothers and/or sisters’.

A similar group is also to be found among derived nouns in a greater number of languages (see 3.1.2).

4.4 Spatial reciprocals; type ‘face’ → ‘to stand face to face’

Here belong verbs derived from various parts of speech (nouns in (38a, c), adverbs in (38b)) denoting spatial contact, all kinds of motion or position relative to each other or changing position of parts of a whole (38a), and also chaotic movements (38c). In (38a, c), the marker is the same as in (29).

Yakut (Nedjalkov & Nedjalkov, 26, §12)

- (38) a. *atax* ‘leg/foot’ → *atax-ta-s-* ‘to lie together with heels touching’
eŋer ‘side, edge’ → *eŋer-de-s-* ‘to live next to [each other]’
n’uur ‘face’ → *n’uur-da-s-* ‘to stand face to face’
xar-ə ‘ice-blocking’ → *xar-ta-la-s-* ‘to pile up (of ice blocks) one upon another’

- b. *aksa* ‘nearby, close (to)’ → *aksa-la-s-* ‘to be next to each other’
ürüö-taraa ‘to and fro’ → *ürüö-te-s-* ‘to gather/crowd together’
serge- ‘next to, near’ → *serge-s-te-s-* ‘line up, walk next to each other’
- c. *üömex* ‘disorderly crowd/flock’ → *üömex-te-s-* ‘to flock/crowd/mill together’
üörük ‘matted hair’ → *üörük-te-s-* ‘to become matted/entangled’
ïama ‘young fish’ → *ïama-la-s-* ‘to swarm/teem with.’

The meaning of the last derivative in the list reflects the fact that young fish generally move in flocks in various directions, to and fro.

4.5 Derivatives related to the bases in an individual idiomatic way; type ‘shoulder’ → ‘to marry’

The following varieties can be distinguished: the meaning of the base may be employed metaphorically or the base names an object that is relevant in the reciprocal situation. The connection with the base by association can be traced here. Derivatives (39c) and (40c) also have a similarity with group (13b). On the whole, the boundaries between this and the previous types are vague and often subjective.

Evenki (Nedjalkov & Nedjalkov, Ch. 38, §13)

- (39) a. (verbal derivatives with suffixes *-meet* and *-ldə* see in (5); the latter suffix is employed as sociative and reciprocal)
 b. *mire* ‘shoulder’ → *mire-meet-* ‘to marry’
 c. *dəl* ‘head’ → *dəl-maat-* ‘to wrestle setting heads against each other’
ŋaale ‘arm’ → *ŋaale-ldə-* ‘to wrestle holding each other by the arms.’

Kirghiz (Nedjalkov, Ch. 28, §12.2)

- (40) a. *kubala-* ‘to chase’ → *kubala-š-* ‘to chase each other’
 b. *kez* ‘occasion’ → *kez-de-š-* ‘to come across’
 c. *mojun* ‘neck’ → *mojun-de-š-* ‘to embrace each other by the neck.’

4.6 A reciprocal marker in its regular meaning; type ‘love’ → ‘mutual love’

In Tagalog, the principal class of reciprocal verbs is derived by means of the prefix *mag-* from reciprocal nouns (*nomina actionis* in meaning) which in their turn are derived from non-reciprocal nouns, occasionally from lexical reciprocals (41c).

Tagalog (Shkarban & Rachkov, Ch. 22, ex. (79), (80), (92))

- (41) a. *ibig* ‘love’ → *ibig-an* ‘mutual love’ [→ *mag-ibig-an* ‘to love each other’]
 b. *patay* ‘killing’ → *patay-an* ‘killing each other’ [→ *mag-patay-an* ‘kill each other’]
 c. *alit* ‘quarrel’ → *alit-an* ‘mutual quarrel’ [→ *mag-alit-an* ‘quarrel with each other’].

The highly polysemous suffix *-an* may also denote the sociative meaning (41d) and a number of other meanings in some of which the semantic component of plurality may be perceived (41e):

- d. *ális* ‘departure’ → *ális-an* ‘departure of several persons together’
 e. *bahay* ‘house’ → *bahay-an* ‘position of a number of houses’
saging ‘banana’ → *saging-an* ‘banana grove.’

The derivational chain in (41a) is probably unique if we regard it as the only one possible. However, another path of derivation, namely, omission of the prefix, seems to be possible:

- f. *um-ibig* ‘to love’ → *mag-ibig-an* ‘to love each other’ → *ibig-an* ‘mutual love.’

Here the noun of action is formed by omission of the prefix *mag-*, and the reciprocal verb by means of the confix *mag...-an* (the formation of verbal reciprocals by means of circumfixes is very common in Malay-Polynesian languages; cf. (10) and (35)). More widespread cross-linguistically is derivation of *nomina actionis* from reciprocal verbs by means of a special marker; cf.:

- Yakut (-s/-h- = REC, -h- in intervocalic position; -əə = marker of *nomina actionis*)
 (42) *uura-* ‘to kiss sb’ → *uura-s-* ‘to kiss each other’ → *uura-h-əə* ‘mutual kissing.’

4.7 A reciprocal marker on numerals

This case seems to be extremely rare: so far it has been attested in two languages, each manifesting a different usage of the marker.

4.7.1 *The distributive meaning on numerals; type ‘two’ → ‘two each’*

In Mundari (Osada, Ch. 37), there is a reciprocal infix *-p-/pa-/po/...* which has no other meanings when used on verbs. Of special interest is the ancient use of this infix on five numerals, while a productive parallel means on all numerals is the reduplication of the first syllable (see the right-hand column).

- Mundari (Osada, Ch. 37, ex. (14))
- (43) *bar-ia* ‘two’ → *ba-pa-r-ia* ‘two each’ – *ba-ba-r-ia* ‘two each’
miad ‘one’ → *mi-pi-ad* ‘one each’ – *mi-mi-ad* ‘one each’
moNe-a ‘five’ → *mo-po-Ne-a* ‘five each’ – *mo-mo-Ne-a* ‘five each.’

There seems to exist a reciprocal marker used in a similar way in other, viz. in most of the Turkic languages, where the marker of distributive numerals is *-ar/-er* after final consonants and *-š-ar/-š-er* after vowels (Tenishev 1988:193–5). The component *-ar/-er* is traced back to the marker of collective plurality. Thus the component *-š-* can be genetically related to the reciprocal marker; cf. Turkish *iki* ‘two’ → *iki-šer* ‘in twos’, Tatar *žide* ‘seven’ → *žide-šär* ‘in sevens’, *dürt* ‘four’ → *dürt-šär* ‘in fours’.

4.7.2 *A reciprocal marker as a multiplier by two; type ‘three’ → ‘two times three’*

This type shows semantic connection with the meaning of duality considered in 3.1.

- Southern Paiute (Langacker 1976:14, 53)
- (44) *pai* ‘three’ → *na-vai* ‘six’ (= ‘two times three’).

Langacker (ibid., 53, footnote 7) agrees with E. Hamp that this latter usage is connected with the reciprocal:

Eric Hamp has observed that the use of *na-* in numerals is almost directly parallel semantically to its use in kinship terms. In both cases, two entities treated as being equivalent (parent and daughter; three and three) additively and exhaustively define a set. The set thus implies reciprocity for its defining members.

4.8 Derivatives with a pleonastic or fossilized marker

Nominal *lexical reciprocals* occur in some languages optionally or obligatorily with a reciprocal marker. Typical reciprocal meanings of such nouns are ‘friend’, ‘neighbour’, ‘brother’, etc.

1. *With a pleonastic reciprocal marker.* In this case the base is a lexical reciprocal or denotes a relative in converse relations with other relatives. The reciprocal marker may be optional or fossilized.

Ainu (Alpatov et al., Ch. 42, §11.2)

(45) *tokoj* ‘friend’ → *u-tokoj* (same).

2. *With a fossilized reciprocal marker*

Abaza (Tabulova 1976:193)

(46) a. *ai-gva* ‘friend’
ai-cala ‘daughter-in-law’
ai-clba ‘the youngest’

Abkhaz (G. Hewitt, p.c.)

b. *ai-a.hW.sha* ‘sister’
ai-a.sca ‘brother’

5. Derivational pairs “Verb → Noun”

This type of derivation is attested in one language only, namely, Bamana. These derivatives are formed with the reciprocal adverb *ɲɔgɔn* which functions here as a suffix. The derivatives are relative nouns used either in the plural (see (ii) in (47b)) or with a possessive attribute (see (47a) and (47b.i)). The suffix *-ɲɔgɔn* regularly functions as a word-forming suffix when added to (intransitive) verbal stems or combinations “direct object + (transitive) verbal stem”. The meaning of the derivative is “[somebody’s (explicit marking is necessary)] companion/partner in the activity in question”, or, necessarily with the plural marker, “[group of] companions in the activity in question”. These derivatives are compound nouns, which is explicated by the fact that they take the plural suffix *-w*. There seem to be no restrictions on this type of derivation, except semantic compatibility:

Bamana (Vydrine, Ch. 46, §10.1)

- (47) a. *kà bòlí* ‘to run’ → *í bòlí-ɲǝ̀gɲ* ‘your companion in escape’
 b. *sígí* ‘to live’ → i. *à sígí-ɲǝ̀gɲ* ‘his neighbour’
 ii. *sígí-ɲǝ̀gɲ-w* ‘neighbours.’

6. Derivational pairs “Adverb, postposition, etc. → Adverb”

The underlying bases are locative adverbs, postpositions, prepositions and auxiliary locative nouns. They mostly enter into pairs with converse relations, like ‘next to’ – ‘far’, ‘in front of’ – ‘behind’, ‘above’ – ‘below’, ‘top’ – ‘bottom’, etc. (cf. Ch. 1, §10). This type seems to be more common cross-linguistically than those discussed in Sections 3–4, though lexically more restricted than the verbal-nominal group (see 1.3). It can be subdivided into three groups.

6.1 Reciprocal adverbs

6.1.1 *With standard reciprocal markers*

In this case the regular reciprocal marker is used and the derivative is used as an adverb. In Ainu, there are about 40 reciprocal adverbs some of which are strongly lexicalized and removed from the spatial meaning.

Ainu (Alpatov et al., Ch. 42, §12)

- (48) *enka* ‘upper part, above’ → *u-enka* ‘one above another’
ka ‘top of sth’ → *u-ka* ‘one on top of another’
sam ‘place in proximity, near’ → *u-sam* ‘next to each other’
piskan ‘place around, in the area of’ → *u-piskan* ‘here and there.’

Kolyma Yukaghir (Maslova, Ch. 44, §4.1, §6.4)

- (49) *arqa* ‘near’ → *n’e-arqa* ‘near each other’
molho ‘among, between’ → *n’e-molho-n* ‘among ourselves/yourselves/...’
jela: ‘after, behind’ → *n’e-jela:* ‘one after another.’

Chukchi (Nedjalkov, Ch. 40, §§3.5 and 4.5; *-e* = ADV)

- (50) *čimče* ‘near’ → *čimče-wəly-e* ‘near each other.’

Mundari (Osada, Ch. 37, §9.1; *-re-* = ‘in’; *aRi* = ‘edge’)

- (51) *aRi-japa?-re-* ‘near the edge’ → *ja-pa-pa?-re-* ‘near each other.’

6.1.2 *With non-standard reciprocal markers*

The use of a reciprocal marker can be combined with additional marking or other changes. Thus, in Nivkh, the standard marking of reciprocal adverbs (52a) may combine with optional (52b) or obligatory (52c) reduplication.

Nivkh (Otaina & Nedjalkov, Ch. 41, §3.4; *v-* = REC before vowels)

- (52) a. *-laya* ‘next to’ → *u-laya* ‘next to each other’
 b. *-laqv* ‘around sth’ → *u-laqv[-laqv]* ‘around each other’
 c. *-ənk* ‘in front of’ → *v-inkə-v-inkə* ‘preceding each other’, ‘(in) single file’
-əri ‘behind sth’ → *v-əri-v-əri* ‘following each other’, ‘(in) single file.’

In Even, locative auxiliary nouns can function as common adverbs and postpositions when used with case endings and/or possessive markers. Reciprocal adverbs are formed by means of the non-standard marker *-lta/-lte* specialized for derivation of reciprocal adverbs (it is likely to be genetically related to the standard sociative/reciprocal suffix *-lda/-lde*); cf.:

Even (Malchukov, Ch. 39, §9.2.1; *-n* = 3SG.POSS)

- (53) *hergi* ‘bottom’ (noun)
hergi-le <bottom-LOC> ‘underneath’ (adverb)
hergi-n <bottom-its> ‘underneath’ (postposition)
uu hergi-le-n <house bottom-LOC-its> ‘under the house’ (postposition)
hergi-lte ‘one under another’ (spatial reciprocal pronoun)

So far, the Even suffix *-lta/-lte* and its Evenki cognate *-lta/-lte/-lto* are the only attested reciprocal markers which do not coincide with the intraverbal reciprocal markers; cf. Even (where *-du* = DAT; *-n* = POSS): *oldon-du-n* ‘at the side next to sb/sth’ → *oldini-lta* ‘one upon another’, *žüle-du-n* ‘in front of sb/sth’ → *žüle-lte* ‘one after another’ (Nedjalkov & Nedjalkov, Ch. 38, §6.2 and 12).

6.2 Reciprocal adverbs-preverbs (see also Ch. 5, §12.2)

A reciprocal marker can be attached to prepositions to form indivisible entities – adverbs and adverbs-preverbs. The latter term reflects their intermediate character. Semantically, adverbs-preverbs may serve as parts of complex two-component verbal formations. Positionally, they may be more or less fixed, either in postposition or preposition to the verb, or either, depending on the construction used. The spatial meaning of an adverb-preverb may undergo changes so that its meaning does not equal that of both components.

This type of adverbs-preverbs is represented in German. A certain semantic affinity of these formations with verbs is achieved, both combined into a kind of complex verbs with spatial meanings. It is not accidental that (though it is rather conventional) they are spelt as one with verbs when the latter are used, e.g., as infinitives or participles. In this case attachment of a preposition to the *reciprocal pronoun* takes place rather than the attachment of the reciprocal marker to the preposition. For instance, *auf etwas* ‘on sth’ – *aufeinander-* ‘on each other’, *über etwas* ‘above sth’ – *übereinander-* ‘above each other’; they behave like separable prefixes *auf*, *ein*, *über*, etc., i.e. adverbs-preverbs may be distanced from the verb; cf. *Er stapelt etwas übereinander* ‘He piles something on top of one another’ and (54a):

German (Wiemer & Nedjalkov, Ch. 10, §5.5)

- (54) a. *etwas über etwas stapeln* 'to pile sth on sth'
 → *etwas übereinanderstapeln* 'to pile sth on top of one another'
 b. *etwas in etwas schieben* 'to push sth into sth'
 → *etwas ineinanderschieben* 'to push sth into one another.'

Some of these formations undergo lexicalization and the verbs combined with them have no semantic correlates without *einander*; cf. both forms in (55a) and also in (55b) where the verbs without *einander* do not correspond semantically to the derivatives in a standard way; note that the form *durcheinander* practically never had a reciprocal meaning, though its meaning is expressed by reciprocal markers in some other languages.

- (55) a. *aus etwas herausfallen* 'to fall out of sth'
 – *auseinanderfallen* 'to fall to pieces'
 b. *durch etwas laufen* 'to run through sth'
 – *durcheinanderlaufen* 'to run in different directions (without aim).'

6.3 Reciprocal complex preverbs (see Ch. 5, §12.2)

Semantically, the Kabardian derivatives in the examples below are close to the previous case, though they are formally different, as they involve preverbs rather than adverbs, i.e. items that are used within verbs and never occur separately. Note, however, that preverbs have mostly developed from adverbs. Strictly speaking, these derivatives should not be considered in this section as it is concerned with reciprocal adverbs, but they are mentioned as a typologically possible endpoint of the development of reciprocal adverbs.

With most bases both the locative preverb and the reciprocal prefix may preserve their own meanings. Thus, in (57c) the prefix of proper reciprocals *zə-* (56) preserves its meaning in combination with the preverb *-te-* (denoting an action on some surface).

Kabardian (Apazhev 1957:45, 114, 115, 122, 338; see also Ch.1, §13.1.5 and Kazenin, Ch. 17, §9)

- (56) *guoun* 'to shout to sb' → *zə-zguoun* 'to shout to each other.'
 (57) a. *dzən* 'to put, throw sth'
 → b. *te-dzən* 'to throw sth on top'
 → c. *zə-te-dzən* 'to throw sth one upon another.'

In (58) the same combination *zə-te-* is not the sum of the components semantically: in this case it has an intensive meaning and denotes a plurality of participants.

- (58) *məxən* 'to faint' → *zə-te-məxən* 'to faint (of many).'

Here are two more examples with the preverbs *-ščIə-* typically denoting an action inside some space or under something (cf. *ščIə-šxəklən* 'to eat the lower part of sth, from beneath'), and *xə-* often denoting an action within some mass (cf. *xə-šxəklən* 'to eat out (the inside)'): they are fused with the reciprocal prefix and lose these meanings, thus becoming complex preverbs, with the semantic component of plurality representing the reciprocal meaning.

- (59) a. *ščəščən* ‘to neigh’ → *zə-ščIə-ščəščən* ‘to neigh (of many horses)’
 b. *šxən* ‘to eat’ → *zə-xə-šxəkIən* ‘to eat together with sb.’

The derivational chain in (57) corresponds to German (54) in that in both cases there is a non-reciprocal base related to the reciprocal in a standard way. As regards (58) and (59), where the reciprocal marker *zə-* and the preverbs *-te-*, *-ščIə-* and *-xə-* are fused into an indivisible complex, there are naturally no correlates without *zə-* in the same way as there is no semantically relatable correlate without *einander* in (55a) and (55b).

7. Concluding remarks

7.1 Morphological types

The four morphological types of reciprocal derivatives involving non-verbal bases (see §§3, 4, 5 and 6) display three types of markers each:

- (a) the same markers as in intraverbal derivation (see, e.g., (1), (4c, d), (8a), (10));
- (b) markers including the reciprocal marker used in intraverbal derivation (see *da-s-/la-s/...* in (3), (25), (29), (38), (40a, b)); *u-...-kor* in (37), *-š-kə-* in (12) and *n’iη-...-jil’-* in (21));
- (c) special markers (see *se* in (36), *ka-* in (24) and *-lta/-lte/-lto* in (53)).

7.2 Productivity

Intraverbal derivation, when productive, generally does not exhibit any significant restrictions except some lexical-semantic and pragmatic ones. On the other hand, the derivations considered in this section are never as productive; they are lexically restricted to a considerable degree in some of their meanings (e.g. ‘both’, ‘all together’). The bases of most derivatives are lexical reciprocals denoting reciprocal actions like *quarrel*, *speech*, reciprocal relations like *peace*, *agreement*, participants of reciprocal actions or relations, like *friend*, *companion* (see, for instance, 4.1). Among the latter, the kinship terms (like *spouse*, *brother*) are especially common (see, for instance, 3.1.2). In contrast, derivatives denoting similarity and identity are not restricted to lexical reciprocals and converses as bases (see 3.3 and 4.2).

7.3 Converse bases

A special place in derivation involving non-verbals belongs to converse bases. They are varied lexically, e.g. *father – child*, *younger brother – elder brother*, *top – bottom*, *near – far*, etc. One base word may enter into more than one converse pair, e.g. ‘younger brother’ – ‘elder brother’ and ‘younger brother’ – ‘elder sister’. Derivatives of such words include the meaning of both members of a converse pair, like ‘father and child’ (see 3.1.2). Some bases denote paired entities differing in their position relative to each other: *right hand – left*

hand, right foot – left foot. Their reciprocal form means ‘both hands, feet’ (see 3.1.3), or the reciprocal form of the members of the converse opposition ‘right’ – ‘left’ is used with regard to the left or right hand in order to characterize a person (see ‘left-handed’ – ‘right-handed’ in 3.1.4). In this respect a characteristic feature is the use of the reciprocal marker on the word *u-mure* ‘pair’ in Ainu (see 3.1.3) and a specialized plural marker for kinship terms on the word *tie-mule* ‘pair’ in Udehe (see 3.1.2 beneath (16)).

7.4 Duality

One of the main characteristics of the derivatives in question is that they normally express non-singular, especially dual or paired objects. In most cases the derivatives involve the names of relatives singled out among other relatives. Three types of meanings can be distinguished here:

1. ‘brother’ – ‘two brothers’, ‘foot’ – ‘both feet’, as in (6b), (8), (17);
- 2a. ‘mother’ – ‘mother and daughter’, as in (9), (10), (12)–(14);
- 2b. ‘mother’ – ‘mother and daughter’ and ‘daughter’ – ‘daughter and mother’, as in (37);
3. ‘brother’ – ‘all the brothers together’/‘brothers to each other’/‘brothers between themselves’, as in (19), (21), (22).

Note that in cases 2a and 2b the base form names a relative of higher status, as in 2a, or this feature is irrelevant, as in 2b. I have not encountered any languages where all the base words name relatives of lower status, although such a case cannot be ruled out.

7.5 The meaning of similarity

The meaning of similarity or identity with respect to the feature named by the base word (type ‘father’ – ‘born of the same father’, ‘class’ – ‘classmate’) is attested in five languages of my corpus. Characteristically, only in two of them is this meaning expressed by the same marker as in standard reciprocal verbs derived from verbs (see (34) and (35)). In two languages specialized markers are used (see (36) and (24)), and in one language a marker is used which contains the standard reciprocal marker (see (25)). The marking differences probably reflect a lesser degree of semantic proximity between this type of derivatives and standard reciprocals like ‘to see each other’.

7.6 Reciprocal adverbs

Derived reciprocal adverbs usually have spatial meanings (needless to say, some may acquire non-spatial meanings, due to metaphoric change or for some other reason). This is illustrated by derivatives with standard reciprocal markers in (48)–(52), (54)–(55). The second morphological type of reciprocal markers containing a standard reciprocal marker, e.g. Yakut *-das-...*, derives spatial reciprocals, but they are not adverbs but verbs (see 4.4). And lastly, the third morphological type of markers, distinct from standard recipro-

cal markers and used to derive reciprocal adverbs, is registered in two genetically related languages, Even and Evenki: it is the suffix *-lte/...* (see (57) above). Thus, the main device for marking reciprocal adverbs is a standard reciprocal marker.

As we are concerned here with spatial reciprocal relations, it may be appropriate to note that the spatial meaning is widely represented among standard reciprocal verbs, i.e. derivatives from verbal bases, cross-linguistically (see Ch. 1, §2.2.4, two subsections (b) in §12.1.1.2 and also 1.13 and 1.15.5 of Ch. 1). In some languages spatial reciprocal adverbs show a tendency to merge with verbs and form complex entities with them (cf. 6.2).

CHAPTER 8

Questionnaire on reciprocals

Vladimir P. Nedjalkov and Emma Geniušienė

Institute for Linguistic Studies, St. Petersburg / Vilnius University

1. Introductory notes
 - 1.1 General
 - 1.2 Definitions of terms
2. Overview and database
3. Grammatical notes
4. Means of encoding reciprocity
 - 4.1 Syntactic marking
 - 4.2 Morphological marking
 - 4.3 Clitics and clitic-like markers
 - 4.4 Reciprocal markers on other than the predicate constituents
 - 4.4.1 A reciprocal marker in the position of a possessive attribute of the direct object
 - 4.4.2 A reciprocal marker on the locative postposition of an adverbial phrase
 - 4.5 Non-reciprocal and reciprocal markers with a tendency to co-occur always or frequently
 - 4.6 Reciprocal markers dependent on the number of the reciprocants
5. Diathesis types of verbal reciprocal constructions
 - 5.1 Explanation
 - 5.2 Diatheses with argument coreferentiality
 - 5.2.1 “Canonical” reciprocals. Intransitive diathesis
 - 5.2.2 “Indirect” reciprocals. Transitive diathesis
 - 5.3 Reciprocals with non-argument coreferentiality (the valency of the base is retained)
 - 5.3.1 “Possessive” reciprocals. Transitive diathesis
 - 5.3.2 “Adverbial” reciprocals
 - 5.4 Multiple-diathesis reciprocals
 - 5.5 Lexical range of diathesis types. Restrictions on forming verbal reciprocals
 - 5.6 Deviations from the standard case
6. Simple and discontinuous constructions. Semantics of reciprocants
7. Productivity and restrictions on derivation of reciprocals
 - 7.1 Introductory notes
 - 7.2 Trivial restrictions
 - 7.3 Semi-trivial restrictions
 - 7.4 Non-trivial (proper) restrictions
8. Simultaneity and succession of actions within a reciprocal situation
9. Reciprocal specifiers; two types: i. ‘mutually’, ii. ‘between/among oneself’

10. Polysemy of reciprocal markers
 - 10.1 Three main types of polysemy
 - 10.2 Conditions of actualization of the main meanings
 - 10.3 Other types of polysemy
 11. *Nomina actionis*
 12. Pronominal reciprocals and their relationship with verbal reciprocals
 - 12.1 Pronominal reciprocals
 - 12.2 Three types of languages with respect to the reciprocal marker(s) employed
 - 12.3 Interchangeability and co-occurrence of pronominal and verbal reciprocal markers
 13. Lexical reciprocals
 - 13.1 Introductory notes
 - 13.2 Subject-oriented lexical reciprocals
 - 13.3 Object-oriented lexical reciprocals
 14. Lexicalized reciprocals
 15. *Reciproca tantum*
 16. Reciprocal markers on non-verbal bases and/or non-verbal derivatives
 - 16.1 Introductory notes
 - 16.2 Five main derivational pairs
 - 16.3 Four main morphological types of reciprocal markers
 - 16.4 Semantic groups within derivational pairs
 - 16.4.1 Derivational pairs with nominal bases
 - 16.4.1.1 Derivational pairs “Noun → Noun”
 - 16.4.1.2 Derivational pairs “Noun → Verb”
 - 16.4.2 Derivational pairs “Verb → Noun”
 - 16.4.3 Derivational pairs “Postposition/... → Adverb”
 17. Etymology of reciprocal markers and their structure
 18. Attachment: List of typical derived reciprocal sentences

1. Introductory notes

1.1 General

The questionnaire on the typology of reciprocals is combined here with a digest of Chapters 1, 3, 5 and 7 (which naturally leads to a number of repetitions), to save the researcher from the trouble of searching for the relevant information in the text. This questionnaire is meant to facilitate a detailed description of the morphological, syntactic and semantic properties and polysemy of reciprocal markers of individual languages in comparable terms.

The earlier drafts of this questionnaire have been considerably revised after all the chapters of the present collective monograph were completed. Therefore, the papers on individual languages do not entirely conform to this questionnaire.

To facilitate its independent use without a preliminary study of Chapters 1, 3, 5, and 7, some basic definitions and main assumptions are repeated here and examples are supplied,

the references to the chapters listed being made in order to assist the reader in finding the details. To repeat, the questionnaire contains questions, which are framed, and also promptings that suggest typologically possible cases. It also recommends an outline and order of description of reciprocal constructions in an individual language.

This chapter is certainly too long for a questionnaire, but the core of the questionnaire is really comprised of the framed questions, and the reader is free to use only this essential part of this chapter.

The sequence of presentation of the material shown below is not obligatory, and a different order of description may be used, if the material requires it, and some section(s) may be omitted if the issue is irrelevant for the language or if there is no material. Needless to say, the questionnaire does not outrule discussion of other relevant problems if the researcher of a particular language is lucky enough to find some new phenomena not reflected here.

1.2 Definitions of terms

Markers which allow to replace two sentences with inverted arguments like (1a') and (1a'') by one sentence (1b) carrying the same semantic content as that of the first two are termed *reciprocal markers*. They may be of two main types: *verbal*, mostly morphological (affixes, reduplication, compounds, inflection, etc.) or clitic, and/or *pronominal* (more generally, *syntactic*: pronouns and adverbs) (see Section 4 below). If reciprocalization involves unmarked changes in the syntactic sentence structure only (e.g. deletion of the direct object, as in (2b)) the relevant changes are provisionally classified as verbal markers (because deletion of the direct object in most cases takes place when explicit verbal marking is used).

- (1) a'. *Marie küßte Paul* + a''. *Paul küßte Marie* = b. *Marie und Paul küßten sich*.
[= themselves, each other]
- (2) a'. *Mary kissed Paul* + a''. *Paul kissed Mary* = b. *Mary and Paul kissed [each other]*.

Besides these two main types of reciprocal markers, a language may use “unexpected” expressions of reciprocity (e.g. German poetic *die Liebenden* lit. ‘the loving (PL)’, ‘the lovers’ or ‘those in love’). A language may possess both verbal and pronominal reciprocal markers; moreover, it may possess more than one of each type.

Situations described by sentences like (1b) and (2b) are *reciprocal situations*. They consist of two *subevents* otherwise expressed by (1a', a'') and (2a', a'') respectively. The subevents may be *simultaneous* or *sequential*.

Two types of reciprocals, *verbal* (with a verbal marker; cf. *sich küssen*) and *pronominal* (with a pronominal marker; cf. *to kiss each other*) are distinguished according to the type of the marker. Of course, there can be intermediate types, due to the tendency of pronominal reciprocals, especially reflexive, to evolve into verbal; of course, this does not mean that any pronominal marker will eventually change into verbal.

If a verb can form two sentences with inverted arguments and these two sentences have the same meaning and can be replaced by one sentence with the same verb and both

arguments in the subject position, such verbs are termed *lexical reciprocals*; they describe situations representing one event where the subevents cannot as a rule be singled out; cf.:

- (3) a'. *Mary argues with Paul* = a". *Paul argues with Mary*
 = b. *Mary and Paul argue [with each other].*

Depending on the subject or object position of the antecedent of the reciprocal marker, two types of reciprocal constructions are distinguished, subject-oriented (see (1b) and (3b) above) and object-oriented. The latter may be of two main subtypes, *embedded*, often causative (see (4a) below where the antecedent of the reciprocal marker is *ihnen* and (5a) where the antecedent is *sie*) and *non-embedded* (as a rule, lexical reciprocals; see (4a)):

- (4) a. *Er erlaubte ihnen nicht sich zu küssen.* 'He did not allow them to kiss.'
 (5) a. *Er stellte sie einander vor.* 'He introduced them to each other.'

Reciprocal markers may be *monosemous* or *polysemous*. Verbal reciprocal markers are often polysemous, and pronominal ones are mostly monosemous. Thus, the pronominal marker in (2b) cannot denote anything but reciprocity, whereas the verbal marker in (1b) can have either the reciprocal ('each other') or the reflexive ('themselves') meaning.

Reciprocals with the meaning of type (1b) and (2b), i.e. those on which the reciprocal meaning is expressed by a special marker and which enter into a standard semantic opposition with a non-reciprocal underlying verbal base, are termed *grammatical*, in contrast to lexical reciprocals.

The arguments in (1b) and (2b) of the same semantic class (human in this case), standing in the same relation to each other and expressed by the subject, are termed *reciprocal arguments* or *reciprocants*, for brevity. In a prototypical reciprocal situation, there are two reciprocants: for convenience, they may be referred to as the first and the second, or *co-reciprocants* (*Marie und Paul* in (1b) and *Mary and Paul* in (2b) respectively). Each is assigned two semantic roles, being both an agent and a patient of the same reciprocal situation: namely, the agent in one of the subevents and patient in the other. In type (1b) and (2b) reciprocal constructions, the subject position can be filled only by a plural noun phrase (e.g. 'The boys', 'They'), at least semantically (e.g. 'People', 'The group') or conjoined singular nouns, as in the examples cited. Reciprocal constructions with the singular subject and an object are a secondary development and not always possible: they are termed *discontinuous*, while constructions with a plural subject denoting both reciprocants are termed *simple* (see §6 below).

In the *simple* reciprocal construction, the valency decreases, and in the *discontinuous* construction it is retained, though the object lowers its syntactic status. Compare Swahili (Vitale 1981: 145, 150–1; see also Maslova, Ch. 6, §3.4):

- (6) a. *Juma na Halima wa-na-pend-an-a.*
 J. and H. 3PL.SB-PRES-love-REC-a
 'Juma and Halima love each other.'
 b. *Juma a-na-penda-an-a na Halima.*
 J. 3SG.SB-PRES-love-REC-a with H.
 'Juma and Halima love each other', lit. 'Juma loves each other with Halima.'

Both grammatical and lexical reciprocals (though not each one) may be used in the discontinuous as well in the simple construction. They differ, however, with respect to the type of construction, simple or discontinuous, which should be considered basic for each class of reciprocals. There are reasons for considering the simple construction to be basic for grammatical reciprocals and the discontinuous for lexical reciprocals.

In the case of some non-reciprocal meanings of polysemous derivatives with the reciprocal marker, the valency is either preserved (cf. the sociative meaning) or even increases (cf. the comitative and the assistive meanings). Cf. Tuvan (Kuular, Ch. 27, ex. (99)):

- | | | | | |
|--------|----------------|----------------------------------|------------------------|------------|
| (7) a. | <i>üpte-</i> | ‘to rob sb’ | two-place transitive | |
| b. | <i>üpte-š-</i> | i. ‘to rob <i>each other</i> ’ | one-place intransitive | reciprocal |
| | | ii. ‘to rob sb <i>together</i> ’ | two-place transitive | sociative |
| | | iii. ‘to rob sb <i>with sb</i> ’ | three-place transitive | comitative |
| | | iv. ‘to <i>help sb</i> rob sb’ | three-place transitive | assistive |

The derivative with the reciprocal meaning in (7b) is identifiable as intransitive in comparison with the other three meanings: the latter retain the direct object of the base structure. Moreover, the sociative sentence retains the valency structure of the base sentence. The comitative and the assistive meanings, being both three-place, differ in the form of the non-direct objects: the object marked by the postposition *-bile* ‘with’ (spelled as part of the noun, e.g. *ača-zə-bile* ‘with his father’) is comitative whereas the dative marking (e.g. *ača-zə-n-ga* ‘to his father’) indicates the assistive meaning. If the non-direct object is deleted the only help comes from the context.

If a language possesses two or more reciprocal markers, each should be described separately, and their description should be followed by a comparison of these types of reciprocals semantically, stylistically, from the viewpoint of productivity and frequency and other distinctions if they are registered. The issue of interchangeability of different types of reciprocals should also be considered.

For instance, here is an illustration of stylistic differences: in German (1b) the reflexive/reciprocal *sich* can be replaced by the monosemous reciprocal pronoun *einander*. But the marker *sich* is prevalent in oral speech and it is more neutral *stylistically*, while *einander* is more suitable in written texts, being more literary (cf. Berger et al. 1972:544: “...fast immer gehoben, bei einigen Verben sogar gespreizt”).

- (8) *Marie und Paul küßten einander.* ‘Mary and Paul kissed each other.’

Usually, constructions with verbal reciprocals derived from two-place transitives are intransitive (i.e. intransitivization of transitive verbs takes place). They are termed here “canonical” (see (1b) above; though the term “intransitive” can be an alternative). In languages with ergative constructions the latter change into absolutive; compare Chukchi:

- (9) a. *Eqel̄-e atlay-ən penrə-nen.*
 enemy-INST father-ABS attack-AOR.3SG+3SG
 ‘The enemy attacked father.’
- b. *Eqel̄-ən ənkl̄am atlay-ən penrə-wəly-ə-γ̄lat.*
 enemy-ABS and father-ABS attack-REC-AOR.3PL
 ‘The enemy and father attacked each other.’

The *diathesis type* of a reciprocal construction is established relative to the constituent reciprocalized with the subject. In the “canonical” type, the direct object undergoes reciprocalization with the subject. There are two more basic diathesis types: “indirect”, when a non-direct object of a three-place verb is reciprocalized, and “possessive”, when an attribute of an object is subjected to reciprocalization with the subject, the object retaining its status. Thus, transitivity is retained in constructions termed here “indirect” and “possessive” (see below Section 5). Transitivity is also retained in the case of some non-reciprocal meanings of derivatives with a reciprocal marker; cf. the Karanga sociative in (10c) (Marconnès 1931:195):

- (10) a. *Ti no chek-a nyama.*
 we no cut-IND meat
 ‘We shall cut meat.’
- b. *Ti no chek-an-a.* reciprocal (intransitive)
 we no cut-REC-IND
 ‘We shall cut each other.’
- c. *Ti no chek-an-a nyama.* sociative (transitive)
 we no cut-REC-IND meat
 ‘We shall cut meat together.’

Unless otherwise indicated, the subsequent text concerns verbal reciprocals.

The sequence of the sections below is in fact the recommended order of description of reciprocals of an individual language.

If there are more than one means of marking reciprocity in a language, each should be described separately, and so should the simultaneous use of two markers.

2. Overview and database

An article on reciprocals should open with a brief overview (one or two pages long) summarizing the characteristics of reciprocals in the language under analysis. The following features should be briefly listed and illustrated: reciprocal markers, diathesis types of reciprocal constructions illustrated by examples, polysemy, productivity.

It is advisable to provide brief information about the people speaking the language in question, their place of habitation and areally close languages. This information should precede the overview.

In this section, the sources of the data (dictionaries, grammars, fiction, colloquial speech, information from native speakers, etc.) should be named. The approximate number of reciprocals registered and/or considered in the paper should be pointed out.

3. Grammatical notes

Minimal grammatical information (2 to 6 pages) on the structure of the language should be provided prior to the analysis of reciprocals as a grammatical background, in order to facilitate the reader's understanding of the material.

Most of the examples in the articles, especially sentential, should be glossed.

1. General characteristics. Emphasis should be made on the following points if they are relevant for the description of the reciprocals: morphophonology, sentence structure (nominative, ergative, etc.); neutral WO, word classes, case marking, personal pronouns, possessivity, tense/aspect system (in particular, on the grammatical means of expressing iterativity, durativity and semelfactivity, if there are any, and on their co-occurrence with reciprocals), agreement, non-finite verb forms (converbs, participles, infinitives), etc.

2. Means of marking reciprocity. This section should provide additional information on the examples cited in the overview: the reciprocal marker used and its type and structure, existence of other synonymous markers, their "weight" and order of preference, etc. (for details see Section 4 below).

3. Valency-changing means. Other valency-affecting categories, such as reflexive, passive, applicative, causative, etc. attested in the language should be listed and the place of reciprocals among them established. As a rule, the core of these categories does not exceed the following list: (a) valency-decreasing categories, e.g. reflexive, passive, reciprocal, resultative, antipassive; (b) valency-increasing categories may include causative, applicative (applicative-comitative, applicative-assistive, applicative-benefactive, etc.), and (c) valency-retaining categories may be sociative (it is mentioned here due to the semantic proximity to reciprocals, though it does not increase valency; however, it increases the number of the participants).

It may be useful to mention whether the grammars of the language under analysis regard reciprocals as a grammatical (form-changing) or derivational category of the verb.

4. Co-occurrence of valency-changing means. If there is anything of interest concerning combinability of valency-changing means it should be briefly pointed out.

Possibility of the derivation of verbal reciprocal forms from semantic reflexives, causatives and other categories just listed should also be mentioned, as well as their derivation from reciprocals.

In some languages, reciprocal derivation may be based on two-place (explicit or implicit semantic) derivatives with reflexive or autocausative meanings; cf. Karachay-Balkar (11) and Tuvan (12) respectively:

- | | | | |
|------|--|----------------------------|---------------|
| (11) | <i>maxta-</i> | 'to praise sb' | |
| | → <i>maxta-n-</i> | 'to praise oneself, boast' | reflexive |
| | → <i>maxta-n-əš-</i> | 'to boast to each other' | |
| | (there is no reciprocal * <i>maxta-š-</i> with the intended meaning 'to praise each other'). | | |
| (12) | <i>čöle-</i> | 'to lean sth onto sth' | |
| | → <i>čöle-n-</i> | 'to lean on sth' | autocausative |
| | → <i>čöle-n-əš-</i> | 'to lean on each other.' | |

5. *Synonymy of non-reciprocal markers and non-reciprocal meanings of polysemous markers.* A common enough case is the anticausative meaning shared by reciprocal and non-reciprocal markers; it usually shows the “ripe” age of the marker, its being in the stage of the semantic erosion of the main function and general desemantization. A good illustration are the following Karachay-Balkar examples (borrowed from KB. 220-1) where the forms of an intransitive verb with the reciprocal, reflexive and both suffixes are synonymous (see (13b, c, d)), and so are their causative derivatives with the meaning ‘to join sth’ (see (13b’, c’, d’)).

- (13) a. *džalya-* ‘to join/combine/couple’ (vt) (e.g. *uč-lar-n džalya-* ‘to join the ends of sth’)
 b. *džalya-š-* ‘to join/combine’ (vi) → b’. *džalya-š-dər-* (vt)
 c. *džalya-n-* ‘to join/combine’ (vi) → c’. *džalya-n-dər-* (vt)
 d. *džalya-n-əš-* ‘to join/combine’ (vi) → d’. *džalya-n-əš-dər-* (vt).

Henceforth, most of the subsections open with a question (questions) followed by examples and or explanations.

4. Means of encoding reciprocity

1. In what way(s) can the reciprocal meaning be expressed in the language under consideration? Is there one marker, or more than one?
2. What are the status and properties of the marker(s)?
3. Are these means in complementary or some other kind of distribution? (E.g., in Abaza there are at least eight, productive and unproductive, ways of marking reciprocals which are in complementary distribution, only three of them being productive).
4. Are there any affixes, particles or words that co-occur with reciprocals regularly, or often? What may be the cause of their co-occurrence?
5. Does the main reciprocal marker have any other meanings that entail detransitivization of a transitive base stem/verb?
6. Do the reciprocal markers differ with respect to the number of reciprocants?

The main types of markers are considered in the subsections that follow. As is shown below, one language may employ different reciprocal markers which may be used simultaneously.

The primary subdivision distinguishes three main types: syntactic marking, morphological marking and clitics. Withing the first two types, subtypes from A to F are distinguished. The third type is not further subdivided and thus it represents type G alone.

4.1 Syntactic marking

There are at least two basic sybtypes of syntactic marking.

Subtype A (grammaticalized) doubling of the clause or verb phrase with a concomitant inversion of the arguments (cf. (1a’) + (1a’’)). Cf. Modern Chinese (He 1990: 124–32):

- (14) a. *Tāmen zǒngshì nǐ bāng-zhù.*
 they always you.SG help-help
 ‘They always help you.’
- b. *Tāmen zǒngshì nǐ bāng-zhù wǒ, wǒ bāng-zhù nǐ.*
 they always you.SG help-help I I help-help you.SG
 ‘They always help each other’; lit. ‘They always you help me, I help you.’

Subtype B. This subtype might be more precisely termed *lexico-syntactic*. As the prevalent device is reciprocal pronouns, it is convenient to term this subtype *pronominal*:

1. **Reciprocal pronouns**, like English *each other* (see translations in (14b), (15i), (16b), (17b), etc.) or personal pronouns when used as coreferent with the subject; cf. the To’aba’ita example (Lichtenberk, Ch. 36, §5):

- (15) *Keero’a keko thathamī keero’a...*
 3DU 3DU.SEQ like 3DU
 i. ‘The two of them liked *each other* ...’
 ii. ‘The two of them liked *themselves* ...’
 ii. ‘The two of them liked *them* ...’

2. **Reciprocal adverbs**, like Malayalam *tammil* ‘among them’ (Jayaseelan 2000:119) and Chinese *hùxiāng* ‘mutually’. In contrast to reciprocal pronouns, reciprocal adverbs are usually not case-inflected and do not combine with adpositions. In isolating languages the status of these two – reciprocal pronoun or adverb – is often problematic. Compare the following Modern Chinese (Hoa et al., Ch.43, §3.2.1.2) example with a two-place intransitive taking a prepositional object:

- (16) a. *Wǒ xiàng tā dào-qiàn-le.*
 I to he apologize-PERF
 ‘I apologized to him.’
- b. *Tāmen hùxiāng dào-qiàn-le.*
 they mutually apologize-PERF
 ‘They apologized to each other.’

3. **Reciprocal specifiers** – words and phrases like Russian *vzaimno* ‘mutually’, German *gegenseitig* and its English counterpart *mutually* as well as phrases like German *unter sich*, English *among/between themselves* (considered below in Section 9) cannot as a rule be used to encode reciprocity on their own. They may co-occur with grammatical or lexical reciprocals, either for emphasis, or for disambiguation if the reciprocal marker is polysemous. However, some of them may encode reciprocity by themselves when used in the position of an attribute; cf. German:

- (17) a. *Sie liebten sich.* i. ‘They loved *themselves*’, ii. ‘They loved *each other*.’
 b. *Sie liebten sich gegenseitig* ii. ‘They loved *each other mutually*.’
 c. **Sie liebten gegenseitig* lit. ‘They loved *mutually*.’
 but: d. *gegenseitige Liebe* ‘*mutual love*.’

The rules of selectivity are sometimes rather complicated; cf. (17b) and [?]*Sie trafen sich gegenseitig* in the meaning ‘They met mutually’.

Reciprocal specifiers sometimes have a tendency to be used as the only reciprocal markers in colloquial speech; for instance, in Russian (18) the regular reciprocal marker (pronoun in this case) is omitted:

- (18) *My dolžny vzaimno proščat' [drug drugu] nedostatki.*
 we must mutually forgive each other shortcomings
 'We must mutually forgive shortcomings [of each other].'

4.2 Morphological marking

It is commonly termed *verbal marking*. There are five main subtypes.

Subtype C: periphrastic constructions, e.g. active participle + auxiliary verb; cf. Bantawa (Ebert 1994: 54):

- (19) *dhat-pa tí-mi-a-nin.*
 beat-ACT.PART 2-DO-PAST-2PL
 'you beat each other', lit. 'you made fighter.'

Subtype D: compounds with recurrent components (see Ch. 3, §5). The Modern Chinese examples below contain the verbs *jiāo* 'to intersect/cross', 'to join', and *duì* 'to be opposite (to) each other'. These verbs, like a number of other verbs, can function as recurrent components either pleonastically on lexical reciprocals (see (20a)) or as reciprocal markers (see (20b)) (Hoa et al., Ch. 49, §7).

- (20) a. *hǎo* 'to be friends' → *jiāo-hǎo* (same)
 bǐ 'to compare sth with sth' → *duì-bǐ* (same)
 b. *bài* 'to bow to sb' → *jiāo-bài* 'to bow to each other'
 liú 'to flow' → *jiāo-liú* 'to flow together (into one place)'
 kàn 'to look' → *duì-kàn* 'to exchange glances'
 mà 'to scold' → *duì-mà* 'to scold each other.'

Subtype E: affixes, i.e. prefixes, suffixes, circumfixes and postfixes (like Russian *-sja/-s'*); see (6), (7b), (9b), (10b), etc.

Subtype F: root reduplication, mostly combined with affixation (see Ch. 3, §7); cf. Indonesian (Ogloblin & Nedjalkov, Ch. 33, §4.5.1):

- (21) *mem-bunuh* 'to kill sb' → *bunuh-mem-bunuh* 'to kill each other.'

4.3 Clitics and clitic-like markers

Subtype G: the devices listed in the heading comprise one subtype (see (1b)). It covers reflexive (clitic or clitic-like) pronouns, like French *se*, German *sich*. See (1b), (17a).

Functionally, they do not differ from affixes, being intermediate between markers of *subtypes B* and *E*. Sometimes, there is no clear-cut distinction between syntactic reciprocals and those marked with clitic pronouns (see Ch. 3, §8).

4.4 Reciprocal markers on other than the predicate constituents

Constructions that enter into standard semantic relations, as in (1) and (2) above, can be derived not only by means of a reciprocal marker on the predicate, as in most cases, but also in two other ways, by attaching a reciprocal marker to the direct object or to a locative adverbial. These two cases deserve brief consideration.

4.4.1 *A reciprocal marker in the position of a possessive attribute of the direct object*

This case is close semantically to the “possessive” diathesis type (see 5.3.1 below). Both reciprocal pronouns (cf. *They love each other’s children*; see also (59)), affixes (see (22)) and, which is a specific feature of this type, purely possessive markers on their own, without an obligatory reciprocal marker, can be used here (see (23) below). Here are the latter two cases.

1. In Nivkh, the common reciprocal marker *u-* is attached to the direct object (which, as a rule, is in fixed pre-position to the predicate and makes up a single phonetic word with it) in a construction semantically analogous to the “possessive” diathesis type (Otaina & Nedjalkov, Ch. 41, §3.2.4; *-γ-* ‘to kill sb’ → *u-γ-* ‘to kill each other’):

- (22) a. ... *mat’kalk i-dəmk zap-r ler-d’.*
 kiddy his-hand take.hand-CONV.3SG play-FIN
 ‘... the child; plays holding his_i, j hand.’
 b. *mat’kalk-xu u-dəmk rəmk zap-t ler-d’-yu.*
 kiddy-PL REC-hand hand take.hand-CONV.3PL play-FIN-PL
 ‘Children play holding each other by the hand.’

2. In To’aba’ita, the possessive affix (marked for person and number) on the direct object co-referential with the subject may denote possessive reciprocity. Basically, the possessive marker allows the same three interpretations as the personal pronoun in example (15) from this language, and (23) may also be read as ‘They kissed them on the cheeks.’ Therefore both these markers, the possessive suffix and the personal pronoun, can be disambiguated by the use of the main reciprocal marker prefix *kwai-* illustrated in (27). For obvious reasons, a reflexive interpretation is not available here; cf. Lichtenberk, Ch. 36, §5, ex. (32).

- (23) *Kero musu-a babali-daro’a.*
 3DU.FACT kiss-3.OBJ cheek-3DU.POSS
 ‘The two of them kissed each other on the cheek.’
 lit. ‘The two of them kissed their cheeks.’

In Even, there is a special marker attached to the direct object of a “possessive” diathesis (see (31)).

4.4.2 *A reciprocal marker on the locative postposition of an adverbial phrase*

In this case the marker derives spatial reciprocal adverbs mostly from postpositions, locative nouns, etc., which imply converse and reciprocal situations (e.g., *if you are opposite me*

I am opposite you, etc.). Such words may take case markers (e.g. LOC *-in* in (24); see also 16.4.3 below). An example from Nivkh (Otaina & Nedjalkov, Ch. 41, ex. (52)):

- (24) a. *if pʼ-ətək řara-in hur tʼiv-dʼ.*
 he REFL-father opposite-LOC there sit.down-FIN
 ‘He sat down opposite his father.’
- b. *if ətək-xe u-tʼara-in hur tʼiv-dʼ-γu.*
 he father-COM.DU REC-opposite-LOC there sit.down-FIN-PL
 ‘He and [his] father sat down opposite each other.’

4.5 Non-reciprocal and reciprocal markers with a tendency to co-occur always or frequently

Here we find various cases. For instance, in Bolivian Quechua subject-oriented constructions the reciprocal marker *-na* is always combined with the reflexive *-ku* indicating co-reference with the subject (cf. *maylla-na-ku* ‘to wash each other’ < *maylla-* ‘to wash sb’; cf. *maylla-ku* ‘to wash oneself’); in object-oriented constructions with the causative marker *-chi* the reflexive suffix is not used (van de Kerke, Ch. 31, §5.1; ex. (56)); cf.:

- (25) *mama-y wawa-s-ta maylla-na-chi-n.*
 mother-1SG child-PL-ACC wash-REC-CAUS-3SG
 ‘My mother makes the children wash each other.’

A few more cases: In West Greenlandic Eskimo, the iterative suffix *-sar/-rar* may accompany the reflexive-reciprocal pronoun *imminnut* for actualization of the reciprocal meaning (Fortescue 1984: 166). In Udehe, the reciprocal suffix *-masi* is very often preceded by the imperfective affix *-si-* which can also have the meaning ‘many (objects or subjects)’ or ‘many times’; cf. *zima-masi-* = *zima-si-masi-* ‘to visit each other’ (Nikolaeva, Ch. 23, §3.4). In Buryat, the suffix *-sa/-se/...* with an unclear meaning, seldom used separately, sometimes precedes the reciprocal suffix *-lda/lde*; e.g.: *xatxa-* ‘to stab sb’ → *xatxa-lda-* ‘to stab each other’ = *xatxa-sa-lda-* (same) (*xatxa-sa-* is not registered). Here is one more instance attested in Adyghe where the suffix *-žbə-* with the main meaning ‘back’ often accompanies the reflexive-reciprocal prefix *zə-*: *dəIə-n* ‘to help’ → *zə-dəIə-žbə-n* ‘to help each other’. On simultaneous use of verbal and pronominal markers see Section 12 below.

4.6 Reciprocal markers dependent on the number of the reciprocants

Here is one of three types of reciprocal pairs of this type illustrated by Muna examples (van den Berg 1989:206; *po-* = REC for DU; *po-* and reduplication of the root for more than two; *do-* = 3PL (sic!), *-mo* = PFV).

- (26) a. *do-po-foguru* ‘they teach each other’ (of two only)
 b. *do-po-logo-logo-mo* ‘they competed with each other’ (of more than two).

5. Diathesis types of verbal reciprocal constructions

7. What types of diathesis do reciprocals form? Point out specially if there are transitive reciprocal constructions in the language under study.
8. Do the diatheses of the attested reciprocals correspond to the accessibility hierarchy shown in (36) below?
9. Are there any other types or subtypes of the four major types (“canonical”, “indirect”, “possessive”, “adverbial”) of diathesis?
10. Are there any two-diathesis (= multiple diathesis) reciprocals?
11. Do the different diathesis types employ the same or different reciprocal markers?
12. Are there any deviations from the standard “indirect” and “possessive” diathesis types?

5.1 Explanation

In this section, *subject-oriented* reciprocals are to be considered (on *object-oriented* reciprocals see 13.3 below). The diathesis type of a subject-oriented reciprocal construction is determined by the sentence constituent *reciprocalized* with the *subject* and, as a result, omitted (if a verbal marker is used) or replaced by a pronoun (which naturally retains the same syntactic status). The label of the type of diathesis is also extended to refer to the respective reciprocal verb. Therefore, there are “canonical” reciprocal constructions and “canonical” reciprocals, etc. If we apply the feature of the syntactic status of the reciprocalized sentence constituent twice, we obtain four types of reciprocal constructions: “canonical”, “indirect”, “possessive” and “adverbial”. The characteristics given below do not take into account marginal cases.

The first feature is reciprocalization of an argument or a non-argument and it yields the following subclassification.

1. Constructions involving argument reciprocalization. The valency diminishes by one.

The second feature is reciprocalization of the single object or one of two object arguments distinguishing two subtypes:

1a. “Canonical” (intransitive; derived from two-place transitives (27) and two-place intransitives (28)).

1b. “Indirect” (transitive; derived from three-place transitives); see (29).

2. Constructions involving non-argument reciprocalization. By definition, the valency does not decrease, though the number of (optional) constituents may decrease.

According to the reciprocalized sentence constituent, two types are distinguished:

2a. “Possessive”, when a possessive attribute of the direct object is reciprocalized (the construction is transitive, like “indirect” constructions); see (30) and (31).

2b. “Adverbial”, if an adverbial constituent is reciprocalized; the construction may be either transitive or intransitive, depending on the valency of the base verb; see (32) and (33).

Illustrations and some comments follow.

5.2 Diatheses with argument coreferentiality

5.2.1 “Canonical” reciprocals. Intransitive diathesis

The following should be noted.

1a. Derived from two-place transitives. There are languages where only this diathesis type is possible, e.g. in Greenlandic Eskimo (Fortescue, Ch. 19, §§7.1.2, 7.1.3), To’aba’ita, etc. Here is an example from To’aba’ita (Lichtenberk, Ch. 36, ex. (3), (23)):

- (27) a. *Roo wela kera kwa’e nau.* two-place transitive base verb
 two child 3PL.FACT hit 1SG
 ‘The two children hit me.’
 b. *Roo wela kera kwai-kwa’e-i.* one-place intransitive reciprocal
 two child 3PL.FACT REC-hit-REC
 ‘The two children hit each other.’

1b. Derived from two-place intransitives. The “canonical” type can also be derived from two-place intransitives. An example from Itelmen (Volodin, Ch.43, §§3.1 and 3.3):

- (28) a. *k-pens-knen kəmm-anke.* two-place intransitive base verb
 3-rush-3 I-ALL
 ‘He/They rushed to me.’
 b. *Qnaŋ k-lo-pens-knen.* one-place intransitive reciprocal
 at.once 3-REC-rush-3
 ‘At once they rushed to each other.’

Intransitivity shared by both transitive-based and intransitive-based reciprocal derivatives distinguishes them from transitive “indirect” (see Ch. 1, §12.1.2) and “possessive” (Ch. 1, §12.2.1) reciprocals. Therefore these first two subtypes of derivatives are considered as “canonical”, though in some languages they may differ in marking (see Ch. 1, §9.4), and intransitive-based reciprocals may show the same marking as “indirect” reciprocals. And in some languages, there may also be constraints on the reciprocalization of constituents other than direct objects.

5.2.2 “Indirect” reciprocals. Transitive diathesis

This type is non-existent in Tundra Yukaghir (Maslova, Ch. 44, §8.2) which has both subtypes of the “canonical” diathesis of reciprocals. In Udehe, only this diathesis type and the previous two subtypes of the “canonical” diathesis are possible. Here is an example (Nikolaeva, Ch. 23, §3.1.2)

- (29) a. *Ei a:nta nuan-dule-ni lepeška-we titi:-ni.* three-place vt
 this woman he-LOC-3SG flat.cake-ACC take.away-3SG
 ‘This woman takes a flat cake away from him.’
 b. *Lepeska-we titi-masi:-ti.* two-place vt
 flat.cake-ACC take.away-REC-3PL
 ‘They take the flat cake away from each other.’

5.3 Reciprocals with non-argument coreferentiality (the valency of the base is retained)

5.3.1 “Possessive” reciprocals. Transitive diathesis

In Yakut, this and all the previous diathesis types are possible. Here is a Yakut example (Nedjalkov & Nedjalkov, Ch. 26, ex. (78); in (b) reduplication iconically signals two objects; possessivity 3PL is marked by the suffix *-leri/-teri* only).

- (30) a. [*Bukatəər at-a atən bukatəər at-2-n*] *tüü-tü-n, et-i-n,*
 athlete horse-his other athlete horse-his-ACC hair-his-ACC flesh-his-ACC
tirii-ti-n baraa-ta-Ø. two-place transitive base
 skin-his-ACC destroy-PAST-3SG
 ‘[The athlete’s horse] destroyed the hair, flesh and skin [of the other athlete’s horse].’
- b. ... *tüü tüü-leri-n, et et-teri-n, tirii tirii-leri-n*
 hair hair-their-ACC flesh flesh-their-ACC skin skin-their-ACC
bara-s-pət-tara. two-place transitive reciprocal
 destroy-REC-NR.PAST-3PL
 ‘[The horses of the athletes] destroyed each other’s hair, flesh and skin.’

These “possessive” reciprocals may have peculiarities in the additional marking on the direct object, by means of the suffix *-takan/-tak* ‘each other’s’ (attested in the Oxotsk dialect of Even, also used to derive reciprocal pronouns in this dialect; Malchukov, Ch. 39, §5). In To’aba’ita, this diathesis type can be marked by a possessive suffix on the object only, without any marking on the predicate (see (23) above). An example from Even:

- (31) a. *Bej hooni-wa-n irič haa-ži-m?*
 man strength-ACC-his how know-FUT-1PL
 ‘How can we try the man’s strength?’
- b. *Honi-l beji-l, hooni-tak-mar irič haa-mat-či-p?*
 strong-PL man-PL strength-tak-REFL.PL how know-REC-FUT-1PL
 ‘Strong men, how can we try each other’s strength?’

In some languages, e.g. in Mundari (Osada, Ch. 37, §3.1.3), this kind of constructions is formed if only the direct object of the base construction denotes an inalienable possession.

5.3.2 “Adverbial” reciprocals

Verbal reciprocals of this diathesis type are not attested in my corpus, unless we count isolated instances when a transitive reciprocal construction is interpreted as reciprocal-benefactive, e.g. Even with the meaning ‘They built houses for each other’. If the base verb contains a benefactive marker, the corresponding reciprocal should be interpreted as “indirect”. Therefore all the examples below contain a pronominal reciprocal marker.

In the following Chinese example, the base construction contains a one-place intransitive predicate and the non-subject constituent denotes a human referent not determined by the lexical meaning of the verb, but related to the subject referent by the expression of the emotion named. (32a) and (32b) differ to a certain degree in that (32b) “would imply that the participants intentionally shed tears to each other” (F. Li, p.c.):

- (32) a. *Tā duì wǒ diào-zhe yǎnlèi.*
 s/he to I shed-DUR tear
 ‘He is shedding tears before/in front of me.’
 b. *Tāmen hùxiāng diào-zhe yǎnlèi.*
 they mutually shed-DUR tear
 ‘They are shedding tears in front of/in the presence of each other.’

In this type of constructions, spatial adverbials are frequent, though it is not always easy to distinguish between locative adverbials and locative objects (some verbs of motion with locative objects, e.g. ‘to throw oneself upon sth/sb’, ‘to approach sth/sb’ usually form verbal “canonical” reciprocals). However, reciprocal pronouns (such as *meen meen-duk-ur* ‘from each other’ in Even sentence (33b)) can be supplemented – pleonastically – by the reciprocal suffix on the predicate (Malchukov, Ch. 39, (3)).

- (33) a. *Hurken nöö-duk-i tut-te-n.*
 youth.NOM brother-ABL-REFL run-NFUT-3SG
 ‘The youth runs from his (younger) brother.’
 b. *Aknil meen meen-duk-ur tut-te.*
 brothers.NOM each other-ABL-REFL.POSS.PL run-NFUT.3PL
 ‘The brothers run from each other.’

5.4 Multiple-diathesis reciprocals

This term is used to refer to reciprocal forms which can be used in constructions of two diathesis types, depending on the syntactic context: “canonical” and “indirect” (if the base is a three-place transitive) or “canonical” and “possessive” (if the base is a two-place transitive). Here are two Yakut multi-diathesis reciprocals derived from *əət-* ‘to send sb to sb’ and *bil-* ‘to know sb’:

- (34) *Kiniler [oyo-loru-n] əət-əs-ti-ler.*
 they child-3PL.REFL.POSS-ACC send-REC-PAST-3PL
 i. ‘They sent *each other* [to someone].’ “canonical” (if the bracketed object is omitted)
 ii. ‘They sent their children *to each other*.’ “indirect” (if the object is explicit)
- (35) *Kiniler [oyo-loru-n] bil-s-el-ler.*
 they child-3PL.REFL.POSS.-ACC know-REC-PRES-3PL
 i. ‘They know *each other*.’ “canonical” (if the bracketed object is omitted)
 ii. ‘They know *each other’s* children.’ “possessive” (if the bracketed object is explicit)

5.5 Lexical range of diathesis types. Restrictions on forming verbal reciprocals

It is natural that among the diathesis types the most numerous are “canonical” reciprocals derived from two-place transitives. Next in the lexical range are “canonical” reciprocals derived from two-place intransitives. And lastly, “indirect” reciprocals of three-place transitives follow. This is determined by the relative number of respective base verbs in a language. As for “adverbial” reciprocals, the use of such verbal reciprocals seems to be rather limited, with the exception of some groups of verbs.

The “canonical” type of reciprocals being the most common cross-linguistically, a language may lack some other diathesis type(s).

The tentative implicational hierarchy of the diathesis types proposed here is:

- (36) “canonical” > “indirect” > “possessive” > “adverbial”.

The illustrations of these four types are given below in the same order.

The Chinese pronominal marker *hùxiāng* cited in (16) forms all the diathesis types of reciprocals.

The Even reciprocal suffix *-mat-* derives the first three diathesis types but not “adverbial” reciprocals (which is shown in (33) where the reciprocal pronoun is used).

The Udehe suffix *-masi* derives “indirect” and “canonical”, but not “possessive” and “adverbial” reciprocals (cf. (29) above).

The Itelmen prefix *lo-* derives “canonical” reciprocals from two-place intransitives (see (28)) and two-place transitives, but no “indirect”, “possessive” and “adverbial” reciprocals. And lastly, the To’aba’ita prefix *kwai-* (sometimes in combination with the suffix *-i-* which is not used in any other way) is used to form “canonical” reciprocals from two-place transitives exclusively (see (27)).

Thus, the higher the syntactic status of the sentence constituent, the higher its chance of reciprocalization: direct object < indirect object < possessive attribute < adverbial.

Verbal reciprocals are mostly intransitive, the base verb being either transitive or, less commonly, two-place intransitive. However, in my list of languages, there are two languages in which the number of registered intransitive-based reciprocals exceeds that of transitive-based reciprocals, namely, Itelmen (where the reciprocal prefix *lo-/lu-* is registered on about 25 transitive-based and about 45 intransitive-based reciprocals; Volodin, Ch. 43, §§3.2–3.6) and Kusaiean where, according to Lee (1975:201–3), the reciprocal circumfix *a-...-i* is “usually used with intransitive verbs but some transitive verbs [...] can be used with this” circumfix. Curiously enough, among transitive verbs meaning ‘to see’, ‘to hear’, ‘to love’, ‘to remember’ are cited, and among intransitives there are verbs meaning ‘to hit’, ‘to kick’, ‘to wash’. The state of affairs in these two languages is possibly connected with the ratio of transitives and intransitives rather than with the peculiarities of the reciprocal markers.

Intransitivity shared by both transitive-based and intransitive-based reciprocal derivatives distinguishes them from transitive “indirect” (Ch. 1, §12.1.2) and “possessive” (Ch. 1, §12.2.1) reciprocals. Therefore the first two types of derivatives are listed as “canonical”, though in some languages they may differ in marking (see Ch. 1, §9.4) and intransitive-based reciprocals may show the same marking as “indirect” reciprocals. And in some languages, there may also be constraints on the reciprocalization of constituents other than direct objects.

The regularities noted above need further investigation in order to find more supplementing data which may help to clarify some issues.

5.6 Deviations from the standard case

Since cross-linguistically the main (and sometimes the only) diathesis type is “canonical” which is intransitive, transitive, i.e. “indirect” and “possessive” diathesis types in some of those languages reveal some properties of intransitive constructions, probably due to the indirect influence of the prevalent type. The following cases are registered across languages.

1. A reciprocal verb has a marker of intransitive verbs instead of that of transitives; e.g. in Mundari in “indirect” and “possessive” reciprocal constructions the transitive marker *-ʔ-* on the predicate is replaced by the intransitive marker *-n-*, as on “canonical” reciprocals (see Osada, Ch. 37, ex. (16)). A rather similar case is observed in Kolyma Yukaghir where “indirect” reciprocals can be inflected both like transitives and intransitives (Maslova, Ch. 44, §3.2).

2. The reciprocal verb forms an absolutive construction instead of the ergative, as in Cashinahua where the subject of “indirect” reciprocal constructions lacks the ergative case marker – suffix *-n* (Camargo, Ch. 45, §1.2). In Warrungu, the subject of “indirect” and “possessive” reciprocals is not ergative but nominative, despite the fact that the direct object can be retained (Tsunoda, Ch. 32, §§1.2, 4.2, 4.3).

3. The reciprocal marker may be attached to the direct object rather than to the verb in semantically “possessive” reciprocal constructions. Two varieties are registered:

3a. The direct object retains its position, as is the case in Nivkh; cf. *u-dəmk rəmk zap-t* <REC-hand hand hold-CONV> ‘holding each other by the hand’ in example (22) above;

3b. The direct object of the base construction is incorporated in the verb; cf. Alpatov et al., Ch. 42 on Ainu, §3.1.3. Example (37b) is a semantic counterpart of Even (31b):

- (37) a. *E-kiror-o* *ku-nukar.* → b. *esi-u-kiror-nukar.*
 your-strength-POSS 1SG-test/see YOU.PL-REC-strength-test
 ‘I test your strength.’ ‘You compete in strength.’

In Ainu, there are no regular “possessive” reciprocals. In Kolyma Yukaghir, there are regular “possessive” reciprocals. Therefore it is surprising that several reciprocals with an incorporated direct object appear in this language (Maslova, Ch. 44, §3.3.2); cf.:

- (38) ... *n'e-pōme-aŋs'i-jejl'i.*
 REC-lice-look.for-1PL-INTR
 ‘... we are looking for each other’s lice.’

6. Simple and discontinuous reciprocal constructions. Semantics of reciprocants

13. Are reciprocal verbs of the language under investigation used only in the simple or in the discontinuous construction as well?

Simple constructions are those in which both reciprocants are expressed by the subject. Discontinuous constructions are those in which the second reciprocant is a non-subject. This distinction divides languages into two groups. In some languages, verbal reciprocals

can be used in simple constructions only (Kabardian, French, To'aba'ita, etc.; see examples (1b) and (27b)), and in other languages, they can occur in discontinuous constructions as well (in Turkic languages, Evenki, Swahili, Quechua, Mongolian, etc.; see examples (6b), (39b), (45a)). Languages with the discontinuous construction and no simple reciprocal construction are hardly possible.

14. What are the syntactic relations between the reciprocants in a complex subject: coordinative (*Peter and John*) or comitative (*Peter with John*) or either? Does the relevant marker differ from the respective marker(s) in non-reciprocal constructions?

A language may employ both types of markers: a special marker for each type of syntactic relations. For instance, Evenki has comitative marking of the type *eni hunat-nun-mi* 'Mother with her daughter' (see (39a, b)) and a purely coordinative particle *-da* 'and', e.g. *eni [-da] hunan-in-da* 'mother[-and] daughter-her-and'.

15. If the language has homophonous coordinative and comitative markers, is their coordinative or comitative meaning determined by their position between the reciprocants (coordinative) or after the second (comitative)?

Coordinative/comitative markers are widespread cross-linguistically in general, and not only in reciprocal constructions. Their use in reciprocal constructions is attested in many languages, e.g. in Tuvan, Quechua, Fula, Swahili, etc. For a Swahili example see (6).

16. What are the means of marking the second reciprocant in the non-subject position in discontinuous constructions: a comitative preposition or postposition, or a comitative case, etc.? Can these same markers be used as linkers when both reciprocants are named by the subject (in the simple construction)?

17. Is the comitative marker used only with animate nouns or also, for instance, in sentences like *He came with a spade*?

18. Does the reciprocal predicate of discontinuous constructions agree with the subject alone if the language has subject agreement markers? Note that if the subject is singular the predicate is singular as well.

This is registered in quite a number of languages, e.g. in Evenki, as is shown in example (39) (Nedjalkov & Nedjalkov, Ch. 38, §3.1.5; see also Ch. 1, §1.7.3):

- (39) a. *Eni hunat-nun-mi n'ukani-maat-čere-Ø.* simple construction
 mother daughter-with-her kiss-REC-PRES-3PL
 'Mother and her daughter [lit. 'with her daughter'] are kissing each other.'
- b. *Eni hunat-nun-mi n'ukani-maat-čere-n.* discontinuous construction
 mother daughter-with-her kiss-REC-PRES-3SG
 (same translation as in (a))
 lit. 'Mother with her daughter is kissing each other.'

Both nouns in (39a) comprise a complex subject group and the predicate agreement is plural, therefore it is a simple construction. In (39b) the first singular noun is the subject

and the second is an object, since the agreement is in the singular, and thus the construction is discontinuous (in the genetically closely related Udehe language, the agreement in similar cases is always plural). If the first reciprocant is plural both interpretations are possible (39c). There is some slight pragmatic difference in the distribution of prominence and no semantic difference between the constructions.

- c. *Nuḡartən hunat-nun-mer n'ukani-maat-čere-Ø.*
 they daughter-with/and-their kiss-REC-PRES-3PL
 i. 'They *and* their daughter are kissing each other.' simple 'interpretation'
 ii. (same as (i)), lit. 'They *with* their daughter are kissing each other.' discontinuous

In isolating languages where subject agreement is non-existent, the problem of establishing the simple or discontinuous status of a reciprocal construction may be more complicated. In these cases the use of some criteria may help; for instance, insertion of an adverb between the reciprocants transforms an assumed simple construction into discontinuous rather than serves as a diagnostic criterion for the discontinuous construction.

19. Are there any selective restrictions on the use of reciprocals in the discontinuous construction? If only a limited number of reciprocals can be used in the discontinuous construction, are they lexicalized reciprocals?

In languages, e.g. in Indonesian, where simple reciprocal constructions, as a rule, are alone possible, discontinuous constructions may be allowed with lexicalized reciprocals (see Ogloblin & Nedjalkov, Ch. 33, §7.2). In German, where most of the reciprocals are used in simple constructions only, there are about 20 reciprocals which allow discontinuous usage, including *sich umarmen* 'to embrace each other', *sich necken* 'to tease each other', *sich dutzen* 'to say 'thou' to each other' (E. König, p.c.); the best known exception is (40b).

- (40) a. *Marie und Paul begrüßten sich.* → a'. **Marie begrüßte sich mit Paul.*
 b. *Marie und Paul schlugen sich.* → b'. *Marie schlägt sich mit Paul.*

20. Can the subject of a simple reciprocal construction be a collective noun (e.g., 'people', 'family', 'crowd', 'group', 'army', 'pair', 'class', etc.)?

Collective nouns are not allowed, for instance, in Greenlandic Eskimo (see Fortescue, Ch. 19, §9). If the answer is positive, the class of collective nouns that can occur in the subject position should be described. In languages where the use of collective nouns is possible, restrictions may be imposed by the lexical meaning of a reciprocal (cf. **Die Gruppe begrüßte sich* lit. 'The group greeted each other.'; E. König, p.c.).

21. Are there any reciprocals with inanimate reciprocants?
 22. Are there any reciprocal constructions without a subject (= antecedent of the reciprocal marker)? Hereby I mean a type in which the subject is not expressed formally (i.e. is not overt).

An instance of this may be the following Vietnamese example where the reading is indefinite-personal: indefinite human agents are implied: it is people who are in the street (Bystrov & Stankevich, Ch. 47, §3.3):

- (41) *Ngoài đường đánh nhau.*
 outside street hit REC
 ‘There is fighting out there in the street.’

23. Can or must the reciprocal in the discontinuous construction be marked by a verbal affix if the language has an applicative affix (or affixes) one of whose meanings is comitative (see (42 b), (43 c), (44 b))?

Such cases are attested in Tagalog and Maasai. The Tagalog applicative marker *maki-* which often carries the comitative meaning and the Maasai applicative marker *-re* are used on both non-reciprocals and reciprocals, indicating in the latter case a discontinuous construction. Examples from Tagalog (Shkarban & Rachkov, Ch. 22, 1.2, examples (218), (221), (229)) and Maasai (Tucker & Mpaayei 1955: 134–40, 157; *k-* = 1PL, *a-* = 1SG) respectively:

- (42) a. *um-inom* ‘to drink’
 b. *maki-inom* ‘to drink with sb’ applicative of an unmarked verb
- (43) a. *t-um-ulong* ‘to help’
 b. *mag-tulong-an* ‘to help each other’
 c. *maki-pag-tulong-an* ‘to cooperate with sb’ applicative of reciprocal
 [= ‘to help sb who is also helping in his turn’]
- (44) a. *k-iḡor-a* ‘we look at each other’
 b. *a-iḡor-a-re* ‘I look at him (while he looks at me)’. applicative of reciprocal

24. Is the semantic “completeness” of the sentence retained if the second reciprocal, taking the non-subject position, is omitted (the first one being in the singular)?

Generally, in the discontinuous reciprocal construction, object omission is not allowed if the (explicit or pro-drop) subject is singular; see (45c). Subject omission, on the contrary, is allowed (see (45b)); cf. Tuvan (K. Kuular, p.c.):

- (45) a. *Ava-m ača-zə-bile kuspakta-ž-əp tur.*
 mother-my father-3.POSS-with embrace-REC-CONV AUX.3
 ‘My mother is embracing with her father.’
- b. ... *ača-zə-bile kuspakta-ž-əp tur.*
 father-3.POSS-with embrace-REC-CONV AUX.3
 ‘[S/he/they] is/are embracing with his/her/their father.’
- c. **Ava-m kuspakta-ž-əp tur.*
 mother-my embrace-REC-CONV AUX
 ‘My mother is embracing [with whom?]

Note that analogous comitative and assistive constructions with the omitted second participant are grammatical. For instance, in sentences like *Peter makes hay [with someone]*

and *Peter helps [someone] to make hay* the bracketed noun phrases may be omitted, while being implied by the meaning of the predicate.

Incidentally, an attempt to use a reciprocal verb with a singular subject and without the second participant may serve as a diagnostic test for establishing some non-reciprocal meanings of the marker on certain bases. Note that in Yakut, most of the non-reciprocal meanings of the reciprocal suffix allow the singular subject even without an explicit object.

7. Productivity and restrictions on derivation of reciprocals

25. Do the reciprocals form a relatively open or closed set in the language under investigation?
26. What is the approximate number of reciprocals in your language?

7.1 Introductory notes

The following should be noted. Firstly, the restrictions listed below are secondary with regard to restrictions on the formation of diathesis types. Secondly, when a reciprocal form is not possible at all or if it has no reciprocal meaning, a pronominal reciprocal is used to express the required meaning, provided it exists in the language.

Possible provisional answers for languages with a large enough number of verbs (variation within a wide range is possible, partly depending on the number of verbs in the lexicon, by which I mean that if their overall number does not exceed a hundred, e.g. in an underinvestigated language, the figures may be in an entirely different range):

1. Their number is limited and they form a closed set not exceeding 10–60 items, as in Russian and Karachay-Balkar.

27. If the number of reciprocals is limited, can the limits on their number be accounted for by semantic factors?

2. Their number does not exceed 80–200 items, as, for instance, in Latvian and Lithuanian.

3. Their number reaches as many as 300 or more, which means there are very few restrictions on their formation. Here belong, for instance, Yakut, German.

28. Please point out the restrictions on reciprocals registered in the language. Can they be explained? Are there any semantic groups of verbs which do not participate in reciprocal derivation?

With regard to restrictions, the following three possibilities should be kept in mind.

7.2 Trivial restrictions

This concerns, firstly, one-place intransitive verbs, e.g. *to die, to go, to croak* (of frogs), etc. (exceptions are possible in some languages, e.g. in Yakut, reciprocals like ‘to croak to each other’ = ‘to exchange croaks’ are registered). Secondly, this concerns two-place transitives with the subject and object of different semantic classes, e.g. one human and the other inanimate, i.e. verbs like *to build a house, create, write*, etc. (though in this case benefactive reciprocals with the meaning ‘to build houses for each other’ are possible in some languages, e.g. in Yakut).

7.3 Semi-trivial restrictions

In the following cases there are no semantic obstacles of this kind, and thus the reasons are of a different nature.

1. The reciprocal meaning may be blocked by another, pragmatically more significant meaning of the polysemous marker. For instance, the Tuvan reciprocal form of the verb *či-* ‘to eat’ has a metaphorically lexicalized meaning ‘to compete’. For the expression of the standard reciprocal meaning the reciprocal pronoun is added to the derivative. Compare (Kuular, Ch. 27, §3.3):

- (46) a. *či-* ‘to eat’ → *či-š-* i. ‘to compete’, ii. *‘to eat each other.’
 b. *Ol ajmak-tar bot-bot-tar-a-n či-ž-ip ka-ap-kan.*
 this tribe-PL each-other-PL-POSS-ACC eat-REC-CONV AUX-ASP-PAST
 ‘These tribes ate one another.’

Similarly, the reciprocal form of the Kirghiz verb *bajla-* ‘to tie’ does not acquire the expected meaning ‘to tie each other’; instead, *bajla-š-* has the meanings: i. ‘to help tie (e.g. horses)’, ii. ‘to tie together with sb (e.g. horses)’, iii. ‘to bet’. To express reciprocity, the monosemous pronominal marker is used instead of the verbal; cf. *birin biri bajla-* ‘to tie each other, tie each other to sth’.

2. Certain syntactic and/or morphological peculiarities of verbs may prevent reciprocal derivation. Verbal reciprocals cannot be derived from certain syntactic classes of verbs. For instance, in German, verbal reciprocals do not derive from verbs taking a prepositional object, such as *auf jemanden warten* ‘to wait for sb’ (cf. **auf sich warten* ‘to wait for each other’); instead, pronominal reciprocals are commonly used. In many languages, reciprocals do not derive from one-place intransitive bases and/or complex verbs (e.g., Kirghiz *žek kör-* <hatred see> ‘to hate’, Japanese *tobi-kakaru* <jump-hang> ‘to attack’).

3. Restrictions on derivation of verbal reciprocals from lexical reciprocals are possible. They are quite natural because of the inherent reciprocal meaning of the latter, which seems to make the reciprocal marking redundant. For instance, most of the Japanese lexical reciprocals do not take the reciprocal marker (see example (74c) with the verb *kekonsu-ru* ‘to marry sb’ below). But if such derivations happen they are sometimes idiosyncratic.

7.4 Non-trivial (proper) restrictions

These are restrictions which are often idiosyncratic and hard to explicate; for instance, a reciprocal may derive from one synonym and not from another.

In Tuvan, verbal reciprocals are highly productive. As examples of rare restrictions, the following bases which do not yield verbal reciprocals (these bases sound queer to native speakers when combined with the reciprocal marker) can be cited: *sagəndər-* ‘to remind sb (ACC) of sth’, *des-* ‘to avoid sth/sb (ABL)’ (and its synonyms *ojla-* and *durgunna-*), *čalən-* ‘to implore sb (DAT)’, *eereš-* ‘to implore sb (ACC)’, *idege-* ‘to rely on/trust sb (ABL)’, *ijle-* ‘to miss sb very much’. Semantically, these verbs allow reciprocal use (which is shown by the fact that the synonyms *čokta-* ‘to miss’ and *büzüre-* ‘to trust’ do take the reciprocal suffix). In these cases the reciprocal pronoun alone or in combination with a verbal reciprocal is used (Kuular, Ch. 27, §3.3):

- (47) a. *Olar ürgülčü akə-m-dan dez-er tur-gan.*
 they always elder.brother-my-ABL avoid-PART AUX-PAST.3
 ‘They always avoided my elder brother.’
- b. *Olar ürgülčü bot-bot-tar-ə-n-dan dez-er tur-gan.*
 they always each-other-n-ABL avoid-PART AUX-PAST.3
 ‘They always avoided each other.’

8. Simultaneity and succession of actions within a reciprocal situation

29. Do verbal reciprocals fall into groups according to the temporal relation between the subevents?

The following groups seem to cover the main types of relevant reciprocals with respect to the internal temporal structure of the reciprocal situation, viz. succession or simultaneity of the subevents, i.e. the action(s) of each particular reciprocant.

1. Reciprocals with meanings like *to visit each other*, *to talk to each other*, the lexical meaning of the bases determining sequentiality of the subevents (and exchange of the roles) due to the very nature of these actions.

2. Reciprocals denoting simultaneous motion of reciprocants represented as a chain of successive subevents: *to chase each other*, *to follow each other*, *to precede each other*, presupposing exchange of the roles – of the chaser (follower) and the chased (followed) (which does not necessarily take place in reality, as these verbs may denote motion without exchange of positions relative to each other).

3. Reciprocals with meanings like *to kill each other*, *to exploit each other*, generally denoting situations with more than two participants and an unpaired distribution of the roles, different from that in the previous two cases.

4. Reciprocals with meanings like *to wake each other* (in a situation who wakes first becomes the agent and the second reciprocant need not do the same, but s/he may do it on another occasion).

5. Reciprocals denoting simultaneous (only) subactions of both reciprocants: they are either momentaneous (like *to bump into each other*, *to meet each other*) or stative (like *to love each other*, *hate each other*).

6. Reciprocals neutral in respect of the temporal relation of the subevents (like *to hit each other*, *to teach each other*, *to eye each other*, *to curse each other*, *to shoot at each other*), which does not outrule their partial overlap.

30. Does the lexical range of the above listed groups depend only or mostly on the lexical meaning of the base verb or on some other factors as well?

31. Do reciprocals or certain groups of them collocate with adverbials denoting simultaneity or sequentiality, like ‘simultaneously’, ‘at the same time’, ‘at two o’clock (sharp)’, ‘in turn’, ‘by turns’, ‘at one stroke’, ‘one after another’, ‘one by one’, etc.?

Here is a suitable Yakut example (S. 484):

- (48) *Xardarə-taarə təl bərax-s-al-lar.*
 by.turns word fling-REC-PRES-3PL
 lit. ‘By turns they are flinging words at each other.’

Simultaneity may be understood not only as momentous, i.e. the subevents need not take place at the same brief moment: it can extend over a long enough period of time, the subevents being perceived as parts of a single situation taking a longer time (but this seems to be irrelevant for empirical data).

A special place belongs to the combinability of reciprocals with adverbials like *together* implying simultaneity. In most cases such combinations are ungrammatical and sound contradictory opposing both interacting reciprocants to another reciprocal(s) not implied by the reciprocal meaning of the derivative. But they may occur in some languages, most likely with the meaning not only of simultaneity (as is claimed by A. Malchukov for the Even suffix cluster *-lda-mat-* <SOC-REC->; see Ch. 39, §2.5.1), but also with some other nuances. Besides, in closely related Evenki, there are instances of joint use of reciprocal *-mat-* and sociative *-lda*, which can be explained by the fact that *-lda-* is descended from the reciprocal(-sociative) marker and even at present is sometimes used in the reciprocal meaning and thus we deal in Evenki with an archaic pleonastic use of both markers. In Tariana, the sequence *-siwa-kaka-* <SOC-REC-> is “used to emphasize that every one of the participants is, or was involved in a reciprocal action” (Aikhenvald, Ch. 30, §4.4).

And lastly, one may expect, though with a small degree of possibility, to encounter reciprocally marked derivatives whose meaning may allow all the three main possible interpretations. For instance, the Cashinahua derivative *tsaka-namI-* can be used in sentences with the following meanings: i. ‘X and Y killed each other’ (used as a joke), ii. ‘X and Y killed in response some people who had done harm to their relatives’, iii. ‘X and Y killed some people whose relatives would kill X and Y in revenge’ (Camargo, Ch. 45, §3.2).

9. Reciprocal specifiers; two types: i. 'mutually', ii. 'among oneselves'

32. Are there words with the reciprocal meaning, termed here reciprocal specifiers, which are used as a rule with grammatical and/or lexical reciprocals? If there are, to which of the types named in the heading do they belong?

Reciprocal specifiers are words or word groups which are reciprocal in meaning but cannot, as a rule, mark reciprocity by themselves. Two types can be distinguished, specifiers with a meaning like 'mutually' (cf. Polish *nawzajem/wzajemnie*, Tuvan *udur-dedir*, Vietnamese *lan*, etc.) and those with a meaning like 'among between our/your/themselves' (cf. Lithuanian *tarp savęs, tarpusavyje/ savo tarpe*, Tuvan *arazānda*, Even *meer dooli*, Russian *meždu soboj* 'between selves', etc.). The first type can be provisionally termed adverbial and the second, pronominal specifiers.

The adverbial type serves to emphasize the reciprocal meaning of the verb (hence their usage with monosemous reciprocal pronouns, in some languages; cf. Russian *Oni vzaimno uvazhali drug druga* lit. 'They mutually respected each other') or to disambiguate a reciprocal form with a polysemous marker (see example (17) above).

Specifiers of the pronominal type serve to stress that the reciprocal situation is limited to the subject referents exclusively; these specifiers emphasize reciprocity to a certain degree.

33. Do verbal reciprocals display selectional restrictions in combinability with either of the types of the specifiers in question, or with different items of these types, if there are several of each type?

In this domain there can be very subtle differences that are hard to explain. For instance, in Vietnamese (Bystrov & Stankevich, Ch. 47, 2.7; *nhau* = 'each other') the phrase *giúp đỡ lẫn nhau* 'to help each other mutually' is perfectly acceptable, but the phrase *yêu lẫn nhau* 'to love each other mutually' is not.

34. Do reciprocal specifiers ever occur with non-reciprocals instead of the regular reciprocal marker? If they do, is this usage evaluated as standard or occasional?

For instance, in Russian example (18) above, the reciprocal pronoun is felt to be missing. Genetically related languages may differ in the use of such specifiers. Compare: in Even, *meer dooli* 'among themselves' is used with verbal reciprocals exclusively (Malchukov, Ch. 39, §6), while in Udehe (Nikolaeva, Ch. 23, §4) *mene dolo* with the same meaning is used not only with verbal reciprocals but also as the only marker of reciprocity with non-reciprocal verbs. In this respect an interesting fact is that in some dialects of the Khakas language the adverb *udur-tödär* 'mutually, each other' can be used as the only marker of reciprocity (A. Letuchiy, p.c.). Characteristically, in other dialects of Khakas, as well as in the closely related Tuvan languages, the cognate adverb *udur-dedir* is used only as a specifier.

35. Are there instances of the use of the specifiers with emotive base verbs (e.g. ‘to respect’, ‘to love’, ‘to be disposed’, ‘to forgive’, and the like) instead of the regular reciprocal marker?

36. Can a reciprocal pronoun which can be used in a reciprocal construction as the only reciprocal marker (in the direct object position) also appear together with a verbal reciprocal in “canonical” constructions as a kind of reciprocal specifier?

Such usage is characteristic of Turkic languages; see (46b), (65), (66).

37. Are there any reciprocal pronouns closer to reciprocal specifiers than those mentioned in the preceding question, namely, such pronouns that cannot take the direct object position and can only be used independently in certain cases, e.g. in reciprocalization of prepositional constituents?

Examples of such usage can be found in Romance languages; cf. French (Guentchéva & Rivière, Ch. 12, §1.2), where the reciprocal pronoun co-occurs with verbal reciprocals (49c). Thus, it resolves the possible polysemy of construction (49b).

- (49) a. *Pierre a blessé Jean.*
 ‘Pierre hurt Jean.’
- b. *Pierre et Jean se sont blessés.*
 i. ‘Pierre and Jean got hurt.’ anticausative
 ii. ‘Pierre and Jean hurt themselves.’ reflexive proper
 iii. ‘Pierre and Jean hurt each other.’ reciprocal
- c. *Pierre et Jean se sont blessés l’un l’autre.*
 ‘Pierre and Jean hurt each other.’
- d. **Pierre et Jean sont blessés l’un l’autre.*
 (same intended meaning).

This pronoun cannot take the direct object position (49d); it can be used alone (without a verbal reciprocal marker) only for reciprocalization of a prepositional object (50b): in such cases the verbal reciprocal marker cannot be used alone (50c) or with the pronoun (50d) (cf. Guentchéva & Rivière, Ch. 12, §7.2.2):

- (50) a. *Jean compte sur Marie.*
 ‘Jean counts on Mary.’
- b. *Ils comptent l’un sur l’autre.*
 ‘They count on each other.’
- c. **Ils se comptent.*
 (same intended meaning).
- d. **Ils se comptent l’un sur l’autre.*
 (same intended meaning).

38. Do reciprocals, all or some of them, collocate with adverbials (e.g. adverbials meaning ‘between/among themselves’) which delimit the number of the participants of a reciprocal situation? If they do, what could the explanation be?

10. Polysemy of reciprocal markers

10.1 Three main types of polysemy

39. Is the main reciprocal marker monosemous or polysemous?

If a reciprocal marker is polysemous its reciprocal use should be considered first and its non-reciprocal usages discussed next in a separate section. The subsequent questions of this section concern polysemous markers only.

As regards the meanings most closely related to the reciprocal, the three most important are: reflexive (shared feature – expression of anaphoric relations), sociative (shared feature – multiplicity of participants) and iterative (shared feature – multiplicity of actions). It is convenient to term the three meanings in question, i.e. reflexive, sociative and iterative, as the *main* concomitant meanings of reciprocal markers. In accordance with this, three main types of polysemy are: reflexive-reciprocal, reciprocal-sociative and iterative-reciprocal. The other concomitant meanings can be named *secondary* (whatever their productivity).

Note that markers with reflexive-reciprocal polysemy are in fact reflexive markers, and their polysemy has been better investigated typologically than that of the other two types of markers (for details see Ch. 5, §2).

Illustrations of the three types of polysemy:

Sumbwa (Capus 1898:64; *-i-* = REFL)

- (51) *-šim-a* ‘to love’ → *-i-šim-a* i. ‘to love oneself’, ii. ‘to love each other’
-gay-a ‘to hate’ → *-i-gay-a* i. ‘to hate oneself’, ii. ‘to hate each other.’

Karanga (Marconnès 1931:195; *-an* = REC)

- (52) *-chek-a* ‘to cut sb/sth’ → *-chek-an-a* i. ‘to cut each other’, ii. ‘to cut sth together.’

Chinese (Liu 1999:124, 126; *-lái-...-qù* ‘-come-...-go’ = REC)

- (53) *dǎ* ‘to hit’ → *dǎ-lái-dǎ-qù* i. ‘to fight several times’, ii. ‘to beat each other.’

40. Which of the three basic types of polysemy does the polysemous reciprocal marker display?

10.2 Conditions of actualization of the main meanings

41. Is the polysemy realized in the same derivative (with the same base, as in (51)–(53); see also (1b)) or is it in complementary distribution relative to the bases, some of the derivatives being only reciprocal in meaning and others only reflexive, or sociative, or iterative, as is the case in Lithuanian and Russian relative to the reciprocal and reflexive meanings?

Compare Lithuanian:

- (54) a. *prausti* 'to wash sb' → *prausti-s* 'to wash oneself' reflexive only
 b. *apkabinti* 'to embrace sb' → *ap-si-kabinti* 'to embrace each other' reciprocal only

There is also complementary distribution of a different kind which is not as rigid as that shown in (54): it concerns the distribution of non-reciprocal and reciprocal meanings under certain syntactic conditions. The following may be helpful.

1. SG or PL subject. For instance, if the subject is singular the meaning can be reflexive only, while with the plural subject the preferable or the only possible interpretation is reciprocal. In some Australian languages in the case of the plural subject the reciprocal meaning alone is possible.

Less rigidly this tendency manifests itself in German where about 75 per cent of derivatives with *sich* are interpreted by native speakers mostly as reciprocal in meaning when used with a plural subject (their meanings: 'to greet each other', 'to tease each other', 'to support each other', 'to chase each other', etc.), only 10 per cent are mostly reflexive in meaning (e.g. 'to clean oneself', 'to wash oneself', 'to hurt oneself', etc.), and about 15 per cent are interpreted as reciprocal or reflexive with more or less the same frequency, depending on the context (e.g. 'to respect oneself/each other', 'to ruin oneself/each other', 'to underestimate oneself/each other', etc.).

2. Intransitive or transitive base verb. In constructions with a reciprocal-sociative or iterative-reciprocal marker derived from one-place intransitive bases, the interpretation is usually sociative or iterative respectively, depending on the type of the marker, while in constructions derived from two-place transitives both reciprocal and non-reciprocal interpretation is possible, the reciprocal being most likely. In some languages a reciprocal marker is used to derive sociatives from intransitives only.

42. If the polysemy of a reciprocal marker (with broad enough polysemy) does not contain any of these three non-reciprocal meanings is it possible to trace (one of) these meanings in fossilized derivatives with this marker?

Each of the three types of polysemy contains a number of secondary meanings determined to some extent by the primary meaning and valency-affecting functions of the marker.

43. Is it possible to establish the frequency of the main and secondary meanings in a dictionary (if it exists) and/or in texts?

44. Are there only subject-oriented sociatives (type *They laughed together*) or also object-oriented sociatives (type *She washed the pants and shirt together*) if the marker used in the language is reciprocal-sociative?

Note that translations like 'They came together' are ambiguous: they are sociative in the meaning of joint collective *identical* action performed at the same time *in a group*, and spatial-reciprocal in the sense 'to come *from different directions to one point*', close to 'to meet', 'to gather (together)'. When it is sociative, the situation can be explained as 'X came + Y came + Z came (at the same time)'. In the second case this explanation does not apply,

as the spatial component (an adverbial of place) must be added in the definition. Thus, the ambiguity of ‘They came together’ is determined by the polysemy of the adverb *together*: i. ‘collective action’, ii. ‘spatial joining’ (gathering together into a group, heap, etc.).

10.3 Other types of polysemy

45. What other meanings does the reciprocal marker display?

Here is a provisional list of some meanings concomitant with each of the three types of polysemy (the data on the languages of the second and third types of polysemy of reciprocal markers is much more scarce than on those with the reflexive-reciprocal polysemy):

1. *The reflexive-reciprocal type*: autocausative (*to lift sth* → *to lift oneself*), reflexive-benefactive (‘to wash sth for oneself’), reflexive-possessive (*to shave oneself* = ‘to shave one’s beard’), antipassive (‘to frighten’ → ‘to be frightful’), anticausative (*etwas öffnen* → *sich öffnen*), potential (‘to break sth’ → ‘to be breakable’), passive, etc. For details see Nedjalkov (Ch. 5, §3).

2. *The reciprocal-sociative type*: comitative (‘to work with sb’), assistive (‘to help sb work’), multiplicity (‘to work (of many)’), competitive, anticausative, etc. For details see Ch. 5, §3.

3. *The iterative-reciprocal type*: durative, dispersive, distributive, reciprocal, etc. For details see Ch. 5, §4.

There are meanings that occur in two of the types of polysemy in question. Such coincidences are probably determined by the intransitivizing function of all the three types of markers; thus, “canonical” reciprocals, being intransitive, are the main source for development of polysemy). But the productivity of these meanings tends to differ significantly. Thus, for instance, the Turkic reciprocal-sociative marker *-š/-s* (these languages have two more intransitivizing suffixes, reflexive and passive) usually derives no more than 20–30 anticausatives, while in many Indo-European languages the reflexive-reciprocal marker may derive hundreds of anticausatives (e.g. 800 in Lithuanian, 1400 in Russian); see (13b, c, d), (49b.i), (76b’, b’), (80b).

11. *Nomina actionis*

46. Can reciprocal constructions be nominalized?

47. If they can, are there any restrictions? Are there verbal and pronominal nominalizations?

48. In what way are the reciprocants expressed in a nominalization?

49. Are there any differences between nominalization of reciprocals and non-reciprocals?

50. Can a reciprocal nominalization [= a nominalized reciprocal] occupy the position of the direct object?

Here is a Yakut example where the reciprocants in the nominalized reciprocal are indicated by the possessive suffix *-larə-*:

- (55) *uonna kiniler aan bastaanηə uura-h-əə-larə-n uura-s-t-əlar.* (U. 22)
 and they very first kiss-REC-NR-their.ACC kiss-REC-PAST-3PL
 ‘... and they kissed for the first time.’
 lit. ‘... and they kissed-each-other their very first mutual-kiss.’

12. Pronominal reciprocals and their relationship with verbal reciprocals

12.1 Pronominal reciprocals

The term *pronominal reciprocals* is applied as a cover term to verbs on which reciprocity is expressed not only by reciprocal pronouns proper, but by any devices that behave like nominals and, in general, other words and word combinations which can take the direct object position and thus prevent the use of another non-pronominal direct object. This justifies the cover term “pronominal marker” even in the case of adverbs. Incidentally, in isolating languages, specialists sometimes hesitate in identifying reciprocal markers as pronouns or adverbs. Other terms that could be used instead of pronominal markers, are syntactic or, more precisely, lexico-syntactic markers.

This requires some specifications. In some languages possessing antipassive constructions, the use of a reciprocal pronoun in Chukchi and reflexive-reciprocal pronoun in Eskimo requires simultaneous intransitivization by means of antipassive devices (for Chukchi see (61) and (64) below).

Note that in some languages pronominal reciprocal markers can be rather numerous. For instance, in Malayalam there are ten syntactic reciprocal markers, five of them pronouns and five adverbs. Word combinations functioning as pronominal markers can be quite exotic. For instance, in Sinhala, along with other reciprocal pronouns (e.g. reflexive-reciprocal *tamat-taman*) there are formations based on reduplicated numerals denoting the number of the participants, like ‘two two’, ‘three three’, etc. (Gair & Karunatillake 2000:723).

- (56) *Siri-yi Gunapalaə-yi Sunil-uyi tundenaa-Tə+tundenaa-Ø aadareyi.*
 S.-and G.-and S.-and three.ANIM-DAT+three.ANIM-NOM love.PRED
 ‘Siri, Gunapala and Sunil love each other.’ (lit. ‘... love three-to-three’)

51. Do the reciprocal pronouns combine with prepositions, or postpositions? Are they inflected? What is the status of the syntactic reciprocal marker? Is it a pronoun, a noun, an adverb, a single word or a word group, etc.? What properties does it display?

52. What is the morphological structure of pronominal reciprocal markers? For instance, are they differentiated for person/non-person?

53. If there are several reciprocal pronouns, can any differences in the usage, style, preferability with some bases be distinguished?

For instance, in the following example the first pronoun seems to be preferable to the other:

(57) *They love each other / one another.*

54. Are personal pronouns used as reciprocal markers? If they are, in what person(s)? Can they also express the reflexive meaning?

For an example of such usage see To'aba'ita (15) above).

55. Can a reciprocal marker of pronominal type, like English *each other*, take the subject position with the main or subordinate predicate (58) or be a part of the subject noun phrase, for instance, with a distributive or intensifying meaning as in (60)?

(58) *Miss C and I are going to find out what each other are like.* (Jespersen 1924:224)

The only possible interpretation of (58) is 'Miss C is going to find out what I am like and I am going to find out what Miss C is like'. *Each other* is the formal subject of the subordinate predicate, its antecedent being the subject of the main clause.

56. Does the pronominal reciprocal marker occur in the attributive position? If it does, and if it is generally inflected for case (and/or person), what case form does it take: nominative, genitive, etc.?

This concerns the use of the reciprocal pronoun in constructions like *They killed each other's horses*, *They love each other's children*. Compare Khalkha-Mongol (59a) and Karachay-Balkar (59b) (the pronoun in the attributive function is not marked for person and case):

- (59) a. *Xoyor xeree biye biy-iin-xee xar-iig gaixa-na.* (L. 593)
 two raven each other-GEN-REFL.POSS black-ACC amaze-PRES
 'Two ravens are amazed at each other's blackness' (proverb).
 b. *Ala biri biri xali-n səna-y-dəla.* (KB. 584)
 they each other character-ACC size.up-PRES-3PL
 lit. 'They size up each other's character.'

57. Can the reciprocal pronoun possess the distributive function when used as subject in the nominative case or as part of the subject group?

For instance, in Tuvan, when it follows the subject, the nominative case of the reciprocal pronoun has the distributive meaning 'each on their own, by themselves' (Kuular, Ch. 27, §4.1.1.1):

- (60) *Olar bot-bot-tar-ə bot-bot-tar-ə-n kamgala-ar.*
 they self-self-PL-3.POSS self-self-PL-3.POSS-ACC defend-NPAST
 'Each defends the other'; lit. 'They themselves /each of them defend each other.'

58. Can the reciprocal pronoun be related to several coordinated predicates without the verbal reciprocal marker?

59. Does the reciprocal pronoun function as a direct object or does it involve intransitivization by means of antipassivization?

The latter is observed in Chukchi, where one of the reciprocal markers is the reciprocal pronoun which has three personal forms: *mur-γǎçyu* (1st person), *tur-γǎçyu* (2nd person) and *ǝ-γǎçyu* (3rd person); cf. ((61) = (9)):

- (61) a. *Eqell-e atlay-ǝn penrǝ-nen.*
 enemy-INST father-ABS attack-AOR.3SG+3SG
 ‘The enemy attacked father.’
 b. *Eqell-ǝn ǝnkɫam atlay-ǝn ǝγǎçyu penrǝ-tko-γɫat.*
 enemy-ABS and father-ABS each.other.3 attack-REC-AOR.3PL
 ‘The enemy and father attacked each other.’

12.2 Three types of languages with respect to the reciprocal marker(s) employed

These types are:

- languages employing pronominal reciprocals only, e.g. Malayalam, Basque, English, Finnish, Georgian, Lezghian, etc.;
- languages employing verbal reciprocals only, e.g. Bara, Yukaghir, Quechua, Ainu, Mundari, Amele, etc.;
- languages employing both devices named, e.g. German, Polish, Chukchi, Mongolic, Japanese, etc.

60. Which of the three main types of languages does the language under investigation belong to?

61. In what way are the pronominal and verbal markers used in languages of type (c)?

Possible cases:

1. They can be used only separately, without another marker, as in German, Lithuanian, Polish, etc.; cf. German:

- (62) a. *Sie lieben ihn.* ‘They love him.’
 → b. *Sie lieben sich* (seit langem) ‘They love each other (since long ago).’
 c. *Sie lieben einander.* (same translation).
 d. **Sie lieben sich einander.* (same intended meaning).

2. They can be used either separately or simultaneously, as in Chukchi, Japanese, Buryat, Yakut, Tuvan, etc.; Yakut examples *ölör-* ‘to kill’ → *ölör-üs-* ‘to kill each other’, *beye-beye-leri-n ölör-* (same translation) → *beye-beye-leri-n ölör-üs-* (same translation); see also examples (64)–(67).

12.3 Interchangeability and co-occurrence of pronominal and verbal reciprocal markers

62. In what relation are verbal and pronominal reciprocals: (a) in complementary distribution, (b) in overlapping distribution, (c) in free combination of both types?

Case (a) is not attested so far. Case (b) can be exemplified by the data of German, where both markers can be employed on verbs governing non-prepositional objects (see (62a, b) above), whereas only pronouns can be employed instead of a prepositional object (see (63a) and (63b)). The reciprocal meaning cannot be expressed by a reflexive pronoun with a preposition: thus (63c) makes no sense. Reciprocal pronouns are often more flexible than verbal markers.

- (63) a. *Sie warten auf ihn.* 'They are waiting for him.'
 b. *Sie warten aufeinander.* 'They are waiting for each other.'
 c. **Sie warten auf sich.* (same intended meaning).

Constructions like (63c) are grammatical if the meaning is reflexive; cf. *zu sich kommen* 'to come round, regain one's senses'.

Here is an example of case (c) from Chukchi. The distinctions between the forms are hard to explain (-*wəly-* = REC; -*tko-* = antipassive marker in this case); cf. (64a) and (64b):

- (64) a. ... *penrə-nen* '... attacked-he.him.'
 b. ... *penrə-tko-γʔat* '... they attacked (someone).'
 c. ... *əryəčyu penrə-tko-γʔat* '... they attacked each other.'
 d. ... *penrə-wəly-ə-γʔat* (same translation).
 e. ... *əryəčyu penrə-wəly-ə-γʔat* (same translation), see also (62).

63. What is the purpose of the simultaneous use of two reciprocal markers, e.g. pronominal and verbal?

Possible reasons:

- a. The pronominal marker is added to a verbal reciprocal to avoid ambiguity if the verbal marker is polysemous;
- b. It may be added in order to emphasize the reciprocal meaning;
- c. It may be used pleonastically.

Cases b and c are hard to distinguish. As for case a, it can be illustrated by Tuvan (65) where the omission of the reciprocal pronoun may result in the sociative meaning of the predicate (see translation (ii)) (Kuular, Ch. 27, §4.1.2).

- (65) *A bile B bot-bot-tar-ə-n-če xilümzür-ž-üp-ken.*
 A and B each-other-N-ALL smile-REC-ASP-PERF.3
 i. 'A and B smiled *at each other*.' (with the reciprocal pronoun)
 ii. 'A and B smiled *together*.' (without the reciprocal pronoun)

Sometimes, the simultaneous use of both markers may add slight nuances of meaning. For instance, Tuvan (66) sounds "milder" without the pronoun.

- (66) *Daržaa bile Arakčaa bot-bot-tar-ə-n makta-ž-əp tur-gan-nar.*
 D. and A. each-other-ACC praise-REC-CONV AUX-PAST-3PL
 ‘Darzha and Arakcha praised each other.’

64. Are the markers interchangeable generally or on certain verb bases? If they are, what other changes are involved?

Possible cases:

1. They may be interchangeable, but the reciprocal pronoun may sound unnatural, the verbal reciprocal being frequent in speech and therefore the accepted norm, as in the following Tuvan example:

- (67) a. *kuspakta-š-* ‘to embrace each other’
 b. *bot-bot-tar-ən kuspakta-* ‘(same meaning).’

2. If a verbal reciprocal is lexicalized the difference in meaning may be prominent; cf. Tuvan:

- (68) a. *Olar bil-č-ir.* ‘They understand each other.’ (= ‘They are like-minded’, etc.)
 b. *Olar bot-bot-tar-ən bil-ir.* ‘They know each other.’ (i.e. ‘sth/all about each other’).

13. Lexical reciprocals

13.1 Introductory notes

Lexical reciprocals are inherently reciprocal in meaning, reciprocity being part of their lexical meaning, and they have no non-reciprocal underlying bases. Some of lexical reciprocals, especially in simple constructions, may have a reciprocal marker. It is the problem of the use of reciprocal markers with lexical reciprocal verbs that should be specially discussed in this section.

In this respect, languages may differ significantly. For instance, Japanese lexical reciprocals, with the exception of a small group, are incompatible with the reciprocal suffix (cf. (74c)). Generally, marked and non-marked lexical reciprocals may interrelate and overlap in the most idiosyncratic way. The examples below are meant as illustrations and they do not necessarily serve to characterize the lexical reciprocals of the languages.

65. Are there any lexical reciprocals in the language under study?

Like grammatical reciprocals, lexical reciprocals have two obligatory symmetrically related semantic arguments (reciprocants). Lexical reciprocals can be used in a pair of semantically (though not pragmatically) identical constructions like (69a’) and (69a’”), with the opposite order of the reciprocants, and as a rule they lack any non-reciprocal verbal counterparts, in contrast to grammatical reciprocals. Sentences like (69a’, a’”) may serve as a diagnostic test for establishing prototypical lexical reciprocals (the diagnostic test for establishing grammatical reciprocals is given in (1)). When used in the simple con-

struction, some lexical reciprocals either remain (obligatorily) unmarked, while others are obligatorily marked reciprocally, thus falling into two types; compare (69) and (70) (see 13.2 below).

- (69) a'. *Mary is arguing with Paul.* = a". *Paul is arguing with Mary.*
 = b'. *Paul and Mary are arguing.* ≠/≠ b". *Paul and Mary are arguing with each other.*
 c. *Paul and Mary are arguing with John.*

If verbs like 'to argue' are used in type (69a') and (69a'') constructions, the latter are identical in meaning with each other, and also with (69b'), because the meaning of the verb presupposes arguments of the same semantic class. In contrast to verbs like 'to argue', those like 'to stick to sth' (vi), i.e. verbs of locative semantics, do not presuppose denotational identity of the arguments. Therefore (70a') may be semantically identical with (70a''), both of them discontinuous, only if A and B belong to the same semantic class of objects, e.g. two sheets of paper, two postal stamps, etc., but not to different classes, e.g. a stamp and a wall. In the former instance the Indonesian predicate *me-lekat*, like its English counterpart, is a lexical reciprocal. As for the simple construction in (70b'), the predicate must necessarily contain the common reciprocal marker: thus a lexical reciprocal is marked additionally, as in (1). Compare Indonesian (A. Ogloblin, p.c.; *ber-...-an* = REC; *me-* = ACT):

- (70) a'. *A me-lekat pada B.* ≠/≠ a". *B me-lekat pada A.*
 'A stuck to B.' 'B stuck to A.'
 b'. *A dan B ber-lekat-an.*
 'A and B stuck together.'

66. Do lexical reciprocals form any distinct lexical groups? If they do, do they fall into the lexical types listed below? Are there any other lexical types?

In many languages, lexical reciprocals tend to be of three main lexical groups (some verbs may enter into two or more groups if used metaphorically):

- verbs denoting spatial relations of proximity, mostly joining and separating, e.g. *to join, to gather, to border on, to separate, to mix, to divide, to combine, to concentrate, to fasten together, to be not far, to be close, etc.*; cf. (70);
- verbs denoting (dis)similarity, e.g. *to coincide, to contrast with, to resemble, to distinguish, to be similar, to be different, to be alike, to compare, to liken, to imitate, to correspond, to fit, to identify, etc.*;
- verbs of social relations, e.g. *to argue, to agree upon, to fight, to marry, to compete, to rival, to be/get acquainted, etc.*; cf. (69) above.

In this section only verbs and their derivatives are discussed. But there are numerous non-verbal reciprocals: names of reciprocal situations (*war, peace, argument, etc.*), names of the participants of reciprocal relations (*brother, enemy, friend, etc.*), converse reciprocals (*woman, nephew, etc.*), which may also be reciprocal derivatives. On reciprocal markers

on non-verbal bases see Section 16 below. For a detailed analysis of lexical reciprocals see Knjazev, Ch. 2.

67. Are there subject-oriented and/or object-oriented lexical reciprocals in the language under analysis? If there are, describe them separately.

In subject-oriented constructions, the reciprocants are denoted either by the plural subject in simple reciprocal constructions (see (69b'–b", c)) or by the subject and non-subject, mostly a non-direct object in discontinuous reciprocal constructions (see (69a'–a")). In contrast to discontinuous constructions, a simple construction like (69b') may be ambiguous: it is either identical in meaning to (69a'–a"), or it may be understood as elliptical with an omitted comitative argument, as (69c). To resolve ambiguity, the reciprocal marker, usually a pronoun, may be used, as in (69b").

In object-oriented constructions, the reciprocants are denoted either by a plural object in simple reciprocal constructions (see (71b'–b")) or by the direct and non-direct object in discontinuous constructions (see (71a'–a")). In the latter case the object referents may be (i) of different semantic classes or (ii) of the same semantic class; cf. 'to tether a horse to the tree' – 'to tether a horse to another horse' respectively. In case (i), in contrast to case (ii), the predicate does not function as a lexical reciprocal. In the case of a plural object, its referents are necessarily of the same semantic class; cf. 'to tie two horses together', 'to tie small and big (things) together'. Such verbs have two meanings: (a) that of *attaching* one thing to another and (b) that of *joining* two things together. In case (a) the verb is syntactically three-place, in case (b) the verb is two-place. And in both cases the verb is semantically three-place (with object-referents denoting plural things or substance. Here is an example of an object-oriented lexical reciprocal from Yakut (N. Artemyev, p.c.):

- (71) a'. *Kini maŋan kuru qara kur-ga baaj-d-a.*
 s/he white belt black belt-DAT tie-PAST-3SG
 'He tied the white belt to the black belt.' (three-place)
- = a". *Kini kara kuru maŋan kur-ga baaj-d-a.*
 s/he black belt white belt-DAT tie-PAST-3SG
 'He tied the black belt to the white belt.' (three-place)
- = b'. *Kini maŋan kuru ikki qara kuru baaj-d-a.*
 s/he white belt and black belt tie-PAST-3SG
 'He tied the white belt and the black belt.' (two-place)
- = b". *Kini ikki kuru [beje-beje-leri-ger] baaj-d-a.*
 s/he two belt each.other-POSS.3PL-DAT tie-PAST-3SG
 'He tied two belts [to each other] together.' (two-place)

13.2 Subject-oriented lexical reciprocals

68. Which of the following morphological types of subject-oriented lexical reciprocals are attested in the language?

These types are established according to the possibility of their use with or without the reciprocal marker in discontinuous and/or simple constructions. The overall picture may be as follows. The main cases of the use of reciprocal markers on lexical reciprocals in simple and discontinuous constructions (the dash denotes absence of a reciprocal marker, the plus signifies its presence, and parenthesized plus denotes its optionality):

(72)		Discontinuous	Simple
	i.	–	+
	ii.	–	–
	iii.	(+)	(+)
	iv.	+	+
	v.	+	–

Note that the last case, viz. the use of a reciprocal marker in discontinuous but not simple constructions, is not attested and can hardly be expected.

i. In this case, lexical reciprocals require the reciprocal marker in the simple construction and cannot have it in the discontinuous. This type is quite similar formally to the “canonical” diathesis type of grammatical reciprocals (cf. (1) above), except that sentences (a’) and (a’’) and (b) are semantically identical. An example from Nivkh:

- (73) a'. *ōla p'-əmək ηali-d'.*
 child REFL-mother resemble-FIN
 ‘The child resembles his mother.’
- = a'': *əmək p'-ōla ηali-d'.*
 mother REFL-child resemble-FIN
 ‘Mother resembles her her child.’
- = b. *ōla p'-əmək-xe u-ηali-d'-yu /*ηali-d'-yu.*
 child REFL-mother-COM.DU REC-resemble-FIN-PL /resemble-FIN-PL
 ‘The child and his mother resemble each other.’

ii. These lexical reciprocals cannot take the reciprocal marker either in discontinuous or simple constructions. An example from Japanese (Alpatov & Nedjalkov, Ch. 25, §11; *wa* = TOP, *to* = ‘with’ in (a, a’), ‘and’ in (b, c), *-ta* = Past, *-at-* = REC):

- (74) a. *Taroo wa Akiko to kekkonsi-ta.* ‘Taro married Akiko.’
 = a'. *Akiko wa Taroo to kekkonsi-ta.* ‘Akiko married Taro.’
 = b. *Taroo to Akiko wa kekkonsi-ta.* i. ‘Taro and Akiko got married [to each other].’
 ii. ‘Taro and Akiko each got married to someone else.’
 c. **Taroo to Akiko wa kekkonsi-at-ta.* (same intended meanings as i. in (b)).

iii. Lexical reciprocals take the reciprocal marker optionally both in discontinuous and simple constructions. An example from Khalkha (Tuvshintogs, p.c.):

- (75) a'. *Dordžo Bataa-tai xagra[-lda]-w.*
 D. B.-COM argue-REC-PAST
 ‘Dorji argued with Bat.’
- = a'': *Bata Dordž-toi xagra[-lda]-w.*
 B. D.-COM argue-REC-PAST
 ‘Bat argued with Dorji.’

- = b. *Dordžo Bata xoyor xagra[-lda]-w.*
 D. B. two argue-REC-PAST
 ‘Dorji and Bat argued [with each other].’

The following lexical reciprocals are also of this type: Japanese *kooronsu/koorunsi-a-u* ‘to argue’ and Chinese *zhēng-lùn/ hùxiāng zhēng-lùn* ‘to argue’.

iv. Lexical reciprocals always contain the reciprocal marker in either type of constructions: this pertains to all those lexical reciprocals which are at the same time anticausatives, lexicalized reciprocals or *reciproca tantum*. Discontinuous constructions seem to be much less frequent than simple. Some anticausatives can hardly be used in the discontinuous construction. Here are the relevant examples respectively:

iv.a. *Anticausatives*

Tuvan:

- (76) a. *Ol spirt-ti sug-bile xolu-p tur.* (T. 481)
 he alcohol-ACC water-with mix-CONV AUX.PRES.3
 ‘He is mixing alcohol with water.’
 → b’. *Spirt sug-bile xolu-ž-a ber-gen.*
 alcohol water-with mix-REC-CONV AUX-PERF.3
 ‘Alcohol has mixed with water.’
 = b’’. *Sug spirt-bile xolu-ž-a ber-gen.*
 water alcohol-with mix-REC-CONV AUX-PERF.3
 ‘Water has mixed with alcohol.’

iv.b. *Lexicalized reciprocals* (for details see Section 14 below)

- (77) a. Ainu *yee* ‘to say’ – *u-yee* ‘to quarrel, argue’ (Alpatov et al., Ch. 42, §8)
 b. Swahili *-nen-a* ‘to speak’ – *-nen-an-a* ‘to argue’, also ‘to talk to each other’ (Loogman 1965:140).

iv.c. *Reciproca tantum* (for details see Section 15 below)

- (78) a. Japanese *tonaria-u* ‘to be next {to each other}’ (Matsuda 1978:1832)
 b. Tuvan *tuluš-* ‘to fight, struggle’ (T. 423).

69. What is the proportion [approximately] of lexical reciprocals taking the reciprocal marker in simple constructions?

13.3 Object-oriented lexical reciprocals

70. Which of the following morphological types of object-oriented lexical reciprocals are attested in the language?

The relevant morphological groups are parallel to the groups of subject-oriented reciprocals, and thus yield the same classification as (72) commented on further on. As type (v) in (72) is not attested among subject-oriented lexical reciprocals it is unlikely to be found among object-oriented lexical reciprocals.

In prototypical cases, the three-place base transitive turns into a two-place transitive.

i. In this case lexical reciprocals take the reciprocal marker in the simple construction and cannot have it in the discontinuous. In the Kabardian example below the object-referents of the reciprocal constructions are in converse relation to each other:

- (79) a. *mə čərbəš-ər mo čərbəš-əm te-ləxbən.*
 this brick-ABS that brick-OBL PRV-put
 ‘to put this brick on that brick.’
 b. *čərbəš-xə-r zə-te-ləxbən.*
 brick-PL-ABS REC-PRV-put
 ‘to put bricks one upon another.’

Reciprocally marked object-oriented derivatives may be rather numerous (cf. about 230 units in Kabardian, though some of them do not have underlying counterparts at all or with a standard semantic relationship; see Ch. 1; also 13.1 above).

A reciprocal marker can also be used in simple constructions not as the only element but also in combination with a causative marker: the latter may be used to derive a causative from an anticausative or it may be integrated into a complex affix attached immediately to the underlying three- or two-place base verb. In both cases the base transitive and the final derivative may be very close in meaning, as, for instance, the Tuvan *holu-* ‘to mix sth with sth’ → *holu-š-* ‘to get mixed’ → *holu-š-tur-* ‘to mix sth with sth’ (cf. (76)). Here is an analogous Kirghiz example, and another example illustrating the use of a reanalyzed complex reciprocal-causative affix:

- (80) a. *ula-* ‘to join sth to sth’, ‘to join the ends of sth and sth’
 → b. *ula-š-* ‘to join sth/sb’ anticausative
 → c. *ula-š-tər-* ‘to tie sth and sth together’ causative of anticausative
 (81) a. *bajla-* ‘to tie something to something’ three-place
 b. no anticausative
 → c. *bajla-š-tər-* ‘to tie (e.g. horses) together’ two-place
 (cf. d. *bajla-š-* ‘to help sb to tie something’).

ii. Lexical reciprocals cannot take a reciprocal marker at all either in discontinuous or simple constructions (see Yakut example (71) above).

iii. Lexical reciprocals take the reciprocal marker optionally both in discontinuous and simple constructions. An example from Buryat (Cheremisov 180):

- (82) *dabxasa-* i. ‘to put one upon another’, ii. ‘to accumulate in layers, double up’
 → *dabxasa-[lda-]* i. ‘to put one upon the other’, ii. ‘to put (many things) one upon another.’

iv. Lexical reciprocals contain the reciprocal marker in all constructions: this pertains to all lexicalized reciprocals and *reciproca tantum*. Discontinuous constructions seem to be much less frequent than simple. Here is an example of a reciprocal *tantum* (Southern Paiute, Sapir 1930: 106, 108, 109; *na-* = REFL/REC > *nan-* before *ts*, *tc*; *-tsin’na* is a “stem not used alone”):

- (83) *nan-tsm’na* ‘to join, cause to be joined together’
 cf. *kwip’a-* ‘to hit’ → *na-ywi’pa-* ‘to beat each other.’

14. Lexicalized reciprocals

71. Are there any derivatives with the reciprocal marker related in a non-standard way to the underlying base and possessing nevertheless the reciprocal meaning?

The typical meanings of these lexicalized reciprocals are: 'to argue', 'to fight', 'to compete', 'to meet', 'to come to an agreement', and other meanings which are often enough expressed by lexical reciprocals proper. For instance, the typical meanings of lexicalized reciprocals registered in Buryat are 'to compete', 'to fight', 'to wrestle', 'to argue', 'to meet', 'to unite', 'to jostle (in a crowd)', 'to copulate', 'to quarrel', 'to come to an agreement', 'to be at law with sb', 'to be enemies', and the like. These lists show that the meanings of these reciprocals generally coincide with the semantic range of non-derived lexical reciprocals.

The relations between the base verb and the lexicalized derivative may vary considerably. The following principal cases can be pointed out (cf. Alpatov & Nedjalkov, Ch. 25 on Japanese, §7). The illustrations are Japanese.

i. The derivative may be polysemous and have a lexicalized reciprocal meaning alongside the preserved standard reciprocal meaning; e.g.:

- (84) a. *os-u* 'to push sb' → *osi-a-u* i. 'to push each other', ii. 'to throng'
 b. *nagur-u* 'to hit sb' → *naguri-a-u* i. 'to hit each other', ii. 'to fight.'

ii. The derived meaning preserves a part of the base meaning or coincides with it; e.g.:

- (85) a. *i-u* 'to say, speak, tell' → *ii-a-u* 'to dispute with each other'
 b. *har-u* i. 'to spread, strain', ii. 'to rival' → *hari-a-u* 'to rival, compete.'

iii. The derived meaning may be idiosyncratic; e.g.:

- (86) a. *cam-u* 'to bite' → *cami-a-u* 'to be harmonious'
 b. *yar-u* 'to do sth' → *yari-a-u* 'to quarrel.'

72. Are there any lexicalized derivatives whose reciprocal meaning is marginal?

Marginal reciprocal meanings are those which to a greater or lesser degree imply a prior or response action. Compare the following Yakut derivative which denotes reaction of disagreement to a prior statement:

- (87) *kirietee-* i. 'to cut with a blunt knife' → *kiriete-s-* 'to contradict' (P. 1105)
 ii. 'to reproach'

73. Are lexicalized derivatives always reciprocal or can they lose the reciprocal meaning?

Here is an example from Yakut where the lexicalized meaning (e.g. (88ii)) is not reciprocal:

- (88) *əl-* 'to take, seize sth' → *əl-səs-* i. 'to seize each other' (S. 525)
 ii. 'to start, rush (doing sth).'

15. *Reciproca tantum*

74. Are there in the language words which are lexical reciprocals in meaning, and which contain a component of the root identical with the reciprocal marker, but have no respective underlying base?

Needless to say, attribution of some verbs to the class of *reciproca tantum* is not always self-evident. A part of the root may accidentally coincide with a reciprocal affix. In this case this verb should be attributed to lexical reciprocals proper. The origin of *reciproca tantum* is mostly the same: first a reciprocal marker is pleonastically attached to a lexical reciprocal, and some time later the base verb goes out of use.

Among *reciproca tantum*, as well as among lexicalized reciprocals, there are formations which cannot be regarded as reciprocals proper but as peripheral ones. Their characteristic meanings are those of response actions (e.g. 'to die' > 'to condole') or actions implying a response action (e.g. 'to inquire' > 'to answer').

Here are, for instance, the typical meanings of Japanese *reciproca tantum* (see Alpatov & Nedjalkov, Ch. 25, §8), mostly (a) spatial, (b) reciprocals of social relations and (c) of similarity/dissimilarity, and others:

- | | | | |
|------|----|------------------|---|
| (89) | a. | <i>tonaria-u</i> | 'to be next to each other' (Matsuda 1978:1832) |
| | | <i>na-u</i> | 'to twine', 'to twist sth together' (Matsuda 1978:1201) |
| | b. | <i>araga-u</i> | arch. 'to dispute', 'contend with', 'resist' (Brinkley 1896:35) |
| | | <i>isaka-u</i> | arch. 'to quarrel, dispute' (Brinkley 1896:45) |
| | | <i>semegia-u</i> | 'to struggle' |
| | | <i>kana-u</i> | 'to match', 'to be equal', 'to rival' (Matsuda 1978:702) |
| | | <i>tekita-u</i> | 'to be hostile' (Brinkley 1896:1459) |
| | | <i>ukuna-u</i> | 'to ask', 'to inquire' (Brinkley 1896:1555) |
| | | <i>tomura-u</i> | 'to mourn', 'to condole' (Matsuda 1978:1831) |
| | | <i>tika-u</i> | 'to give an oath' (Brinkley 1896:116) |
| | c. | <i>maga-u</i> | 'to be similar to' |
| | | <i>tiga-u</i> | 'to be different' (Brinkley 1896:111) |
| | | <i>nara-u</i> | 'to imitate' (Matsuda 1978:1192) |
| | d. | <i>mika-u</i> | arch. 'to change one favorite for another' (Brinkley 1896:921). |

Compare the following verbs from Karachay-Balkar tentatively regarded here as *reciproca tantum* (collected from Gochijaeva & Sujunchev 1989):

- | | | |
|------|---------------|--|
| (90) | <i>eriš-</i> | 'to compete, be rivals' |
| | <i>keŋeš-</i> | 'to exchange opinions' |
| | <i>küreš-</i> | 'to struggle, wrestle' |
| | <i>öčeš-</i> | i. 'to argue', ii. 'to bet', iii. 'to compete' |
| | <i>üleš-</i> | 'to divide, share' |
| | <i>qatəš-</i> | 'to get mixed' |
| | <i>awuš-</i> | 'to alternate' |
| | <i>eš-</i> | 'to plait, weave, roll together' |
| | <i>söleš-</i> | 'to talk, speak' |
| | <i>qarəš-</i> | 'to resist' |

16. Reciprocal markers on non-verbal bases and/or non-verbal derivatives

This domain is discussed in Nedjalkov (Ch. 7).

16.1 Introductory notes

Reciprocal derivation from non-verbal bases, or, rather, the use of reciprocal markers on non-verbal bases, (which may result in reciprocal verbs as well as non-verbs, such as nouns, adjectives, etc.) is attested in many, though not all languages of the world possessing verbal and pronominal reciprocal markers. Overall, reciprocal derivation from non-verbal bases is extremely diverse semantically and some semantic types may be language-specific, though there happen semantic parallels across languages. These derivatives often display interesting associative relations with deverbal reciprocals. As a part of the domain of reciprocity, though often on its periphery and neglected, they also deserve attention.

Unfortunately, the data available are extremely limited as this is a poorly investigated domain. There is a chance they have not been noticed in many languages and remain unknown yet. But even now the variety of the types discovered is fascinating.

On the other hand, there is another marginal domain related to the one discussed: reciprocal derivation of non-verbs from verb bases. It may be useful at this point to look at the three following domains together: derivation of non-verbs from verbs and of verbs and non-verbs from non-verbs alongside the dominating derivation of reciprocal verbs from verb bases.

The following should also be noted with respect to reciprocal markers on non-verbal bases.

1. The range of meanings of the derivatives named in the heading, and not infrequently of the underlying bases, as a rule, does not exceed the limits of lexical meanings characteristic of lexical reciprocals.

2. Bordering on reciprocity are the meanings of converse relations, such as *parents – children*, *aunt – nephew*, *husband – wife*, *elder brother – younger brother*, *brother – sister*, *in front of – behind*, *in the back of*, *far – near*, *to follow – to precede*, etc. Converse relations display a marked similarity to reciprocal relations, because one member of a converse pair also obligatorily implies the existence of the other member.

16.2 Five main derivational pairs

If we take into account the affiliation of the underlying bases and the derivatives with a reciprocal marker to the the word classes as a classifying feature, we obtain five main derivational types. (91) contains the list of the five main derivational pairs with reciprocal markers and their illustrations. Type (91a) is outside the subject-matter of this section, but it is added to give a complete overview of the possible types.

The Ainu illustrations show that in cases (b), (c) and (e) the same marker is used as in (91a). For (91d) a parallel Bamana example with a reciprocal marker for verbs is *màfile* ‘to look’ → *ɲɔgɔn màfile* ‘to look at each other’.

- | | | | | | | |
|------|----|---------------------|---|---------------|--------|---|
| (91) | a. | <i>Verb</i> | → | <i>Verb</i> | Ainu | <i>nukar</i> ‘to see’ → <i>u-nukar</i> ‘to see each other’ |
| | b. | <i>Noun</i> | → | <i>Noun</i> | Ainu | <i>irwak</i> ‘brother’ → <i>u-irwak</i> ‘both brothers’ |
| | c. | <i>Noun</i> | → | <i>Verb</i> | Ainu | <i>ona</i> ‘father’ → <i>u-ona-kor</i> ‘to be related as
father and child’ |
| | d. | <i>Verb</i> | → | <i>Noun</i> | Bamana | <i>sigí</i> ‘to live’ → <i>à sigi-ɲɔgɔn</i> ‘his neighbour’ |
| | e. | <i>Postposition</i> | → | <i>Adverb</i> | Ainu | <i>sam</i> ‘the place close to sth/sb’ → <i>u-sam</i> ‘close
to each other.’ |

For the sake of convenience, the term ‘noun’ in (91b, c) is used broadly to include adjectives and numerals, which are much more rare in this domain. Similarly, the term ‘postposition’ is also applied in the broad sense to prepositions, adverbs, and locative nouns.

75. Does the reciprocal marker combine with non-verbal bases: nouns, adjectives, numerals, adverbs, prepositions, postpositions, locative nouns?
76. If the answer is positive, which of the types, not counting the first one, occur in your language?

A special place belongs to reciprocals derived from postpositions, prepositions and auxiliary locative nouns on which the reciprocal meaning is as clear-cut as in (91a). This may be due to the reciprocal adverbs implying a kind of mutual proximity of some entities or their motion towards each other, i.e. the meanings similar to those of reciprocal verbs of position or motion.

16.3 Four main morphological types of reciprocal markers

I have in mind the markers that combine with non-verbal bases.

77. Which types of reciprocal markers listed in (92) are employed in the language under investigation?

- (92) a. The same marker is used for (91b, c, d, e) as for (91a).
 b. A complex marker used for the derivation from nouns, includes the reciprocal marker used for the derivation of reciprocal verbs of the (91a) type. For instance, in Yakut (92b.i), the verb is derived by means of the complex suffix *-te-s*, the corresponding form without *-s* being ungrammatical; in other instances both *-te* and *-s* can function independently, as is shown in (92b.ii).
- (92b) i. *kürex* ‘competition’ → (**kürex-tee-*) → *kürex-te-s* ‘to compete’
 ii. *aadərəs* ‘address’ → *aadərəs-taa-* ‘address sth to sb’ → *aadərəs-ta-s-* ‘to address sth to each other.’

The derivative in (91c) is also of this type although the meaning of the non-reciprocal component is possessive.

- c. A marker used for the derivation of reciprocal nouns coincides with a part of the marker used for derivation of reciprocal verbs. There are no “pure” examples of this case. But if one assumes that verbal reciprocals in Tagalog are formed by means of the circumfix *mag-...-an*, as is shown in (92c.ii), and not by means of the prefix *mag-* from the reciprocal noun *ibig-an* ‘mutual love’, so this can be tentatively regarded as an illustration for this logical possibility concerning reciprocal markers:
- (92c) i. *ibig* ‘love’ → *ibig-an* ‘mutual love’
 ii. *um-ibig* ‘to love’ → *mag-ibig-an* ‘to love each other’ (*um-* = ACT)

Note that the prefix *mag-* can derive about 30 reciprocals of the (92c.iii) type.

- iii. *y-um-akap* ‘to embrace sb’ → *mag-yakap* ‘to embrace each other.’
- d. A marker used for the derivation from non-verbal bases does not contain any components of the marker used for the derivation of reciprocal verbs. Here I have in mind only those derivatives whose meanings are similar to the meanings of derivatives formed by means of the three former types of markers. The Indonesian derivative with the prefix *se-* in (92’d.ii) (Ogloblin & Nedjalkov, Ch. 33, (60), (173)) has a meaning similar to that of the Nêlêmwa derivative in (92d.ii) (taken from Brill, Ch. 34, (21), (114)).
- (92d) i. *khua* ‘to bite’ → *xla pe-xua-xla*
 they REC-bite-3PL
 ‘They are biting each other.’
- ii. *bala-xla* ‘their partner’ → *pe-bala-xla*
 partner-3PL REC-partner-3PL
 ‘They are partners / in the same team.’

Compare:

- (92’d) i. *ber-pandang-an* ‘to see at each other’
 ii. *nasib* ‘fate’ → *se-nasib* ‘to have the same fate.’

Nêlêmwa is so far the only language where this semantic group with a marker of type (91a) is registered. In other languages special markers are used, as in Indonesian.

78. Which of the following semantic groups are represented in the language?
 79. Are there any other semantic groups attested in the language?

16.4 Semantic groups within derivational pairs

This concerns derivational pairs listed in (91), namely (91b, c, d). Derivational pair (91d) consists only of one semantic group (see 16.4.2). Needless to say the derivational pairs of the (91a) type are outside the scope of this section.

16.4.1 Derivational pairs with nominal bases

Among these pairs there are two subgroups, viz. with nominal and verbal derivatives. The latter derivatives seem to be less frequent across languages than the previous one.

16.4.1.1 *Derivational pairs 'Noun → Noun'* The main derivational meanings are:

1. Duality: naming two participants, usually relatives in converse relations, by means of a single noun phrase; e.g.:

1a. 'brother → two brothers'

1b. 'mother → mother and child'

1c. 'hand → both hands'.

2. Collective plurality: 'sister → (all) sisters between themselves (to each other)'.

3. Affinity or relatedness with respect to the feature named by the base, e.g. 'father → person who has the same father'; 'river → (a settlement) situated on the banks of the same river'; 'class → classmate'.

4. The reciprocal meaning: 'love → 'mutual love'.

5. The distributive meaning: 'two → in/by twos'.

16.4.1.2 *Derivational pairs 'Noun → Verb'* The main derivational subtypes and meanings are:

1. Plain verbalization: 'a friend → to be friends', 'difference → to differ', 'relatives → to become relatives'.

2. Similarity or relatedness with respect to the feature named by the noun: 'a year → to be born in the same year'.

3. Denoting a converse pair by the name of one participant of the pair: 'child → to be related as parent and child'.

There also happen derivatives with a non-reciprocal meaning, usually one metaphorically related to that of the base; cf. Buryat *seeže-* 'breast', fig. 'heart' → *seeže-lde-* 'to memorize' (Cheremisov 1973:126).

16.4.2 *Derivational pairs 'Verb → Noun'*

The derivative denotes the partner in the activity denoted by the base verb; e.g.: 'to drink beer → boon companion'. So far, this type is attested in one language only, viz. Bamana; see (91d).

16.4.3 *Derivational pairs 'Postposition/... → Adverb'*

Derived adverbs are used with verbs of motion (of the subject or object) and in combination with them denote either (a) joining or *proximity* of two or more entities or (b) separating of a whole into two or more parts or entities. The adverbs themselves denote mostly spatial position or acquiring some spatial position by those entities relative to each other. In reciprocal construction (93b), the number of arguments diminishes in contrast to non-reciprocal (93a); at least the reciprocal construction is syntactically simpler. Needless to say, reciprocal adverbs may develop some non-spatial meanings.

There are two main morphological types of reciprocal adverbs: (a) with the reciprocal marker attached to the base with the spatial meaning, as in Nivkh example (93), or (b) with a spatial preposition attached to the reciprocal pronoun, as in German example (94).

- (93) a. *if atək řara-in hur-t'iv-d'.*
 he father opposite-LOC there-sit.DOWN-FIN
 'He sat down opposite his father.'
- b. *if atək-xe u-t'ara-in hur-t'iv-d'-yu.*
 he father-COM.DU REC-opposite-LOC there-sit.DOWN-FIN-PL
 'He and [his] father sat down opposite each other.'

German reciprocal adverbs seem to show a tendency towards functioning as preverbs in certain syntactic structures:

- (94) a. *Sie hat neue Waren auf die alten gestapelt.*
 'She has heaped new goods onto the old ones.'
- b. *Sie hat neue und alte Waren aufeinandergestapelt.*
 'She has heaped new and old goods onto one another.'

Some reciprocal adverbs have a meaning which is not the sum of the meanings of their components, and they lack base constructions with the respective preposition, as in (94). Instances are the reciprocal adverbs *durcheinander* (*durch* 'through') adding, roughly speaking, the sense of disorder as a result of the action named by the base verb (*alles durcheinanderbringen* 'to turn everything upside down'), and the reciprocal adverb *auseinander* lit 'out of each other' denoting the meaning 'in different directions, in pieces', as an antonym of *zusammen* 'together' (*auseinanderfallen* 'to fall to pieces')

Outside this morphological type, there is a case semantically analogous to it. I mean the cases when a spatial meaning is denoted by a preverb which then takes a reciprocal marker; cf. Kabardian (root alternation $\partial \sim \text{ə}$ is determined by intransitivity/transitivity):

- (95) a. *dən* 'to sew' (vi)
 → b. *kIɛrə-dən* 'to sew sth onto sth'
 → c. *zə-kIɛrə-dən* 'to sew two pieces together.'

In this type, as well as in the German reciprocal adverb *durcheinander* just cited, there are combinations of the reciprocal marker with preverbs whose meaning does not follow immediately from that of the components, i.e. a derivative without the reciprocal marker is either not semantically related to the derivative with the reciprocal marker or it is non-existent; thus a complex preverb comes to function as an independent semantic item; cf.:

- (96) a. *gɔə-sxɔən* 'to burn sth' → *zə-te-gɔə-sxɔən* 'to burn everything'
 b. *čətɔən* 'to tear into parts' → *zə-xə-čətɔən* 'to tear violently into small parts'

In (96) the preverb *te-* denotes an action on the surface of a thing, and the preverb *xə-* denotes being inside something. The meaning of these preverbs is lost in that of the complex preverbs.

17. Etymology of reciprocal markers and their structure

80. Are there any data on the origin of the verbal reciprocal marker(s) and the tendencies of its (their) semantic evolution?

81. What lexical items have the syntactic reciprocal marker or its components developed from? The possible situations: if a reciprocal marker is composed of one component it may coincide with the reflexive marker or it may have developed from nouns meaning 'friend', 'relative', 'body', etc.; if a reciprocal marker is composed of two components, it may be a reduplicated reflexive pronoun or its components may be various combinations or repetition of words like 'one', 'another', 'each', 'person'.

82. Is the position of the syntactic reciprocal marker(s) (pronoun or adverb) fixed or free relative to the verb? Is insertion of any (limited number of) words allowed between the verb and the syntactic marker(s) with fixed position?

83. Are there any non-reciprocal markers to which the reciprocal marker may be related formally and/or semantically?

84. In what other complex markers is the reanalyzed reciprocal marker used?

85. In what way is the reciprocal pronoun composed of two (or more) components characterized relative to the following possible properties: (a) fixed or non-fixed position of the components relative to each other; (b) possibility of case-marking; (c) combinability with prepositions and/or postpositions; (d) the position of the case marker after the first or the second component; (e) placing of the preposition before the first or second component?

Attachment

List of typical derived reciprocal sentences

The list of verbs below is suggested as a guide for the translation of reciprocal constructions by a bilingual native informant (needless to say, ideally, the author should be a native speaker of the language). These reciprocal constructions should be given in opposition with their underlying base constructions (in the list below they are implied by the reciprocal constructions; e.g.: *He protected her* (+ *She protected him*) – *They protected each other*). Of course, original constructions with reciprocals obtained from running texts, from natural contexts, are much more valuable and reliable than reciprocal constructions obtained via another language, even if they are checked by other informants. But, since reciprocals are extremely rare in running texts, collecting a sufficient corpus may take too much time, therefore resorting to translating a list of suggested constructions may be useful at least at the initial stage or research. The shortcomings of the “translation method” may be compensated for by the quantity of the material that can be obtained.

Investigation of the polysemy of reciprocal constructions needs other lists of constructions and a different procedure.

A. One group comprises verbs of *physical action* upon a human object that may result in a change of the state of the latter (note that among verbs of physical action those of violent hostile actions may be prevalent).

Hostile, unpleasant, etc. actions/ attitudes

<i>They accused each other</i>	<i>They angered each other</i>
<i>They attacked each other</i>	<i>They avoided each other</i>
<i>They beat each other</i>	<i>They betrayed each other</i>
<i>They bit each other</i>	<i>They bumped into each other</i>
<i>They butted each other</i>	<i>They cheated each other</i>
<i>They chopped each other</i>	<i>They complained of each other</i>
<i>They compromised each other</i>	<i>They condemned each other</i>
<i>They contradicted each other</i>	<i>They crowded each other</i>
<i>They criticized each other</i>	<i>They cudgelled each other</i>
<i>They cursed each other</i>	<i>They damned each other</i>
<i>They deceived each other</i>	<i>They deprived each other of sth</i>
<i>They despised each other</i>	<i>They destroyed each other</i>
<i>They disappointed each other</i>	<i>They disturbed each other</i>
<i>They elbowed each other</i>	<i>They exposed each other</i>
<i>They exterminated each other</i>	<i>They fired at each other</i>
<i>They followed each other</i>	<i>They fooled each other</i>
<i>They grappled with each other</i>	<i>They hated each other</i>
<i>They hindered each other</i>	<i>They hit each other</i>
<i>They humiliated each other</i>	<i>They hunted each other</i>
<i>They hurt each other</i>	<i>They ignored each other</i>
<i>They insulted each other</i>	<i>They kicked each other</i>
<i>They knocked each other down</i>	<i>They lashed each other</i>
<i>They let each other down</i>	<i>They maimed each other</i>
<i>They objected to each other</i>	<i>They offended each other</i>
<i>They oppressed each other</i>	<i>They pained each other</i>
<i>They pecked each other</i>	<i>They persecuted each other</i>
<i>They pierced each other</i>	<i>They pinched each other</i>
<i>They poisoned each other</i>	<i>They pressed each other</i>
<i>They pricked each other</i>	<i>They pushed/shoved each other</i>
<i>They reproached each other</i>	<i>They revolted against each other</i>
<i>They robbed each other</i>	<i>They shunned each other</i>
<i>They slashed each other</i>	<i>They sold each other</i>
<i>They spit at each other</i>	<i>They stabbed each other</i>
<i>They ridiculed each other</i>	<i>They ruined each other</i>
<i>They scolded each other</i>	<i>They scratched each other</i>
<i>They slandered each other</i>	<i>They slapped each other</i>
<i>They squeezed each other</i>	<i>They strangled each other</i>
<i>They tore each other to pieces</i>	<i>They teased each other</i>
<i>They threatened each other</i>	<i>They teased each other</i>
<i>They tired each other</i>	<i>They tormented each other</i>
<i>They tortured each other</i>	<i>They tripped each other</i>
<i>They victimized each other</i>	<i>They whipped each other</i>
<i>They wounded each other</i>	

Pleasant actions/attitudes

<i>They admired each other</i>	<i>They bowed to each other</i>
<i>They caressed each other</i>	<i>They cheered up each other</i>
<i>They defended each other</i>	<i>They embraced each other</i>
<i>They flattered each other</i>	<i>They freed each other</i>
<i>They guarded each other</i>	<i>They kissed each other</i>
<i>They looked for each other</i>	<i>They overestimated each other</i>
<i>They praised each other</i>	<i>They protected each other</i>
<i>They relied on each other</i>	<i>They rescued each other</i>
<i>They respected each other</i>	<i>They supported each other</i>
<i>They saved each other</i>	<i>They stroked each other</i>
<i>They took care of each other</i>	

Neutral, at least non-hostile (mostly physical), actions

<i>They bandaged each other</i>	<i>They raised each other</i>
<i>They clasped each other</i>	<i>They replaced each other</i>
<i>They clutched each other</i>	<i>They rubbed each other with dirt</i>
<i>They combed each other</i>	<i>They shook each other</i>
<i>They covered each other with rugs</i>	<i>They sluiced each other with water</i>
<i>They dirtied each other</i>	<i>They smeared each other</i>
<i>They dressed each other</i>	<i>They soaped each other</i>
<i>They drive each other (in a car)</i>	<i>They sprinkled each other</i>
<i>They dried each other</i>	<i>They stand up for each other</i>
<i>They fed each other</i>	<i>They tickled each other</i>
<i>They hid each other</i>	<i>They tied each other to a tree</i>
<i>They held each other</i>	<i>They took each other by the hand</i>
<i>They held fast onto each other</i>	<i>They took each other out</i>
<i>They licked each other</i>	<i>They touched each other</i>
<i>They lifted each other</i>	<i>They tugged each other</i>
<i>They lost each other</i>	<i>They undressed each other</i>
<i>They massaged each other</i>	<i>They untied each other</i>
<i>They missed each other</i>	<i>They waited for each other</i>
<i>They painted each other</i>	<i>They warmed each other</i>
<i>They pressed each other to the wall</i>	<i>They washed each other</i>
<i>They provoked each other</i>	<i>They watched each other</i>
<i>They pulled each other</i>	<i>They winked at each other</i>

B. Verbs denoting all kinds of relations between humans that do not necessarily involve physical action, and also verbs of speech:

Human relations

<i>They depended on each other</i>	<i>They entertained each other</i>
<i>They inspired each other</i>	<i>They saved each other from sb/sth</i>
<i>They named each other</i>	<i>They hurried each other</i>
<i>They amused each other</i>	<i>They tamed each other</i>
<i>They ensured each other about it</i>	<i>They taught each other</i>
<i>They smiled at each other</i>	<i>They tested each other</i>
<i>They excused each other</i>	<i>They were displeased with each other</i>
<i>They forgave each other</i>	<i>They looked askance at each other</i>

They saved each other
They woke each other
They tried to outstrip each other

They equalled each other in strength
They checked each other

Verbs of speech

They asked each other about sth
They called each other
They called each other names
They congratulated each other
They greeted each other
They interrupted each other
They inquired each other about sth
They invited each other
They looked each other over

They mentioned each other
They murmured to each other
They praised each other
They quoted each other
They shouted each other down (= outvoiced)
They talked each other into it
They thanked each other
They warned each other
They whispered to each other

Successive actions (by turns)

They persecuted each other
They followed each other
They chased each other
They pursued each other
They preceded each other

They succeeded each other
They overcame each other
They overpowered each other
They outdrank each other

C. Verbs denoting feelings or their manifestation, approval or disapproval, mental activities or sense perception form a distinct lexical group; verbs denoting causation of feelings.

Emotions, attitudes and their manifestation

They pitied each other
They loved each other
They cherished each other
They fell in love with each other
They were scared/afraid of each other
They were shy of each other
They were ashamed of each other
They envied each other
They suspected each other

They admired each other
They idealized each other
They valued each other
They preferred each other to X
They interested each other
They were angry with each other
They pestered each other
They seized each other

Causation of feelings

They worry each other
They excite each other
They shocked each other
They annoyed each other
They comfort each other
They embarrass each other
They quieted each other
They pacified each other
They persuaded each other to go there
They inspired each other
They provoked each other

They scared each other
They made each other laugh
They amazed each other
They seduced/tempted each other
They made each other drunk
They charmed each other
They forced each other to do sth
They obliged each other to do sth
They urged each other on
They encouraged each other
They upset each other

Mental activities, states, attitudes

<i>They compared each other with X</i>	<i>They appraised each other</i>
<i>They remember each other</i>	<i>They believe each other</i>
<i>They forgot each other</i>	<i>They forgot of each other</i>

Verbs of motion

<i>They approached each other</i>	<i>They lead each other in the dark</i>
<i>They catch each other</i>	<i>They leaned against each other</i>
<i>They catch up with each other</i>	<i>They left each other</i>
<i>They chase each other</i>	<i>They penetrated into each other</i>
<i>They let each other go past</i>	<i>They ran into each other</i>
<i>They went to meet each other</i>	<i>They ran after each other</i>
<i>They hunted each other</i>	<i>They rushed at/after each other</i>
<i>They moved from each other</i>	<i>They visit each other</i>

Verbs of sense perception

<i>They met each other</i>	<i>They smelt each other</i>
<i>They heard each other</i>	<i>They sniffed at each other</i>
<i>They felt each other</i>	<i>They stared at each other</i>
<i>They found each other</i>	<i>They sniff at each other</i>
<i>They noticed each other</i>	<i>They recognized each other</i>
<i>They saw each other</i>	

“Indirect” reciprocals (derived from three-place transitives)

<i>They admitted their mistakes to each other</i>	<i>They passed the bread to each other</i>
<i>They asked each other about their families</i>	<i>They promised sth to each other</i>
<i>They boasted of their children to each other</i>	<i>They read books to each other</i>
<i>They borrowed money from each other</i>	<i>They saved money for each other</i>
<i>They bought gifts for each other</i>	<i>They sent books to each other</i>
<i>They brought gifts for each other</i>	<i>They shared food with each other</i>
<i>They carried things for each other</i>	<i>They shift work on each other</i>
<i>They demanded the truth from each other</i>	<i>They showed their findings to each other</i>
<i>They dispatched sth to each other</i>	<i>They set the dogs on each other</i>
<i>They exchange sth with each other</i>	<i>They sold things to each other</i>
<i>They expressed their feelings to each other</i>	<i>They stole goats from each other</i>
<i>They found wives for each other</i>	<i>They told tales to each other</i>
<i>They gave things/their names to each other</i>	<i>They threw stones at each other</i>
<i>They hid their cattle from each other</i>	<i>They took money from each other</i>
<i>They informed each other about it</i>	<i>They took the clothes (away) from each other</i>
<i>They introduce sb to each other</i>	<i>They turned their heads to each other</i>
<i>They offered gifts to each other</i>	<i>They wrote letters to each other</i>

“Possessive” reciprocals

<i>They answered each other’s questions</i>	<i>They patted each other on the shoulder</i>
<i>They braided each other’s hair</i>	<i>They pressed each other’s hands</i>
<i>They cleaned each other’s shoes</i>	<i>They pushed each other on the breast</i>
<i>They cut each other’s hair</i>	<i>They put on each other’s shoes</i>
<i>They drank to each others’ health</i>	<i>They rubbed each other’s backs</i>
<i>They forgave each other’s mistakes</i>	<i>They shook each other’s hands</i>

They grasped each other by the hand
They hate each other's guts
They kill each other's horses
They kissed each other's hands
 [= each other on the hand]
They kissed each other on the cheek
They love each other's children
They know each other's children
They hate each other's children
They see each other's wounds
They have shed each other's blood

They sized up each other's characters
They spilled each others' blood
They stroked each other's bodies
They stroked each other's hair

They tell stories about each other
They understood each other's thoughts
They do not understand each other's language
They are watching for each other's faults
They water each other's horses
They wring/twist each other's hands

“Adverbial” reciprocals

They fumed before each other
They cleaned shoes for each other

They cook for each other
They run from each other

Lexical reciprocals

Subject-oriented

The two rivers flow together here
Water and alcohol mix together
They approached each other (come together)
They stuck to each other
They had intercourse (with each other)
They bargained with each other
They collided (with each other)

They parted (from each other)
They quarrelled (with each other)
They squabbled (with each other)
They argued (with each other)
They played with each other
They communicated with each other

Object-oriented

He tied the white horse to the black horse – He tied the horses together
He exchanged a book for a fishing-rod
He connected the ends of the wire together
He brought John and Mary together

He divided the loaf into portions
They exchanged handshakes

Reciprocals derived from supposedly two-place intransitives (prepositional, postpositional objects
 = non-direct objects, case-marked as non-direct object)

They counseled with each other
They nodded to each other
They pounced on each other
They toasted each other
They whistled to each other
They pressed to each other
They rubbed against each other
They shouted to each other
They chattered with each other
They spat at each other
The ducks are quacking to each other
The wolves growl at each other
The cows moo to each other
The horses neigh to each other
They became afraid/scared of each other

They glanced at each other
They pounced on each other
They associated with each other
They faced each other
They pestered each other
They snuggled up to each other
They were tied to each other
They fell upon each other
They smiled at each other
They confided in each other
They huddled to each other
They turned to each other
They resented each other
They leaned upon each other
They spoke to each other

<i>They revenged on each other</i>	<i>They swore at each other</i>
<i>They visited each other</i>	<i>They got offended with each other</i>
<i>They bored each other</i>	<i>They whistled to each other</i>
<i>They loathed each other</i>	<i>They whispered to each other</i>
<i>They apologized to each other</i>	<i>They talked to each other</i>
<i>They annoyed each other</i>	<i>They complained to each other</i>
<i>They trusted each other</i>	<i>They winked to each other</i>
<i>They longed for each other</i>	<i>They chattered to each other</i>
<i>They sympathized with each other</i>	<i>They were disappointed with each other</i>
<i>They thought about each other</i>	<i>They became upset by each other's behaviour</i>
<i>They waited for each other</i>	<i>They lived in harmony with each other</i>
<i>They obeyed each other</i>	<i>They hindered each other</i>
<i>They resisted each other</i>	<i>They called to each other</i>
<i>They lied to each other</i>	<i>They were ashamed of each other</i>
<i>They harmed each other</i>	<i>They were shy of each other</i>
<i>They appealed to each other</i>	<i>They relied on each other</i>
<i>They tried to please each other</i>	<i>They helped each other</i>
<i>They jumped on each other</i>	<i>They approached each other</i>
<i>They ran after each other</i>	<i>They believed each other</i>
<i>They bumped into each other</i>	<i>They envied each other</i>
<i>They shouted at each other</i>	<i>They parted from each other</i>
<i>They were sulky with each other</i>	
<i>They were angry with each other</i>	
<i>They resembled each other</i>

Some typologically relevant properties of reciprocal markers and arrangement of the subsequent chapters

Emma Geniušienė
Vilnius University

This overview chapter is intended to show the reader the way the chapters on reciprocals of individual languages are organized and grouped together according to the types of the polysemy of the reciprocal markers employed. The similarities and differences are emphasized in order to serve as guidelines in the comparison of languages. In fact, this chapter is a kind of amplified Table of Contents of the subsequent parts of the monograph, nearly all the material being naturally extracted from those and previous chapters. The presentation is inevitably simplified and fragmentary. It is meant as a typological background for and an introduction to a detailed analysis of reciprocals in the subsequent chapters on individual languages.

1. Three main types and three extended types of prototypical polysemy of reciprocal markers

As shown in Nedjalkov (Ch. 5, §1.4), three meanings are used alongside the reciprocal meaning as the basis for establishing the types of polysemy of reciprocal markers: reflexive, sociative, and iterative, because they are most closely related to the reciprocal, though to a varying degree, among all those meanings that can be expressed by the same markers cross-linguistically.

This makes it possible to distinguish three *main* types of polysemy of reciprocal markers with two of the meanings and three *extended* types of polysemy with an added third meaning, these six types being regarded here as *prototypical*:

- reflexive-reciprocal, reciprocal-sociative, iterative-reciprocal;
- reflexive-reciprocal-sociative, iterative-reciprocal-sociative, iterative-reciprocal-reflexive.

The relations between the four meanings are shown by the following schema (presented and discussed in §1.4.4 of Ch. 5) where the arrows indicate the most likely direction of semantic evolution; the bilateral arrow shows a particular semantic affinity of the sociative and the iterative meanings. Due to this affinity, the reciprocal-sociative and the iterative-reciprocal types of polysemy are in a way opposed to the reflexive-reciprocal polysemy.

Contrasted to polysemous reciprocal markers are monosemous reciprocal markers. In this monograph languages with all the types of polysemy of reciprocal markers, except iterative-reciprocal (see Section 4 below), and with monosemous markers are represented. In addition, languages with markers with non-prototypical (not containing the non-reciprocal meanings listed) polysemy are included in the monograph.

The subsequent chapters of Parts II to VII contain descriptions of reciprocals and related categories in individual languages. They are grouped according to the type of polysemy of the main reciprocal marker(s).

The prototypical sets of polysemy named above are a result of a trivial calculus based on a combination of the reciprocal meaning first with one and then with two basic non-reciprocal meanings. Other meanings which are often expressed by reciprocal markers, e.g. anticausative, autocasative, competitive, passive, and a number of others, are not used as the classifying meanings (though they may be more productive in type frequency than the main meanings) because it would enormously increase the number of types and make the classification unfeasible. These secondary meanings are dealt with within the range of the prototypical sets of polysemy; they may recur in two or more prototypical types of polysemy. For instance, the anticausative meaning occurs both in the reflexive-reciprocal and reciprocal-sociative polysemy, though in the latter type it is much less productive, as these anticausatives derive mostly from three-place transitives of joining.

The six prototypical types of polysemy serve as guidelines in the domain of the polysemy of various reciprocal markers. The distribution of languages according to these types of polysemy of reciprocal markers is not always a simple task, due to a number of factors. For instance, a language may have two or more reciprocal markers differing in the type of polysemy, and even dialects of the same language may differ in this respect. Another factor is that one type of polysemy, e.g. reflexive-reciprocal, may merge into another, e.g. reciprocal-sociative, and *vice versa*.

In languages with two or more reciprocal markers the problem of establishing the “main” marker according to whose polysemy the language should be classified may arise. As a rule, if a language possesses two markers it is classified according to the more polysemous one which is regarded in this case as the main one. It follows that if there is a monosemous and a polysemous marker, the polysemous marker is chosen as the classifying one. As a rule, if a language possesses a verbal and a pronominal reciprocal markers the verbal marker is usually more polysemous and therefore it is given priority though it may be restricted in productivity. But generally the rules are not rigid, and sometimes classifying a language may be to a certain degree arbitrary. As is known, pronominal markers, being “younger” and thus generally more etymologically transparent than the verbal ones, are mostly monosemous.

In this chapter, reciprocal markers of each language are briefly characterized with respect to the typologically relevant features.

2. Reflexive-reciprocal polysemy (Part II)

This type of polysemy characteristic of markers with the primary reflexive meaning is represented in a number of languages described in 12 chapters. Seven of the languages are of the Indo-European stock. The other languages are Kabardian and Adyghe, West Greenlandic Eskimo, North Arawak languages and Djaru.

As is usually noted, if one and the same derivation can have both a reflexive and a reciprocal meanings, it is usually reflexive if the subject is singular and it is always or mostly reciprocal if the subject is plural or dual.

The common feature of the six present-day Indo-European languages (Chapters 10–15) is expression of reciprocity by verbal reflexive markers which have acquired a broad range of meanings also attested in other languages, though in different combinations and with a different productivity. For instance, in Russian the most productive function of the reflexive-reciprocal marker is passive (about 4,000 passive forms of imperfective transitive verbs registered in dictionaries), and it is entirely absent in Lithuanian. In Bulgarian, in contrast to all the other Indo-European languages described in this monograph, the reflexive-reciprocal clitic, in interaction with the prefix *nad-* denoting overcoming (which determines the meaning of competition) derives a group of verbs (about 25 items) with the competitive meaning; cf. *Te go nadpivat* ‘They overdrink him’ → *Te se nadpivat* ‘They compete in drinking’ and not proper reciprocal ‘They overdrink each other’. However, when the reciprocal verb is used in the aorist of the perfective aspect, instead of the competitive meaning the latter meaning comes to the fore, but it sounds illogical, because two participants cannot overcome each other at the same time.

The type frequency of a meaning of reciprocal markers may differ significantly across languages. For instance, in Russian, Lithuanian and German, the approximate number of reciprocals is about 40, 160 and (no less than) 480 respectively. There may be a correlation between the frequency of different meanings; for instance, reverse productivity between the reciprocal and anticausative meanings in these languages, cf. the given numbers with the number of anticausatives: 1400, 800 and 400 respectively.

All these Indo-European languages also employ monosemous reciprocal markers with the status of pronouns whose usage may differ in various ways across these languages.

In German (Wiemer & Nedjalkov, Ch. 10) and Polish (Wiemer, Ch. 11), in contrast to French (Guentchéva & Rivière, Ch. 12) and Bulgarian (Penchev, Ch. 13), substitution of a pronominal reciprocal marker for a verbal one is often possible and simultaneous use of both markers is not allowed. A specific feature of German is reciprocal adverbs consisting of prepositions and pronominal reciprocal marker. The adverbs with spatial meanings may function as preverbs, in which case they may form object-oriented reciprocal constructions denoting mostly joining; cf. *etwas an etwas fügen* ‘to fasten sth to sth’ → *etwas aneinanderfügen* ‘to fasten together’ (Ch. 10, §3.12.2). A specific feature of Polish is the existence of two reciprocal markers, *się* and *siebie*, each with reflexive-reciprocal polysemy; cf.: *Przyjaciele bronili się/siebie długo* i. ‘The friends defended *themselves* for a long time’, ii. ‘The friends defended *each other* for a long time’.

In Lithuanian (Geniušienė, Ch. 14) and Russian (Knjazev, Ch. 15), verbal reciprocals form closed sets, which means that no new reciprocals are derived. For instance, in Lithuanian verbal reciprocals do not derive from verbs like *įtarti* ‘to suspect’, *stebėti* ‘to watch’, *gerbti* ‘to respect’, etc. In these two languages the reciprocal and the reflexive meanings are in complementary distribution, their lexical range being different. This is to say that there are practically no derivatives that can be interpreted either as reciprocal or reflexive depending on the context and other factors, while in the former four languages the overlap is considerable (a case of such an overlap is the Polish example above).

In contrast to German and French, the verbal reflexive-reciprocal markers in Polish, Bulgarian, Lithuanian and Russian are the same for all three persons.

It seemed reasonable to include Vedic (Kulikov, Ch. 16) in the class of languages with reflexive-reciprocal polysemy. In this language verbs with middle inflexion practically lost the reciprocal and the reflexive meanings (there are only indirect traces of the reflexive meaning, e.g. the autocausative (closest to the reflexive) derivative (*bhr* ‘bring’ →) *bhárate* ‘moves’ (< *‘brings oneself’)). The middle form which had previously had a reflexive-reciprocal polysemy suffered the same fate as, for instance, the reflexive clitic in a number of Scandinavian languages. The reciprocal meaning in early Vedic was commonly expressed by the preverb (= semi-free morpheme) *ví* added to forms with middle inflexion, and by the adverb *mithás* ‘mutually’. About 20 reciprocals with the preverb *ví* are attested (most of them denoting hostile activities and communication); cf.: *dviṣ* ‘hate’ → *ví-dviṣ-ate* ‘they hate each other’. This is a manifestation of the tendency in a number of Indo-European languages to use some verbal prefixes for marking the reciprocal meaning (cf. Latin *lido* ‘to hit’ → *col-lido* i. ‘to hit against each other’, ii. ‘to bring sth together’; Ancient Greek *ἐράω* ‘to love’ → *ἀντ-εράω* ‘to love each other’; see Zaliznjak & Shmelev, Ch. 4) which however did not develop into full-fledged reciprocal markers.

In each of the genetically closely related Kabardian (Kazenin, Ch. 17) and Adyghe languages (Letuchiy, Ch. 18), the verbal marker *z-* occupies different slots in the verb structure depending on its reflexive or reciprocal function (on transitive verbs an extended reciprocal form *zərə-* is used); Adyghe examples: *txbaklən* ‘to wash’ (vt) → *zə-txbaklən* ‘to wash oneself’ and *bəun* ‘to kiss sb’ (vi) → *zə-bəun* ‘to kiss each other’ (vowel alternation in the prefix obeys general rules for agreement markers). Combinations of verbal reciprocals with reciprocal pronouns are possible, though rare. Unlike other languages with reflexive-reciprocal markers, Kabardian and Adyghe possess sociatives which are in fact reciprocals derived from comitative verbs; cf. *šxən* ‘to eat’ → *də-šxən* ‘to eat with sb’ (comitative) → *zə-də-šxən* ‘to eat together’ (sociative). In both languages, there are numerous inseparable complex preverbs consisting of the reciprocal prefix *zə-* and a locative preverb; cf. Kabardian where the complex *zəte-* has an intensifying meaning: *gəsxəbən* ‘to burn sth’ → *zəte-gəsxəbən* ‘to burn everything’ (when used on its own, the preverb *te-* denotes that the action expressed by the verb is performed on the surface of an object). In Kabardian, there are spatial reciprocals, especially with the meaning of joining, which are semantically similar to German reciprocal adverbs mentioned above, they denote mostly joining and separating and form object-oriented constructions; cf. Kabardian *gəpšəbələn* ‘to stick sth’ → *kləra-gəpšəbələn* ‘to stick sth to sth’ → *zə-kləra-gəpšəbələn* ‘to stick sth and sth together’

(Nedjalkov, Ch. 1, §1.13.1). The reflexive-reciprocal marker takes part in relativization, occupying the agreement slot of the relativized argument. The prefix *z-* is also used as a common plural marker on nouns - lexical reciprocals, cf. Adyghe *ləgʷu* ‘person of the same age’ → *zə-ləgʷu* ‘persons of the same age’.

In West Greenlandic Eskimo (Fortescue, Ch. 19), the main reciprocal marker is a reflexive-reciprocal pronoun *immin-nut* ‘themselves/each other(3PL)’ marked for person and case; cf. *immin-nut assuari-pput* <self-ALL.PL blame-IND.3PL> ‘(they) blamed each other/ themselves’. Ambiguity may be resolved by the iterative suffix *-sar/-tar* pointing to the reciprocal reading. This pronoun cannot occupy the direct object position and its usage involves a change of the ergative construction into absolutive with substitution of subject agreement for subject-object agreement (a similar situation is observed in Chukchi when a monosemous reciprocal pronoun is used; see Section 8 below). The reciprocal meaning can also be expressed by this latter operation without any special marking; cf.: *kunip-paa* ‘kissed-he.him’ → *kunip-put* ‘kissed-they’.

There is also a number of verbal reciprocals with the suffix *-ut(i)/-up/-ap/...* derived, as a rule, from transitive bases. This suffix also marks transitive applicatives with meanings like ‘for’, ‘with’, ‘with respect to’, etc. Intransitivization of applicative forms usually results in the reciprocal meaning; cf. (a) *tigu-aa* ‘he took it’ → (b) *tigg-up-aa* ‘he took it (along) with sth else’ (applicative) and *tigg-up-put* ‘they took hold of each other’ (reciprocal). Sometimes, stage (b), i.e. derivation of an applicative, may be absent, and both suffixation and intransitivization occur simultaneously; cf.: *malirsu-paa* ‘he pursued him’ → *malirsu-up-put* ‘(they) pursued one another’. This type of reciprocal derivation is unproductive and highly lexicalized. The language has preserved not only the reciprocal but also the sociative meaning on some intransitive bases; e.g. *kavvi-su-up-put* ‘they drank coffee together’ (*-sur/-su-* ‘to drink’). A number of cases are registered when the suffix *-ut(i)* is used to mark subject- and object-oriented reciprocals of joining (see 7.2.3); cf.: *nuiu(rar)-* ‘to string (beads, etc.)’ → *allunaasat (immin-nut) nuiu-up-pai* ‘She braided the strings together’, *allunaasat immin-nut nuiu-up-put* ‘The strings were braided together’.

West Greenlandic Eskimo possesses more than 400 derivational suffixes. Therefore it is not surprising that there are a number of reciprocal and “near-reciprocal” suffixes of limited productivity among them, e.g., the suffix *qatigiC-* (Ch. 19, §3.2.2) which has a reciprocal and a sociative functions and also refers to symmetric states (cf. *taki-* = ‘to be long’ → *taki-qqatigiip-put* ‘they are equally long’). There are suffixes denoting “natural converse relationships”, e.g. the suffix *-giiC-/riiC-*; cf. *qaliq* ‘thing on top’ → *qali-riip-put* ‘they lie one on top of the other’; *irniq* ‘son’ → *irni-riip-put* ‘they are father and son’. There are three competitive affixes of limited productivity, it is interesting to note that all of them contain the suffix *-ut(i)* (ibid., 3.2.4); cf. *ajunngin-niqqisa-ap-put* <be.good-compete.at-3PL.IND> ‘They competed at being best’.

Incidentally, in Siberian Eskimo verbal reciprocals with the suffix *-uta* are the main type. In West Greenlandic Eskimo, the verbal marker with reciprocal-sociative polysemy has been replaced by the pronominal marker *immin-nut* with reflexive-reciprocal polysemy.

And lastly, reflexive-reciprocal polysemy is observed in some North Arawak languages with verbal reciprocals only (Aikhenvald, Ch. 20) and in Djaru with pronominal reciprocals only (Tsunoda, Ch. 21).

In the three North Arawak languages sharing a common origin, the reflexive-reciprocal suffixes are *-na* in Warekena, *-tini* in Bare, and *-kawa* in Baniwa of Içana. Although etymologically different, they are very similar typologically. These suffixes are also used to mark agentless passives. Besides, the Bare suffix *-tini* may express coreferentiality of the subject of an embedded predicate with that of the matrix predicate (an analogy with the relativizing function of the Adyghe and Kabardian prefix *z-* just mentioned?).

In Djaru, an inflected reflexive-reciprocal pronoun *-nyunu* is used; cf. *nga-li-nyunu* <CARRIER-1DU.INC.SB-REFL/REC> ‘we-ourselves/each.other’. Some, though not all native speakers use constructions with this pronoun which can be interpreted as sociative (Tsunoda, Ch. 21, §8).

3. Reciprocal-sociative polysemy (Part III)

This type of polysemy of reciprocal markers is investigated here in nine languages of six genetically distinct families: Tagalog, Udehe, Japanese; Karachay-Balkar, Yakut and Tuvan, (all three of the Turkic language family); closely related Khalkha Mongol and Buryat, and finally Bolivian Quechua. In five of these languages the sociative meaning appears on intransitive bases and/or it is of low productivity.

In Tagalog (Shkarban & Rachkov, Ch. 22), the polysemy of the productive reciprocal marker *mag-...-an* is mostly restricted to the basic reciprocal and sociative functions (see *mag-sulat-an* below). The prefix *mag-* (the initial component of the circumfix *mag-...-an*) occurs on about 30 derivations with the reciprocal meaning (e.g. *t-um-ulong* ‘to help’ → *mag-tulong* ‘to help each other’) and about 15 derivations with other than reciprocal meanings (see Section 7 below). The polysemy of this marker subsumes the dual meaning on nominals (cf. *ka-klase* ‘class-mate’ → *mag-ka-klase* ‘two class-mates’). Though unproductive on verbs, this prefix is more polysemous than the circumfix. This kind of relationship between the polysemy of reciprocal circumfixes and their initial components is also characteristic of some other languages of the same area; cf. *fe-...-’aki* and *fe-* in East Futunan (Moyses-Faurie, Ch. 35; see §5 below) and *ber-...-an* and *ber-* in Indonesian (Ogloblin & Nedjalkov, Ch. 33, §3.2.3), both with iterative-reciprocal-sociative polysemy.

In the paper on Tagalog, morphological reciprocals are regarded as a result of two-step derivation of verbal reciprocals from reciprocal nouns. If we accepted this viewpoint we would have to admit that this is a typologically unique operation: *s-um-alat* ‘to write’ → *sulat-an* i. ‘writing to each other’, ii. ‘writing collectively’ → *mag-sulat-an* i. ‘to write to each other, correspond’, ii. ‘to write collectively’. For a number of reasons it may be justified, though with reservations, to disregard the intermediate derivation and to treat *mag-...-an* as a circumfix.

In Tagalog, a special circumfix is used for object-oriented spatial reciprocals which is different from the reciprocal *mag...-an*. It changes three-place verbs into two-place; cf. *i-dikit* ‘to stick sth onto sth’ → *pag-dikit-in* ‘to stick sth together’.

A peculiarity of Tagalog is the use of the additional comitative prefix *maki-* not only on non-reciprocal verbs (in constructions like ‘to work with sb’) but also in reciprocal constructions with one of the reciprocants in non-subject position (like German *Paul schlägt sich mit Karl* ‘Paul fights with Carl’).

In the northern dialect of Udehe (Nikolaeva, Ch. 23), in contrast to other Tungusic languages considered in this monograph (Evenki (Nedjalkov & Nedjalkov, Ch. 38) and Even (Malchukov, Ch. 39), which possess monosemous reciprocal suffixes only (*-maat* and *-mat* respectively), the reciprocal suffix *-masi* is used, though rarely, in the sociative meaning. In the southern dialect of Udehe, there is a special sociative marker, viz. *-niŋa* (cf. *taŋi-niŋa-si:-ti* <read-SOC-IPF-3PL> ‘they read together’), different from the sociative markers in Evenki and Even (*-ldə* and *-lda* respectively).

A typologically interesting feature of the Udehe reciprocal suffix is that it is often preceded by the aspectual suffix *-si* (cf. *teti-si-* ‘to dress many children’ or ‘to dress one child many times’): e.g. *bile[-si]-masi* ‘to help each other’. On sociative derivatives, this suffix follows the sociative suffix, as a rule; e.g. *te-niŋa-si-* ‘to sit together’. (Note in this respect the bilateral arrow in the schema in Section 1. It is not unlikely that the component *-si* in the reciprocal marker *-masi* is also related to this aspectual marker.) To reciprocalize adjuncts, Udehe uses reduplication of prepositions, rarely of nouns, adverbs and adjectives; cf. *dä* ‘next to’ → *dä:dä:* ‘next to one another’.

In Karachay-Balkar (Nedjalkov & Nedjalkov, Ch. 24), the reciprocal meaning of the verbal marker *-š* is unproductive, being preserved in no less than 60 derivations denoting mostly hostile actions. There are, for instance, no verbal reciprocals derived from verbs *maxta-* ‘to praise’, *suj-* ‘to love’, *ajt-* ‘to say’. But these and some other verbs may be used with the reciprocal suffix in this meaning if the reciprocal pronoun *biri biri-n* ‘each other’ is added. However, native speakers understand many derivatives like *maxta-š* ‘to praise each other’ on hearing them, but do not use them any longer. The latter two factors point to some traces of former productivity of this suffix in Karachay-Balkar.

The sociative meaning of the suffix *-š* is attested in 140 derivatives mostly formed from intransitives (however, sociatives do not derive from some intransitives, e.g. from *džaša-* ‘to live’ and *termil-* ‘to suffer’). As a rule, the sociative meaning in Karachay-Balkar is rather bleached and may acquire some additional semantic nuances depending on context. Therefore it is often hard to render the exact meaning of such a verb in a text and the sociative sense may be lost in translation, as is the case with sociatives derived from the verbs *mušulda-* ‘to snore’, *qaltəra-* ‘to tremble’, *salən-* ‘to hang down (e.g. about apples)’, *dziltinde-* ‘to sparkle’.

In many languages there occurs a limited number (from three to ten) of reciprocally marked competitive verbs denoting sporting events, like ‘to compete in wrestling’, ‘to compete in running’, ‘to compete in jumping’. And only in rare languages the competitive meaning occurs on verbs denoting non-sporting events. So far, this is attested only in two languages, Karachay-Balkar (Nedjalkov & Nedjalkov, Ch. 24, §5.3) and Japanese (Al-

patov & Nedjalkov, Ch. 25, §5.2); cf. Karachay-Balkar *saw-* ‘to milk’ → *saw-š-* ‘to compete in milking’; Japanese *nom-u* ‘to drink’ → *sake o nomi-a-u* ‘to compete in drinking sake’.

In Japanese, the sociative meaning of the reciprocal marker *-a/-aw/-at* is distinguished and illustrated in the literature but it is of restricted productivity (there are, for instance, no sociatives of the verbs *sin-u* ‘to die’ and *tob-u* ‘to fly’). In this language, as well as in Udehe, the reciprocal suffix is attested in the alternative meaning (‘by/in turns’). The verb *a-u* ‘to meet, to fit’ (allomorphs *aw-/at-*) that served as the source of the reciprocal suffix, was used for some time in the nominalized form *a-i* (*-i* = suffix of nominalization) in compounds with the reciprocal meaning and it practically became a prefix. It is entirely unproductive in present-day Japanese and is preserved only in a small group of archaic derivations which are sometimes synonymous correlates of regular reciprocals; cf. *koros-u* ‘to kill’ → *korosi-a-u* ‘to kill each other’ and *ai-koros-u* (same); *kanasar-u* ‘to put sth upon sth’ → *kanasari-a-u* ‘to be piled on top of one another’, *ai-kanasar-u* (same). If this phenomenon had developed further, *ai-* might have become the only verbal prefix in Japanese (cf. parallels in Nivkh where the reciprocal marker *v-/u/-o-* is the only prefix, and in Mundari where the reciprocal marker *-pa-/...* is the only infix).

In the four of the five languages dealt with in the subsequent chapters of Part III, i.e. Yakut (Nedjalkov & Nedjalkov, Ch. 26) and Tuvan (Kuular, Ch. 27) (both are Turkic languages possessing cognate reciprocal suffixes *-s/-š-*), and Khalkha Mongol and Buryat (Nedjalkov et al., Ch. 29), reciprocal markers have three more main meanings, sociative, comitative, and assistive. Compare Tuvan: *sigen kes-iš-* <hay mow-REC> i. ‘to make hay together’ (sociative), ii. ‘to make hay with someone else’ (comitative), iii. ‘to help someone make hay’ (assistive), and iv. ‘to make hay together helping each other’ (sociative-reciprocal-assistive). Another example is the following sentence from a Buryat fairytale: “*Šexee-mni tahala-ls-aag üge-laa*” <ear-my cut-SOC/REC-CONV AUX-MOD> ‘Help me to cut off my ears’. As for Kirghiz (Nedjalkov, Ch. 28), the sociative meaning has become virtually unproductive, being retained in folklore texts: instead, the reciprocal suffix is used optionally as a marker of the 3rd person plural, which is probably the cause of the loss of the sociative function. It should be stressed that a specific feature of the reciprocal markers of these five languages is the assistive meaning.

The differences between these languages are also observed in the range of non-reciprocal meanings of the reciprocal markers. These meanings vary, though their relatedness to the reciprocal meaning is mostly retained, cf. the Yakut converse derivative (*atəəlaa* ‘to sell sth to sb’ → *atəəla-s-* ‘to buy sth from sb’), and Tuvan imitative derivative (*emčile-* ‘to work as a doctor’ → *emčile-š-* ‘to play doctors’).

A complicated situation is observed in Buryat and Khalkha Mongol (Nedjalkov et al., Ch. 29). These languages, being close relatives, do not practically differ in the domain of reciprocals and sociatives (here, Buryat examples are used for illustration). It is usually claimed that there is a reciprocal suffix *-lda/-lde/...* in both languages and sociative *-lca/-lce/...* (Khalkha) and *-lsa/-lse/...* (Buryat). Besides, the complex suffix *-ca-lda/...* in Khalkha and *-sa-lda/...* in Buryat is used to a limited degree, mostly on verbs denoting hostile actions. It is also claimed that *-lda* on the one hand and *-lca* and *-lsa* on the other can be used in the meaning of each other. Their overlap is observed as early as in the writ-

ten sources of the 13th century. As it happens, in the genetically related Monguor language the suffix *-lde* is preserved as the only marker in both meanings, and Dagur has preserved only the suffix *-lči*, also in both meanings. With respect to the expression of reciprocity, three sets can be distinguished in either language: (a) verbs which seem to be used with either suffix interchangeably, like *gete-* ‘to stare at sb’ → *gete-lde-/gete-lse-* ‘to stare at each other’; (b) verbs used with *-lda* as a reciprocal marker, as a rule, e.g. *xööre-* ‘to speak’ → *xööre-lde-* ‘to converse, speak with each other’; (c) verbs taking *-lsa*, as a rule, e.g. *tani-* ‘to recognize’ → *tani-lsa-* ‘to get acquainted with each other’. Both suffixes, when used in the sociative meaning, seem to differ in the lexical range of stems they combine with. On the one hand, the suffix *-lda* combines mostly with intransitive bases, with both animate and inanimate subjects (cf. *yalagaša-* ‘to twinkle (of stars)’ → *yalagaša-lda-* ‘to twinkle (of many stars)’; *hurhira-* ‘to snore’ → *hurhira-lda-* ‘to snore (of many)’). The component ‘of many’ is used in dictionaries to explain the meaning of such derivatives; as a rule, two or four participants are implied; in fact, this meaning seems to refer to the plural participant as a group. On the other hand, the suffix *-lsa* occurs often enough on both transitive and intransitive verbs usually taking human subjects. It is remarkable that the subject mostly names only one of the reciprocants (single or collective) and the second reciprocant is either denoted by an object or implied (cf. *Ši (nam-tai) yaba-lsa!* <you.sg I-COM go-SOC> ‘Come together (with me)!’). The two suffixes differ in the range of non-reciprocal meanings; for instance, the anticausative and autocausative meanings are expressed by *-lda* only (cf. *xolyo-* ‘to mix sth’ → *xolyo-ldo-* ‘to get mixed’, *šaxa-* ‘to press sth’ → *šaxa-lda-* ‘to squeeze oneself into sth’), while the assistive meaning is expressed by *-lsa* almost exclusively, and the same derivatives may have the sociative meaning (e.g. *zöö-* ‘to carry’ → *zöö-lse-* ‘to help carry’, ‘to carry together’, ‘to carry with sb’). The reciprocal pronoun *beye beye* ‘each other’ occurs both with reciprocal verbs in *-lda* and *-lsa* (cf. *beye beye-d-ee durla-lsa-* ‘to love each other’, where *-d-ee* = DAT-REFL.POSS) and, more commonly, with verbs without these suffixes.

In some of the Altaic languages there is a tendency to mark (mostly) two-place transitives (they are three-place semantically) with reciprocal-causative suffixes: a causative suffix is added to an anticausative verb with a reciprocal suffix used in the anticausative function; thus marked three-place object-oriented reciprocals are formed denoting joining of two or more objects. In this case three-member chains are observed: the initial verb and the final derivative of a triad may be very close in meaning; cf. Buryat: *xolbo-* ‘to tie/join sth together’ → *xolbo-ldo-* ‘to be tied/joined’ (anticausative) → *xolbo-ld-uul-* ‘to tie/join sth together’ (causative of anticausative). The two suffixes may be reanalysed into a single morpheme and attached immediately to a transitive verb which has no related anticausative with a reciprocal marker; e.g.: Kirghiz *bayla-* ‘to tie sth to sth’ → *bayla-š-tər-* ‘to tie sth together’. In Japanese, this tendency has acquired a specific expression corresponding to the examples cited semantically but not formally. Causatives do not derive from reciprocals in Japanese, but there are compounds with the verb *aw-ase-ru* ‘to join ...’ composed of the verb *a-u* ‘to meet’ (which, as just mentioned, served as a source of the reciprocal suffix) and the causative suffix *-ase*; cf.: *nu-u* ‘to sew sth’ → *nui-aw-ase-ru* ‘to sew two things together’.

In Tariana (Aikhenvald, Ch. 30), two markers with different types of prototypical polysemy are registered. One is a reflexive-reciprocal suffix *-kaka* (not used by the younger generation), i.e. the type characteristic of other North Arawak languages (see Aikhenvald, Ch. 20). Another device, a serial verb construction containing the verb *-siwa* ‘to be together’, has the reciprocal-sociative type of polysemy, and both markers can be used simultaneously. The latter device with reciprocal-sociative polysemy is becoming prevalent under the influence of the areally close though genetically unrelated Tucano languages.

The Bolivian Quechua marker *-naku* (van de Kerke, Ch. 31) also displays the sociative-reciprocal type of polysemy, although the second component *-ku* of this marker has a reflexive meaning when used singly or with a causative suffix. When combined with the causative suffix, the reciprocal suffix loses *-ku*, because this component does not express coreferentiality with the subject in this case; cf.: *maylla-* ‘to wash sb’ → *maylla-ku-* ‘to wash oneself’, *maylla-na-ku-* ‘to wash each other’ → *maylla-na-chi-* ‘to cause sb to wash each other’.

4. Iterative-reciprocal polysemy

This type of polysemy is not registered among the main reciprocal markers in the languages investigated so far. In Modern Chinese (Hoa et al., Ch. 49), where the main reciprocal marker is the pronominal adverb *hùxiāng*, a marker with iterative-reciprocal polysemy has been registered fairly recently, as an extremely rare reciprocal device (197 occurrences in a corpus of 3.5 million words): it is a compound derivative containing reduplication of a lexical verb and the antonymous auxiliary verbs *lái* ‘come’ and *qù* ‘go’ denoting repeated motion in opposite directions (Liu 2000: 124–32). The reciprocal usage of this marker is not mentioned in Chinese grammars, probably because it is rare, the iterative meaning being the main one. In the examples cited in Liu (2000) it occurs with monosyllabic verbs only. (This formation is one of three types of reciprocals with reduplicated or double auxiliary components; see Hoa et al., Ch. 49, §9.2.) The following example allows an iterative interpretation as the most natural one, and also a reciprocal interpretation depending on the subsequent context: *Lǎoshī-men mà-lái-mà-qù* ... <teacher-PL scold-come-scold-go> i. ‘Teachers kept scolding ...’, ii. ‘Teachers berated each other ...’ (ibid.). Some specialists in Chinese, however, refute the reciprocal reading of this type of formations (S. Yakhontov, p.c.). This type of polysemy is also characteristic of one of the reciprocal markers in Hua (see Nedjalkov, Ch. 5, §3.4.2). Note that this type of polysemy is covered by the extended “iterative-reciprocal-sociative” type of polysemy of reciprocal markers (Part V; Section 6 below).

5. Reflexive-reciprocal-sociative polysemy (Part IV)

This type of polysemy is attested in the Australian language Warrungu (Tsunoda, Ch. 32). In the literature, it is also registered in a number of other Australian languages, e.g. Ritharngu, Mayali (Ch. 5, §3.5.1). It is also represented by a small number of derivations in East Futunan with an unproductive reciprocal prefix *fe-* (used when only two participants are involved; cf. *fe-tuli* ‘to chase each other’, *fe-kapu* ‘to run together’, *fe-vaku* ‘to scratch oneself’), while the productive circumfix *fe-...-’aki* has a different type of polysemy, viz. iterative-reciprocal-sociative, including a number of other meanings (Part V; see Moysse-Faurie, Ch. 35, §3.1).

6. Iterative-reciprocal-sociative polysemy (Part V)

This type of polysemy of reciprocal markers is attested in the Malayo-Polynesian languages: Indonesian, Nêlêmwa, and East-Futunan (Ogloblin & Nedjalkov, Ch. 33; Bril, Ch. 34, and Moysse-Faurie, Ch. 35 respectively). In the latter two languages there is no reciprocal pronoun. In Indonesian, there is an auxiliary word *saling* which can be regarded as a reciprocal pronoun with some reservations.

The main East Futunan reciprocal marker is the circumfix *fe-...-’aki*. Its polysemy can be illustrated by the following derivations: *fe-tapa-’aki* ‘to flash again and again’, *fe-alofa-’aki* ‘to love each other’, *fe-koti-’aki* ‘to cut sth (with scissors) together’. It has a number of other meanings as well (Ch. 35, §3.3). In East Futunan, there is also a special sociative marker *fe-...-(C)i* which is attested in the reciprocal meaning on one derivative (Ch. 35, §3.2).

In Nêlêmwa, the reciprocal marker *pe-*, in certain cases used in combination with the suffix *-i*, may be prefixed to any lexical item, verbal or nominal. Examples of its polysemy on verbs: *pe-thalic* ‘to stumble (over and over again)’, *pe-cabwa-i* ‘to pinch each other’, *pe-shaya* ‘to work together (to work fast)’ (the sociative meaning is combined with the intensive; the intensive interpretation is even more common). The reciprocal prefix also derives object-oriented reciprocals; cf. *pe-na* <REC-put> ‘to pile sth up’. Among denominal reciprocals a productive class are derivations denoting identity; cf.: *ida-t* ‘its line’ → *pe-ida-t* ‘to be on the same line’, *ka* ‘year’ → *pe-kau-n* ‘to be of the same age’ (*-t* and *-n* are possessive determinators).

In Indonesian (Ch. 33), the overall picture of reciprocal derivation is highly complicated: there are two competing productive verbal means of reciprocal derivation (circumfix *ber-...-an*, as in *me-mandang* ‘to look at’ → *ber-pandang-an* ‘to look at each other’, and prereduplication, as in *pandang-me-mandang* (same translation)), four unproductive verbal devices, and the auxiliary *saling* ‘mutually’ with an ambiguous status, which freely combines with non-reciprocal verbs (cf. *saling me-mandang* ‘to look at each other’) and with all types of verbal reciprocals. The highly polysemous prefix *ber-*, which is the first component of the circumfix, is highly productive, especially in denominal reciprocal derivation (cf. *kawan* ‘friend’ → *ber-kawan* ‘to be friends’) and also in derivation of

intransitives with a variety of meanings, e.g. reflexive (*men-cukur* ‘to shave sb’ → *ber-cukur* ‘to shave oneself’), resultative (*me-nyetrika* ‘to iron’ → *ber-cetrika* ‘to be ironed’), absolutive (*me-nanam* ‘to plant (rice)’ → *ber-tanam* ‘to be engaged in rice-growing’), anticausative (*men-campur* ‘to mix’ → *ber-campur* ‘to get mixed’), and reciprocal (*men-cium* ‘to kiss’ → *ber-cium-[an]*), etc. The circumfix *ber-...-an* has a complicated iterative meaning closely connected sometimes with the meaning of joint action of several agents, with additional semantic components, cf.: *terbang* ‘to fly’ → *be-terbang-an* ‘to fly in all directions, repeatedly, etc.’ The sociative meaning in its polysemy can be distinguished with reservations: it is a part of the more general meaning of great “quantity” of an action, and it occurs on intransitive bases only; e.g.: *patah-* ‘to break’ (vi) → *ber-patah-an* ‘to break (of several things)’.

7. Iterative-reciprocal-reflexive polysemy

Out of the three extended types of prototypical polysemy this type (the third in the list, see Section 1) seems to be the least common cross-linguistically, very much like the main iterative-reciprocal type of polysemy, also the last among the three main types (Section 4 above). So far, it is not attested in any language for the main or productive reciprocal marker. In this monograph, it is represented by one case, viz. the Tagalog highly polysemous prefix *mag-* (cf. *mag-sulat* ‘to write much and often’, *mag-yakap* ‘to embrace each other’, *mag-ahit* ‘to shave oneself’). This prefix is not the main reciprocal marker in Tagalog, it is unproductive and, as mentioned above, occurs on about 45 derivations only with a variety of meanings including those by which their polysemy is defined; cf. the converse meaning *b-um-ili* ‘to buy’ → *mag-bili* ‘to sell’ (Nedjalkov, Ch. 5, §6). Note that the main reciprocal marker *mag-...-an* displays the reciprocal-sociative polysemy, and it is productive. The reflexive meaning of the prefix *mag-* is hardly a remnant of its earlier productivity: it is more likely a result of individual semantic evolution (for details see Shkarban & Rachkov, Ch. 22 on Tagalog).

8. Non-prototypical polysemy (Part VI)

The term *non-prototypical polysemy* is provisionally applied to the types of polysemy comprising the reciprocal and a number of other meanings excepting reflexive, sociative, and iterative. In this monograph, such types of the polysemy of reciprocal markers are described in two unrelated languages, To’aba’ita (Lichtenberk, Ch. 36) and Mundari (Osada, Ch. 37). In To’aba’ita, the verbal reciprocal marker *kwai-* (sometimes in combination with the suffix *-i*) also has a reciprocal-antipassive polysemy subsuming two more meanings; cf.: *kwa’e* ‘to hit’ → *kwai-kwa’e-i* ‘to hit each other’ and *fa’ama’u* ‘to frighten’ → *kwai-fa’ama’u-i* ‘frightening’. There are four more devices used to express the recipro-

cal meaning: personal pronouns, a possessive marker on the direct object, and reciprocal adverbs *kwailiu*, *olili*.

In Mundari, the infix *-pa-/...* is reciprocal on verbs, while on adjectives it expresses “intensity” (a high degree of the quality), and on some numerals it acquires a distributive meaning (as a relic). Compare: *ad* ‘to miss’ → *a-pa-d* ‘to miss each other’; ‘*marang* ‘big’ → *ma-pa-rang* ‘very big’; *bar-ia* ‘two’ → *ba-pa-r-ia* ‘two each’.

Across world languages, reciprocal markers with reciprocal-anticausative, reciprocal-resultative polysemy are also registered (see Ch. 5, §8). Such combinations of meanings may be due to a number of factors, in the first place, probably due to the loss of possible “intermediate” meanings in the process of ageing. This may be the case in Mundari, where the ageing of the marker can be deduced from the fact that the reciprocal infix *-pa-/...* was used in Proto-Munda together with a reciprocal prefix. Another reason may be etymological: such kinds of polysemy may be due to the source meaning of the marker. And finally, the reason may be a fragmentary description of reciprocals in the grammars of individual languages.

9. Monosemous reciprocal markers (Part VII)

Languages with monosemous main reciprocal marker(s) are the most numerous in our list. One might expect that these markers are rather similar, especially semantically. Nevertheless, they display interesting variation in some respects. Some of the languages possess both a verbal and a pronominal reciprocal markers (Evenki and Even, Chukchi, Nivkh), some a verbal marker only (Ainu, Yukaghir, and Cashinahua), or mostly or only a pronominal one (Bamana, Vietnamese, Ancient and Modern Chinese).

In the first two (closely related) languages with monosemous reciprocal suffixal markers, viz. Evenki (*-maat*) and Even (*-mat*) (Nedjalkov & Nedjalkov, Ch. 38; and Malchukov, Ch. 39), there are also special sociative markers (cf. Evenki *ηene-* ‘to go’ → *ηene-ldə-* ‘to go together’). These sociative markers express reciprocity on a limited number of verbs and in these cases they can even co-occur with a reciprocal marker, always in pre-position to it; cf. Evenki: *iče-* ‘to see’ → *iče-meet-* ‘to see each other’, *iče-ldə-* (same), *iče-ldə-meet-* (same). This is mostly likely due to the fact that the reciprocal marker is of relatively recent origin (though, as noted above, in Udehe the cognate marker *-masi* occurs in the sociative meaning as well), while the sociative marker *-ldə* used to be the principal marker of both reciprocity and sociativity and was later ousted in the reciprocal function by the suffix *-meet* (note in this connection that the Evenki and Even sociative suffix *-ldə/...* is related to the Mongolian reciprocal suffix *-lda/...*). Both languages preserve relic object-oriented constructions of joining with the sociative marker: there are about 10 such derivatives in Evenki and only one (*uj-* ‘to tie sth to sth’ → *uj-lde-* ‘to tie several things together’) is registered in Even. In comparison with the genetically closely related Evenki, the set of pronominal reciprocal markers in Even is both more elaborate and more specialized (Ch. 39, §4.2.2).

Another language with a monosemous reciprocal suffix *-wəly* and a monosemous reciprocal pronoun *əryəčy* is Chukchi (Nedjalkov, Ch. 40); cf.: *penrə-nen* ‘attacked-he.him’ (vt) → *penrə-wəly-ə-γʔat* ‘they attacked each other’ (vi). The reciprocal pronoun cannot occupy the direct object position and when used as the only marker of reciprocity it requires antipassivization of the underlying construction; cf. antipassive *penrə-tko-γʔat* ‘they attacked [sb]’ and reciprocal *əryəčy penrə-tko-γʔat* ‘they attacked each other’. The suffix *-wəly* freely co-occurs with the pronoun *əryəčy*. Both the suffix and the pronoun are of relatively recent origin. An indication of this is the fact that there is only one lexicalized verbal reciprocal, *lʔu-wəly-* ‘to meet’, ‘to see each other’. Moreover, the reciprocal pronoun is unknown in some Chukchi dialects and has no counterpart in the genetically closely related Koryak language. There is one more reciprocal marker in Chukchi, a polysemous suffix *-čit/-čet* of low productivity. Among reciprocals with this suffix there are numerous lexicalizations, which indicates its “older” age. Its reciprocal use on transitive verbs requires simultaneous antipassivization (e.g.: *rəttelə-nen* lit. ‘pushed-he.him’ → *rəttelə-tko-čet-γlat* ‘(they) jostled each other’), while reciprocalization of two-place intransitives and labile verbs (in particular those derived by means of direct object incorporation; see the next example) does not require it, e.g.: *mənə-ml-u-čit-ə-rkən!* <IMP.1PL-louse-get-REC-ə-IMP> ‘Let us look for lice on each other (by turns)!’ Among derivations with the reciprocal meaning verbs denoting hostile actions are prevalent. Among the other meanings of this suffix, the competitive (e.g. competition in sports and games) and iterative should be noted; cf. *piŋku-* ‘to jump’ → *piŋku-čit-* i. ‘to jump repeatedly’, ii. ‘to compete in jumping’; *atčə-* ‘to hide’ → *atčə-čet-* ‘to play hide-and-seek’. There are attested instances of co-occurrence of *čit-* and *-wəly*.

In Nivkh (Otaina & Nedjalkov, Ch. 41), the marker of reciprocity is a prefix *v-/u-/o-*, it is unproductive and occurs on about 45 verbs which have been preserved under certain morphological conditions. In reciprocal constructions with a direct object, both the prefix *v-/u-/o-* and the reciprocal pronoun *p’-ŋafq-ŋafq* are attached to the direct object; cf. *i-γ-* ‘to kill him/her’ → *u-γ-* ‘to kill each other’ and *i-dəmk zap-t...* <his/her-hand hold-CONV> ‘holding his hand...’ → *u-dəmk rəmk zap-t...* ‘holding each other’s hands...’ (Ch. 41, §3.2.4). There is a small group of reciprocals derived from lexical reciprocals denoting equality; cf.: *ŋəkə-d’* ‘sth is equal in length to sth’ (*-d’* = FIN) (vt) → *u-ŋəkə-d’-γu* ‘they are equal in length (to each other)’ (*-γu* = PL) (vi).

In Ainu (Alpatov et al., Ch. 42), the reciprocal marker is the prefix *u-*, and there is no reciprocal pronoun. The prefix can derive not only subject-oriented reciprocals (cf. *e* ‘to eat sth/sb’ → *u-e* ‘to devour each other’) but also object-oriented reciprocals of joining, of the kind illustrated above by German and Kabardian examples (cf. *kotukka* ‘to stick sth to sth’ → *u-kotukka* ‘to stick sth to each other’). The prefix *u-* is sometimes erroneously claimed to have a sociative meaning as well. In fact, Ainu only preserves a small number of relic derivations in which sociativity may be discerned. But usually this meaning is productively expressed by the marker *u-ko-* which is (historically) a combination of the reciprocal and the applicative prefixes. In fact, a considerable number of reciprocals are derived from applicatives, e.g. *hepenpenu* ‘to nod’ (vi) → *ko-hepenpenu* ‘to nod to sb’ (applicative vt) → *u-ko-hepenpenu* ‘to nod to each other’ (reciprocal of applicative;

vi). The combination *u-ko-* is a single derivational prefix when it functions as a sociative marker, and does not denote reciprocals derived from applicatives. This is supported by the fact that the derived sociatives with this marker either have no respective applicatives or they are not related to the latter semantically, because applicatives, with the exception of two or three formations, do not have a comitative meaning; cf.: *horippa* ‘to dance’ → *uko-horippa* ‘to dance together’ and *ko-horippa* ‘to dance for sb’, but not ‘to dance with sb’. Another sociative marker is a circumfix *u-...-re* composed of the reciprocal prefix and causative suffix, e.g.: *mina* ‘to laugh’ → *u-mina-re* ‘to laugh together’ (cf. *mina-re* ‘to cause to laugh’, **u-mina*). There is a number of derivations on which the reciprocal prefix is attached to an incorporated noun, e.g. *u-tek-ama* <REC-hand-hold> ‘to hold (each other’s) hands’. In this pattern, the bound verb *pakte* is also used, where in combination with the prefix *u-* it acquires the meaning ‘compete’, e.g.: *u-terke-pakte* <REC-jump-compete> ‘to compete in long-jumping’. The reciprocal prefix forms a number of denominal derivations, like *kema* ‘foot’ → *u-kema* ‘both feet’, *ka* ‘top of sth’ → *u-ka* ‘one on top of another’ (Ch. 42).

Itelmen (Volodin, Ch. 43) is usually considered to be genetically related to Chukchi, but the reciprocal markers of these languages are entirely different. The reciprocal marker in Itelmen is a prefix *lu-/lo-*, while in Chukchi it is a suffix *-wəly*. A specific feature of Itelmen reciprocals is that most of them are derived from one- and two-place intransitives; cf. respectively: *tyxo-ka-s* ‘to stand’ → *lo-tyxo-ka-s* ‘to stand in front of each other’, *kel-ka-s* ‘to shout’ → *lo-kel-ka-s* ‘to shout to each other’.

It is easy to see the phonetic similarity of the reciprocal prefixes *v-/u-/o-* in Nivkh, *u-* in Ainu and *lu-/lo-* in Itelmen. It is not unlikely that this is the sequence of the areal proximity of these languages in the past.

Kolyma Yukaghir (Maslova, Ch. 44) has a prefixal reciprocal marker *n’e-* (which is most likely genetically related to the comitative preposition *n’e*) and no pronominal reciprocal marker. A peculiarity of reciprocal constructions derived from two-place intransitives is that they almost obligatorily contain a syntactic reciprocal formation derived from a postpositional stem; cf.: *n’-al’-in n’e-uldo-* <REC-TO-DAT REC-be.tied> ‘to be tied together’. In Kolyma Yukaghir there are also a few of derivations on which the reciprocal prefix is attached to the incorporated noun, e.g.: *n’e-pöme-aŋs’i-* <REC-louse-search> ‘to look for each other’s lice’.

In Cashinahua (Camargo, Ch. 45), there are three verbal reciprocal markers with unclear distinctions, suffixes *-namĩ*, *-nan* and *-nanan*, and there is no pronominal marker; there is a small number of derivatives with the following combinations of the reciprocal suffixes *-namĩ-nanan-*, *-nanan-namĩ*, and *-nan-namĩ*. It is assumed that in Cashinahua reciprocal constructions can denote not only standard reciprocal situations with simultaneous or immediately subsequent subevents (*A and B hit each other*) but also rather odd situations with the subevents that may be far apart in time and involve other persons as a second co-participant who cannot be named (the meaning of these constructions is *A and B hit someone who has hit them, or their relatives, earlier*, or *A and B hit someone who, personally or his relatives, will take the revenge later*).

In Cashinahua, there is a highly productive and polysemous distributive suffix *-akiaki* one of whose meanings is reciprocal (cf. *macin-akiaki* ‘to pile up one of the top of the other’). It also has a number of meanings which are often expressed by reciprocal markers (*išcu-akiaki* i. ‘to jump one after another’, ii. ‘to jump here and there’ (if the subject is singular)). This suffix can also form derivatives from reciprocals (cf. *mia-nami-akiaki* ‘to touch each other by turns’).

In each of the three isolating languages, Bamana (Vydrine, Ch. 46), Vietnamese (Bystrov & Stankevich, Ch. 47), and Ancient Chinese (Yakhontov, Ch. 48), reciprocity is expressed by a pronominal marker and their use in different types of constructions is generally similar. Although the reciprocal markers of these languages are monosemous, they sometimes acquire an extended reciprocal meaning. For instance, in Vietnamese, there are sets of reciprocal verbs denoting situations in which only the first participant performs the action named, while the second participant manifests some activity (or is moved by the other participant) without performing the same action: *Mẹ con bế nhau đi dạo*. <mother child carry.in.arms REC go walk> ‘The mother carrying the child in her arms goes for a walk’; lit. ‘Mother and child carrying each other in their arms go for a walk.’ In a way, the reciprocal action is metaphorically extended to the coparticipant.

In these languages, the sociative meaning is expressed by reciprocal markers in combination with comitative markers: preposition *với* ‘with’ in Vietnamese (*nhau* ‘each other’ → *với nhau* ‘together’) and postpositions *fě* ‘with’ in Bamana (*jógn* ‘each other’ → *jógn fě* ‘together’, lit. ‘with each other’; note that this is the only way of expressing the meaning ‘together’) and *yǔ* ‘with’ in Ancient Chinese (*xiāng* ‘each other, mutually’ → *xiāng yǔ* ‘together’). In Modern Chinese (Hoa et al., Ch. 49), the main reciprocal marker is the adverb *hūxiāng* ‘mutually, each other’. It does not combine with prepositions, therefore sociativity cannot be expressed in the same way as in Ancient Chinese. In Modern Chinese, the meaning ‘together’ is denoted by the adverb *yītóng* and its synonyms.

The Modern Chinese adverb *hūxiāng* is composed of the components *hū* and *xiāng*, each having been used at an earlier period separately in the reciprocal meaning. At present, these components are preserved in frozen verb compounds (were retained in a limited though large enough number of compounds (about 130 entities) and disappeared as free items). Sometimes, the sequence *xiānghū* occurs instead of *hūxiāng*. In accordance with the common rhythmic tendency, *hūxiāng* combines with disyllabic verbs only. Less frequently than *hūxiāng*, a number of other words, the adverb *bìci* ‘mutually’ among them, are also used to express reciprocity.

The means of expressing reciprocity in Modern Chinese are much more varied than in the three other languages. The main rivals of *hūxiāng* are reciprocals with reduplicated or double auxiliary components. One of such devices is cited in Section 4 above. Probably the most idiosyncratic device among these rivalling means is the use of the personal pronouns *nǐ* ‘you.sg’ and *wǒ* ‘I’ repeated in reversed order, as *nǐ V wǒ*, *wǒ V nǐ*; cf.: *Tāmen nǐ kàn wǒ*, *wǒ kàn nǐ*. . . ‘They looked at one another. . .’; lit. ‘They you looked at me, I looked at you’.

Hopefully, this brief survey will help the reader to find his/her way in the subsequent parts of this collective monograph and look for what may be of special interest to him/her.

1. Introduction

1.1 German

German belongs to the continental Germanic languages. It is spoken by about 90 million native speakers (Eisenberg 1994:349). It has some considerable dialectal variation, especially on the axis from North to South. Mutual comprehensibility between dialect speakers from opposite poles of the German language area may be impeded or even excluded, mostly because of phonetic divergences, less so because of syntactic variance. The standard variety (“Hochdeutsch”) is closer to the Northern varieties.

Just for comparison, here are the other modern Germanic languages and their numbers of native speakers: Afrikaans (6 million), Danish (5 million), Dutch (20 million), English (300 million), Faroese (43,000), Frisian (10,000), Icelandic (260,000), Norwegian (4,3 million), Swedish (8 million).

1.2 Overview

In German there are two main and regular means of expressing reciprocity.

1. The highly polysemous reflexive pronoun *sich* (RM; marked for person; see (1c, d, e)), which productively combines with transitive verbs by taking the position of a direct (ACC) or an indirect (DAT) object and with intransitive verbs by taking the position of an oblique (DAT) object. It can almost never take the place of a prepositional object in the reciprocal sense (see 4.6); e.g.:

- (1) a. *Sie liebten ihn* (ACC).
 ‘They loved him.’
- b. *Sie liebten sich*.
 they love.PAST.3PL RM.ACC
 i. ‘They loved *each other*.’
 ii. ‘They loved *themselves* (= each him/herself).’

Polysemy can be reduced or suppressed by contextual elements, e.g.:

- c. *Sie lieben sich schon seit Jahren.* ‘They have loved each other for years.’
- d. *Wir lieben uns schon seit Jahren.* ‘We have loved each other for years.’
- e. *Ihr liebt euch schon seit Jahren.* ‘You have loved each other for years.’

In this case the reciprocal interpretation becomes a much more probable one.

An intervening reflexive reading can be precluded by the addition of the adverb *gegenseitig* (see 4.6), which can occur only together with the reflexive pronoun.

2. The reciprocal pronoun *einander* (ACC and DAT) ‘each other’ which has two usages.

2a. The pronoun *einander* is used instead of the reflexive pronoun and takes the same position as the latter (but can furthermore be employed with prepositions (see (2d)). It is used primarily in high (written) style, for the colloquial language it is rather atypical, though it sometimes occurs. This pronoun and *sich* exclude one another in the same argument position (though this combination does occur in informal speech); e.g.:

- (2) a. *Sie lieben einander.*
‘They love each other.’
- b. **Sie lieben sich einander.*
(same intended meaning).
- c. *Sie warteten auf ihn.*
they wait.PAST.3PL on him
‘They waited for him.’
- d. *Sie warteten aufeinander.*
‘They waited for each other.’
- e. **Sie warteten auf sich.*
(same intended meaning).

2b. Complex forms “preposition + *einander*” (see 5.5), which are in complementary distribution with the prepositionless *einander* and *sich*.

Besides these two regular markers, there are at least three minor or lexically restricted markers of reciprocity. These are:

3. Analytical constructions of the *einer den anderen* (lit. ‘one the other’) type (see Section 6);

4. Complex verb prefixation (see 5.5): combinations of a preposition and *einander* do not collocate with the verbs which occur with the separate form *einander* (see 5.3–4), and, contrary to the latter, these combinations are employed with object-oriented lexical reciprocals (see 8.2);

5. Some prefixes (*zusammen-*, *gemeinsam-* (see 7.2–3); *entgegen-*, *gegenüber-* (see 7.1), each collocating with a specific lexical group of verbs.

Werner Abraham (p.c.) claims that in colloquial German only *sich* or *sich gegenseitig* are used. *Einander* is not among the possibilities in the vernacular. Furthermore, there holds a priority hierarchy with respect to the use of *sich* (more generally, RM in all persons and numbers) and *sich gegenseitig*: *sich* > *sich gegenseitig*, which means that a speaker of colloquial German will use *sich* (RM) unless *sich* can be misunderstood also, or exclusively, as purely reflexive. In this case, *sich* (or RM, more generally) + *gegenseitig* is used.

1.3 Scope of this chapter

The reflexive pronoun *sich* does not by itself signal reciprocity. In most cases reciprocity can be inferred only from an inflected verb in the plural. It is this standard relation and the question of when and with which explicit reciprocity markers such predicates can collocate that will dominate the first part of the paper (Sections 4 and 5). We shall not touch specially upon phraseological entities comprising such verbs. The relationship of verbs collocating with *sich* to verbs inherently bearing a reciprocal meaning, which show quite idiosyncratic behaviour, will be considered separately (Sections 8 and 9). Since reflexive vs. reciprocal (or other) meanings are, as a rule, to a large extent inferred from the meaning of the verb interacting with the context (or previous knowledge), reciprocal relationships form a subject for more thorough studies within the field of lexical semantics. This contribution can give but a more or less systematic overview of expressing reciprocity in German; it does by no means substitute for more detailed lexicological investigations.

1.4 Database

As primary database for heuristic purposes we have used the list of “reciprocal verbs“ in Mater (1969:31–3). This list comprises 352 verbal items that can (but need not!) be used with the pronoun *sich* in a reciprocal reading, including some lexicalized reciprocal verbs and *reciproca tantum* (see 4.1.1). 18 of these verbs have to be subtracted for various reasons.¹ Since Mater’s list can by no means be considered exhaustive, we have also tested the native speaker’s knowledge of the first author against the Duden (see Drosdowski et al. 1976–81, 6 volumes) and, in some cases, the “Wörterbuch der deutschen Gegenwartssprache“ (WdG, 6 volumes, diverse editions). It was not very difficult to find approximately 200 more verbs which can be used with *sich* and then convey – under certain conditions – a reciprocal meaning either exclusively (e.g. *sich abstimmen* ‘to adapt (oneselves) to each other’) or as one reading among others (e.g. *sich beruhigen* ‘to calm (oneselves, each other) down’). The total number of systematically investigated reflexive verbs (with at least a possible reciprocal meaning) is 545. Although the actual number of reflexive verbs with a possible reciprocal meaning has to be estimated as considerably larger (for reasons which are given in 2.3, 5.5 and 7.1–2), an additional account of other possible verbs not included in the number of 545 would, most probably, not have any serious impact on conclusions drawn from the statistical picture discussed below.

1. Some verbs may be regarded as local (phonetic) variants of one another (e.g. *bussen*, *bussekn* ‘to kiss’) or differ only in orthography (*-f-* instead of *-ph-*). In four cases verbs which are used with *sich* only in idiomatic contexts happened to be listed (*geraten*, *sincken*, *trachten*, *zollen*).

2. Grammatical notes

2.1 Syntactic peculiarities of German

There are four syntactic cases (nominative, genitive, dative, accusative), both on nouns and adjectives. But most usually the case (along with number and gender) of a noun is indicated by an accompanying article. Adjective inflexion is of two kinds, depending on the absence vs. presence of the definite article within the noun phrase. German is of a mixed SVO/SOV type, since in declarative main clauses SVO is the rule, while in subordinate clauses SOV holds. Subject inversion (VS) is grammaticalized in questions and for any sentence with an initial non-subject NP, an adverbial or a subordinate clause which then directly precedes the inflected part of the predicate in the main clause.

Furthermore, in German one has to distinguish between fixed and detachable prefixes (the latter are now usually called particles, though, in our opinion, both diachronically and synchronically, this term is less satisfactory; cf. Nedjalkov 1961a: 3–15): if a prefixed verb takes its main stress on the stem morpheme the prefix always remains where it is in the infinitival form (see (3)). If, however, the word stress is located on the prefix itself it is separated from the stem either totally, moving to the end of the clause, as in (4b), or by the morpheme *-ge-* used for participial forms (the so-called Partizip II):

- (3) a. (**sich**) *überlegen* (INF) ‘to think, deliberate.’
 b. *Hans überlegte **sich** die Sache noch einmal.* ‘Hans re-thought the matter altogether.’
 c. *Hans hat **sich** die Sache noch einmal überlegt.* (the same, or: ‘has re-thought’).
- (4) a. *ab*legen (INF) ‘to take off’
 b. *Peter legte seinen Mantel **ab**.*²
 Peter lay.PAST his coat.ACC off
 ‘Peter took off his coat.’
 c. *Peter hat seinen Mantel **abgelegt**.*
 (the same, or: ‘has taken off’).

(Stress here is indicated by bold characters.)

2.2 Polysemous pronouns and the place of clitics

2.2.1 Relation of *sich* to personal pronouns

The morpheme *sich* can be used as a reflexivity marker only with regard to a 3rd person subject. It does not differentiate accusative vs. dative (2nd vs. 3rd argument respectively).³ In the 1st and 2nd person it alternates with *mich* (ACC)/*mir* (DAT), and

2. If a prefix is transferred to the very end of the clause and the sentence is uttered with neutral phrasal intonation the prefix as a rule behaves like a clitic.

3. We shall use the term ‘argument’ to refer to syntactic or semantic valencies of a given verb, while the notion ‘participant’ will be reserved for “the referential entities involved in the event”, in accordance with Kemmer (1993: 7f.) (cf. also Geniušienė 1983 and 1987: passim).

Table 1. Personal pronouns⁴

	a. Non-reflexive			b. Reflexive		c. Reciprocal			
	NOM	ACC	DAT	ACC	DAT	unspecific		specific	
						ACC	DAT	ACC	DAT
SG 1	<i>ich</i>	<i>mich</i>	<i>mir</i>	<i>mich</i>	<i>mir</i>	–	–	–	–
2	<i>du</i>	<i>dich</i>	<i>dir</i>	<i>dich</i>	<i>dir</i>	–	–	–	–
3.M/F	<i>er/sie</i>	<i>ihn/sie</i>	<i>ihm/ihr</i>	<i>sich</i>	<i>sich</i>	–	–	–	–
PL 1	<i>wir</i>	<i>uns</i>	<i>uns</i>	<i>uns</i>	<i>uns</i>	<i>uns</i>	<i>uns</i>	<i>einander</i>	<i>einander</i>
2	<i>ihr</i>	<i>euch</i>	<i>euch</i>	<i>euch</i>	<i>euch</i>	<i>euch</i>	<i>euch</i>	<i>einander</i>	<i>einander</i>
3	<i>sie</i>	<i>sie</i>	<i>ihnen</i>	<i>sich</i>	<i>sich</i>	<i>sich</i>	<i>sich</i>	<i>einander</i>	<i>einander</i>

dich (ACC)/*dir* (DAT) in the singular and with *uns* (ACC/DAT), *euch* (ACC/DAT) in the plural, constituting with them a single “reflexivity paradigm” (see (b) in Table 1 and (1c–e) above) (Engel 1988:663f.). In this respect, *sich* behaves like the English *him/her...-self/selves*. But, contrary to English, in German this alternation holds for both reflexive and reciprocal readings.

From the point of view of its prosodic features, the RM *sich* (and the other members of the paradigm) basically behaves like a clitic, though there is no morphological opposition of clitic vs. non-clitic (stressed) forms, and *sich* has by no means become a part of the verbal inflection (like the Swedish *s*-suffix). It cannot be used in sentence initial position unless as a topicalized benefactive or reflexive proper (but not as a reciprocal; see (52) in 4.6; cf. Engel 1988:664). If stress is needed *sich* usually is accompanied by *selbst* ‘self’ for reflexivity or, under some circumstances (see (67c) in 5.3.2), by *einander* ‘each other’ for reciprocity, respectively. Mere *sich* in stressed focus position sounds very strange:

- (5) a. *Sie haben nicht die anderen kritisiert, sondern [?]sich.*
 ‘They criticized not the others, but themselves.’

But even if the identifying *selbst* accompanies *sich* the sentence remains potentially ambiguous (reflexive or reciprocal?):

- b. *Sie haben nicht die anderen kritisiert, sondern sich selbst.*
 (the same as in (5a), but with a stressed identifying reflexive).

It is only with *einander* or *einer den anderen* that ambiguity can be excluded:

- c. *Sie haben nicht die anderen kritisiert, sondern einander.*
 = d. *Sie haben nicht die anderen kritisiert, sondern einer den anderen.*
 ‘They criticized not the others, but one another.’

4. Note that this paradigm holds for simple constructions only, not for discontinuous ones.

2.2.2 German reflexive and reciprocal pronouns in their typological relation to other Germanic languages

With respect to the place of reciprocals in a morphosyntactic typology of the Germanic languages, German apparently represents the most archaic case since it is the only language in this family that has retained the reflexive pronoun as one of two principal means of marking reciprocity (see 1.2). In English, Dutch and West Frisian⁵ reciprocity cannot be marked by the equivalent of Gothic *sik* ‘self’; instead, the unambiguous markers *each other*, *elkaar/mekaar*, *inoar/elkoar* respectively are used (if at all).⁶ In the North Germanic languages the distribution is not so very clear-cut: the free morpheme *sig*, *seg* cannot be used to mark reciprocity (Geniušienė 1987:244), whereas the clitic *-s* (in Icelandic, Faroese and Nynorsk *-st*), which has become a genuine verbal postfix and can also function as a marker of synthetic passive (like Russian *-sja/-s’*), occurs only in a very small group of verbs that can be used to denote reciprocal events (e.g. Swedish *mötas* ‘to meet’; cf. Braunmüller 1982:248, 1991:48, 93, 162; Haugen 1987:172). To indicate “canonical” reciprocity (see 4.2.1), Scandinavian languages employ unambiguous reciprocal pronouns (Swed. *varandra*, Nor. *hverandre* etc.; cf. Andersson 1994:308; Askedal 1994:251f.), while Icelandic still possesses an analytic construction with insertable prepositions (*hver* PREP *annan*; cf. Thráinsson 1994:172f.; compare Section 6).

From a functional point of view, the polysemy of the German RM *sich* is much more reminiscent of the range of diathesis types which are expressed by its cognates in French (see Guentchéva & Rivière, Ch. 12, §4), on the one hand, and in the West Slavonic languages (see Wiemer, Ch. 11 on Polish, §§4 and 5), on the other.

2.2.3 Possessive pronouns

In German no distinction between reflexive and non-reflexive possessive pronouns is made. Thus, an utterance like (6) becomes potentially ambiguous:

- (6) *Hans_k gab Peter_l sein_{k/l} Buch.*
 ‘Hans_k gave Peter_l his_{k/l} (his own or Peter’s?) book.’

The 1st and 2nd person possessive pronouns agree with their head noun in case, gender and number. For the 3rd person singular, the choice of a possessive pronoun depends on the gender of the antecedent noun (or its equivalent). In a default situation (i.e. if no further referents are involved) the following coreference relations hold:

- (7) a. *Er_k gab ihr_l sein_k (POSS) Buch.* ‘He gave her his book.’
 b. *Er_k gab ihr_l ihr_l (POSS) Buch.* ‘He gave her her book.’
 (8) a. *Sie_k gab ihm_l ihr_k (POSS) Buch.* ‘She gave him her book.’
 b. *Sie_k gab ihm_l sein_l (POSS) Buch.* ‘She gave him his book.’

5. For East and North Frisian dialects the situation may be different. E.g., in Saterland Frisian the reflexive *sik* behaves similarly to German *sich* (e.g., *wie sjo uus* ‘we see each other’), and it can also be encountered in combination with the reciprocal *enunner* (e.g., *jo roupe sik enunner* ‘they shout at each other’); see 1.2 (cf. Fort 1980:197).

6. Cf. Braunmüller (1982:148), Hoekstra & Tiersma (1994:516). We are indebted to Bram ten Cate and Germen J. de Haan for some specifying information on this subject.

Table 2. Possessive pronouns

	SG		PL	
	M/N	F	M/N	F
1.	<i>mein</i>	<i>meine</i>	<i>unser</i>	<i>unsere</i>
2.	<i>dein</i>	<i>deine</i>	<i>euer</i>	<i>eure</i>
3.a.	<i>sein*</i>	<i>seine*</i>	<i>ihr</i>	<i>ihre</i>
b.	<i>ihr*</i>	<i>ihre*</i>		

(* Dependent on the gender of the antecedent.)

The paradigms of possessive pronouns (without case distinctions) are given in Table 2.

2.3 Typological characteristics of German word formation

German is a clear case of satellite-framed language (Talmy 1985:102ff.). This is crucial for the evaluation of stable vs. productive items in the lexicon and of the grammatical as well as normative status of a particular language's morphemes. We are aware of the problems connected with defining the status of free morphemes (particles) vs. bound morphemes (prefixes) in German, but we do not wish to dwell on this complicated issue. For both, we loosely employ the cover term 'prefix'. This term allows to relate these verbal components to the semantically similar verbal components of other languages. It should be noted that detachable components are preposed to the verbal root at least as often as they are postposed (see, for instance, Nedjalkov 1961a: 3–15). Some complex morphemes which bear a reciprocal (or some related) meaning combine productively with simplex verbs. Such are *einander-*, *entgegen-*, *gegenüber-* and *zusammen-* (see 5.5, 7.1–2). With *-einander-*, various local prepositions may be added, which results in verbs such as *auf|einander|stapeln* 'to put onto one another', *in|einander|schieben* 'to insert into one another', *entgegen|gehen* 'to go towards each other' or *gegenüber|platzieren* 'to place opposite to one another'. Most of such verbs can collocate with *sich*, but they convey a reciprocal meaning even without it.

2.4 Definition of 'reciprocal verb'

We shall use this term to refer to verb lexemes with the reflexive pronoun *sich* which denote a reciprocal relationship exclusively or as one of its meanings, regardless of what their derivational history may be. If any particular meaning of this term is intended we shall indicate this explicitly.

3. Polysemy of *sich* (non-reciprocal functions)

If a verb takes a reflexive pronoun its valency decreases. In German, reflexivization of causative verbs results, as a rule, in autocausatives or anticausatives.⁷ In German auto- and anticausatives are the two most basic diathesis changes (besides the reflexive proper).

3.1 Subject-oriented meanings

The following meanings are distinguished.

1. *Reflexive proper*. See the second possible interpretation of example (1b) in 1.2.

2. *Reflexive-possessive or reflexive-benefactive meaning*. Existing “partitive object” reflexives can be considered derivatives from benefactive reflexives; cf.:

- (9) a. *Erich schnäuzte sich* (DAT) *die Nase*. ‘Erik_i blew his_i nose.’
 → b. *Erich schnäuzte sich* (ACC). (the same).

This diathesis type is almost non-existent in German. Most reflexive verbs that may concretize a body part or grooming relationship are either reflexives proper (e.g. *waschen* → *sich* (ACC) *waschen* ‘to wash (vt/vi)’) or “indirect” reflexives (e.g. *putzen* → *sich* (DAT) *das Gefieder putzen* ‘to clean one’s plumage’) or the base verbs do not have a reflexive derivative (e.g. *die Stirn runzeln* → ∅ ‘to wrinkle one’s forehead’).

Benefactives, on the contrary, are very common (on the relation between possessivity and benefactivity see 4.4–5).

3. *Reciprocal meaning*. See the first interpretation of example (1b) in 1.2.

4. *Autocausatives*. These are derived quite regularly by means of the reflexive pronoun from both two-place and three-place verbs of moving an inanimate object and denote movement of an agentive subject; cf. an example with a two-place predicate:

- (10) a. *Er richtete den Stuhl auf*. ‘He picked up the chair.’
 → b. *Er richtete sich auf*. ‘He picked himself up.’

With plural subjects, conflicting readings with the reciprocal meaning occur systematically:

- c. *Sie richteten sich auf*.
 i. ‘They picked *each other* up.’
 ii. ‘They picked *themselves* up.’

5. *Deaccusatives*. See the following example:

- (11) a. *Der Junge fürchtet den Hund*. ‘The boy fears the dog.’
 → b. *Der Junge fürchtet sich vor dem Hund*. ‘The boy is afraid of the dog.’

7. For lack of space we wish to refer the reader to Geniušienė (1987: 86ff., 98ff., 257ff. and Ch. 14, Section 3, of this volume). – It goes without saying that the auto- vs. anticausative character of the derived diathesis often depends on the denotational nature of the arguments.

Deaccusatives are an extremely rare type of recessive diathesis in German, which is no more productive. We have been able to find only a few lexicalized cases like *annehmen* +ACC ‘to accept, take’ → *sich annehmen* +GEN ‘to take care of’ or *verschlucken* +ACC ‘to swallow’ → *sich verschlucken an* +DAT ‘to choke (on sth)’. A few other (non-deaccusative) verbs requiring a genitive or a prepositional object belong to *reflexiva tantum* and sound archaic: *sich erbarmen* ‘to take pity (on sb)’, *sich erwehren* ‘to defend oneself (against sb)’ (cf. Kwapisz 1974:24, 1978:80).

6. *Unattested recessive diatheses.* The pronoun *sich* is not used as a marker of absolutive (a kind of “antipassive”) or reflexive-causative relations.⁸ For the expression of reflexive-causatives an analytic construction with the neutral causative verb *lassen* ‘to let’ is used (cf. Nedjalkov 1976; see Section 9).

3.2 Object-oriented meanings

The following types of formally reflexive verbs are object-oriented.

1. *Anticausatives.* Genuine anticausatives (with the causative sense “subtracted” in the derivative) in German can be illustrated by the following example (cf. also Stötzel 1970:159f.; Haspelmath 1987:18, 1993):

- (12) a. *Beide haben ihr Leben verändert.* ‘Both have changed their lives.’
 → b. *Das Leben der beiden hat sich verändert.* ‘The life of both has changed.’

As often as not, both members of a semantic causative opposition remain unmarked (cf. Nedjalkov & Sil’nickij 1973[1969]:20–1; Wagner 1977: 59f.); e.g.:

- (13) a. *Norbert zerbrach den Stock.* (causative) ‘Norbert broke the stick.’
 b. *Der Stock zerbrach.* (non-causative) ‘The stick broke.’

2. *Converse relations.* This case is represented by the following example:

- (14) a. *Das Wasser spiegelt den Baum [wider].* ‘The water reflects the tree.’
 → b. *Der Baum spiegelt sich im Wasser [wider].* ‘The tree is reflected in the water.’

The RM as a marker of converse relations is another extremely rare case in German. The only other instances we have been able to find are *schmücken* ‘to adorn, decorate’ → *sich schmücken*, *verhängen* ‘to cover’ → *sich verhängen* ‘to be/get covered’ and *bedecken* ‘to cover’ → *sich bedecken* (both about clouds). All other converses are of the suppletive type.

3. *Passive-like meanings.* In German, no productive rules of reflexive passivization obtain (as, for instance, in Russian). But one may encounter reflexive forms of both transitive and intransitive verbs which convey a “modal” passive meaning (cf. Schulz & Griesbach 1967:130f.; Wandruszka 1969:451ff.; Engel 1988:461); e.g.:

- (15) a. *Der neue Roman liest sich (*durch Albert) mühelos.*
 ‘The new novel reads without difficulty (*by Albert).’

8. This clearly distinguishes German from Slavonic languages and Lithuanian (cf. Geniušienė 1983:140ff., 1987:249ff.).

- b. *In diesem Saal tanzt es sich (*von uns) gut.*
 'It is good to dance in this hall'; lit. 'It dances itself well in this hall (*by us).'

This diathesis type is lexically quite restricted (Wagner 1977: 118f.; Abraham 1995: 545ff.),⁹ although one can encounter some predicates formed productively on this pattern in colloquial speech. These are, however, restricted to intransitives (cf. *Mit dieser Maus klickt es sich gut* 'With this mouse one can click/work easily'; M. Haspelmath, p.c.). More important, the adverbial (*müheless* 'without difficulty, easily', *gut* 'well') cannot be left out, nor can one add an agentive complement (cf. the expressions with asterisks in brackets) (Stötzel 1970: 162, 180ff.; Nedjalkov 1976[1971]: 201; Wagner 1977: 108f.; Abraham 1995: 547ff.). The latter restriction is true also of the so-called "resultative-passive" verbs with the RM (Geniušienė 1987: 263f.), which do not contain a modal meaning (as in (15)); cf. (16b):

- (16) a. *Im Laufe von 10 Jahren haben wir einiges Geld angespart.*
 'During 10 years we have saved some money.'
 → b. *Im Laufe von 10 Jahren hat sich (bei uns, *durch/von uns) einiges Geld angespart.*
 'During 10 years some money has accumulated (at us, *by us).'

Other verbs of this type are:

- (17) *sich abnutzen* 'to wear away/get worn out'
sich ergeben 'to fall out/happen'
sich eröffnen, sich auftun 'to arise' (of nouns like *Möglichkeit* 'occasion', etc.).

4. Subject-oriented diathesis types of reciprocal constructions with the clitic *sich*

4.1 General remarks

All the reciprocal verbs with the clitic *sich* can be divided into three categories.

Category A comprises verbs with the RM which enter into a standard reciprocal relation with the base verb; they may also have a reflexive proper or some other reading; e.g.:

- (18) a. *erinnern* 'to remind sb'
 → b. *sich erinnern* i. 'to remind oneself' (reflexive)
 ii. 'to remind each other' (reciprocal)
 iii. 'to remember' (anticausative)

Category B comprises (a) lexicalized reciprocal verbs which are clearly derived from formally non-reflexive (two-place transitive) verbs, but do not show a regular semantic relationship to them; e.g.:

- (19) a. *austauschen* 'to exchange'
 → b. *sich austauschen* 'to exchange news'

9. Instead, modal (personal and impersonal) causatives with *lassen* 'to let' are used extensively (cf. Nedjalkov 1976: 199ff.).

Table 3. Reciprocal verbs with *sich* (with plural subjects)

A	B	C	Total
479 (88.1%)	22 (4%)	44 (7.9%)	545 (100%)

and (b) *reciproca tantum*, i.e. verbs with a reciprocal reading which do not occur without the reflexive pronoun in the respective meaning; e.g.:

- (20) a. **bereden* lit. 'to talk at sb (in order to persuade)'
 → b. *sich bereden* 'to counsel, discuss with each other.'

As it happens, such verbs become *en vogue* or, reversely, go out of use quite quickly. This is the case with *bereden* which is still registered by some dictionaries though it has actually become obsolete.

Category C comprises anticausatives with *sich* derived from object-oriented reciprocals (three-place lexical causatives) and retaining the reciprocal meaning of the underlying verb (see 8.2.3); e.g.:

- (21) a. *vermischen* 'to mix sth with sth'
 → b. *sich vermischen* 'to get mixed' (anticausative)

Table 3 shows the ratio of the three categories in our list of 545 reciprocals.

As we see, the bulk of reciprocal verbs are in a standard semantic relation to their derivational bases (non-reflexive verbs).

In the following, non-standard cases of category B will be discussed first, in order to free ourselves from more or less idiosyncratic irregularities. The more regular cases will be submitted to discussion in Sections 4.2–4.6.

4.1.1 Lexicalized reciprocals and *reciproca tantum*

Lexicalized reciprocals derive from non-reciprocal (formally non-reflexive) verbs, but have deviated from them lexically. Often additional metonymical shifts appear; cf. (19) and the following example:

- (22) a. *Sie zerwarfen das Bündnis.* 'They destroyed their treaty.'
 → b. *Sie haben sich zerworfen (*mit ihnen).* 'They have broken up with one another.'

The number of both *reciproca tantum* and lexicalized reciprocal verbs proves to be very limited. The following lists are probably exhaustive (compare with the lists in 8.1):

- (23) Lexicalized reciprocals (Category B):
sich aufrechnen 'to add up' (vi)¹⁰ ← *aufrechnen* 'to calculate'
*sich austauschen*₂ 'to exchange news' ← *austauschen* 'to (ex)change'
 (≠ *sich austauschen*₁ 'to replace one another')

10. Only with impersonal subjects, with a meaning of "modal-passive"; compare: *Er rechnete Verluste und Gewinne gegeneinander auf.* 'He balanced the books.' (causative) → *Verluste und Gewinne rechneten sich [gegeneinander] auf.* 'Losses and gains cancelled each other out.'

<i>sich bereden</i> ‘to counsel’	← *bereden ‘to discuss’ (see (20a))
<i>sich besprechen</i> ‘to counsel’	← besprechen ‘to discuss’
<i>sich überschlagen</i> ¹¹ ‘to turn over/round’	← überschlagen ‘to assess roughly’
<i>sich überstürzen</i> (same as (23e))	← überstürzen ‘to do sth too quickly, etc.’
<i>sich unterhalten</i> ‘to talk, chat’	← unterhalten i. ‘to entertain’ ii. ‘to maintain, give a living’
<i>sich verabreden</i> ‘to make a date’	← verabreden ‘to make an agreement’
<i>sich verabschieden</i> ‘to say good-bye’	← verabschieden ‘to ratify’
<i>sich zerwerfen</i> ‘to separate’	← zerwerfen ‘to annul.’

(24) *Reciproca tantum:*

<i>sich anfreunden</i>	‘to become friends’
<i>sich duellieren</i>	‘to duel’
<i>sich fraternisieren</i>	‘to fraternize’
<i>sich überkreuzen</i>	‘to cross’
<i>sich überlagern</i>	‘to cover (each other)’
<i>sich überlappen</i>	‘to overlap’ (same without <i>sich</i> ; see 8.1.2)
<i>sich überschneiden</i>	‘to intersect/cross’
<i>sich verbrüdern</i>	‘to fraternize’
<i>sich verkrachen</i> ¹²	‘to split (up)’(coll.)
<i>sich verschwören</i>	‘to conspire.’

Verbs of the above group B and also of group C are excluded from the analysis in the remaining part of this section. Thus, 479 verbs constitute the basis (= 100%) for statistical data in 4.2–3.

4.2 Two-place relations (“canonical” reciprocals)

4.2.1 *The RM taking the place of direct object*

These reciprocals are subsumed under Category A in Table 3. They may be split up into three subcategories, according to the following criteria:

A1. By default, the reciprocal meaning overrules the reflexive or other meanings when used with a plural subject, as in (1b), the other meanings requiring contextual support; e.g.:

- (25) a. *Er umarmte sie.* ‘He embraced her.’
→ b. *Sie umarmten sich.* ‘They embraced each other / *themselves.’

Other verbs of this subgroup are:

- (26) *sich anblaffen* ‘to yell, snarl at each other’
sich befehlen ‘to be at war with each other’
sich grüßen ‘to greet/welcome each other’

11. As a reciprocal verb used only with nouns like *Ereignisse* ‘events’, rendering the meaning ‘follow one after another very quickly, unexpectedly’.

12. A causative *verkrachen* ‘to split up (X with Y)’ seems to be acceptable at best in highly colloquial speech.

<i>sich haschen</i>	‘to play catch’
<i>sich ignorieren</i>	‘to ignore each other’
<i>sich jagen</i>	‘to hunt each other/run after each other’
<i>sich mögen</i>	‘to like each other’
<i>sich necken</i>	‘to tease each other’
<i>sich rammen</i>	‘to bump into each other’
<i>sich schätzen</i>	‘to appreciate each other’
<i>sich unterstützen</i>	‘to support each other.’

A2. No definite decision can be taken with regard to a reciprocal vs. reflexive default (it is much less clear than in A1 and A3, respectively); e.g.:

- (27) *Wir musterten uns (von Kopf bis Fuß) ab.*
 i. ‘We looked over *ourselves* thoroughly (from head to foot).’ (reflexive)
 ii. ‘We looked over *each other* thoroughly (from head to foot).’ (reciprocal)

Other verbs of this subgroup are:

- (28) *sich ablecken* ‘to lick oneself / each other clean’
sich achten ‘to esteem, respect oneself / each other’
sich anfassen ‘to touch oneself / each other’
sich aufmuntern ‘to cheer up oneself / each other’
sich begutachten ‘to watch oneself / each other attentively’
sich bestaunen ‘to admire oneself / each other’
sich umbringen ‘to murder oneself / each other’
sich unterschätzen ‘to underestimate oneself / each other.’

A3. By default the reflexive meaning overrules the reciprocal one (the latter, though, remains in principle possible but it requires contextual support, e.g. the adverb *gegenseitig* ‘mutually’); cf.:

- (29) a. *Hans_i zog sich_i an, und Erich_j zog sich_j an.* ‘Hans dressed and Erik dressed.’
 → b. *Hans_i und Erich_j zogen sich_{i+j} an.* ‘Hans and Erik dressed.’ (i.e. ‘each himself’)
 → c. *Hans und Erich zogen sich gegenseitig an.* ‘Hans and Erik dressed each other.’

This group of verbs includes, among others, the following:

- (30) *sich eincremen* ‘to rub oneself with cream’
sich loben ‘to praise oneself’
sich putzen ‘to clean oneself (with a brush)’
sich reinigen ‘to clean oneself’
sich verletzen ‘to hurt oneself’
sich waschen ‘to wash oneself.’

The number of these verbal items is shown in Table 4 (the data have been checked several times):

The revealing conclusion to be drawn from this Table is that, despite the polysemy of the RM *sich*, at least three thirds of all “canonical” reciprocal verbs (with a plural subject) encode a reciprocal relation by default. Only with about one fourth of all verbs is the reflexive vs. reciprocal reading not disambiguated by the morphological form alone, and

Table 4. Semantic subgroups of “canonical” reciprocals

A1	A2	A3	Total
364 (76%)	68 (14%)	47 (10%)	479 (100%)

nonetheless the number of more or less ambiguous cases (A2) surmounts more or less clear cases of reflexive predicates (in the plural, A3).

4.2.2 The RM taking the place of oblique object (two-place intransitives)

Two-place relations with the second argument in the dative case are encoded by only 39 verbs (out of 479, which equals 8%). The derivative relation can again be illustrated as follows:

- (31) a. *Ich winkte ihr zu, und sie winkte mir zu.*
 ‘I waved his hand at/to her, and she waved her hand at/to me.’
 → b. *Wir winkten uns (zu).*
 ‘We waved our hands (at/to each other).’

Some other examples are:

- (32) a. *Sie blinkten sich zu.* ‘They flickered at each other.’
 b. *Sie standen sich bei.* ‘They aided/supported each other.’
 c. *Ihr mißfielt euch.* ‘You (PL) felt antipathy to each other.’
 d. *Sie stimmten sich zu.* ‘They agreed with each other.’

In most cases these verbs bear the lexical meaning of support or sympathy/antipathy. Three lexical reciprocals can also be mentioned here:

- (33) a. *Sie ähnelten/glichen sich.* ‘They resembled each other.’
 b. *Ihr seid euch begegnet.* ‘You (PL) encountered/met each other.’

From the morphological viewpoint it should be noted that verbs prefixed with *zu-* (originally ‘towards’) are the most numerous ones. The following list is probably exhaustive:

- (34) *sich zuarbeiten* ‘to work jointly on the same topic from different angles’
*sich zubllicken*¹³ ‘to flicker at each other’
sich zuhören ‘to listen to each other’
sich zulachen ‘to look at each other laughing’
sich zulächeln ‘to look at each other smiling’
sich zunicken ‘to nod to each other’
sich zuprosten ‘to drink to each other’s health’
sich zusehen, zuschauen ‘to observe each other’
sich zustimmen ‘to express agreement with each other’s opinion’
sich zutrinken ‘to drink to each other’s health’
sich zuwinken ‘to wave to each other’
sich zuzwinkern ‘to squint one’s eyes at each other.’

13. There are two synonyms with the same morphological structure: *zubllicken*, *zublitzeln*.

This morphological specificity, though, holds not only for two-place intransitives but also for three-place transitives (see (40) in 4.3.2). Consequently, it is the affinity of this prefix to the addressive meaning that is crucial, rather than [\pm transitivity]. It should be emphasized that reciprocals from two-place intransitive verbs of the (34) type appear to be used only in unambiguous cases of reciprocity (cf. Wiemer, Ch. 11, §5.2.1.2). This happens to be less common with three-place predicates, where *sich* occupies the place of the third argument.

4.3 Three-place relations (“indirect” reciprocals)

4.3.1 Standard three-place transitives

The same threefold classification which has been applied to two-place transitives (see 4.2.1) in principle applies also to reciprocal verbs with *sich* occupying the place of the third syntactic argument (indirect object). This group, though, comprises much fewer verbal items, viz. 57 (\approx 12% of 479).

I. The reciprocal meaning is the only one possible for pragmatic or world-referential reasons; cf.:

- (35) a. *Ich erzählte ihm lustige Geschichten, und er erzählte mir lustige Geschichten.*
 ‘I told him funny stories, and he told me funny stories.’
 → b. *Wir erzählten uns lustige Geschichten.*
 ‘We told each other funny stories.’
- (36) *Sie mißgönnten/neideten sich ihre Erfolge.*
 ‘They envied each other success.’
- (37) *Sie reichten sich Getränke.*
 ‘They gave each other drinks.’

II. The reciprocal meaning prevails over the reflexive or is equally likely:

- (38) a. *Wir versperrten uns die Sicht.*
 ‘We obstructed the sight to each other/ourselves.’
 b. *Sie logen sich etwas vor.*
 ‘They told lies to one another/themselves.’
 c. *Sie vermittelten sich die besten Jobs.*
 i. ‘They helped each other get the best jobs.’
 ii. ‘They organized themselves the best jobs.’
 d. *Sie gestanden sich ihre Fehler ein.*
 ‘They admitted their mistakes to each other/themselves.’

III. The reciprocal reading is by default overruled by the reflexive one: among all three-place verbs which were investigated systematically we did not detect any clear cases that would fit this condition

As a matter of fact, the reflexive meaning of the dative *sich* in a three-place diathesis is mostly restricted to benefactives (see 4.5).

4.3.2 Transitive verbs prefixed with *zu-*

As mentioned in 4.2.2, dative reciprocals are formed quite systematically from two- or three-place verbs with the prefix *zu-* (28 out of 96 lexemes with a syntactic dative). This prefix conveys an addressive (or benefactive) meaning and is responsible for this apparent regularity. The base verbs denote either speech acts or directed motion (transfer). Compare a standard example:

- (39) a. *Er flüsterte ihr etwas zu, und sie flüsterte ihm etwas zu.*
 'He whispered sth to her, and she whispered sth to him.'
 → b. *Sie flüsterten sich etwas zu.*
 'They whispered sth to each other.'

Here is a list of three-place transitives prefixed with *zu-*:

- (40) *sich (etwas) zudrehen* 'to turn sth to each other'
sich (etwas) zuflüstern 'to whisper sth to each other'
sich (etwas) zugeben 'to admit sth to each other'
sich (etwas) zugeloben 'to administer an oath to' (arch.)
sich (etwas) zugestehen 'to acknowledge each other sth'
sich (etwas) zukehren 'to turn sth to each other'
sich (etwas) zuraunen 'to murmur sth to each other'
sich (etwas) zurufen 'to call sth to each other'
sich (etwas) zuschreien 'to turn to each other shouting sth'
sich (etwas) zusichern 'to ensure each other (about sth)'
sich (etwas) zuspieren 'to pass over sth to each other'
sich (etwas) zustellen 'to dispatch sth to each other'
sich (etwas) zutreiben 'to urge, chase sth/sb into each other's direction'
sich (etwas) zutuscheln 'to whisper sth into each other's ear'
sich (etwas) zuwenden 'to turn sth to each other.'

This pattern is not extinct, since such examples like *sich (etwas) zupfeifen* 'to whistle (sth) to each other' are imaginable (the authors owe this statement and example to M. Haspelmath, p.c.).

4.4 "Possessive" reciprocals

German has almost no morphological means of unambiguously expressing reciprocity in possessive constructions. The only possible way of explicitly combining possessivity with reciprocity is the use of the analytical pronoun-like phrase *eine(r) des/der anderen* 'one (M/F) of the other (M/F)' (see Section 6); cf.:¹⁴

14. Note that in this case the grammatical number of the reciprocal marker is determined by distributive agreement: the noun denoting the possessed object has to be used in the singular, i.e. its grammatical number agrees with each single "possessor" (expressed in the subject NP). The same holds for a possible reciprocal reading of (42a).

- (41) a. *Hans wusch Marias Kopf, und Maria wusch Hans' Kopf.*
 'Hans washed Mary's hair, and Mary washed Hans's hair.'
 → b. *Hans und Maria wuschen **einer des anderen** Kopf.*
 H. and M. washed.PL one of the other's head.sg
 'Hans and Mary washed each other's hair.'

But such sentences sound clumsy and are, as a rule, avoided. They are restricted to derivatives from two-place transitives, as in (1b), and impossible with any other base diathesis. It is much more usual to employ constructions with *sich* or, for the sake of clarifying the reciprocal meaning, the specialized pronoun *einander* (see 5.3–4), both in the dative position. These constructions, though, are potentially ambiguous, because their interpretation can vacillate between a possessive and a benefactive reading (for the latter see 4.5). (42a–b) appear to be in need of disambiguation (reflexive vs. reciprocal), whereas (42c) is clearly reciprocal:

- (42) a. *Hans und Maria wuschen **sich den Kopf**.*
 H. and M. washed.PL RM ART head.SG.ACC
 'Hans and Mary washed their hair.'
 = b. *Hans und Maria wuschen **sich ihre Köpfe**.*
 H. and M. washed.PL RM POSS head.PL.ACC
 'Hans and Mary washed their hair' = i. 'each his/her own'; ii. 'each other's'.
 c. *Hans und Maria wuschen **einander den Kopf** (ihre Köpfe).*
 H. and M. washed.PL REC ART head.SG.ACC POSS head.PL.ACC
 'Hans and Mary washed each other's hair.'

In general, when investigating possessivity in German, one cannot avoid taking into account the interplay between *sich*, the definite article, the denotational class the nouns belong to and diathesis defaults of the predicate. Here is, however, not the place for going into any details.

4.4.1 *Inalienable possession*

Body part relations and similar cases of inalienable possession, taken in isolation, are widely expressed by the subjective genitive (*Hugos Haare* 'Hugo's hair'). But with agentive verbs the "possessor" of an inalienable referent is usually explicated by the dative, provided this referent is the patient of the action and the "possessor" is alive (*Maria wusch Hugo (DAT) die Haare (ACC)* 'Mary washed Hugo's hair.'). The genitive construction proves indifferent with regard to the feature [±alive]. For this reason reciprocal possessives are commonly expressed in the way shown in (42b) above, despite the potential interference of the reflexive reading.

4.4.2 *Alienable possession*

Although the distinction between alienable and inalienable possession does not show any repercussions for the use of markers of reciprocity (and reflexivity), we would like, for the sake of typological comparability, to add the following remarks. The inference which showed valid for inalienable possession may be less strong with alienable objects.

If the manipulated objects are alienable such an interference is much less likely (Martin Haspelmath objects to it, p.c.); cf.:

- (43) *Anne und Marie zogen sich Schuhe an.*
 A. and M. put.PL RM shoes on
 i. ?‘Ann and Mary put shoes on each other.’
 ii. ‘Ann and Mary put on their shoes (each).’

This is due to the fact that benefactivity comes to the fore here. And for some pragmatic reasons it seems much more likely that each agent acts on behalf of him/herself, less so mutually. With verbs denoting some kind or other of harmdoing a reciprocal interpretation seems more probable than a reflexive one. This effect is even stronger if the dative *sich* is used together with a possessive pronoun (cf. (44a)); e.g.:

- (44) a. *Sie setzten sich ihre Häuser in Brand.*
 lit. ‘They set themselves their houses on fire.’
 (most likely or even only ‘each other’s’).
 b. *Sie setzten ihre Häuser in Brand.*
 ‘They set their houses on fire.’
 (rather their own ones, i.e. each his/her or possessed together).

4.5 Benefactive meaning (potential ambiguity)

In German the reflexive-benefactive function of *sich* is encountered frequently if the base verb is a two-place transitive and allows an optional indirect object expressed by the dative case;¹⁵ cf.:

- (45) a. *Norbert kaufte ihm ein Buch.*
 ‘Norbert bought him a book.’
 → b. *Norbert kaufte sich (DAT) ein Buch.*
 ‘Norbert bought himself a book.’

Noteworthy enough, the benefactive *sich* can hardly be used in the reciprocal sense with these verbs; cf.:

- (46) a. *Norbert kaufte sich Bücher und Erika kaufte sich Bücher.*
 ‘Norbert bought [himself] books and Erika bought [herself] books.’
 → b. *Norbert und Erika kauften sich Bücher.*
 i. ‘Norbert and Erika each bought books for themselves.’
 ii. ?‘Norbert and Erika bought books for each other’ (much less likely).

The reciprocal sense is rendered by the unambiguous reciprocal pronoun *einander* (in written, or highly stylized German only: W. Abraham, p.c.).

- (47) *Norbert und Erika kauften einander Bücher.*
 ‘Norbert and Erika bought books for each other’ (cf. (46b.i)).

15. Benefactives can be distinguished from datives proper (and possessives) by a permutation test: if dative-*sich* can be replaced by *für + sich* ‘for + RM’ the meaning is benefactive. Note that there is no formal identity between benefactivity and possessivity as, e.g., in Bulgarian (cf. Penchev, Ch. 13, Section 5.1.1).

4.6 Clitic *sich* + adverb *gegenseitig* ‘mutually’

The adverb *gegenseitig* lit. ‘(on) the opposite’ can be used only together with the pronoun *sich*;¹⁶ cf.:

- (48) a. *Sie halfen sich gegenseitig.* ‘They helped each other.’
 b. **Sie halfen gegenseitig.* (same intended meaning).

Its derivational relationship with the adjective *gegenseitig* ‘mutual’ is transparent enough (see 5.2). It does not specify the syntactic link between the two involved arguments (subject vs. direct, indirect or prepositional object?), i.e. it remains totally neutral with respect to diathetical distinctions. Therefore nominalisation of (48b) sounds correct; cf.:

- c. *Ihre gegenseitige Hilfe.* ‘Their mutual help.’

For this reason it seems justified to regard *gegenseitig* as a marker of reciprocity deprived of an independent syntactic function. However, it cannot be used (in order to rule out the reflexive reading) in constructions with *sich* derived from two-place intransitives taking a prepositional object (but in colloquial speech (49c) for some Germans seems to be acceptable; W. Abraham, p.c.). In such cases only *einander* can be used (see 5.3).

- (49) a. *Hans meckerte über Peter.* ‘Hans deplored Peter.’
 b. *Sie meckerten über sich (selbst).* ‘They deplored themselves.’
 c. **Sie meckerten gegenseitig über sich.* (intended meaning:) ‘They deplored each other.’

Gegenseitig can hardly be used tautologically with lexical reciprocals; at best it may appear with predicates of joining as in (50), and in no case with predicates of separating, as in (51) (see 8.2.1–8.2.2). Most native speakers reject both of them;¹⁷ cf.:

16. Cf. WdG, vol. 2 (1977:1488): “(...) is often added to the reciprocal pronoun *sich* for clarity” (“tritt oft zur Verdeutlichung zum reziproken Pronomen *sich* hinzu”).

17. Wandruszka (1973:13) rejects the possibility of collocating *gegenseitig* with inherently symmetrical predicates altogether, and, by and large, this corresponds to the standard norm. This assertion, however, needs specifying and additional study. As follows from example (e) found in a text, at least some inherently symmetrical predicates allow such use of *gegenseitig*, though it remains redundant; this seems to be related to the use of the reciprocal pronoun; cf.:

- a. *Diese Balkansprache grenzt an eine andere Balkansprache*
 ‘This Balkan language borders on another Balkan language’
 b. **Die Balkansprachen grenzen*
 lit. ‘The Balkan languages border’
 c. **Die Balkansprachen grenzen gegenseitig*
 lit. ‘The Balkan languages border mutually’
 d. *Die Balkansprachen grenzen aneinander*
 ‘The Balkan languages border on each other’
 e. *Die Balkansprachen grenzen gegenseitig aneinander*
 lit. ‘The Balkan languages border on each other mutually.’

- (50) [?]*Sie trafen sich gegenseitig.* lit. ‘They met mutually.’
 (51) **Sie trennten sich gegenseitig.* lit. ‘They parted with each other mutually.’

The merits of *gegenseitig* show up in cases of topicalization, as in (52d), where one cannot use *sich* because of its clitic nature and because this pronoun would be interpreted only as a reflexive proper (i.e. meaning ‘each him/herself’); cf.:

- (52) a. *Holger und Erich lieben (beide) Annette.*
 ‘Holger and Erik (both) love Annette.’
 b. *Holger und Annette lieben sich gegenseitig.*
 ‘Holger and Annette love each other mutually.’
 c. **Sich (gegenseitig) mögen sie gar nicht.*
 RM REC like they at.all not
 (intended meaning as (52d)).
 = d. *Gegenseitig ↑ mögen sie sich gar nicht.*
 REC like they RM at.all not
 ‘Each other they don’t like at all.’

The reciprocity markers *einander* (see 5.3) and *einer den anderen* (see Section 6) function in a similar way, although one can hardly combine them with *sich*.

4.7 Discontinuous constructions

Certain non-reciprocal two-place verbs are reciprocalized by means of the RM *sich* and then allow for discontinuous expression with the preposition *mit*. Only verbs with the RM in a simple construction (see (53b) and (53e)) allow the “comitative variant” *miteinander* ‘with each other’ (see 5.5.5.2). Constructions with *einander* cannot be discontinuous (cf. (53g)).

- (53) a. *Hans schlägt Paul. ≠ Paul schlägt Hans.* ‘Hans beats Paul’ ≠ ‘Paul beats Hans.’
 → b. *Hans und Paul schlagen sich.* ‘Hans and Paul beat each other/fight.’
 → c. *Hans schlägt sich mit Paul.* ‘Hans fights with Paul.’
 = d. *Paul schlägt sich mit Hans.* ‘Paul fights with Hans.’
 = e. *Hans und Paul schlagen sich miteinander* ‘Hans and Paul fight with each other’,
 but f. *Hans und Paul schlagen einander.* (= (53b)) ‘Hans and Paul beat each other/fight.’
 g. **Hans schlägt mit Paul einander.* lit. *‘Hans beats with Paul each other.’

As can be seen from the translation, the inclusion of *sich* with verbs of this subgroup triggers a shift in meaning. Here is a list of verbs which show this derivative behaviour; all of them belong to the lexical group with the general meaning ‘to fight’, related semantically to many lexical reciprocals listed in 8.1 (which can also be used in discontinuous constructions with the preposition *mit*).

- (54) *hauen* ‘to beat, strike’ → *sich hauen* ‘to fight, box’
knuffen (coll.) ‘to prod’ → *sich knuffen* ‘to prod each other’
prügeln ‘to fight’ (with fists) → *sich prügeln* ‘to beat one another up’
schlagen ‘to hit, beat’ → *sich schlagen* ‘to fight.’

Another subset of verbs (of social (ritual) behaviour), which otherwise behave like the verbs under (53)–(54), do not at all or at best marginally allow for discontinuous constructions nor for the “comitative variant”.¹⁸ These are at least the following verbs:

- (55) *begrüßen* ‘to welcome’ → *sich begrüßen* ‘to greet each other’
küssen ‘to kiss’ → *sich küssen* ‘to kiss each other’
umarmen ‘to embrace’ → *sich umarmen* ‘to embrace one another’; cf.:
- (56) a. *Hans umarmte Maria.*
‘Hans embraced Mary.’
→ b. **Hans umarmte sich mit Maria.*
lit. *‘Hans embraced himself with Mary.’
c. **Hans und Maria umarmten sich miteinander.*
lit. *‘Hans and Mary embraced themselves with each other.’

(But in Martin Haspelmath’s opinion, p.c., the sentence *Hans küsste sich mit Maria* sounds almost acceptable for some native speakers.)

Finally, in rare cases even verbs which encode a reciprocal relation without *sich*, but also allow its inclusion, behave like the verbs under (54) in that they allow a discontinuous construction; cf. the verb *treffen* ‘to meet’ → *sich treffen* ‘to meet’:

- (57) a. *Peter traf Hans.* ‘Peter met Hans.’ = *Hans traf Peter.* ‘Hans met Peter.’
→ b. *Peter und Hans trafen sich.* ‘Peter and Hans met.’
= c. *Peter traf sich mit Hans.* = *Hans traf sich mit Peter.*
‘Peter met with Hans.’ ‘Hans met with Peter.’
but d. **Peter und Hans trafen* (the same as (b), but without *sich*; cf. with 8.1.1.2).

Discontinuous constructions are possible also with almost all lexicalized reciprocals and *reciproca tantum* listed in (23)–(24) (see 4.1.1), an exception being *sich überschlagen* ‘to occur very rapidly one after another’. Separate lexical reciprocals may appear with a preposition other than *mit* (see (59)):

- (58) a. *Hans verabredete sich mit Marie.*
‘Hans agreed about a date with Mary.’
= b. *Marie verabredete sich mit Hans.*
‘Mary agreed about a date with Hans.’
= c. *Hans und Marie verabredeten sich (miteinander).*
‘Hans and Marie agreed (with each other) about a date.’
- (59) a. *Hans verabschiedete sich von Marie.*
‘Hans said goodbye to Marie’ (implies most likely (b)).
= b. *Marie verabschiedete sich von Hans.*
‘Mary said goodbye to Hans.’
= c. *Marie und Hans verabschiedeten sich voneinander.*
‘Mary and Hans said goodbye to each other.’

18. This idiosyncratic behaviour of verbs in German demonstrates the difference from Slavonic languages and Lithuanian, where discontinuous constructions with these verbs are much less restricted (see the respective contributions in this volume).

4.8 Embedded subject-oriented reciprocals in non-causative constructions

Reciprocal subject-oriented predicates can be embedded as the infinitival part of *acusativus cum infinitivo* constructions, regardless of the diathesis type of the simple sentence (a); cf.:

- (60) a. *Sie_k beschimpften sich_k.* 'They insulted each other.'
 → b. *Er₁ sah sie_k sich_k beschimpfen.* 'He saw them insult each other.'

In case of interference of reflexive interpretations one can use for disambiguation the reciprocal pronoun *einander* (see Section 5) in place of *sich*.

5. The reciprocal pronoun *einander* 'each other' and units deriving from it

5.1 Introductory

The least restricted lexical unit marking reciprocity explicitly is *einander* (besides the syntactically non-self sufficient *gegenseitig* 'mutually' discussed in 4.6). It can always substitute for *sich* if the latter cannot distinguish between a reflexive vs. reciprocal meaning (this happens with plural and coordinated subjects; see Section 4). Its paradigmatic behaviour is analogous to the reflexive pronoun in the plural in that *einander* does not have case markings and cannot be used in discontinuous phrases (for these see Section 8); but, differently from *sich*, it is not marked for person either (see the right-hand part of Table 1).

The syntactically unrestricted character of *einander* is demonstrated by the fact that it can combine with almost any preposition. As a consequence, combinations of prepositions with this unit have developed, which will be discussed in 5.4. From a stylistic viewpoint *einander* is usually viewed as a marker of elaborated speech (Berger (ed.) 1985:560) and, as such, does not show any restrictions with respect to grammatical person. For an understanding of the syntactic behaviour of the unambiguous reciprocity markers and their distribution in modern German, some brief remarks on their origin and historical development may be appropriate.

5.2 Diachronic remarks

The unit *einander* descends from the older dative and accusative form *ein andar* (without an article before the second part!, contrary to the English *one another*); cf.: *alsō ungelih sint sie alle ein anderen* (Notker 1, 491) lit. 'too much unequal are they all to one another' (cf. Kluge 1957: 157). It has the same etymology as the complex marker *einer den anderen* (see Section 6; cf. Behaghel 1923: 409f., 447ff.). But as early as Notker's time (ca 1000) the position of prepositions varied, and with time both parts ceased to be declined. Already in Middle High German (12th–15th centuries) *ein andar* was treated consistently as one unit and became ultimately distinct from its analytic counterpart. Thus it very early got close to adverbials (Grimm & Grimm 1862: 143). According to Lockwood (1968: 69f.), *sich* and

einander have competed with each other since the same period. Vernaleken (1861:93) and Behaghel (1923:306) give examples from the 12th–17th centuries in which both pronouns are used together (see 5.3.2), and Lemmer (1987:69) notes that such use was attested as early as 1070.

For comparison, the history of *gegenseitig* (4.6) is much shorter. According to Grimm & Grimm (1897: 2260f.) it derives from the adjective *gegenseits*, and can be found not earlier than from the 17th century onwards. At the beginning it was used exclusively as a juridical term denoting the respective opponent before a court of law (e.g., *als der gegenseitige sachverwalter sich weigerte* ‘when the other party’s administrator refused’). Then its usage expanded and came to mean the members of any opposition and even differences of opinion in general. Finally it spread to denote opposite sides in space (landscape, etc.). The contemporary meaning of mutuality developed in the beginning of the 18th century. Curiously enough, *wechselseitig*, which can be regarded as a synonym of *gegenseitig* in its contemporary usage, is employed to a much lesser extent. It will therefore be neglected in the following.¹⁹

5.3 Constructions with *einander* (subject-oriented)

As noted in 5.1, *einander* can always replace the clitic *sich* in reciprocal function. For this reason, the same subdivision of diathesis types which was elaborated for the reflexive clitic in Section 4 holds for *einander*, too. It can be used regularly with “canonical” (61a), “indirect” (61b) as well as with “possessive” reciprocals (61c) instead of the reflexive pronoun:

- (61) a. *Sie verletzten einander* (ACC) (*mit einem Messer*).
 ‘They hurt each other (with a knife).’
 b. *Sie sandten einander* (DAT) *Nachrichten* (ACC) *zu*.
 ‘They conveyed news to each other.’
 c. *Sie wuschen einander* (DAT) *das Haar*.
 ‘They washed each other’s hair.’

The “possessive” reciprocal interferes with the benefactive one on the same grounds as those touched upon in 4.4 and 4.5.

Einander proves not only unambiguous, but even syntactically more universal than *sich* because it can combine with almost every preposition (Stötzel 1970:196f.; Kwapisz 1978:77f.) and therefore clearly mark benefactive reciprocals as well (see 4.5):

- (62) a. *Sie erledigten für sich wichtige Geschäfte*. (only reflexive-benefactive)
 ‘They managed different deals for themselves.’
 b. *Sie erledigten füreinander wichtige Geschäfte*. (reciprocal-benefactive)
 ‘They managed different deals for each other.’

19. Grimm & Grimm (1922:2761, Vol. 13) note that *wechselseitig* could have been introduced in the first half of the 18th century as an equivalent of French *réiproque*. They add that afterwards it became much less frequent than *gegenseitig*.

It can also freely substitute for the reflexive pronoun with lexically reciprocal predicates (see 8.1); e.g.:

- (63) *Sie ähnelten einander* (DAT).
‘They resembled each other.’

5.3.1 *Multiple use within clauses*

The reciprocal pronoun can also be used more than once within one and the same clause, if there are more than two arguments (besides the subject) and regardless whether the outcome corresponds to non-lexical reciprocals, as in (64), or the predicate is a lexical reciprocal, as in (65):

- (64) a. *Er_i erzählte ihr_j von ihr_j, und sie_j erzählte ihm_i von ihm_i.*
‘He_i talked to her_j about her_j, and she_j talked to him_i about him_i.’
→ b. *Sie_{i+j} erzählten einander_{i+j} voneinander_{i+j}.*
‘They_{i+j} talked to each other_{i+j} about each other_{i+j}.’
- (65) a. *Sie_i stritt mit ihm_j über ihn_j, und er_j stritt mit ihr_i über sie_i.*
‘She_i quarrelled with him_j about him_j, and he_j quarrelled with her_i about her_i.’
→ b. *Sie_{i+j} stritten miteinander_{i+j} übereinander_{i+j}.*
‘They_{i+j} quarrelled with each other_{i+j} about each other_{i+j}.’

5.3.2 “Tautological” combination of *einander* and *sich*

Although standard grammars and stylistic handbooks on German usage reject *sich* together with *einander* (cf. Berger 1985:561; Engel 1988:665f.; Hentschel & Weydt 1990:62f.), it is not very unusual to encounter such pleonastic constructions in casual speech. It can be shown that the acceptability of such pleonasm depends on at least two factors, namely: the diathesis type represented and topicality (marked vs. unmarked).

Clearly unacceptable cases are recessive diatheses deriving from base two-place verbs, i.e. where no need of disambiguation of case roles arises. A combination of both markers then proves impossible; cf. a standard example:

- (66) a. *Hans wusch Otto, und Otto wusch Hans.*
‘Hans washed Otto and Otto washed Hans.’
→ b. **Sie wuschen sich* (ACC) *einander* (ACC).
*‘They washed themselves each other.’

If, however, a third argument becomes syntactically involved in the diathesis, provided *sich* does not mark the direct object but only an optional (“benefactive”) argument or the “possessor”, tautologic emphasis turns out to be less “out of order”; cf.:

- (67) a. *Hans putzte Willys Schuhe, und Willy putzte Hans’ Schuhe.*
‘Hans cleaned Willy’s shoes, and Willy cleaned Hans’s shoes.’ (“possessive”)
b. *Hans putzte die Schuhe für Willy, und Willy putzte die Schuhe für Hans.*
‘Hans cleaned the shoes for Willy, and Willy cleaned the shoes for Hans.’ (benefactive)
→ c. ²*Sie putzten sich einander* (DAT) *die Schuhe* (ACC).
‘They cleaned the shoes for each other.’ (reciprocal derived from benefactive)

This observation agrees with the diachronic development (see 5.2), due to which *sich* extended to the dative only after 1500 (Behaghel 1968:179; Lockwood 1968:69; Stötzel 1970:173). In this “younger” position it might therefore nowadays be expected to be more marked and substitutable.

Furthermore, *einander* is obligatory if a reciprocal relationship is denoted by *reflexiva tantum* (e.g. *sich sorgen (um)* ‘to take care of’), by lexicalized reflexive verbs (e.g. *sich verlassen (auf)* ‘to rely upon’, as in (68)) or by autocausatives (e.g. *sich zudrehen* ‘to turn to’, as in (69)). With *sich* only the reflexive meaning can be expressed, but it is then recommendable to add the reflexive intensifier *selbst* ‘self’ (see 2.2.1); cf.:

- (68) a. *Die alten Leute verlassen sich ?auf sich / auf sich selbst.* (reflexive)
 ‘The elderly people rely on themselves.’
 b. *Die alten Leute verlassen sich **aufeinander**.* (reciprocal)
 ‘The elderly people rely on one another.’
- (69) *Die Opponenten drehen sich einander zu.* (reciprocal of autocausative)
 ‘The opponents turned (lit. ‘themselves’) to each other.’

Finally, *sich + einander* may be possible if the reciprocity marker is topicalized in sentence-initial position (indicated by bold type); cf.:

- (70) *Hans und Peter sahen **sich** im Spiegel. **Einander** ↑ konnten sie (*sich*) nicht sehen.*
 ‘Hans and Peter saw each himself in the mirror. Each other they could not see.’

In such a case *sich* becomes merely optional, but it can well be inserted for rhythmic reasons and because the topicalized element tends to be treated as a left-dislocated, i.e. syntactically disconnected, element (cf. with *gegenseitig* in (50)). From this angle, *einander* in (70) still shows a behaviour similar to that of *einer den anderen* (see Section 6).

Our informants (almost all of them linguists) did normally not accept such utterances if asked explicitly about their wellformedness, arguing that such a construction would be totally redundant.²⁰ However, besides an occasional need to emphasize reciprocity (see (67)), another reason for a pleonastic use of *sich + einander* may be detected in a syntactic analogy to object-oriented lexical reciprocals, as in *Mehl und Zucker miteinander verrühren* ‘to mix flour with sugar’ (see 8.2), to anti- and autocausatives deriving from them (e.g., *Weibchen und Männchen paaren sich miteinander*. ‘Male and female copulate’; see 8.2.3) and to discontinuous constructions with lexical reciprocals, e.g. *sich mit jdm. streiten* ‘to have a quarrel with sb’ (see 4.7, 8.1, (101a)).

20. Similar pleonasms are quite widespread in other languages, e.g. French or Bulgarian. In the history of German *sich* and *einander* have been compatible with each other (see 5.2), and nowadays considerably systematic tautologies in relevant parts of the lexicon are apparent, e.g. in productive word formation (see 2.3, 5.5 and many verbs in 7.2, 8.2). Consequently, the argument that *sich + einander* is tautological does not suffice to reject their combinability. Despite its stigmatization in normative speech possible lines of evolution should be indicated, and one of them might result in the expansion or, on the opposite, some archaic residues of *sich + einander*.

5.4 Object-oriented constructions

The unexpanded form of the pronoun *einander* can be used in non-causative embedded constructions (see 4.8), but not with object-oriented lexical reciprocals (see 8.2). Instead, combinations of this pronoun with prepositions have to be used (see 5.5).

5.5 Lexical combinations of preposition + *einander*5.5.1 *Introductory*

In modern German almost every simple preposition can combine with the pronoun *einander* to form one lexical unit. Only two underived prepositions do not collocate with *einander*, *außer* ‘except’ and *seit* ‘since’. With *bis* ‘up to’ the combination *biseinander* seems possible, but is unusual, probably because locative *zu-* and *aneinander* with some appropriate directional adverbs do the same job (see below). The preposition is always fronted. Altogether 16 such combination types exist (see below). In most cases their meaning is related directly to the semantics of the respective preposition. These more or less trivial cases will be considered in 5.5.2–4; then the meaning of joint action and other non-standard cases will be discussed (5.5.5).

Combinations of preposition and *einander* do not collocate with verbs that occur with the separate form *einander* (see 5.3–5.4), and, contrary to the latter, these combinations are employed with object-oriented lexical reciprocals (see 8.2, 9). As for two-place predicates, such combinations can be encountered only with verbs that require a prepositional object (see (71)). With two-place predicates these combinations are clearly preferred to the reflexive pronoun; with object-oriented lexical reciprocals only these combinations (and not *sich*) can be used.

It is often arguable whether these combinations are to be regarded as parts of a verb lexeme (“Verbzusatz”) or as separate adverbs (see 2.3). Together with Mater’s list (see 1.4) about 90 more or less frequently used reciprocal verbs could be established which are prefixed with *-einander-* together with another prefix (*an-* ‘at’, *auf-* ‘on(to)’, *aus-* ‘from, off, out’, *bei-* ‘at’, *gegen-* ‘against’, *hinter-* ‘behind’, *in-* ‘in’, *neben-* ‘beside’, *über-* ‘above’, *unter-* ‘under’, *zu-* ‘(directed) at’); e.g.:

(71) <i>aneinanderreihen</i>	‘to line up next to each other’
<i>aufeinanderhäufen</i>	‘to heap things together’
<i>auseinanderdividieren</i>	‘to divide from each other’
<i>beieinanderhalten</i>	‘to keep together’
<i>gegeneinanderlegen</i>	‘to put next to one another (contiguously)’
<i>ineinanderschieben</i>	‘to push into one another’
<i>übereinanderstapeln</i>	‘to pile on top of one another’
<i>zueinanderordnen</i>	‘to group.’

Of course, this number has to be treated as a minimum, for reasons given in 2.3. For instance, the compound prefix *auseinander-* serves as a productive means of forming object-oriented lexical reciprocals (see 8.2). Its third, “reciprocal” argument becomes incorporated into the prefix itself, e.g.:

- (72) *Die jüngsten Ereignisse dividierten sie auseinander.*
 ‘The last events separated them (lit.: ...divided them apart) from each other.’

That these two prefixes have merged into one morphological entity, is partly confirmed by the fact that the particular locative prefix and *einander* are separated from the stem only jointly, never one without the other. In Berger (1985), *füreinander* ‘for each other’, *miteinander* ‘with each other’, *nacheinander* ‘after each other’, *umeinander* ‘for/about each other’, *voneinander* ‘from/about each other’ and *voreinander* ‘in front of each other’ are treated only as adverbial complements spelt separately from verbs. *Durcheinander* does not convey a reciprocal meaning, though it is encountered as a prefix in complex verbs (see 5.5.6.1).²¹ But the tendency in modern German has been to link such complex adverbials together with the respective verbs (see 2.3). Since we cannot go into any details here, suffice it to say that preposition + *einander* should best be characterized as part of the verb itself if it fills out one of its valencies, irrespective of whether it is spelt jointly with or separately from the verb stem (in the infinitive).

5.5.2 Non-locative constructions

Many prepositions can be used both with locative and non-locative meanings. No decision concerning the semantic or pragmatic relations between these domains will be made here. We shall begin with non-locative constructions.

5.5.2.1 Subject-oriented constructions. Here is an example:

- (73) a. *Er wartet auf sie, und sie wartet auf ihn.*
 ‘He waits for her, and she waits for him.’
 → b. *Sie warten aufeinander.*
 ‘They wait for each other.’

Besides *aufeinander* (meaning also ‘on(to) each other’), the following combinations exist:

- | | |
|---|--|
| (74) <i>auseinander nicht schlau werden</i> | ‘to be unable to make sense of each other’ |
| <i>füreinander leben</i> | ‘to live for each other’ |
| <i>gegeneinander</i> ²² <i>kämpfen</i> | ‘to fight against each other’ |
| <i>sich ineinander verlieben</i> | ‘to fall in love with each other’ |
| <i>sich nacheinander sehnen</i> | ‘to long for (lit. ‘after’) each other’ |
| <i>übereinander reden</i> | ‘to talk about each other’ (<i>über</i> = lit. ‘above’) |
| <i>voneinander erzählen</i> | ‘to tell stories about each other’ |
| <i>voreinander Angst haben</i> | ‘to be afraid before each other’ |
| <i>zueinanderstehen</i> | ‘to stick to each other.’ |

21. It can, though, be encountered as a trivial combination to denote a “reciprocal agent“ in regular passives (see also (159)).

22. The synonym *widereinander* has become obsolete.

5.5.2.2 *Object-oriented constructions.* Among the combinations listed in 5.5.2.1, only *aufeinander* and *gegeneinander* can be employed with some specific three-place transitives. This normally occurs with verbs of joining, disjoining and competition (see 8.2.2); cf.:

- (75) a. *Er hetzte Peter auf Hans und Hans auf Peter.*
 ‘He baited Peter against Hans and Hans against Peter.’
 → b. *Er hetzte sie **aufeinander**.*
 ‘He baited them against (lit. *on*) each other.’
- (76) a. *Sie wollte Gerda gegen Hans und Hans gegen Gerda ausspielen.*
 ‘She wanted to play Gerda against Hans and Hans against Gerda.’
 → b. *Sie wollte sie **gegeneinander** ausspielen.*
 ‘She wanted to play them against each other.’

But even those combinations which are not encountered otherwise with more specific causative verbs can be used with the highly productive construction *machen* ‘to make’ + predicative adjective [= three-place predicate] signalling causativity; cf.:

- (77) a. *Er machte sie **füreinander** akzeptabel.*
 ‘He made them acceptable for each other.’
 b. *Er machte sie **voneinander** abhängig.*
 ‘He made them dependent on each other.’

5.5.3 *Locative constructions*

More than half of all underived locative prepositions enter into converse relations indicated by two-headed arrows below (6 pairs where 3 units correspond to 2 each). These relations are preserved in reciprocal constructions with *einander*, regardless of whether they denote location or directed movement; cf.:

- (78) a. ***untereinander*** ‘under/below each other’ $\left\{ \begin{array}{l} \rightarrow \text{a.} \text{ } **aufeinander** \text{ ‘onto each other’}^* \\ \rightarrow \text{a.} \text{ } **übereinander** \text{ ‘above each other’}^{**} \\ \rightarrow \text{b.} \text{ } **hintereinander** \text{ ‘behind each other’} \end{array} \right.$
- b. ***voreinander*** ‘in front of each other’ $\left\{ \begin{array}{l} \rightarrow \text{b.} \text{ } **nacheinander** \text{ ‘after each other’} \\ \rightarrow \text{c.} \text{ } **voneinander** \text{ ‘away from each other’} \end{array} \right.$
- c. ***zueinander*** ‘towards each other’ $\left\{ \begin{array}{l} \rightarrow \text{c.} \text{ } **voneinander** \text{ ‘away from each other’} \\ \rightarrow \text{c.} \text{ } **auseinander** \text{ ‘away from each other.’} \end{array} \right.$

* With direct contact.

** Direct contact not necessary.

There are only 5 combinations without converse counterparts:

- (79) ***aneinander*** ‘(tightly) at/on each other’ (contact necessary)
beieinander ‘near to/at/besides each other’ (direct contact not necessary)
ineinander ‘one into the other’
nebeneinander ‘besides each other’ (without direct contact)
zwischeneinander ‘between each other.’

Zwischeneinander can be used only with regard to objects of a toothed form, i.e. consisting of parts which can mutually be dovetailed (e.g. *Die Zahnräder griffen zwischeneinander*. 'The cog-wheels came together'). This unit is rare and can most often be replaced by *ineinander*. Note that *ineinander* 'one into the other' and *auseinander* 'away from each other' are not converses of each other, contrary to the simple prepositions *in* vs. *aus* (see 5.5.5.1).

5.5.3.1 Subject-oriented constructions. An example of a regular converse relation with reciprocal combinations is the following:

- | | | | |
|------|----|-----------------------------|-------------------------------|
| (80) | a. | <i>auf jmdn zugehen</i> | 'to go towards sb' |
| | → | <i>aufeinander zugehen</i> | 'to go towards each other' |
| | ↔ | b. <i>von jmdm weggehen</i> | 'to go away from sb' |
| | → | <i>voneinander weggehen</i> | 'to go away from each other.' |

As an example of a reciprocal combination without a converse counterpart cf.:

- (81) *Hans und Maria saßen nebeneinander.* 'Hans and Mary sat next to each other.'

With *umeinander* 'around each other' a locative prefix (or adverb) has to be added; cf.:

- | | | | |
|------|----|---------------------------------|-----------------------------|
| (82) | a. | * <i>um jmdn gehen</i> | (intended meaning as (82b)) |
| | → | b. <i>um jmdn herumgehen</i> | 'to go around sb' |
| | → | c. <i>umeinander herumgehen</i> | 'to go around each other.' |

5.5.3.2 Object-oriented constructions. Object-oriented counterparts to the constructions just mentioned can be formed regularly with the causative counterparts of motion verbs, such as (*hin*)*stellen* 'to put upright', (*hin*)*legen* 'to lay (down)', (*hin*)*setzen* 'to seat/make sb sit (down)'; cf. (*weg* in (83) means 'away from'):

- | | | | |
|------|----|--|--|
| (83) | a. | <i>Er zog die Kästen von der Wand weg.</i> | 'He pulled the boxes away from the wall.' |
| | → | b. <i>Er zog beide Kästen voneinander weg.</i> | 'He pulled both boxes away from each other.' |

The separable prefix *hin-* bears a vague meaning of 'directed towards (sth)'. By saying 'causative' we shall have in mind lexical causatives.

5.5.4 Reciprocals of converse bases

Relations denoted by these reciprocals belong to the periphery of reciprocity since they hold between a whole set of referents constituting a group (agglomerate) in which most of the members do not stand in direct contact to each other and, thus, do not enter into a really symmetrical relationship (cf. Lichtenberk 1985:24ff.; Kemmer 1993:100f.). For this reason such relations may be called quasi-reciprocal (Otkupshchikova 1978:185) or chaining. Nonetheless, German *einander*-combinations are used to denote them in the same way as they denote reciprocity proper. (For chain relations in the temporal domain see 10.3 below).

5.5.4.1 *Subject-oriented constructions.* Similarly to symmetrical locative constructions, some *einander*-combinations denoting chain relations can be paired as converses; these are:

- (84) a. *übereinander* ‘above each other’ ↔ *untereinander* ‘under each other’
 b. *aufeinander* ‘onto each other’ ↔ *untereinander* ‘under each other’
 c. *hintereinander* ‘after each other’ ↔ *voreinander* ‘before each other’, e.g.:
- (85) a. *Die Bücher lagen über den Zeitschriften.* ‘The books lay on the journals.’
 → b. *Die Bücher lagen übereinandergestapelt.* ‘The books lay heaped onto one another.’

Aufeinander can be used as a synonym of *nacheinander* denoting temporal succession (see 10.3). *Hinter-* and *voreinander* do not always behave as real converses, since one cannot say (86b):

- (86) a. *Die Schlepper fahren vor den Segelbooten.*
 ‘The tug-boats drove in front of the sailboats.’
 → b. *Die Schlepper und die Segelboote fahren *voreinander.*
 ‘The tug-boats and the sailboats drove one before the other.’

Instead, *hintereinander* has to be used. This reflects a more general restriction, since the same holds for English ‘to precede’ compared with ‘to follow’ (cf. Kemmer 1993:256, fn. 64; see also 10.3). It is, however, possible to use *voreinander* (as well as *hintereinander*), with a slight change of perspective, if the local particle *her* (‘towards sb/sth’) is added:

- c. *Die Schlepper und die Segelboote fahren voreinander her.*
 ‘The tug-boats and the sailboats proceeded one in front of the other.’

Lack of genuine converseness has already been stated for *in-* and *auseinander* (5.5.3).

5.5.4.2 *Object-oriented constructions.* All combinations listed in 5.5.4.1 can be employed in object-oriented reciprocal constructions on the same conditions as symmetric locative reciprocals (see 5.5.3.2); cf.:

- (87) a. *Die Arbeiter legten die Heuballen auf den Wagen.*
 ‘The workers put the bales on top of the car.’
 → b. *Die Arbeiter legten die Heuballen aufeinander.*
 ‘The workers put the bales on top of each other.’

It should be noted that in causative constructions the restriction on *voreinander*, which has been stated for subject-oriented constructions, is less rigid. Compare (86) and (88):

- (88) a. *Die Techniker koppelten die Schlepper vor die Segelboote.*
 ‘The technicians connected the tug-boats to the front of the sailboats.’
 → b. *Die Techniker koppelten die Schlepper und die Segelboote voreinander.*
 ‘The technicians connected the tugs-boats and the sailboats to each other.’

5.5.5 *Non-trivial (“non-reversible”) derivative relations*

Some units consisting of *einander* and a fronted preposition bear idiosyncratic meanings, because they either do not denote a proper reciprocal relationship or their meaning cannot

be derived directly from the preposition and *einander*. Contrary to the above combinations, none of the items in this subsection can be replaced by the reciprocal construction *eine(r) den/die andere(n)* (see Section 6).

5.5.5.1 *Constructions with productive combinations.* These are represented by two items:

- (89) a. *durcheinander* lit. 'through each other'
 b. *auseinander* lit. 'out of each other.'

Unlike *zwischeneinander* (see 5.5.3), *durcheinander* establishes only one set of haphazardly co-located objects without any (obvious) reciprocal notion. It therefore refers to any chaotic, improper state of a collective entity. Compare an example of a subject-oriented construction:

- (90) a. *Im Kinderzimmer lagen alle Spielsachen durcheinander* (= *verstreut auf dem Boden*).
 'In the children's room all toys lay scattered around (= in disorder on the floor).'

In colloquial speech it is often used to denote a distracted state of mind:

- b. *Hans ist vollkommen durcheinander* (= *kann keinen klaren Gedanken fassen*).
 'Hans is absolutely confused (= doesn't have any clear thoughts).'

And it serves as a prefix of causative verbs denoting actions (or behaviour) that lead to a disorderly state; cf. the following object-oriented sentence:

- c. *Die neue Verwaltung brachte alles durcheinander* (= *in Unordnung*).
 'The new administration turned everything upside down.'

The meaning of *auseinander* is best captured as an antonym of *zusammen*, but not of *ineinander* 'one into the other' (see 5.5.3); cf.:

- (91) a. *Sie setzten sich auseinander.* 'They sat down at different places'
 ↔ b. *Sie setzten sich zusammen.* 'They gathered and sat down'
 c. **Sie setzten sich ineinander.* *'They sat (down) into one another.'

5.5.5.1.1 *Subject-oriented complex verbs.* The following items can be named as typical representatives of intransitive *durcheinander*-verbs (for an example see (90a)):

- (92) *durcheinanderlaufen* 'to run in different directions (without aim)'
durcheinandergeraten 'to get disordered'
durcheinanderpurzeln 'to get thrown around/about.'

An example for *auseinander*-:

- (93) a. *auseinanderfallen* 'to fall to pieces'
 b. *Das Gerüst fiel auseinander.* 'The scaffolding went tumbling down.'

Other typical verbs are:

- (94) *auseinanderfließen* 'to flow out in different directions'
auseinanderfliegen 'to fly in different directions; to explode.'

5.5.5.1.2 *Object-oriented complex verbs.* *Durcheinander-* has been illustrated by *durcheinanderbringen* ‘to cause confusion’ in (90c). Other verbs are:

- (95) a. *durcheinanderschütteln* ‘to mix sth by shaking up’
 b. *durcheinanderwerfen* ‘to scatter sth around’
 c. *durcheinanderwehen* ‘to scatter sth by blowing.’

The examples show that *durcheinander-* often changes the meaning of transitive verbs by adding, roughly speaking, the resultative sense of disorder achieved by the action named by the base verb (cf. *schütteln* ‘to shake up’ and (95a)) and often involving transitivity (cf. *wehen* ‘to blow’ and (95c) and (96b)). (The component *durcheinander-* behaves like many other verbal components with the initial spatial meaning, in particular *weg-*, *hinaus-*, *heraus-*, *hinunter-*, etc.; see, for instance, Nedjalkov 1961b:81–3, 101, 104–5). Compare:

- (96) a. *Der Wind wehte durch das Tal.*
 ‘The wind blew through the valley.’
 → b. *Der Wind wehte die losen Blätter und Äste durcheinander.*
 ‘The wind scattered the leaves and boughs all over the ground.’

An example of derived *auseinander-*verbs is the following:

- (97) *Sie nahm die Schachteln auseinander.* ‘She took the boxes apart.’

Here are some more verbs with this morpheme:

- (98) *auseinanderbiegen* ‘to bend straight’
auseinandersetzen ‘to set apart’
auseinanderschneiden ‘to cut apart.’

5.5.5.2 *Miteinander* ‘with each other’. From a morphological point of view, *miteinander* has to be considered as a combination of comitative and reciprocal. It has this meaning in all cases when it does not occupy a valency slot of the respective predicate; e.g.:

- (99) a. *Erika ging mit Peter zur Schule.* = *Peter ging mit Erika zur Schule.* (comitative)
 ‘Erika went to school with Peter.’ ‘Peter went to school with Erika.’
 → b. *Erika und Peter gingen miteinander zur Schule.* (reciprocal from comitative)
 ‘Erika and Peter went to school together.’

(99b) implies both temporal and spatial simultaneity. In its second function *miteinander* serves to indicate reciprocal arguments; e.g.:

- (100) a. *Erika machte sich mit Peter bekannt.* = *Peter machte sich mit Erika bekannt.*
 ‘Erika became acquainted with Peter.’ ‘Peter became acquainted with Erika.’
 → b. *Erika und Peter machten sich miteinander bekannt.*
 ‘Erika and Peter got (lit. ‘made themselves’) acquainted with each other.’

In the first, comitative, function (see (99b)) *miteinander* is readily replaceable by *zusammen* or *gemeinsam* ‘together’ (see 7.3). In the second function (see (100b)) it cannot be replaced by the latter two adverbs.

If, however, some lexical reciprocals are used in a simple (not discontinuous) construction where both participants are named by the subject, the (optional) *miteinander* can be replaced by the (likewise optional) lexemes *zusammen* or *gemeinsam*.

- (101) a. *Sie unterhielten sich miteinander / zusammen.*
 ‘They talked with each other / together.’
 b. *Sie haben miteinander / zusammen angestoßen.*
 ‘They clinked glasses.’

As an adverbial, *miteinander* has become lexicalized in the meaning of *insgesamt* ‘altogether’, though in this function it has to be regarded archaic or dialectal; cf.:

- (102) *Alcestens Geld, das er nicht lang erhielt, ist miteinander fort.* (Goethe)
 ‘Alcesten’s money, which he didn’t preserve for a longer time, has totally disappeared’ (lit.: ‘... is altogether off’).

In this meaning *miteinander* has been used since ancient times, as testified by Jelinek (1911: 187).

Furthermore, only *miteinander*, contrary to *untereinander* (see 5.5.5.4), is used in some Southern German varieties as part of greeting formulae, e.g.: *Grüß Gott, miteinander!* (= *zusammen*) ‘Hi, everybody!’.

5.5.5.3 *Beieinander* ‘at each other = together’. In this context *beieinander* (*beieinand*’) and *beisammen* can also be encountered (cf. the entry on *zusammen* in WdG, Vol. 6, 1977: 4511). The comitative meaning of both *mit-* and *beieinander* is quite old and may well have preceded proper reciprocal meanings (cf. ample examples in Grimm & Grimm 1854: 1367f., 1862: 143, 1885: 2337).

5.5.5.4 *Untereinander* ‘among each other’. This adverb is more restricted than *miteinander* because it bears a clear meaning of exclusiveness. This is due to the semantics of the preposition *unter* in the meaning ‘among’, and the reader is referred to Subsection 7.4, since all that can be said about the discontinuous *unter sich* ‘among + RM’ holds for *untereinander*, too. The following example from M. Luther’s translation of the Gospel is of interest in which *sich* is used together with *untereinander*:

- (103) “... so sollen wir uns auch untereinander lieben.” (1. Joh. 4, 11)
 ‘... we in turn are bound to love one another.’

5.5.5.5 *Lexicalized compound verbal units.* The following lexicalizations can be listed:

- (104) a. *aneinandergeraten* = *in Streit geraten* ‘to rub one another the wrong way’
 b. *Leitungen nebeneinanderschalten* = *parallelschalten* ‘to lay parallel switches’
 c. *sich (mit etwas) auseinandersetzen* = *sich beschäftigen* ‘to deal with sth seriously’
 d. *seine Gedanken beieinander haben* ‘to think clearly.’

There is furthermore an adverb *hintereinanderweg* ‘(fast) one after the other’, which can be used with verbs of motion and, even better, with verbs of speech. It entails a notion of distributiveness and of rapid or fluent speed; e.g.:

- (105) *Er listete alle Teilnehmer hintereinanderweg auf.*
 ‘He named all participants rapidly one after the other.’

This adverb is morphologically isolated since no other combinations of this kind are attested.

6. The phrase *einer den anderen* ‘one the other’

This is a cover phrase for the following phrases marked for gender and case: *einer den anderen* (= SG.M.NOM – SG.M.ACC) and *eine die andere* (= SG.F.NOM – SG.F.ACC). This marker of reciprocity is peculiar inasmuch as it can be used productively with all the oblique cases and readily permits prepositions to be included. But nonetheless it cannot be considered a grammaticalized marker (see below). It is not properly discontinuous since it repeats the syntactic status of the subject-NP and only “spells out” what has already been encoded by the latter. Like *einander*, which has developed from this syntactic marker (see 5.2), this phrase does not combine with *sich* in normative standard speech. It is often encountered in dictionary explications of reciprocal verbs or of combinations of the type discussed in 5.5. But on the textual level it is employed to a much lesser extent than the markers already presented. It can, though, be preferred for emphasis (see 6.2). Therefore, without some special context, sentences like the following appear to be quite unusual, albeit acceptable:

- (106) a. *Die Hunde bellten einer den anderen an.*
 the dogs barked one.SG.M.NOM the other.SG.M.ACC at.PREF
 ‘The dogs barked at one another.’ (two-place transitive)
- b. *Sie übermittelten einer dem anderen Neuigkeiten.*
 they conveyed one.SG.M.NOM the other.SG.M.DAT news
 ‘They conveyed news to each other.’ (three-place transitive)

The same holds for the other diathesis types dealt with in Section 4.

Note that both components are marked for the same gender and number and, if used in a subject-oriented construction, the first component is always in the nominative (cf. (106)). Object-oriented constructions seem principally possible, but sound artificial and may not be accepted by many native speakers; cf.:

- (107) [?]*Er machte sie einen mit dem anderen bekannt.*
 ‘He introduced them to each other.’

6.1 As grammatical subject (independent nominative)

That *einer den anderen* is but a semi-grammaticalized marker of reciprocity can be demonstrated if we look at what happens when it does not repeat a subject-NP and is

split up into a normal subject-object construction (see also (190b)). In such a case the meaning of the sentence becomes potentially ambiguous, since it need not denote a really symmetrical relationship between the two participants; cf.:

- (108) a. *Einer blaffte den anderen an.* ‘One shouted at the other’
 b. *Eine sah erschrocken auf die andere.* ‘One (woman) looked fearfully at the other.’

6.2 As a syntactically desintegrated marker

Native speakers’ judgements about the acceptability of *einer den anderen* vary considerably. It certainly sounds natural rather as a kind of afterthought (right dislocation), i.e. if it is prosodically disconnected from the preceding sentence and serves to accentuate a reciprocal relation. Thus, one can hear say:

- (109) *Sie reizten ↓ sich, einer den anderen ↓*
 they irritated.PL RM ONE.NOM.M ART.ACC.M OTHER.ACC.M
 ‘They irritated each other, one the other one.’

7. Verbs with locative reciprocal prefixes

In this section we will discuss lexically reciprocal morphemes that are often incorporated into the verb, but which can also be used as adverbs. As was noted in 2.3 and 5.5.1, many such morphemes in German “oscillate” between these two statuses.

7.1 With *entgegen-* ‘from the opposite side’ and *gegenüber-* ‘vis-à-vis’

Both morphemes are used as adverbs and verbal prefixes as well, the latter specifying location on two opposite sides (cf. (110); Eroms 1981:167), the former indicating motion towards one another (cf. (111)). In standard cases they encode more or less symmetrical (reciprocal) relations and are used in discontinuous constructions; cf.:

- (110) a. *Das Paar tanzte uns gegenüber.* ‘The pair danced opposite to us.’
 b. *Er saß ihr gegenüber. = Sie saß ihm gegenüber.*
 ‘He sat opposite to her. = She sat opposite to him.’
 (111) a. *Das Paar tanzte uns entgegen.* ‘The pair moved dancing towards us.’
 b. *Er ging ihr entgegen.* ‘He went towards her.’

There is an internal difference of degree of natural reciprocal implicature in these sentences, (110b) being the most natural one. The reason lies in the fact that *entgegen* and *gegenüber* do not specify what is happening with the counterpart. He/she/it may be totally passive (static), so that verbs of location normally render totally symmetrical situations, while verbs of motion do not entail a necessarily reciprocal relationship.

With plural subjects, reciprocal standard constructions with the RM *sich* (Section 4) or *einander* (5.3) are used; the bulk of the verbs belong to the intransitive subtype of “canon-

ical” reciprocals (4.2.2) (e.g., *Sie tanzten einander/sich entgegen* ‘They danced towards each other’).

Verbs with the prefix *entgegen-* are considerably more numerous than verbs prefixed with *gegenüber-* (70:7). Of each verb type only the smaller part, though, represents lexically symmetrical items, namely 14 for *entgegen-*, of which most are verbs of rather unspecified motion (e.g., *entgegenfahren* ‘to drive towards’, *entgegenkommen* ‘to come towards’ or the autocausative *sich entgegenbewegen* ‘to move towards’), and 3 for *gegenüber-*, all of them derived from base verbs of location (*gegenüber-liegen*, *-sitzen*, *-stehen* ‘to lie, sit, stand opposite to’). There is a semantic continuum from these necessarily symmetrical verbs to verbs prefixed with *entgegen-* which encode a totally non-symmetrical situation, e.g. (*einer Prüfung*) *entgegenbängen* ‘to be anxious about a test’, (*ein Geschenk*) *entgegennehmen* ‘to receive a present’.

7.2 With *zusammen* ‘from different directions towards each other’, ‘joint identical actions’

In one of its functions the morpheme *zusammen* serves as a prefix to derive subject- and object-oriented lexical reciprocals (see 8; compare Lithuanian verbs on *su-* and *susi-* in Geniušienė (Ch. 14, §5.2) and Polish verbs on *z(e)-* + *się* (Wiemer (Ch. 11, §8.4)). It is noteworthy that only about half (i.e. 87) out of 160 verb lexemes with this prefix which are attested in the dictionaries encode a proper reciprocal meaning, with the generalized meaning ‘to come/bring (put) together’. With these verbs there is, for sure, a continuum ranging from genuinely reciprocal meanings, e.g. (*die Hände*) *zusammenfalten* ‘to fold one’s hands’, to nearly lexicalized non-reciprocal meanings, e.g. (*einen Text*) *zusammenfassen* ‘to summarize’. The degree of a verb’s ability to denote a reciprocal event is quite clearly dependent on the referential status of its arguments, in particular, with object-oriented lexical reciprocals: they name an object created of parts vs objects manipulated together; cf. respectively: (*das Mosaik*) *zusammenfügen* ‘to fit together (the mosaic)’ vs. (*die Steine*) *zusammenfügen* ‘to fit together (the stones)’. These verbs can occur both in simple and discontinuous constructions; cf.:

- (112) a. *Elsie vermischte das Mehl und den Zucker.*
 ‘Elsie mixed up the flour and the sugar.’
 b. *Elsie vermischte das Mehl mit dem Zucker.*
 ‘Elsie mixed the flour with the sugar.’

These patterns are highly productive, i.e. one can encounter numerous occasional and tautological verbs (e.g., *zusammen|addieren* ‘to add together’, *zusammen|sammeln* ‘to gather together’).

7.2.1 Subject-oriented lexical reciprocals

There are 42 items of this type in our corpus. Here belongs a subgroup of 17 items, which can, in turn, be subdivided into verbs conveying a notion of ‘meeting’ (e.g. *zusammen-treffen* ‘to meet’) and verbs with a general meaning of ‘harmonizing’ (e.g. *zusam-*

menpassen 'to fit, suit each other'). They derive from one-place (see (113)) or two-place verbs (see (114)); e.g.:

- | | | | | |
|-------|----|--|---|---|
| (113) | a. | <i>fließen</i> 'to flow' | → | <i>zusammenfließen</i> 'to flow together' |
| | b. | <i>stimmen</i> 'to be true/in concord' | → | <i>zusammenstimmen</i> 'to agree' |
| | c. | <i>wachsen</i> 'to grow' | → | <i>zusammenwachsen</i> 'to grow together.' |
| (114) | a. | <i>geraten</i> 'to get into' | → | <i>zusammengeraten</i> 'to clump together' |
| | b. | <i>kommen</i> 'to come' | → | <i>zusammenkommen</i> 'to assemble, gather' |
| | c. | <i>treten (in)</i> 'to enter (into)' | → | <i>zusammentreten</i> 'to assemble.' |

A larger subgroup of verbs prefixed with *zusammen-* (25 items) does not show a proper reciprocal meaning. On the periphery of reciprocity we can locate verbs denoting some kind or other of diminishing. These can be subdivided into two small sets of items:

1. Verbs with the meaning of shrinking, e.g.:

- | | | |
|-------|---------------------------|----------------------|
| (115) | <i>zusammenschrumpfen</i> | 'to shrink together' |
| | <i>zusammenlaufen</i> | 'to shrink.' |

2. Verbs referring to natural reactions of fear, fright, e.g.:

- | | | |
|-------|-----------------------|------------------------|
| (116) | <i>zusammenfahren</i> | 'to start with fright' |
| | <i>zusammenzucken</i> | (the same). |

Semantically related verbs bear a generalized meaning of crashing down, e.g.:

- | | | |
|-------|-------------------------|-----------------|
| (117) | <i>zusammenbrechen</i> | 'to break down' |
| | <i>zusammenstürzen.</i> | 'to fall down.' |

These verbs are not included in the subgroup of 17 verbs noted above. With proper reciprocal verbs they share, however, the semantic feature of 'motion directed from the edges to the centre'. Finally, there are verbs with a mere sociative meaning, e.g.:

- | | | |
|-------|-----------------------|--------------------|
| (118) | <i>zusammenwohnen</i> | 'to live together' |
| | <i>zusammenwirken</i> | 'to act jointly.' |

With verbs of this latter group the prefix *zusammen-* can often be replaced by *miteinander-* 'with each other' (see 5.5.5.2). For the statistics see below.

7.2.2 Object-oriented lexical reciprocals

This group is considerably larger and comprises about 118 verbs. These are derived from two-place (see (119)) or three-place base verbs (see (120)); e.g.:

- | | | | | |
|-------|----|-------------------------------|---|--|
| (119) | a. | <i>knoten</i> 'to tie a knot' | → | <i>zusammenknoten</i> 'to tie sth together' |
| | b. | <i>leimen</i> 'to glue' | → | <i>zusammenleimen</i> 'to glue together' |
| | c. | <i>schließen</i> 'to close' | → | <i>zusammenschließen</i> 'to unite, group together.' |
| (120) | a. | <i>bringen</i> 'to bring' | → | <i>zusammenbringen</i> 'to bring together' |
| | b. | <i>legen</i> 'to put' | → | <i>zusammenlegen</i> 'to put/place together' |
| | c. | <i>stecken</i> 'to stick' | → | <i>zusammenstecken</i> 'to stick together.' |
| (121) | a. | <i>fügen</i> 'to fit, join' | → | <i>zusammenfügen</i> 'to put together' |
| | b. | <i>heften</i> 'to fasten' | → | <i>zusammenheften</i> 'to staple' |
| | c. | <i>pferchen</i> 'to push in' | → | <i>zusammenpferchen</i> 'to round up.' |

7.2.2.1 *Lexical subgroups.* Among the object-oriented verbs a number of lexical subgroups can be distinguished.

1. Verbs denoting causation of direct contact without its fixation (4 items only); e.g.:

- (122) a. (*die Zähne*) *zusammenbeißen* 'to clench one's teeth'
 b. (*zwei Gläser*) *zusammenstoßen* 'to knock (two glasses) together.'

2. Verbs of connecting (see 9.1), which are the most numerous ones, including:

2a. verbs denoting mere uniting of two or more objects, e.g.:

- (123) a. (*Papiere*) *zusammenheften* 'to staple together (pieces of paper)'
 b. (*Stühle*) *zusammenstellen*₁ 'to place together (chairs).'

2b. Verbs denoting bringing into existence of a new object (composed of some united parts) or repairing a broken or damaged object, e.g.:

- (124) a. (*die Hose*) *zusammenflicken* 'to patch (the pants) together'
 b. (*einen Blumenstrauß*) *zusammenstellen*₂ 'to make a bouquet.'

2c. Verbs that may have either of these meanings, e.g.:

- (125) a. (*ein Haus / die Wände*) *zusammenbauen* 'to build (a house)/connect (the walls)'
 b. (*einen Strauß / Blumen*) *zusammenbinden* 'to tie (a bouquet / the flowers) together.'

3. Verbs denoting causation of diminution; here some subgroups can be named:

3a. Verbs referring to two or more distinct objects, these objects often being parts of a larger, integral object, e.g.:

- (126) a. (*zwei Brote*) *zusammenklappen* 'to put (two bread slices) together.'
 b. (*Bücher*) *zusammenrücken* 'to push together (books).'

3b. Verbs denoting the diminishing of an object by folding, rolling or pressing it, e.g.:

- (127) a. (*einen Teppich*) *zusammenrollen* 'to roll up (a rug)'
 b. (*die Faust*) *zusammenballen* 'to ball (the fist).'

4. Verbs with a generalized meaning of gathering, assembling sth, e.g.:

- (128) a. (*Blätter*) *zusammenfegen* 'to sweep (the leaves) together'
 b. (*Geld*) *zusammensparen* 'to save up (money).'

The order of these subgroups, from 1 to 4, roughly reflects a decrease of the prototypical reciprocal meaning. From a semantic viewpoint groups 3 and 4 are peripheral. Beside these groups, among verbs prefixed with *zusammen-* at least two more can be figured out which are more or less void of a reciprocal meaning and which do not belong to the 160 verbs mentioned in 7.2.

5. Verbs denoting actions that lead to demolition, damaging or harming, e.g.:

- (129) a. (*jmdn*) *zusammenschießen* 'to shoot down'
 b. (*jmdn*) *zusammenstauchen* 'to beat down.'

Table 5. Lexical subgroups of verb lexemes prefixed with *zusammen-*

5.1. Subject-oriented (7.2.1)						
'harmonize'	'meet'	'shrink'	'crash down'	sociative	Total	
5	12	9	4	10	40	
5.2. Object-oriented (7.2.2.1)						
contact without fixation	'connect'	'gather'	'diminish'	'demolish'	disorderly actions	Total
4	35	26	22	10	16	113

6. Verbs referring to actions done without order or sloppily, e.g.:

- (130) a. (*etwas wahllos*) *zusammenschreiben* 'to write something up (blindly)'
 b. (*sich etwas*) *zusammenlügen* 'to fabricate lies.'

Subgroup 5 is represented only by a few verbs, while subgroup 6 belongs to the most prolific ones in colloquial speech.

Table 5 summarizes the distribution of the lexical subgroups considered in 7.7.1 and 7.7.2.

There are 2 subject-oriented (*sich zusammenkauern* 'to huddle up', *sich zusammensetzen* 'to sit down together') and 5 object-oriented verbs (e.g., *sich zusammennehmen* 'to pull oneself together', which is semantically irreversible since *zusammennemen* means 'to take together') which can be used only with the RM and/or are lexicalized. Altogether we obtain 42 subject-oriented + 118 object-oriented verb items.

7.3 Markers of collective actions with reciprocals (the adverbs *zusammen*, *gemeinsam* 'together, jointly')

These two adverbs are almost totally synonymous. They may be optionally employed with inherently reciprocal verbs and cannot differentiate between reciprocal and comitative meaning (see 5.5.5.2). *Gemeinsam*, but not *zusammen* can be used to stress joint action if the subject of the sentence (i.e. the first argument) denotes a collective referent (irrespective of grammatical number); cf.:

- (131) *Die Gruppe versammelte / traf* (SG) *sich* [*gemeinsam*, **zusammen*] *im Restaurant*.
 'The group gathered / met [+ *gemeinsam*, **zusammen*] in the restaurant.'
 (132) *Alle versammelten / trafen* (PL) *sich* [*gemeinsam*, **zusammen*] *im Restaurant*.
 'All (people) gathered / met [+ *gemeinsam*, **zusammen*] in the restaurant.'

With the comitative meaning there seem to be no restrictions; cf.:

- (133) *Olaf ging* [*gemeinsam*, *zusammen*] *mit Renate ins Restaurant*.
 'Olaf went to the restaurant [together] with Renate.'

7.4 “Reciprocal exclusiveness” of *unter* ‘among’

The preposition *unter* has a primarily spatial meaning ‘under’. But with lexical reciprocals it can also be used to mean ‘among’. In comparison to *mit* ‘with’ (see 8.1) it adds a clear sense of exclusiveness (cf. Brinkmann 1971:174; Reiter 1975:206); e.g.:

- (134) *M. und L. berieten unter sich / untereinander* (was zu tun war).
 M. and L. counseled among themselves / among each other what to do
 ‘Max and Lisa counselled with one another (what to do).’

Unter cannot be used with non-reciprocal predicates, probably the only exception being existential and state verbs like *sein* ‘to be’ or *sitzen* ‘to sit, be seated’; cf. (in (135) *untereinander* could have only a locative reading ‘one higher than the other’):

- (135) *Max und Lisa waren / saßen unter sich / *untereinander.*
 ‘Max and Lisa were / sat alone (spending their time together).’

From a diachronic viewpoint *unter* (*under*) acquired its contemporary meaning only at the beginning of the New High German period (15th–16th centuries). Notker and Heliand (9th–10th centuries) used *undor tuisk* (lit. ‘among two’) in the meaning of *untereinander* ‘among each other’ (Behaghel 1924:32; Grimm & Grimm 1954, Vol. 16:1321ff.). For the Middle High German period Lexer (1876:1777) and Benecke et al. (1963:187) give meanings of *under* as ‘in the midst of’ or ‘in between’ (e.g. *under den Zeiten* = *manchmal* ‘from time to time, sometimes’; as for *untereinander* cf. the example from M. Luther *under* (103)). Even more interesting, *under* could be used together with *sich* indicating reciprocity (Benecke et al. *ibid.*).

7.4.1 Extinct reciprocal meaning of the prefix *under* ‘among’

Furthermore, at that time *under* was productive as a prefix ascribing a reciprocal meaning. In Lexer (1876:1179–814, 1969:246–49), Jelinek (1911:753–60), Pretzel et al. (1959:47) and Benecke et al. (1963:187) 51 reciprocal verbs prefixed with *under-* are registered. Among them slightly more than half (i.e. 29) are accompanied by the RM *sich*; e.g.:

- (136) *sich underbâgen* ‘to brawl’
sich underbrîzen ‘to bite one another’
sich undergrüezen ‘to greet each other’
sich underkennen ‘to know each other’
sich underkösen ‘to talk (with each other)’
sich underminnen ‘to love each other’
sich undersêhen ‘to look at each other.’

The remaining 22 verbs did not take the RM, regardless of whether they were transitive (see (137)) or intransitive (see (138)):

- | | | |
|-------|----------------------|--|
| (137) | <i>undergöben</i> | ‘to give sth to each other’ |
| | <i>undermengen</i> | ‘to mix sth with each other’ |
| | <i>underschicken</i> | ‘to separate sth’ |
| | <i>undervarn</i> | ‘to make sth different’ |
| | <i>undervrâgen</i> | ‘to ask each other.’ |
| (138) | a. <i>underreden</i> | ‘to counsel (with each other)’ |
| | b. <i>understân</i> | ‘to have intercourse (with each other).’ |

In contemporary German only remnants of this quite productive pattern have survived, e.g. the lexical reciprocal *unterscheiden* ‘to distinguish’, the lexicalized reflexive *sich unterhalten* ‘to talk (with each other)’ and some derived nouns (e.g. *Unterredung* ‘counselling session’, compare with (138a)).

8. Lexical reciprocals

In German the highly polysemous preposition *mit* ‘with’ (Eroms 1981:327ff.) can serve to mark the syntactically subordinate member of a reciprocal relationship, but only with lexical reciprocals. Beside *mit*, only occasionally the prepositions *gegen* ‘against’ and *von* ‘from, off’ (see 9.2) can be encountered in this function, depending on the syntactic valencies of a particular verb. Because of the polysemy of *mit* (it also broadly expresses comitativity; cf. Seiler 1974:37f.; see 5.5.5.2), it cannot be regarded as a *grammatical* marker of reciprocity. Therefore, discontinuous constructions, with the subject-NP (first argument) in the singular, cannot be connected with simple constructions beyond quite limited semantic sets of verbs. One such set has already been discussed in 4.7. Others will be treated in the following subsections; for some details concerning particular verbs the reader is referred to Wandruszka (1969:448ff., 1973), Stötzel (1970:197f.), Eroms (1976:228ff., 1981:375ff.) and Kunze (1995:28ff.).

8.1 Two-place intransitive reciprocals (verbs with *mit* ‘with’)

8.1.1 Verbs without *sich*

They readily occur in discontinuous constructions; e.g.:

- | | | | | |
|-------|----|---|--|-----------------------------------|
| (139) | a. | <i>Er rang (*sich) mit ihr um den Sieg.</i> | ‘He competed with her for victory.’ | |
| | = | b. | <i>Sie rangen (*sich) beide um den Sieg.</i> | ‘They both competed for victory.’ |

It is an open question whether these verbs are to be treated as two- or three-place; but its solution does not hinge upon the character of reciprocal expression. (The same holds for verbs in 8.1.2.) Here is the probably entire list of this subgroup; most of them share the general meaning of competition, and some communication:

- | | | |
|-------|--------------------|--------------|
| (140) | <i>diskutieren</i> | ‘to discuss’ |
| | <i>fechten</i> | ‘to fence’ |
| | <i>kämpfen</i> | ‘to fight’ |

<i>kommunizieren</i>	‘to communicate’
<i>konkurrieren</i>	‘to compete/rival’
<i>korrespondieren</i>	‘to have correspondence (with each other)’
<i>ringen</i>	‘to compete/wrestle’
<i>rivalisieren</i>	‘to rival’
<i>verhandeln</i>	‘to negotiate’
<i>wetteifern</i>	‘to compete/take part in a competition.’

8.1.2 Verbs with optional *sich*

Semantically close to the previous subgroup is a small number of verbs which do occur with the *mit*-phrase, but do not necessarily take an additional reflexive pronoun; cf.:

- (141) a. *Er zankte [sich] mit ihr.* ‘He quarrelled with her.’
 = b. *Beide zankten [sich].* ‘Both quarrelled (with each other).’

Here is a list of these verbs:

- (142) *abwechseln* ‘to alter (= be altered by each other)’
balgen ‘to wrestle (in a playful manner, pleasantly)’
beraten ‘to counsel (with each other)’
boxen ‘to box’
raufen ‘to wrestle’
streiten, zanken ‘to quarrel/brawl’
überlappen ‘to crosscut.’

Almost all of these verbs share a notion of *competition*, with the exception of *beraten* and *überlappen*. The latter verbs, together with *abwechseln* and *boxen*, are also peculiar in that they can be used in the singular in an ordinary transitive diathesis (cf. the meaning shift hinted at in 4.7). They are then void of any reciprocal meaning; cf.:

- (143) a. *Hans beriet Peter.* ≠ *Peter beriet Hans.*
 ‘Hans counseled Peter.’ ≠ ‘Peter counseled Hans.’
 b. *Hans beriet [sich] mit Peter.* = *Peter beriet [sich] mit Hans.*
 ‘Hans counseled with Peter.’ = ‘Peter counseled with Hans.’

8.2 Three-place reciprocals

Object-oriented reciprocal relations can be expressed only by a relatively small number of verbs (about 50 items). But there are surely more than these 50 verbs if we take into consideration all the compound verbs with “reciprocal prefixes” like *auseinander-*, *zusammen-* etc., which were discussed in 5.5, 7.1–7.2. Three-place reciprocals show numerous irregularities in their derivation of recessive diatheses and in syntactic behaviour. Since it is impossible here to give an exhaustive account of all German object-oriented lexical reciprocals and their peculiarities, we shall give only the outlines viewed, first, from a syntactic and, second, from a semantic angle (8.2.1–2). Subsequently we shall analyse anticausatives (8.2.3) and, finally, give attention to one peculiar subset of verbs (8.2.4).

8.2.1 Syntactic types

Typical three-place lexical reciprocals (see 8.2.2) show no restrictions with respect to a discontinuous expression of their two objects. However, verbs of disconnecting (see 8.2.2.), focussing on splitting or dispersion of a previously integral referent (set) have to be regarded as peripheral cases of object-oriented reciprocal verbs, because they encode actions of destroying or dividing an entity and thus creating new objects which are *parts* or *portions* of the previously *whole* object. Such verbs can be used only in simple constructions, as e.g. *teilen* ‘to divide sth into separate parts or portions’:

- (144) *Er teilte das Brot in Scheiben.*
 ‘He sliced the bread into pieces.’

The meaning of the related verb *aufteilen* ‘to distribute parts or portions of sth among a number of persons’ (cf. *verteilen*, *aufteilen*) includes, as it is, a part of the above meaning and the additional component of distribution, and thus it involves two steps of “disconnecting”, which finds expression in two objects (but the construction is not discontinuous); cf.:

- (145) *Er teilte das Brot unter den Kindern auf.*
 ‘He distributed the bread among the children.’

Other verbs with the meaning of disconnecting that do not allow for discontinuous constructions are:

- | | | |
|-------|-----------------------|-----------------------------------|
| (146) | <i>antagonisieren</i> | ‘to antagonize sb’ |
| | <i>entzweien</i> | ‘to split sb up, set at variance’ |
| | (zer)spalten | ‘to cleave sth’ |
| | <i>zersplittern</i> | ‘to split sth (up)’ |
| | <i>zersprengen</i> | ‘to scatter sth’ |
| | (zer)teilen | ‘to divide sth (up)’ |
| | <i>zerreißen</i> | ‘to tear sth into pieces.’ |

There are three semantically isolated verbs which allow a simple construction only:

- | | | |
|-------|------------------------|------------------------------|
| (147) | <i>ablösen</i> | ‘to exchange, replace’ |
| | <i>versammeln</i> | ‘to assemble’ |
| | <i>zusammensammeln</i> | ‘to gather, flock together.’ |
- (148) a. *Der Rektor versammelte die Professoren und Dozenten.*
 ‘The dean assembled the professors and instructors.’
 = b. **Der Rektor versammelte die Professoren mit den Dozenten.*
 ‘The dean assembled the professors with the instructors.’

The semantic reason for the idiosyncratic behaviour of *versammeln* (148) rests on the fact that this verb denotes gathering (assembling) of objects which are just juxtaposed, but not opposed to each other (as is the case with verbs of connecting; see 8.2.2). Thus, *versammeln* turns out semantically to be two-place with one plural object (represented either by the morphological plural or by a collective noun). The same regards *zusammensammeln*.

Finally, verbs with a complex prefix containing *-einander-* (see 5.5), as a rule, also allow simple constructions only; cf.:

- (149) *Erich hat beide Hälften aneinandergefügt.*
 ‘Erik has joined together the two halves.’

This is only natural since the complex prefix by itself incorporates a “reciprocal argument”.

Apart from such “reciprocal prefixes”, but including verbs prefixed with *zusammen-* (see 7.2), the bulk of object-oriented lexical reciprocals can be used both in simple and discontinuous constructions; cf.:

- (150) a. *Hans verwechselte Erich mit Willy.* lit. ‘Hans mixed Erik up with Willy.’
 = b. *Hans verwechselte Willy mit Erich.* lit. ‘Hans mixed Willy up with Erik.’
- (151) a. *Anna tauschte die Blumen aus.*
 ‘Anna changed the flowers.’
 = b. *Anna tauschte die einen Blumen gegen die anderen aus.*
 ‘Anna changed one set of flowers with another.’

The predominant number of these verbs, in order to be used in a discontinuous construction, requires the preposition *mit* ‘with’; here belong:

- (152) *bekanntmachen* ‘to acquaint’
verbinden ‘to connect’
versöhnen ‘to reconcile’
vertauschen ‘to mix up’
zusammenbringen ‘to bring together.’

There are only a few verbs with the general meaning of ‘separating’ or ‘mutual exchange’ which require *gegen* ‘against’ (see (153)), or *von* ‘from, against’ (see (154)); e.g.:

- (153) *austauschen* ‘to exchange’
auswechseln ‘to replace.’
- (154) *abgrenzen* ‘to separate’
unterscheiden ‘to distinguish.’

Most of the verbs that allow both constructions can combine with an *-einander-* phrase, according to their syntactic valency, i.e. *mit|einander*, *gegen|einander* or *von|einander* (see 5.5).

The reciprocity marker *gegenseitig* (see 4.6) can be employed only to a very limited extent. It can be used with verbs of exchange (see (158)). But even these verbs, with the exception of *ablösen* (see (147a)), sound better with an *-einander-* phrase (*gegen-* or *mit-einander*) than with *gegenseitig*. As for the remaining bulk of lexical reciprocals, only the “comparison verbs” *abgleichen*, *abpassen*, *abstimmen* (see (160)) and the “connecting verbs” *bekanntmachen* ‘to acquaint’, *kreuzen* ‘to (inter)cross’, *verschränken* ‘to cross’ sound natural also with *gegenseitig*.

8.2.2 Semantic types

1. The most numerous and typical groups are verbs of connecting; e.g.:

- | | | |
|-------|----------------------------------|------------------------------------|
| (155) | <i>X mit/und Y vereinen</i> | ‘to unite X with/and Y’ |
| | <i>die Arme verschränken</i> | ‘to cross one’s arms’ |
| | <i>X und Y zusammenbringen</i> | ‘to bring together X and Y’ |
| | <i>zwei Apfelsorten kreuzen</i> | ‘to cross two varieties of apples’ |
| | <i>X mit/und Y bekanntmachen</i> | ‘to acquaint X with/and Y’ |

28 out of the 50 verbs mentioned above belong in this group. Among them, in turn, the most regular prefix, beside *zusammen-*, is *ver-* (25 verbs).

2. The number of verbs with the meaning of disconnecting (separating) is smaller. They are formed predominantly with the “reciprocal prefix” *auseinander-*; cf.:

- | | | |
|-------|--------------------------------------|---|
| (156) | <i>X und Y auseinanderdividieren</i> | ‘to divide X and Y (to opposite sides)’ |
|-------|--------------------------------------|---|

Only 4 verbs have been found without this prefix:

- | | | | |
|-------|----|----------------------------------|---|
| (157) | a. | <i>X und Y antagonisieren</i> | ‘to antagonize X and Y’ |
| | b. | <i>X und Y entzweien</i> | ‘to set X and Y at variance’ |
| | c. | <i>X von/und Y unterscheiden</i> | ‘to distinguish X from/and Y’ |
| | d. | <i>X mit/und Y verfeinden</i> | ‘to cause X and Y to fall out with each other.’ |

3. Somewhat differently from the “disconnecting group”, a small number of verbs can be distinguished that denote situations of competition and mutual exchange. This group consists of five verbs:

- | | | |
|-------|----------------------------------|--------------------------------------|
| (158) | <i>X und Y ablösen</i> | ‘to replace X and Y’ |
| | <i>X gegen/und Y austauschen</i> | ‘to exchange, replace X by Y’ |
| | <i>X gegen/und Y auswechseln</i> | ‘to exchange, replace X by Y’ |
| | <i>X mit/und Y vertauschen</i> | ‘to change the positions of X and Y’ |
| | <i>X mit/und Y verwechseln</i> | ‘to mix up (in mind, by mistake).’ |

The reciprocal situation encoded by *ablösen* must be interpreted as occurring repeatedly or even regularly (cf. Kunze 1992: 122, 1995: 30f.):

- | | | |
|-------|---|-------------------|
| (159) | <i>Er löste sie gegenseitig (= durcheinander) ab.</i> | (see footnote 21) |
| | ‘He replaced them by each other (regularly).’ | |

The same often holds for *auswechseln* ‘to change, replace’.

4. A further small subgroup of 6 verbs has the meaning of comparing, harmonizing or confronting two objects; these are:

- | | | |
|-------|---|---|
| (160) | <i>Version A mit Version B abgleichen</i> | ‘to compare version A to version B’ |
| | <i>Zug A auf Zug B abpassen</i> | ‘to time trains A and B’ |
| | <i>das Hemd auf das/mit dem Jacket abstimmen</i> | ‘to fit the shirt with the jacket’ |
| | <i>eine Theorie einer anderen entgegenstellen</i> | ‘to compare one theory against another’ |
| | <i>zwei Zeugen einander gegenüberstellen</i> | ‘to bring two witnesses face to face’ |
| | <i>X mit/und Y vergleichen</i> | ‘to compare X with/and Y.’ |

5. Last not least, there are 7 verbs related to matrimonial events which behave quite idiosyncratically and, therefore, will be treated separately in 8.4.

8.2.3 Anticausatives

1. Only about a dozen object-oriented lexical reciprocals show a standard derivational relation with respective anticausatives. Some of them belong only to the periphery of reciprocity. Beside the already mentioned [*sich*] *entzweien* (see (146b), (157b)) and the near synonyms *verbünden/vereinen/vereinigen* (vt) vs *sich verbünden/vereinen/vereinigen* (vi), here belong the following verbs:

- | | | | |
|-------|--|---|---|
| (161) | <i>aneinanderfügen</i> ‘to knit, set together’ | → | <i>sich aneinanderfügen</i> ‘to fit together’ |
| | <i>kreuzen</i> ‘to cross, intersect’ | → | <i>sich kreuzen</i> ‘to intersect’ (vi) |
| | <i>verbinden</i> ‘to connect’ (vt) | → | <i>sich verbinden</i> ‘to connect’ (vi) |
| | <i>verbrämen</i> ‘to mix up’ | → | <i>sich verbrämen</i> ‘to get mixed up’ |
| | <i>verfeinden</i> ‘to set at variance’ | → | <i>sich verfeinden</i> ‘to become enemies’ |
| | <i>verfransen</i> ‘to make ragged’ | → | <i>sich verfransen</i> ‘to become ragged’ |
| | <i>verhaken</i> ‘to hook up’ | → | <i>sich verhaken</i> ‘to get entangled’ |
| | <i>vermischen</i> ‘to mix’ (vt) | → | <i>sich vermischen</i> ‘to mix (up)’ (vi) |
| | <i>verrühren</i> ‘to mix’ (about liquids) (vt) | → | <i>sich verrühren</i> ‘to mix up’ (vi) |
| | <i>versammeln</i> ‘to assemble’ (vt) | → | <i>sich versammeln</i> ‘to assemble’ (vi) |
| | <i>die Arme verschränken</i> ‘to cross one’s arms’ | → | <i>sich verschränken</i> ‘to intersect’ |
| | <i>versöhnen</i> ‘to reconcile’ | → | <i>sich versöhnen</i> ‘to become reconciled’ |
| | <i>zusammenrollen</i> ‘to roll together’ | → | <i>sich zusammenrollen</i> ‘to whirl’ |

2. There are a number of other verbs which however do not show a regular semantic relationship to the derived anticausatives, since the latter do not encode the implications of the underlying causatives (as do the verbs in (161)) or they show lexical shifts. Here belong [*sich*] *unterscheiden* (see (154b), (157c)) and the following verbs:

- | | | | |
|-------|---|---|--|
| (162) | <i>zusammenballen</i> ‘to ball (e.g. the fist)’ | → | <i>sich zusammenballen</i> ‘to agglomerate’ |
| | <i>zusammensetzen</i> ‘to put together’ | → | <i>sich zusammensetzen</i> ‘to consist of’ |
| | <i>zusammensparen</i> ‘to save (money)’ | → | <i>sich zusammensparen</i> ‘to accumulate (of money).’ |

The remaining verbs discussed in 8.2.1–2 do not have anticausative derivatives at all. Some of them form reciprocal constructions with *sich* according to the “canonical” pattern (see 4.2.1); cf.:

- | | | | |
|-------|----|--|--|
| (163) | a. | <i>Petra verwechselte Marta und Helga.</i>
‘Petra mixed up Martha and Helga.’ | |
| | → | b. | <i>Petra und Marta verwechselten sich [gegenseitig] (mit Helga).</i>
‘Petra and Martha mixed each other up (with Helga).’ |

Derived anticausatives show almost no restrictions on discontinuous constructions; compare (112) with its derivatives:

- | | | | |
|-------|----|---|---|
| (164) | a. | <i>Das Mehl und der Zucker vermischten sich.</i>
‘The flour and the sugar mixed up.’ | |
| | = | b. | <i>Das Mehl vermischte sich mit dem Zucker.</i>
‘The flour mixed up with the sugar.’ |

As concerns verbs with a peripheral reciprocal meaning, the restrictions that were observed with their causative counterparts (see 8.2.) are less serious, although the discontinuous construction (165b) still sounds odd:

- (165) a. *Die Professoren und Dozenten versammelten sich.*
 ‘The professors and instructors assembled.’
 = b. [?]*Die Professoren versammelten sich mit den Dozenten.*
[?]‘The professors assembled with the instructors.’ (cf. (148)).

8.2.4 Verbs pertaining to matrimonial events

This small group of verbs shows idiosyncrasies both syntactically and semantically. *Verheiraten* ‘to cause to marry’ indicates a reciprocal relation, but the simple construction requires an explicit marker to signal (166c) that both objects get married to each other and not each to a third person; cf.:

- (166) a. *Er verheiratete ihn mit ihr.* ‘He married him to her.’
 b. *Er verheiratete beide.* i. ‘He married both [to sb else]’
 ii. [?]‘He married both to each other.’
 c. *Er verheiratete beide miteinander.* ‘He married both to each other.’

In the case of the first interpretation of (166b), which is preferred by native speakers (especially if the object phrase *beide* ‘both’ is stressed), the sentence is syntactically complete but semantically elliptical implying third parties in two marriages, because a change in the social status of the referents is foregrounded. The second interpretation is, as a rule, rejected. The derived anticausative even more strongly suggests that each one marries another (third) person; cf.:

- d. *Sie verheirateten sich.* ‘They married’ (each a third person).

At this point, the two-place reciprocal verb *heiraten* ‘to marry’, from which *verheiraten* derives, should be mentioned. It can be used as a transitive (167a) or as an intransitive predicate (167b):

- (167) a. *Hans heiratet Maria.* = *Maria heiratet Hans.*
 ‘Hans marries Mary.’ = ‘Mary marries Hans.’
 = b. *Hans und Maria heiraten.*
 ‘Hans and Mary marry.’

Most native speakers do not accept *heiraten* together with a reflexive pronoun, though this can still sporadically be encountered in some descriptions and dictionaries.²³ In other words, *heiraten* is ceasing to derive a recessive diathesis and cannot be used with a prepositional phrase (with *mit*, see 4.7, 8.1).

Verehelichen should be treated as an obsolete synonym of *verheiraten*, which has diatheses identical with those of the latter verb (both in a causative and anticausative construction). The synonym *vermählen* and the analogous *verloben* ‘to engage/betroth’ differ

23. It is included in Mater’s list (see 1.4) and is considered as collocating with *sich* by Kunze (1995:32). But the collocation with *sich* is clearly becoming obsolete.

from *verheiraten* in this respect, since native speakers are more apt to discern a reciprocal relation both in the causative and the derived anticausative construction (cf. with (166)).

9. Reciprocals in periphrastic causative constructions

In German, analytic causative constructions with the auxiliary *lassen* ‘to let’ are used abundantly. Other causative auxiliaries are used to a much lesser extent (Nedjalkov 1976: 32ff.). The following remarks concern constructions with *lassen*.

1. *Embedded infinitives*. Simple reciprocal constructions with either the reflexive pronoun or the unambiguous reciprocal pronoun can be embedded into analytic causative constructions without any difficulty, both with transitives (see (168)) and intransitives (see (169)):

- (168) a. *Peter_i und Maria_j küssten sich_{i+j}*
 ‘Peter_i and Mary_j kissed each other_{i+j}’
 → b. *Er_k ließ Peter_i und Maria_j sich_{i+j} küssen.*
 he let.PAST P. and M. RM kiss.INF
 ‘He_k let Peter_i and Mary_j kiss each other_{i+j}’.
- (169) a. *Sie_{i+j} halfen sich_{i+j}*
 ‘They_{i+j} helped each other_{i+j}’
 → b. *Hans_k ließ sie_{i+j} sich_{i+j} helfen.*
 ‘He_k let them_{i+j} help each other_{i+j}’.

Instead of the RM *sich* one can use the reciprocal pronoun *einander*, too.

No major problems arise with three-place transitives, either, though such sentences may sound rather clumsy. Lexical reciprocals can be encountered as well (e.g., *Er_k ließ sie_{i+j} sich_{i+j} verabreden* ‘He let them make an agreement’).

Note that with the reflexive pronoun ambiguity (reciprocal vs. reflexive proper) can arise on the same conditions which were shown in Section 4. (The same holds for distant reciprocal constructions, see below.) Lexical causative reciprocals in embedded infinitival constructions imply yet another referent as the immediate agent of the causative situation who is not identical with the causer named by the subject-NP; cf.:

- (170) a. *Er versammelte sie.*
 ‘He gathered/assembled them.’
 → b. *Er ließ sie versammeln.*
 ‘He ordered them to assemble (via his assistant(s)).’

This additional referent in (170b) can even be syntactically specified. Compare (170c) and (171c) below:

- c. *Er_i ließ sie_{j+k} durch seine_i Helfer₁ versammeln.*
 ‘He_i ordered his_i assistants₁ to assemble them_{j+k}.’
 lit.: ‘He_i ordered to assemble them_{j+k} by his_i assistants₁.’

2. *Distant reciprocal constructions.* In German one can totally incorporate reciprocals into an analytic causative construction if the plural subject corresponds at once to the initiator and to the patient or recipient (beneficiary) of the whole situation. These constructions are possible with all two- and three-place simple reciprocals, e.g.:

- (171) a. *Sie_{i+j} beobachteten sich [gegenseitig]_{i+j}.*
 ‘They_{i+j} observed each other_{i+j}.’
 → b. *Sie_{i+j} ließen sich [gegenseitig]_{i+j} beobachten.*
 they let.PAST RM REC observe.INF
 ‘They let/made each other be observed (by third persons).’
- (172) a. *Ernst_i und Helga_j halfen sich [gegenseitig]_{i+j}.*
 ‘They_{i+j} helped each other_{i+j}.’
 → b. *Ernst_i und Helga_j ließen sich [gegenseitig]_{i+j} helfen.*
 E. and H. let.PAST RM REC help.INF
 ‘Ernst and Helga let/made each other be helped (by third persons).’

Again, the RM *sich* can be replaced by the reciprocal pronoun *einander* (see above).

The crucial difference in comparison with the embedded infinitives (see above) rests in the fact that the referent of the subject-NP remains the intrasentential antecedent of the reciprocal (direct or indirect) object. Thus, the subject-NPs of the derived (b) sentences are coreferential with those of the (a) sentences. Furthermore, the (b) sentences imply a semantic inclusion of a further referent who is supposed to be the proper agent (“executor”) of the event caused (see the added phrase in the translations of the (b) sentences). But these third persons are usually not named. Their explicit naming, albeit principally possible, renders quite awkward sentences; cf.:

- (171) c. *Sie_{i+j} ließen einander_{i+j} sich_{i+j} [?]durch ihre Helfer / [?]von ihren Helfern beobachten.*
 ‘They ordered to observe each other [?]by their assistants.’

10. Simultaneity and succession of reciprocal events

10.1 Introductory

When it comes to analyzing the internal temporal structure of reciprocal predicates, perhaps the most intimate interaction of diathesis with actionality can be revealed. Basically, we ought to distinguish at least between absolute simultaneity (coincidence), partial parallelism (overlapping) and regular succession of actions or events (chaining). Overlapping should further be subdivided into singular subsequence and (more or less) regular exchange (“dovetailing”). The chaining type is to be regarded as the most marginal one (cf. Kemmer 1993:101). Since there is no space here to dwell on the interrelation between actionality, time-locatedness (episodicity) and diathesis in detail, the following remarks will suffice.

10.2 Obligatory simultaneity (coincidence)

For a verb to encode coincidence in its proper sense, two conditions must be fulfilled: first, the relationship between the respective participants has to be really symmetrical. And, second, the situation denoted by the verb must either not be discernible as consisting of discrete “acts” (or phases), i.e. it must encode a state or a homogeneous activity (cf. Kemmer 1993: 109ff.), or, otherwise, consist of but one punctual prompt, i.e. denote an achievement.²⁴ Homogeneous activities are inherent in lexically reciprocal predicates which have been discussed in Section 8, since these, as a rule, leave open the question of the degree of internal fragmentation of the encoded situation.

Coincidental states can easily be encoded by two-place verbs; cf.:

- (173) a. *Er mochte sie, und sie mochte ihn.* ‘He liked her and she liked him.’
 = b. *Sie mochten sich [gegenseitig].* ‘They liked one another.’

Other appropriate state verbs are:

- (174) *sich achten* ‘to value each other’
sich (ver)ehren ‘to adore/venerate each other’
sich kennen ‘to know each other’
sich lieben ‘to love each other’
sich schätzen ‘to value/appreciate each other’
sich verstehen ‘to understand each other’ (only as a state verb!).

Because a state is not fractionable in phases, the substitution of the clitic *sich* by the pronominal *einander* does not change anything in its temporal structure.

As concerns achievements, with ordinary reciprocal verbs other readings easily come to the fore; cf.:

- (175) a. *Hans erblickte Erich, und Erich erblickte Hans.*
 ‘Hans caught sight of Erik and Erik caught sight of Hans.’
 → b. *Hans und Erich erblickten sich.* (simultaneously or after one another?)
 ‘Hans and Erik caught sight of each other.’

We have found only two exceptions to this rule. These are the synonyms *verfehlen*, *verpassen* ‘to fail to meet’. This exception can be explained as the effect of a semantically included negation; cf.:

- (176) a. *Olga verfehlte Anna, und Anna verfehlte Olga.*
 ‘Olga missed Anna, and Anna missed Olga.’
 → b. *Olga und Anna verfehlten sich.*
 ‘Olga and Anna missed each other (= did not meet).’

As for activities, there are certain exceptions to the rule that subevents should not be internally discernible for an activity to be interpreted as mutually simultaneous. These are predicates denoting processes that may last over some conceivable time interval, but re-

24. The terms ‘state’, ‘activity’ and ‘achievement’ are used in Vendler’s (1957: 146f.) sense.

quire a constant physical (cf. (177)) or perceptual (cf. (178)) contact between the two referents (resp. their body parts). Note that it is irrelevant whether the respective participants are conceived of as agents or not. Typical agentive reciprocals more often than not belong under 2. in 10.3:

- (177) a. *Sie schüttelten sich [gegenseitig] die Hände.*
 ‘They shook hands [with one another].’ (totally simultaneous)
 vs. b. *Sie klopfen sich [gegenseitig] auf die Schulter.*
 ‘They patted each other on the back.’ (successive or simultaneous-repetitive?)
- (178) a. *Sie sahen sich [gegenseitig] scharf in die Augen.* (totally simultaneous)
 ‘They looked intently into each other’s eyes.’
 vs. b. *Sie besahen sich aufmerksam von oben bis unten.*
 ‘They looked at each other attentively from top to bottom.’
 (successive or simultaneous-repetitive?)

This brings us to the question if and to which degree different reciprocity markers can trigger a fragmentation of the denoted situations into subevents. First of all, the “reciprocity intensifier” *gegenseitig* can be added to the reflexive pronoun on the conditions named in 4.6. But it alters nothing with regard to the internal structure of the event. As concerns the pronoun *einander* (see Section 5), it cannot generally be stated that this “heavier” marker enhances internal segmentation (in comparison to the “light” marker *sich*). This happens only with *küssen* ‘to kiss’ (see (179)), but not even with *die Hände schütteln* ‘to shake hands’ (see (177a)), *umarmen* ‘to embrace’ or *zuprosten* ‘to toast’. With the latter verbs the internal segmentation (without context) in any case remains vague (for more on this subject see Turek 1988: 116; Kemmer 1993: 102ff.; Knjazev, Ch. 2, §2.3); cf.:

- (179) a. *Hans und Maria küßten sich.* (rather simultaneously)
 ‘Hans and Mary kissed.’
 b. *Hans und Maria küßten einander.* (more likely, one after the other)
 ‘Hans and Mary kissed each other.’
- (180) *Hans und Maria umarmten sich / einander.*
 ‘Hans and Mary embraced each other.’
- (181) *Hans und Maria prosteten sich / einander zu.*
 ‘Hans and Mary toasted each other.’

The point is that, in order to “segmentize“, the heavier marker must distinguish some feature which is not necessarily specified by the predicate itself. With shaking hands the three features of direct physical contact, mutual emotional involvement and specification of the affected body part are *eo ipso* named, not so with kissing. (One can imagine a situation with mutual, but successive kissing, and not necessarily on each other’s lips and by the free will of both referents.) Thus, with the latter the heavier marker suggests additional subevents, whereas with the former the actional character of the denoted situation is not modified. With the other predicates, which do not include physical contact (or one of the other two components), the choice of *sich* or *einander* does not have bearing on the internal segmentation of the situation either (see (181)). It will be simply underdetermined, as it would with *sich*, too.

With the even heavier marker *einer den anderen* (see Section 6), though, those reciprocal situations can also be internally fragmented which otherwise encode totally simultaneous events – provided direct physical contact obtains. Compare, for this purpose, (177a) and (177a’):

(177) a. *Sie schüttelten einer dem anderen die Hände.* (rather one after the other).

If physical contact is lacking no such effect can be observed; cf. (178a) and (178a’):

(178) a. *Sie sahen einer dem anderen scharf in die Augen.* (rather simultaneously).

As for *aufeinander warten* ‘to wait for each other’, *sich beobachten* ‘to observe one another’, *einander hören* ‘to hear each other’ and similar verbs of perception, the interpretation of [\pm simultaneity] depends on the time interval presupposed or set up by the context. Furthermore, if verbs denoting attentive perceptual activities, like *zuhören* ‘to listen (to)’ and *zusehen* ‘to look at’, are used as reciprocal predicates they do not refer to totally simultaneous processes, since they then can only presuppose a change of roles (comparable with ‘ask-reply’ turns) and automatically belong under 1. or 2. in 10.3 (depending on the number of role changes).

10.3 Types of sequences

As is remarked in 10.1, partially parallel reciprocal actions (events) should be subdivided into singular and repetitive sequences of subevents.

1. *Singular subsequence.* Here belong events which are normally not conceived of as consisting of repeated subactions (within one episode). Nothing changes when the clitic *sich* is replaced by the pronominal *einander*. Most typically, such reciprocals are encoded by predicates which name encounters or similar kinds of social interaction (welcoming, greeting, introducing oneself to each other); cf.:

(182) *Hans und Maria begrüßten sich [gegenseitig].*
‘Hans and Mary welcomed each other.’

2. *Repeated sequences* (“dovetailing”). Without context, the only factor inclining to fraction or not reciprocal events is the actional value of the predicates and some encyclopaedic knowledge. Substitution of the pronominal *einander* for the RM *sich* does not change anything in the internal temporal structure of the denoted event. Thus, sentences (183) probably will be conceptualized rather as repeated similar actions, while sentences (184) do not preclude an interpretation of uninterrupted, internally not fractionable complex mutual processes:

- (183) a. *Sie riefen sich Befehle zu.*
‘They called orders to each other.’
b. *Sie antworteten sich auf ihre Fragen.*
‘They answered each other’s questions.’
c. *Sie verbesserten (= korrigierten) sich gegenseitig.*
‘They corrected each other.’

- (184) a. *Sie bewarfen sich mit Schneebällen.*
 ‘They threw snow-balls at each other.’
 b. *Sie beschossen sich gegenseitig.*
 ‘They shot at each other.’
 c. *Die Verwundeten stützten sich gegenseitig beim Gehen.*
 ‘The wounded supported each other while walking.’

3. *Obligatory succession of subevents.* Certain verb-object constellations, if used in reciprocal constructions, encode actions that, according to encyclopaedic knowledge, most probably take place subsequently. Typical examples are reciprocals of “grooming verbs”; cf.:

- (185) a. *Sie schnitten sich gegenseitig die Haare kürzer.*
 ‘They trimmed each other’s hair.’
 b. *Sie wuschen sich gegenseitig den Rücken.*
 ‘They washed each other’s back.’

The temporal interpretation of such sentences heavily depends on the type of object involved, but not on the choice of the clitic *sich* or the pronominal *einander*.

10.4 Uni-directional succession of events (chaining)

There is a restricted group of verbs which force to view situations as consisting of discrete instances but deprived of a real symmetrical relationship between them (compare with case 2 in 10.3). Different from the other subgroups, most verbs of this subgroup need the pronominal marker *einander* since most of them either require a prepositional object (see the remarks in 5.1, 5.3) or because the clitic RM would render a reflexive meaning (e.g., *vor sich hergehen* ‘to stroll along’). Exceptions are the verbs *verfolgen* and *jagen* (see (189)); but the choice of the marker does not have an impact on the temporal fragmentation of the event.

The prototype verb of this group in German is (*aufeinander/hintereinander/nacheinander*)*folgen* ‘to follow (each other/one after the other)’:

- (186) a. *Einer folgte dem anderen / auf den anderen.*
 ‘One followed after the other.’
 = b. *Sie folgten (auf)einander.*
 ‘They followed each other / one after another.’

Among the semantically similar *vorausgehen* ‘to precede’ and *voreinander hergehen* ‘to go in front of each other’ only the latter can be used as an antonym of *folgen* (i.e., with the necessary change in perspective); cf.:

- (187) a. *Einer ging vor dem anderen her.*
 ‘One went before the other.’
 = b. *Sie gingen voreinander her.*
 ‘They went one before the other.’

As for *vorausgehen* most informants do not accept it at all in a reciprocal construction:

- (188) ?*Sie gingen einander voraus.*
 ‘They pursued/went one before the other.’

Thus, only *vorausgehen* fits the behaviour of English ‘to precede’ (Kemmer 1993:256, fn. 64), whereas a mere change of deictic viewpoint with regard to an otherwise identical situation type can principally be encoded in German. Other verbs that allow to encode temporal chaining relations with reciprocal constructions are:

- | | | |
|-------|--|--------------------------|
| (189) | <i>verfolgen</i> | ‘to pursue’ |
| | <i>jagen</i> | ‘to chase’ |
| | <i>hinterherjagen (nach)</i> | ‘to follow up (chasing)’ |
| | <i>hinterherlaufen, hinterhereilen</i> | ‘to run, hurry after.’ |

Note that all of these verbs, if used in ordinary reciprocal constructions, as a rule, convey only repeated sequences with a permanent change of roles (“chased” vs. “chasing”; see case 2 in 10.3). A reciprocal relationship is obstructed if only two referents are spoken of and the periphrastic construction *einer den anderen* is used:

- | | | | |
|-------|------|--|--|
| (190) | a. | <i>Die Jungen jagten sich gegenseitig [über die Wiesen].</i> | (temporal chaining) |
| | | ‘The boys chased each other [over the meadows].’ | |
| | ≠ b. | <i>Einer (der Jungen) jagte den anderen.</i> | (without role change, non-symmetrical) |
| | | ‘One (of the boys) chased the other (one).’ | |

This agrees with the observation, made with regard to simultaneous events (see 10.2), that only the heaviest marker can lead to a more discrete division into subevents.

Acknowledgments

We wish to thank Daniela Hartmann, Gabriele Klewits, Matta Loewe (Konstanz) for their proof-reading of an earlier version of this paper and for their useful comments on a couple of examples. We are also indebted to Werner Abraham for his suggestions. The final version has been perused with extreme thoroughness by Martin Haspelmath, and most of the changes he suggested are incorporated in the text. Special thanks to Martin. Of course, the usual disclaimers apply.

Reciprocal and reflexive constructions in Polish

Björn Wiemer

Konstanz University

“Co się lubi, to się czubi.”

1. Introduction
 - 1.1 Polish
 - 1.2 Overview
 - 1.3 Data base and lexicographical principles
 - 1.4 Definition of ‘reciprocal verb’
2. Grammatical notes
 - 2.1 Flexion and structure of the verb phrase
 - 2.2 Grammatical status of pronominal forms
 - 2.2.1 The morphosyntactic status of *się* vs. *siebie*
 - 2.2.2 The status of the dative clitic *se*
 - 2.3 Possessive pronouns
 - 2.4 Productive conversion (*nomina actionis*)
3. Non-reciprocal functions of *się*
 - 3.1 Subject-oriented meanings
 - 3.2 Object-oriented meanings
 - 3.3 Grammatical functions of the clitic *się*
 - 3.3.1 Impersonal (deagentive) constructions
 - 3.3.2 Complex reflexive-causatives
4. Reciprocals with the clitic *się* (ACC) (“canonical” reciprocals only)
 - 4.1 General remarks (concerning Sections 4 and 5)
 - 4.2 Reciprocals from two- and three-place transitives
 - 4.3 Semantic subdivision
 - 4.4 Discontinuous constructions
 - 4.5 Comitative subject
5. Reciprocals with *siebie* (ACC), *sobie* (DAT) and *sobą* (INST) (non-clitic)
 - 5.1 Remarks on the opposition *się* vs. *siebie* in “canonical” reciprocals
 - 5.1.1 *Się* not replaceable by *siebie*
 - 5.1.2 *Siebie* replaces *się* with a change to reciprocity
 - 5.1.3 *Siebie* replaces *się* with a change to reflexivity proper
 - 5.2 Diathesis types
 - 5.2.1 “Canonical” reciprocals
 - 5.2.1.1 Derived from two-place intransitives with prepositional objects (*na siebie, za sobą, o sobie*, etc.)
 - 5.2.1.2 Derived from two-place intransitives with dative objects (*sobie*)

- 5.2.2 “Indirect“ reciprocals (*sobie*)
 - 5.2.3 “Possessive” reciprocals (*sobie, swój*)

1. Introduction

1.1 Polish

Polish belongs to the Western subgroup of the Slavonic language family. It is spoken by about 35 mln native speakers in Poland. There is also a considerable number of Poles and people of Polish origin living abroad from Poland (~ 10 mln., mainly in the USA, Canada, Brazil, England, France, Germany, Sweden, Lithuania, Ukraine), who to some degree or other have retained Polish as their first or second mother tongue.

Post-war Polish shows very little regional differentiation (in phonetics as well as in the grammar and the lexicon). At least, it is, in this respect, much more homogeneous than English, French or German.

1.2 Overview

The standard reciprocal construction in Polish is expressed by a verb in the plural collocating with the clitic *się*, a highly polysemous reflexive pronoun, and productively derived from a base non-reflexive verb. As in German (cf. Wiemer & Nedjalkov, Ch. 10, Section 1.2), such verbs with plural subjects often render potentially ambiguous sentences; cf.:

- (1) a. *As-ia codziennie czesa-ł-a Jank-a.*
 A.-NOM every.day comb.IPFV-PAST-F.SG J.-ACC
 ‘Every day Asia combed Janek.’
- b. *As-ia i Jan-ek czesa-ł-i się codziennie.*
 A.-NOM and J.-NOM comb.IPFV-PAST-PL.MP RM every.day
 i. ‘Every day Asia and Janek combed *each other*.’
 ii. ‘Every day Asia and Janek combed *themselves* (i.e. each her/himself).’

The ACC-GEN of the reflexive pronoun is used either in the clitic form *się* or in an orthotonic variant *siebie* (see Sections 2.2.1, 4.5, and 5). Orthotonic forms also replace clitic ones after prepositions. The dative reflexive *sobie* and the instrumental *sobą* do not have separate clitic forms; cf.:

- (2) a. *Jan-ek pomaga-ł Frank-owi, a Fran-ek pomaga-ł Jank-owi.*
 J.-NOM help.IPFV-PAST.SG.M E.-DAT and ...
 ‘Janek helped Franek, and Franek helped Janek.’
- b. *Jan-ek i Fran-ek pomaga-ł-i sobie.*
 J.-NOM and F.-NOM help.IPFV-PAST-PL RM
 ‘Janek and Franek helped each other.’

Unlike German, the reflexive pronoun distinguishes regular case forms with complementary distribution.

The lexical markers *nawzajem* and *wzajemnie* ‘mutually’ can be employed (see 6.1) to mark reciprocity unambiguously. They can be added to almost every kind of predicate, regardless of its diathesis, but they cannot occur without the reflexive pronoun (compare German *gegenseitig*); cf.:

- (3) a. *El-a podtrzymywa-ł-a Mariol-ę, a Mariol-a podtrzymywa-ł-a El-ę.*
 E.-NOM hold.up.IPFV-PAST-F.SG M.-ACC and ...
 ‘Ela was holding up Mariola, and Mariola was holding up Ela.’
- b. *El-a i Mariol-a podtrzymywa-ł-y się nawzajem.*
 E.-NOM and M.-NOM hold.up-PAST-NMP RM mutually
 (**podtrzymywały nawzajem*)
 ‘Ela and Mariola were holding up one another.’

In addition, it is possible to make use of another unambiguous marker of reciprocity, the construction *jeden drugiego* lit. ‘one another’ (see Section 7). Its status remains half-way

between a nominal and a pronominal, it is regularly inflected in its second part and readily includes prepositions, if needed. This construction is used much more rarely than the two means already mentioned (for differences in comparison to Russian *odin drugogo* ‘one another’, *drug druga* ‘each other’ see 7.1).

1.3 Data base and lexicographical principles

More than 1200 Polish verbs collocating with the clitic reflexive pronoun (either as part of lexicalized items or as marker of recessive diatheses) have been systematically extracted from the *Słownik Języka Polskiego* (SJP, 3 vols.) and some literature on the subject. In cases of doubt I have also consulted the larger *Słownik Języka Polskiego* edited by W. Doroszewski (SJP Dor, 11 vols.). Systematic questionnaires with these verbs were prepared for checks by native speakers.¹

Without going into any detail, it should be briefly remarked that Polish has a grammaticalized aspect system of a derivational type. As a consequence the amount of verbs to be investigated would increase considerably if every kind of correlation between corresponding verbs of two aspects were analysed more systematically. Some preliminary observations show that many perfective verbs do not lend themselves easily or at all to an alternative reciprocal interpretation, whereas their imperfective counterparts do so more often.² As a rule, this is conditioned by the interval structure, which plays a central role in the functioning of grammatical aspect. Here I will account for the interaction of reciprocity with aspect only in the concluding section (Section 10, but see also 8.1, 8.1.1, and 8.2.1).

1.4 Definition of ‘reciprocal verb’

See the definition given for German reciprocal verbs in Wiemer & Nedjalkov (Ch. 10, §2.4).

1. On this occasion I want to thank some Polish colleagues who answered most of my inconvenient questions. In the first place I thank Joasia Błaszczak, Ania Socka, Ela Solak and prof. Halina Satkiewicz. But also Magda Bondkowska, Adam Dobaczewski, Dorota Filar, Grażyna Habrajska, Waldemar Klemm, Marek Łaziński, Paweł Nowak, Halina Pietrak-Meiser, Mariola Walczak, Ewa Walusiak and prof. Małgorzata Korytkowska should be mentioned here. Furthermore, I am extremely grateful to Ela Solak for her repeated proof-reading; she also directed my attention to some mistakes I had previously overlooked. Of course, the whole responsibility for the presentation of the data and the conclusions drawn on them remains mine.

2. I thank Ela Solak for confirmation on this point.

2. Grammatical notes

2.1 Flexion and structure of the verb phrase

Polish is highly inflected for the nominal parts of speech (6 cases + vocative), less so in verbal morphology, as it has only one past tense paradigm and no synthetic future tense. It shows consistent morphonological alternations, both with consonants and vowels. The past tense is derived from a separate stem and its formation shows some agglutinative features, inasmuch as after the verb stem the categories of tense (marked by *-ł*), number/gender and person are often distinguishable by different morphemes one after the other (in the mentioned order). Person morphemes behave like enclitics and can be separated from the rest of the verb.

2.2 Grammatical status of pronominal forms

All third person pronouns distinguish case and number; in the singular there are three genders – with a subgender of the masculine, restricted to animate male referents, in the plural two (the so-called masculine-personal, *MP*, vs. non-masculine-personal, *NMP*). In the masculine and neuter also some distinctions of \pm clitic forms occur. The clitics always behave like enclitics and, thus, cannot be used sentence initially. Provided a clitic form does not have a non-clitic counterpart it can become orthotonic by being put under stress (e.g., the feminine accusative singular *ją* for indicating a marked topic or a marked rheme). Non-possessive reflexive pronouns do not show number distinctions. The *RM* *się* distinguishes cases and shows clitic and orthotonic (accentuated) forms; the dative form of the *RM* (*sobie*) can be used both as a clitic and orthotonic morpheme (Table 1a). In this regard it behaves like the German *RM* *sich* (cf. Wiemer & Nedjalkov, Ch. 10, Section 2.2.1). The *3PL* pronoun is marked for masculine-personal vs. non-masculine-personal gender (Table 1b).

As for the 1st person pronouns, at least in contemporary speech, only the dative singular distinguishes clitic vs. orthotonic form (*mi* vs. *mnie*). With the 2SG pronouns the *ACC-GEN* clitic *cię* has an orthotonic counterpart *ciebie*, as has the dative *ci* vs. *tobie*.

Table 1a. The forms of the reflexive pronoun

Singular	Clitic	Non-clitic
NOM	–	–
GEN	<i>się</i>	<i>siebie</i>
DAT	(<i>se</i>)*	<i>sobie</i>
ACC	<i>się</i>	<i>siebie</i>
INS	–	<i>sobą</i>
LOC	–	(prep.+) <i> sobie</i>

* See 2.2.2 below.

Table 1b. The paradigm of 3rd person pronouns

		Clitic		Non-clitic	Plural (all genders, no distinction of \pm clitic)	
Singular	M	N	F		<u>MP</u> *	<u>NMP</u>
NOM	<i>on</i>	<i>ono</i>	<i>ona</i>		<i>oni</i>	<i>one</i>
	M	N	F	M, N		
GEN	<i>go</i>	<i>go</i>	<i>jej</i>	<i>jego</i>		<i>ich</i>
DAT	<i>mu</i>	<i>mu</i>	<i>jej</i>	<i>jemu</i>		<i>im</i>
ACC	<i>go</i>	<i>je</i>	<i>ją</i>	<i>jego</i> (only M)	<i>ich</i>	<i>je</i>
INS	<i>nim</i>	<i>nim</i>	<i>nią</i>	(<i>nim, nim, nią</i>)		<i>nimi</i>
LOC	(prep.+) <i>nim</i>	<i>nim</i>	<i>niej</i>	(<i>nim, nim, niej</i>)		(prep.+) <i>nich</i>

* Basically, this gender refers to male adult persons (Polish “rodzaj męsko-osobowe”).

If two or more predicates with the reflexive clitic are coordinated within one clause, all but the first clitic are omitted. This regards derivational (see (4a)) as well as grammatical functions (cf. (4b)) of the clitic:

- (4) a. *Bracia często klócili się i znowu [#się] godzili.*
 ‘Often the brothers brawled with each other and again became reconciled.’
 b. *Na przyjęciu piło się, rozmawiało [#się] i tańczyło [#się] bardzo dużo.*
 ‘During the banquet there was very much drinking, talking and dancing.’

2.2.1 The morphosyntactic status of *się* vs. *siebie*

Only the clitic form *się* is employed as part of certain reflexive-causative constructions (see 3.3.2, 9). The non-clitic *siebie* replaces the clitic form in rhematic and marked-topic positions (cf. Buscha & Wiese 1983:73). Naturally, in this function it can be employed only as a marker of semantic reflexivity or reciprocity (cf. Fokker & Smolikowska 1971:26; Niedzielski 1976:171), but not in any derivational functions of recessive diathesis.

2.2.2 The status of the dative clitic *se*

Differently from the ACC/GEN-form, the dative of the reflexive pronoun has actually only one form, *sobie*. The clitic *se* could at best be regarded as a substandard variant with a very unclear distribution. Informants reject it altogether. (For details on the loss of the dative clitic *si* and the history of *se* see Decaux 1955:83.)

2.3 Possessive pronouns

The 3rd person reflexive possessive pronoun *swój* always refers back to the sentence subject (see 2.2.1 for personal pronouns). Non-reflexive forms of the 1st and 2nd person (*mój*, *twój*) are used rather for the purpose of empathy. If the subject is not coreferential with the specified referent, the suppletive forms *jego* (M, N), *jej* (F), *ich* (PL, all genders) must be used. The latter forms agree in gender and number with their antecedents, while all other forms show agreement with their head noun; cf. Table 2.

Table 2. Possessive pronouns (without case distinctions)

	1st person		2nd person		3rd person			
	Singular	Plural	Singular	Plural	coreferential		non-coreferential	
					Singular	Plural	Singular	Plural
M	<i>mój</i>	<i>moje / moi*</i>	<i>twój</i>	<i>twoje/twoi*</i>	<i>swój</i>	<i>swoje/swoi*</i>	<i>jego</i>	} <i>ich</i>
F	<i>moja</i>	<i>moje</i>	<i>twoja</i>	<i>twoje</i>	<i>swoja</i>	<i>swoje</i>	<i>jej</i>	
N	<i>moje</i>	<i>moje</i>	<i>twoje</i>	<i>swoje</i>	<i>swoje</i>	<i>swoje</i>	<i>jego</i>	

* Masculine-personal gender.

2.4 Productive conversion (*nomina actionis*)

Standard Polish demonstrates regular derivation of gerundial nouns, which exist beside lexicalized deverbial nouns (Netteberg 1953: 118ff.; Tkachenko 1969; Fokker & Smolikowska 1971: 26; Kwapisz 1978: 87; Faulstich 1981); cf.:

- (5) a. *wyrąbać* (PFV) / *wyrąbywać* (IPFV) (las) 'to cut down' (forest.ACC)
 → b. *wyrąbanie* (PFV) / *wyrąbywanie* (IPFV) (lasu) 'cutting down' (of the forest.GEN).

(The lexicalized item would be *wyrąb* 'fall, felling'.) Differently from the other Slavonic languages, Polish *nomina actionis* retain the distinction of grammatical aspect (5) and the reflexive pronoun, i.e. the marker of recessive diathesis. Among others, this concerns also reciprocal meanings; cf.:

- (6) a. *opierać rower o słup* 'to lean.IPFV the bike.ACC against a pillar.ACC'
opierać się o siebie 'to lean.IPFV (+ RM) against each other.'
 → a. *opieranie roweru o słup* 'the leaning of-the-bike.GEN against a pillar.ACC'
opieranie się o siebie 'the leaning.IPFV (+ RM) against each other'
 (compare with (53c)).

Productivity of derivation is not restricted by any type of valency; other examples would be: *podziękować/dziękować* (PFV/IPFV) *sobie* (DAT) *za pomoc* 'to thank each other for help' → *podziękowanie/dziękowanie* *sobie* *za pomoc* 'thanking of each other for help', *przekomarzać* (IPFV) *się ze sobą* 'to poke fun at each other' → *przekomarzanie się ze sobą* 'poking fun at each other', *skłócić się* (PFV) *między sobą* 'to be set at variance among themselves' → *skłócenie się między sobą* 'setting at variance among each other' etc.

3. Non-reciprocal functions of *się*

The clitic *się* can be encountered in all main subject- and object-oriented types of recessive diathesis, excluding passive proper (see 3.2.4, 3.3.1). Below I shall leave aside isolated, rare cases of polysemy.

3.1 Subject-oriented meanings

The following meanings can be distinguished here:

1. *Reflexive proper*. See first reading of (1b) and the following:

- (7) a. *Kierownik wynagrodził współpracownika za dobre wyniki pracy dodatkowym urlopem.*
 ‘The supervisor rewarded the collaborator for his good work with some extra free days.’
 → b. *Kierownik wynagrodził się za wyniki pracy dodatkowym urlopem.*
 ‘The supervisor rewarded himself for his good work by some extra free days.’

2. *Possessive-reflexive*. Only the dative reflexive can be used in this diathesis (see 5.2.3).

3. *Partitive-reflexive*. This type is attested only with a few verbs denoting performance on one’s own body parts (*wysmarkać się* ‘to blow one’s nose’, *uczesać się* ‘to comb one’s hair’, *malować/szminnować się* ‘to make up’, *zmarszczyć się* ‘to frown’) and with another few verbs encoding actions upon parts of one’s own clothes (e.g., *zapiąć się* ‘to button one’s coat, trousers etc.’, *rozpiąć się* ‘to unbutton one’s clothes’).

4. *Autocausative*. Beside the reflexive proper and reflexive-possessive, the auto-causative meaning is the most frequently attested subject-oriented type; cf. an example:

- (10) a. *Jan rzuca piasek do basenu.*
 J.NOM throw.IPFV.PRES.3SG sand.ACC to pool.GEN
 ‘Jan throws sand into the swimming-pool.’
 → b. *Jan rzuca się do basenu.*
 J.NOM throw.IPFV.PRES.3SG RM to pool.GEN
 ‘Jan throws himself into the swimming-pool.’

5. *Deaccusative*. Such verbs are less numerous; e.g.:

- (11) a. *Marek podjął ciężką pracę(ACC).* ‘Marek undertook some hard work.’
 → b. *Marek podjął się ciężkiej pracy(GEN).* ‘Marek engaged himself in hard work.’

6. *Absolute diathesis*. It is difficult to find clear examples of reflexive verbs with “absolute” (a kind of anti-passive) meaning.³ Close to the “absolute” function are reflexive variants of some very few intransitive verbs. These are normally not found in works on reflexives, e.g. *(po)wrócić (się)* ‘to return’, *(po)śpieszyć (się)* ‘to be in a hurry’, *(po)patrzeć (się)* ‘to look at’, as well as some seven verbs denoting luminous phenomena (e.g., *lśnić (się)* ‘to sparkle’; cf. Wilczewska 1966:102).⁴

3. This observation indicates quite clearly the intermediate status of Polish in areal terms: the Eastern Slavonic and Baltic languages do have both partitive object and absolute functions of the RM, whereas the languages West from them hardly have any (see Geniušienė 1987:244, 249f. and Wiemer & V. Nedjalkov, Ch. 10, 3.1).

4. Only slight differences on the level of semantic roles can be observed, which cannot be dwelt on here (cf. Schenker 1985:16ff., 1993:68f.; Greń 1991:129–32).

3.2 Object-oriented meanings

1. *Anticausative*. This is probably the most frequent type of all recessive diatheses (beside the reflexive proper and reciprocal meanings); cf.:

- (12) a. *Ewa uspokoiła małą siostrę.* ‘Ewa calmed down her little sister.’
 → b. *Mała siostra uspokoiła się.* ‘The little sister calmed down.’

2. *Converse relations*. These are conveyed by only a few verbs and their reflexive counterparts; e.g.:

- (13) a. *Pleśń(NOM) pokryła chleb(ACC).* ‘Mould covered the (loaf of) bread.’
 → b. *Chleb(NOM) pokrył się pleśnią(INS).* ‘The bread was/got covered by mould.’

3. *Reflexive causatives*. Such relations can be expressed by another lexically very restricted group of verbs. All of them arise on the basis of metonymic relationships between an inalienable “possessor”, his/her body parts and a separate implied agent. The latter can be explicated by a prepositional *u* +GEN phrase (lit. ‘at sb’); cf.:

- (14) *Adam strzy-że się (= swoje włosy) u modnego fryzjera.*
 A_i-NOM cut.hair.IPFV-PRES.3SG RM his_i hair at fashionable.GEN barber.GEN
 ‘Adam has his hair cut at a fashionable barber’s.’

(Cf. Bogusławski 1977: 102ff.; Kwapisz 1978: 68.)

4. *Passive-like meanings*. The reflexive pronoun does not serve as a marker of a genuine (three-partite) passive, since in contemporary Polish there are no derived constructions with *się* that would allow a syntactic explication of the demoted agent by the construction *przez* lit. ‘through’ + ACC, which is otherwise applied with the analytic passive (Weiss 1982: 198f., 212ff.; Rytel-Kuc 1990: 120; Wiemer 1996: 174).⁵ There are, however, different passive-like meanings, which often overlap with the anticausative referring either to ongoing actions (e.g., *Spodnie się piorą* ‘The trousers are being laundered’) or to events that happened against the will or without the control of an agent, e.g. (cf. Geniuśienė 1987: 275):

- (15) *Rozla-ł-o mi się mleko.*
 spill.PFV-PAST.SG-N me.DAT RM milk.NOM
 ‘I have spilled the milk unintentionally’, or (less likely)
 ‘The milk got spilt on me.’

A clear modal meaning is rendered by these constructions if they co-occur with evaluative adverbials, such as *łatwo* ‘easily’, *szybko* ‘quickly’, *przyjemnie* ‘with pleasure’ etc. (cf. Bogusławski 1977: 119; Kwapisz 1978: 57),⁶ e.g.:

- (16) *Nasze drzwi zamykaj-ą się łatwo.*
 our.PL door.PL* close.IPFV-PRES.3PL RM easily
 ‘Our door closes easily.’

* *Drzwi* is a *plurale tantum*.

5. A regular reflexive passive most probably existed in Polish only for a very short period, namely in the first half of the 19th century (cf. Szlifersztejnowa 1968: 133, 154f., 157ff.).

6. Compare with the German equivalents in Wiemer & Nedjalkov (Ch. 10, 3.2).

3.3 Grammatical functions of the clitic *się*

3.3.1 Impersonal (*deagentive*) constructions

Beside more or less lexicalized and restricted functions of the clitic RM (see 3.1–2) modern Polish permits the reflexive pronoun to be used as a marker of recessive diathesis with the 3SG of any verb having a personal agent in its diathesis, e.g.

- (17) a. *Adam i Bartek gra-l-i w szachy.*
 A.NOM and B.NOM play.IPFV-PAST.3PL-MP in chess.ACC.PL
 ‘Adam and Bartek played chess.’
- b. *Gra-ł-o się w szachy.*
 play.IPFV-PAST.3SG-N RM in chess.ACC.PL
 ‘There was some chess-playing.’

(Compare with lexically impersonal verbs, e.g. *świtać* ‘to dawn’, which do not allow for this construction: **Świtało się.*) Demotion of the first argument, without any other changes on the syntactic level, operates almost universally with respect to verbs of both aspects and almost all base diatheses (Bogusławski 1977: 118; GWJP 1984: 139–41; Rytel-Kuc 1990: 110), and even with the copula *być* ‘to be’ – a phenomenon which is singular among all Slavonic languages (Růžička 1986: 265f.).

3.3.2 Complex reflexive-causatives

In connection with the reflexive-causative function discussed in 3.2 it has to be mentioned that in Polish considerable use is made of the verb *dać*(PFV)/*dawać*(IPFV) lit. ‘to give’, in an auxiliary-like way of marking reflexive causativity. This verb forms the inflected part of compound predicates with an infinitive and the clitic reflexive (cf. Rothstein 1970: 194); e.g.:

- (18) *Magda nie da-ł-a się ogłupi-ć.*
 M-.NOM NEG give-PAST3-SG.F RM make.fool-INF
 ‘Magda did not let herself be fooled.’

Such constructions are roughly equivalent semantically and syntactically to the German analytic causatives with *lassen* (Nedjalkov 1976: 32ff.; Kwapisz 1974, 1978: 38f.; Gehrmann 1983: 11; Wiemer & Nedjalkov, Ch. 10, §9) and the English ones with *to let*, but are encountered only jointly with the reflexive clitic. With non-agentive subject-NPs the analytic reflexive-causative construction is freely interchangeable with the “modal passive”; cf. (16) in 3.2 and the following:

- (19) *Nasze drzwi da-j-a się zamkną-ć łatwo.*
 our.PL door.NOM give.IPFV-PRES.3PL RM close.PFV-INF easily
 ‘Our door can be closed easily.’

4. Reciprocals with the clitic *się* (ACC) (“canonical” reciprocals only)

4.1 General remarks (concerning Sections 4 and 5)

The reciprocal reading brought by the reflexive clitic can derive only from an interaction of this marker with semantic components of the respective verb (usually together with grammatical number). Tables 3–4 comprise verbs that are encountered in one of the syntactic patterns demonstrated in 4.2 and 5.2. The criteria for the labels in Table 3 itself are semantic and derivational: category **A** represents verb pairs with the reflexive derivative having a possible (see (25)–(26), (28)–(29)) or predominant (see (24), (27)) reciprocal meaning; category **B** comprises lexicalized reciprocals and *reciproca tantum*; and category **C** consists of reflexive derivatives of three-place object-oriented lexical reciprocals (see 8.3). As for category **B**, look the following examples of lexicalized reciprocal verbs (20) and *reciproca tantum* (21) (cf. also Wilczewska 1966:89ff.; Zawilska 1996:61):

- (20) a. *złożyć* ‘to found’ → b. *złożyć się* ‘to bet (with sb)’
 (21) a. **droczyć* → b. *droczyć się* ‘to tease each other.’

Verbs of category **A** can be further subdivided according to the syntactic criteria which are applied in 4.2, 5.2.1 and 5.2.2: category **AA** of Table 4 comprises “canonical” cases with the clitic reflexive pronoun occupying the place of the direct object (accusative) (4.2); **AB** comprises two-place intransitive reciprocals (5.2.1.2), **AC** those with the dative reflexive with transitive three-place verbs (5.2.2); and **AD** subsumes cases with the orthotonic forms (*siebie*, *sobie* or *sobą*) occupying the place of a prepositional argument (5.2.1.1).

The “canonical” cases (= category **AA**) can further be split up by separating two-place verbs allowing for recession of their second argument from three-place verbs permitting the same derivation with their second argument (see (23), (27)–(29)). Such a division shows that two-place verbs considerably more often allow recessive diatheses of their second argument than three-place verbs, the split-up being 641:92, i.e. almost 7:1 (see the right-most column of Table 5).

Table 3. Reciprocal verbs collocating with *się* (with plural subjects)

Category	A	B	C	Total
number of reflexive verbs	975 (85%)	78 (7%)	97 (8%)	1150 (100%)
examples	(see 4.2, 5.2.1–2)	(20)–(21)	(see 8.3)	

Table 4. Syntactic subtypes of standard (simple) reciprocal constructions

Category	AA	AB	AC	AD	Total
number of verbs	733 (76%)	55 (6%)	109 (11%)	72 (7%)	969 (100%)
examples	(20)–(21)	(45)–(46)	(47)–(50)	(43)–(44)	

Table 5. Semantic subgroups of canonical reciprocal constructions

Category	A1	A2	A3	Total
two-place verbs	362 (49%)	100 (14%)	179 (24%)	641 (87%)
three-place verbs	37 (5%)	15 (2%)	40 (5%)	92 (13%)
	419 (54%)	100 (16%)	214 (29%)	733 (100%)

4.2 Reciprocals from two- and three-place transitives

As has just been said, reciprocals with the reflexive clitic occupying the position of the second argument (direct object) should be divided into derivatives of two-place (see (22)) and of three-place verbs (see (23)):

- (22) a. *Jacek ściska Wacka.* 'Jacek is hugging Wacek.'
 → b. *Jacek i Wacek ściskają się.* 'Jacek and Wacek are hugging each other.'
- (23) a. *Asia namawia Basię do wagarowania.* 'Asia persuades Basia to play truant.'
 → b. *One namawiają się do wagarowania.* 'They persuade each other to play truant.'

4.3 Semantic subdivision

The verbs of category AA can further be distinguished roughly by their default meanings: either the reciprocal meaning will prevail over other meanings (especially the reflexive proper) and be subsumed under A1; or no definite decision can be taken as for the default meaning (A2); or the reflexive or autocausative meaning will be stronger than the reciprocal one (A3). The distribution is shown in Table 5.

Here some two-place verbs of these subtypes are listed:

- A1 (24) *doceniać się* 'to value/appreciate each other'
implikować się 'to imply one another'
kopać się 'to kick each other'
mijać się 'to pass (by) each other'
obalać się 'to overthrow each other.'
- A2 (25) *brudzić się* 'to soil each other' vs. 'to get dirty'
chwalić się 'to praise each other' vs. 'to boast'
kontrolować się 'to control *each other* / *oneselves*'
opryskać się 'to spray, sprinkle *each other* / *oneselves*'
zadręczyć się 'to worry the life out of *each other*' vs.
 'to worry *oneselves* to death.'

The lexical items listed for A1 and A2 coincide only partly with the verbs given by Penchev (Ch. 13, §§4.1.1.1.1–2) for Bulgarian.

- A3 (26) *bronić się* 'to defend oneself'
huśtać się 'to swing/rock (oneself)'
kształcić się 'to educate oneself'
łudzić się 'to delude/deceive oneself'
rozebrać się 'to undress.'

And here are some recessive three-place verbs of these subgroups:

A1 (27)	<i>darzyć się</i> (zaufaniem) <i>instruować się</i> (+ clause) <i>ostrzec się</i> (o niebezpieczeństwie) <i>powiadomić się</i> (o czymś) <i>wtajemniczyć się</i> (w coś)	‘to give trust to each other’ ‘to instruct each other (how to do)’ ‘to warn each other (about some danger)’ ‘to inform each other (about)’ (see (31b)) ‘to initiate each other (into a secret).’
A2 (28)	<i>bawić się</i> (czymś) <i>obarczać się</i> (czymś) <i>obsypać się</i> (czymś) <i>wpędzić się</i> (w tarapaty) <i>wynagrodzić się</i> (czymś)	‘to amuse <i>each other / oneselves</i> (with)’ ‘to burden <i>each other / oneselves</i> (with)’ ‘to shower <i>each other / oneselves</i> (with)’ ‘to drive each other (into trouble)’ ‘to reward <i>each other / oneselves</i> (by).’
A3 (29)	<i>nastroić się</i> (do czegoś) <i>oduczyć się</i> (czegoś) <i>otulić się</i> (w coś) <i>przekonać się</i> (o czymś) <i>uodpornić się</i> (na coś)	‘to adopt a mood (of doing sth)’ ‘to lose the habit (of doing sth)’ ‘to wrap, tuck <i>oneselves</i> (in sth)’ ‘to take a conviction (about sth)’ ‘to harden, inure <i>oneselves</i> (to sth).’

30 out of 40 three-place verbs of type A3 can equally well be interpreted as derived anticausatives (20 items) or autocausatives (10 items). It must be stressed that many native speakers are reluctant to accept even quite far-fetched reciprocal readings with many verbs of group A2 and A3. Here I can hint only at the most widespread types of polysemy with derived reflexive verbs. A thorough analysis of these defaults, their strength and the role of the reflexive pronoun would require systematic lexicological investigations – an enormous task for future research.

4.4 Discontinuous constructions

A discontinuous encoding of reciprocal relations is, as a rule, excluded for prototypical “canonical” reciprocals (30) and for reciprocals from intransitive two-place verbs (31), but it is possible for such “canonical” reciprocals which show a certain semantic shift with regard to their transitive (two-place) base verbs (32) (for some details on these see 6.2, 8.1). The discontinuous argument is expressed by a comitative object *z* ‘with’ + INST. There are no restrictions exerted by grammatical person; cf.:

- | | | | |
|------|------|---|--|
| (30) | a. | <i>Jola ceni Bartka.</i> | ‘Jola has a high opinion of Bartek.’ |
| | b. | <i>Jola i Bartek się cenią.</i> | ‘Jola and Bartek have a high opinion of each other.’ |
| | → c. | * <i>Jola ceni się z Bartkiem.</i> | lit. ‘Jola esteems herself with Bartek.’ |
| (31) | a. | <i>Pomagam ci [odrobić zadania].</i> | ‘(I) help you [to do your school exercises].’ |
| | b. | <i>Pomagamy sobie [odrobić zadania].</i> | ‘We help each other [to do our exercises].’ |
| | → c. | * <i>Pomagam sobie z tobą.</i> | lit. ‘(I) help myself with you.’ |
| (32) | a. | <i>Widz-isz babc-ię [na uroczystości rodzinnej].</i> | see.IPFV-PRES.2SG grandma-ACC.SG on celebration.LOC.F of.family.LOC.F |
| | | | ‘(You) see grandma [at the family ceremony].’ |

- b. *Widz-isz się z babc-ią [dwa razy w tygodn-iu].*
 see.IPFV-PRES.2SG RM with grandma-INST.F.SG two times in week-LOC.M
 = ‘You and grandma meet [twice a week].’
 lit. ‘(You) see yourself with grandma [twice a week].’

4.5 Comitative subject

Beside the *comitative object* construction in (32b) there are, however, two *comitative subject* constructions. The first is of the same structure as the discontinuous object (see (32b)), but the prepositional phrase *z* + INST has to appear before the finite verb and cannot be disjoined from the nominative NP (cf. Szupryczyńska 1993:417; Kopcińska 1995:133). The comitative subject can be placed after the finite verb only if the nominative NP (or pronoun) is omitted by general rules of ellipsis (cf. Szupryczyńska 1990:441); the comitative subject then becomes distinguishable from the comitative object only by virtue of the plural marking in the predicate (finite verb); compare (32b) with (32c):

- c. *Widz-icie się z babc-ią dwa razy w tygodn-iu.*
 see.IPFV-PRES.2PL RM with grandma-INST.F.SG two times in week-LOC.SG
 (the same as in (32b)) lit. ‘(you.PL) see.2PL yourselves with grandma twice a week.’

It then represents the second type of comitative subject which consists of the *plural subject-NP* with *z* + INST (cf. Dyla 1988; Greń 1991:133f.). Comitative subjects with nominative NPs and finite verbs in the plural are ambiguous, since they permit both an exclusive (i.) or an inclusive (ii.) interpretation of the prepositional phrase with respect to the plural subject-NP: i. ‘you = you(PL) + grandma (grandma $\not\subseteq$ you)’, ii. ‘you = you(SG) + grandma (grandma \subseteq you)’. This type can be encountered only very marginally, this being also the main difference from a parallel construction in Lithuanian (cf. Geniušienė, Ch. 14, §7.2, example (90b); it is also encountered in Russian).

Semantically both constructions come close to sociativity inasmuch as they convey that “the simultaneity of action of two agents is not accidental”;⁷ they are used first of all to refer to a couple of (just two) referents, not more (Szupryczyńska 1990:440).

5. Reciprocals with *siebie* (ACC), *sobie* (DAT) and *sobą* (INST) (non-clitic)

5.1 Remarks on the opposition *się* vs. *siebie* in “canonical” reciprocals

Quite often the clitic *się* is interchangeable with *siebie*. When this takes place a meaning of reflexive proper can come to the fore. Although the conditions on which this happens are extremely difficult to explicate and native speakers’ judgements are far from unanimous, some tendencies can be shown. I will begin with cases where a substitution of *siebie* for *się* is (almost) totally excluded and proceed stepwise to cases where such a replacement

7. “(...) równoczesność działań dwóch agensów nie jest przypadkowa” (Kopcińska 1995:134).

is possible, triggering a change of meaning (for a detailed account see Wiemer 1999: 304–9). The preliminary results conveyed here confirm only partly an iconic principle due to which the phonologically “stronger” form entails greater internal discrimination of the involved participants than the “weaker” (= clitic) form (see Kemmer 1993: 109–19, 122).

5.1.1 *Się* not replaceable by *siebie*

Reflexive verbs which typically denote naturally reciprocal events (cf. Kemmer 1993: 102ff.) do not allow at all *siebie* in place of *się*; e.g.:

- | | | |
|------|--|---|
| (33) | <i>spotkać się</i> | ‘to meet’ |
| | <i>zamienić się</i> [<i>miejscami</i>] | ‘to exchange (places)’ |
| | <i>żegnać się</i> | ‘to take one’s leave (from one another).’ |

The same holds for *reflexiva tantum* with reciprocal meaning (e.g., *rozstać się*/**siebie* ‘to take one’s leave from each other’) and for certain non-reciprocal derivatives, e.g. for anticausative and partitive-reflexive verbs:

- | | | | |
|------|----|--|--------------------------------------|
| (34) | a. | <i>powstrzymać się</i> / * <i>siebie</i> | ‘to abstain/resist (from doing sth)’ |
| | → | <i>powstrzymać</i> | ‘to restrain/suppress.’ |
| | b. | <i>rzucić się</i> / * <i>siebie</i> na obiad lit. | ‘to throw oneself on the lunch’ |
| | → | <i>rzucić</i> | ‘to throw (sth).’ |
| | c. | <i>trzymać się</i> / * <i>siebie</i> za poręcz(ACC) / poręczy(GEN) | ‘to hold on to the handrail’ |
| | → | <i>trzymać</i> | ‘to hold (sth)/keep holding.’ |
| | d. | <i>ukryć się</i> / * <i>siebie</i> | ‘to hide’ |
| | → | <i>ukryć</i> | ‘to hide/conceal.’ |

5.1.2 *Siebie* replaces *się* with a change to reciprocity

But native speakers accept properly reflexive verbs with *siebie*. With the clitic the diathesis remains vague. Cf. (35)–(36) in which the (a) sentences may be interpreted in three different ways: the subject referents act (i) each for him/herself (reflexive), (ii) jointly and only for themselves (“exclusive” collective reading), (iii) for/against one another. A reciprocal reading was judged as less probable. But with *siebie*, in the (b)-sentences, the reciprocal reading becomes preferable:

- | | | | |
|------|----|------------------------------------|---|
| (35) | a. | <i>Przyjaciele bronili się.</i> | ‘The friends were defending themselves.’ (ambiguous) |
| | b. | <i>Przyjaciele bronili siebie.</i> | ‘The friends were defending each other.’ (reciprocal) |
| (36) | a. | <i>Znajomi oszukiwali się.</i> | ‘The acquaintances were deceiving themselves.’ |
| | b. | <i>Znajomi oszukiwali siebie.</i> | ‘The acquaintances were deceiving each other.’ |

At first sight, this is a paradoxical situation, since *siebie* is customarily considered as a marker of reflexivity proper. This issue requires further investigation.

With anticausative reflexives such a substitution in many cases proves if not impossible but unnatural (mainly for pragmatic reasons). However, some of my informants confirm that *siebie* can be used and then entails a reciprocal reading, e.g.:

- | | | | |
|------|----|--|--|
| (37) | a. | <i>Bartek i Ania uspokoiłi się.</i> | ‘Bartek and Ania calmed down.’ |
| | b. | <i>Bartek i Ania uspokoiłi siebie.</i> | ‘Bartek and Ania appeased each other.’ |

- (38) a. *Bracia obudzili się.* ‘The brothers woke up (at once).’
 b. *Bracia obudzili siebie.* ‘The brothers woke up each other’ (e.g., by snoring).

5.1.3 *Siebie* replaces *się* with a change to reflexivity proper

Here belong verbs that are on the periphery of verbs denoting naturally reciprocal events (see above). Typically these are verbs naming some kind or other of beating, e.g. *bić się* ‘to beat each other’, *kopać się* ‘to kick each other’, *dziobać się* ‘to peck each other’, but also *całować się* ‘to kiss each other’ (see 8.1); e.g.:

- (39) a. *Ptaki się dziobią.* ‘The birds are pecking each other.’
 b. *Ptaki dziobią siebie.* ‘The birds are pecking each itself.’

More complicated and least clear is the case of reflexives proper and autocausatives which in 4.3 were put into groups A2 and A3 (see (25)–(26)). They stand somewhat opposite to the reflexives proper discussed in 5.1.2: with verbs of these groups the clitic *się* still renders principally possible the three interpretations mentioned in 5.1.2, but with *siebie* the reciprocal interpretation becomes either less probable, or nothing changes with regard to *się*; cf.:

- (40) a. *Siostry chwaliły się.* ‘The sisters praised *themselves* / *each other*.’
 b. *Siostry chwaliły siebie.* ‘The sisters praised themselves (= each herself).’
 (= ii. both jointly; “exclusive“ reading).

Native speakers’ judgements differ especially with regard to these verbs. In both (39) and (40), addition of the reflexive intensifier *samych/same*(ACC.PL, MP/NMP, respectively) would stress reflexivity. And, the other way round, the reciprocity marker *nawzajem* ‘mutually’ (see 6.1) or *jeden drugiego* ‘one another’ (see Section 7) would obstruct the reflexive meaning.

All this shows the instability of defaults with the mentioned verbs taking *się* or *siebie*, and we see that the possibility and effect of placing *siebie* instead of *się* largely depend on the range of polysemy of a given reflexive verb. In no case is this opposition to be regarded as grammaticalized.

5.2 Diathesis types

In the following subsections I will discuss the behaviour of orthotonic, i.e. basically non-clitical forms of the reflexive pronoun (see Table 1).

5.2.1 “Canonical” reciprocals

These subsume constructions with reciprocal verbs that have only two arguments, the second of which not being encoded by an accusative without preposition (the direct object of traditional grammar).

5.2.1.1 *Derived from two-place intransitives with prepositional objects (na siebie, za sobą, o sobie etc.).* There are reciprocals derived from two- or three-place verbs with the reflexive pronoun employed in prepositional arguments, e.g.:

- (41) a. *Adam mrug-a do Ew-y.*
 A.NOM wink.IPFV-PRES.3SG to E.-GEN
 ‘Adam is winking at Ewa.’
 → b. *Adam i Ew-a mrug-ają do siebie.*
 A.NOM and E.-NOM wink.IPFV-PRES.3PL to themselves
 ‘Adam and Ewa are winking at one another.’

They represent category AD of Table 4 and can be exemplified by the following items:

- (42) *czekać na siebie* ‘to wait for each other’
mrugać do siebie ‘to wink to each other’
myśleć o sobie ‘to think about each other’
patrzeć na siebie ‘to look at each other’
 tęsknić za sobą ‘to long for each other.’

Like three-place “dative” verbs (5.2.2), many verbs with obligatory prepositional objects demonstrate a more or less clear polysemy of reciprocal vs. reflexive meaning, e.g. *dbać o siebie* ‘to take care of each other / oneselves’, *wątpić w siebie* ‘to have doubts as to each other / oneselves’ or *patrzeć na siebie* ‘to look at each other / oneselves’.

5.2.1.2 *Derived from two-place intransitives with dative objects (sobie)*. Here belong productive simple reciprocal constructions derived from non-transitive verbs which require an indirect object in the dative (see AB in Table 4); cf. construction (43b) and the list in (44):

- (43) a. *Janek sympatyz-uje Frank-owi.*
 J.NOM sympathize.IPFV-PRES.3SG F.-DAT
 ‘Janek sympathizes with Franek.’
 → b. *Janek i Franek sympatyz-ują sobie.*
 J.NOM and F.NOM sympathize.IPFV-PRES.3PL themselves.DAT
 ‘Janek and Franek sympathize with each other.’
- (44) *asystować sobie* ‘to assist each other’
dokuczać sobie ‘to annoy/bore each other’
dorównywać sobie ‘to equal one another’
urągać sobie ‘to revile each other’
wierzyć sobie ‘to trust each other.’

Remarkably enough, there is almost no two-place intransitive which would not be characterized by a reciprocal default when it takes the reflexive *sobie* (for a parallel with German cf. 4.2.2 in Ch. 10). Nor do reciprocals of this kind allow any discontinuous coding (see 4.4).

5.2.2 “Indirect” reciprocals (*sobie*)

These are reciprocals derived from three-place verbs with the mutual relationship concerning the first and the third argument expressed by the dative case (see category AC in Table 4); cf.:

- (45) a. *Agata pożycza-ł-a książki Eli.*
 A.NOM lend.IPFV-PAST.SG-F book.ACC.PL E.DAT
 ‘Agata lent books to Ela.’
- b. *Agata i Ela pożycza-ł-y sobie książki.*
 A.NOM and E.NOM lend.IPFV-PAST.PL-NMP themselves.DAT books
 ‘Agata and Ela lent each other books.’

Here are a few more verbs of this type:

- (46) *aranżować sobie (zlecenia)* ‘to organize (orders) for each other’
oddać sobie (klucze) ‘to return (the keys) to each other’
narzucać sobie (poglądy) ‘to impose (one’s opinion) on each other’
odwzajemniać sobie (grzeczności) ‘to reciprocate each other (niceties)’
wypożyczyć sobie (książki) ‘to lend each other (books).’

This group can be characterized by a considerable polysemy of reciprocal vs. reflexive-benefactive meaning (see 5.2.4). Typically, this can be observed regularly with predicates naming situations of deprivation or acquisition; e.g.:

- (47) *Basia i Kasia codziennie kradły sobie cukierki.*
 i. ‘Every day B. and K. stole *from each other* (= *each other’s*) sweets.’
 ii. ‘Every day B. and K. stole sweets (*for their own benefit*).’

But also with many *verba dicendi*, especially those encoding explanation;⁸ e.g.:

- (48) *Przyjaciele tłumaczyli sobie problem.*
 i. ‘The friends explained the problem *to each other*.’
 ii. ‘The friends tried to find a solution of the problem (*for themselves*).’

5.2.3 “Possessive” reciprocals (*sobie, swój*)

Though Polish has possessive pronouns (see 2.3), the possessive relation is not obligatorily expressed by them but rather by a dative personal pronoun. Thus, in practice “indirect” and “possessive” reciprocals often are formally identical. Especially with arguments denoting body parts and other cases of inalienable possession one normally uses *sobie*, not *swój* (cf. Wierzbicka 1988: 411ff.; compare with German in Buscha & Wiese 1983: 75f.; and Wiemer & Nedjalkov, Ch. 10, § 4.4.1):

- (49) a. *Piotr i Paweł myli sobie twarz.*
 ‘Peter and Paul washed their face(s)’ = i. ‘*each his own face*’; ii. ‘*each other’s face*.’
 b. *²Piotr i Paweł myli nawzajem swoje twarze.*
 ‘Peter and Paul washed each other’s face(s)’ (unambiguous, but not idiomatic).

8. Another problem arises with many verbs which do have a reciprocal default, but as for which it remains arguable whether they are really three-place. E.g., *gratulować sobie (z jakiejś okazji)* ‘to congratulate each other (on some occasion)’ or *oświadczyć (sobie), że* ‘to declare (each other) that’ do not necessarily need a third argument to be explicated syntactically, though on the semantic level it is clearly implied. As concerns the syntactic level, one has also to indicate that nine verbs of the group under discussion require their second argument (direct object) to be not in the accusative, but the genitive (e.g. *dostarczać* ‘to supply, provide’, *udzielać* ‘to dispense’).

On the contrary, if the “possessor” is separated from the “possessed object” (or only temporary) the possessive pronoun proves more natural, but should be accompanied by an explicit reciprocity marker (see 6.1) in order to block the default of the reflexive-possessive:

- (50) a. [?]*Basia i Kasia karmi-ł-y nawzajem sobie*
 B.NOM and K.NOM feed.IPFV-PAST-3PL.NMP mutually RM.DAT
kon-ie. (unidiomatic)
 horse-ACC.PL.NMP
- b. *Basia i Kasia karmi-ł-y nawzajem swoje*
 B.NOM and K.NOM feed.IPFV-PAST-3PL.NMP mutually POSS.ACC.PL.NMP
konie.
 horse.ACC.PL.NMP
 ‘Basia and Kasia fed each other’s horses.’

5.2.4 Benefactive meaning

Benefactives can theoretically be made more explicit by the preposition *dla* ‘for’, but only with a limited number of verbs. In practice prepositional phrases with benefactive meaning are used very rarely, probably because – without explicit reciprocal markers – the standard ambiguity with the reflexive proper remains; cf.:

- (51) *Małżonk-owie kupowa-ł-i dla siebie (= sobie)*
 married.couple-NOM.PL buy.IPFV-PAST-3PL.MP for themselves.GEN = themselves.DAT
książk-i.
 book-ACC.PL
 ‘Man and wife bought books for each other / themselves.’

Furthermore, benefactive meanings are normally distinguishable from possessive neither morphologically nor syntactically, in sentences both with uni-directional and reciprocal predicates. (Compare German in Wiemer & Nedjalkov, Ch. 10, § 4.5.)

5.3 Reciprocals with *sobie* derived from verbs with *się*

Since the reflexive pronoun covers an enormous range of functions both in lexical derivation and as grammatical marker of argument demotion (see Section 3), its forms can also be exploited more than once within one clause fulfilling different functions (Kwapisz 1978:36, 40, 64f.). One thus encounters sentences in which the reflexive clitic performs a derivational function, whereas the orthotonic forms *siebie*, *sobie* etc. can serve to mark reciprocity.⁹

5.3.1 Reciprocals from reflexive verbs (standard constructions)

“Double reflexives” occur regularly with recessive diatheses of three-place verbs, i.e., first of all, anti- and autocausatives. Compare the anticausative verb *przyzwyczaić się* ‘to get accustomed’ (← *przyzwyczaić* ‘to accustom’):

9. The same holds, *mutatis mutandis*, for reflexivity proper with converses, e.g. *dziwić się sobie* ‘to be surprised by oneself’ (← *dziwić* (tr.) ‘to astonish (sb)’) (on *reflexiva tantum* see below).

- (52) a. *Marek przyzwyczaił się do Basii.*
 M.NOM get.used.PFV-PAST.3SG.M RM to B.GEN
 ‘Marek accustomed himself (= got accustomed) to Basia.’
 → b. *Marek i Basia przyzwyczaił-i się do siebie.*
 M.NOM and B.NOM get.used.PFV-PAST-3PL.MPR RM to themselves.GEN
 ‘Marek and Basia accustomed themselves to each other.’

Other examples are:

- (53) a. (*odwzajemnić* ‘to reciprocate’ → *odwzajemnić się* (the same)
 → *odwzajemnić się sobie* ‘to reciprocate with each other’
 b. (*narzucać* ‘to impose (sth on sb)’ → *narzucać się* ‘to impose oneself (on)’
 → *narzucać się sobie* ‘to impose oneself upon each other’
 c. (*opierać* ‘to lean sth against sth’ → *opierać się (na czymś)* ‘to rely on sb, repose on sth’
 → *opierać się na sobie* ‘to rely/repose on each other.’

Compare also reflexive-causatives. With these, however, regular reflexive/reciprocal polysemy arises; cf. (14) with the following:

- (54) *Adam i Jan strzy-gą się u siebie.*
 A.NOM and J.NOM cut.hair.IPFV-PRES.3PL RM at themselves.GEN
 i. ‘Adam and Jan have their hair cut at *one another’s* home.’
 ii. ‘Adam and Jan have their hair cut *each at his* home.’

On the one hand, the interpretation of the two reflexive morphemes depends on the reflexive vs. reciprocal default in simple constructions (see 4.3), i.e. if the reflexive derivative belongs to subgroup A3 (= non-reciprocal default) the orthotonic form will mark reciprocity (see (52)–(53)). On the other hand, there are hardly any verbs belonging to subgroup A1 (= reciprocal default) with which *siebie* could be used in natural contexts; cf. the derivative of the imperfective *zapraszać* ‘to invite (repeatedly)’:

- (55) a. *Marek zapraszał Basię do siebie.*
 ‘Marek invited Basia to his house.’
 → b. [?]*Marek i Basia zapraszali się do siebie.*
 ‘Marek and Basia invited each other to their houses.’

5.3.2 Lexicalized reflexives and reciprocal verbs

Lexicalized reflexives (e.g., *odwołać się do siebie* ‘to let each other know about oneself’ ← *odwołać (kogoś ze stanowiska)* ‘to dismiss (sb from service)’) and reflexiva tantum like *odwdziżyć się komu*(DAT) ‘to repay sb’s service’ behave alike; cf. for the latter:

- (56) *Jacek i Wacek odwdziżyć-l-i się sobie [za swoje usługi].*¹⁰
 J.NOM and W.NOM repay.PFV-PAST-3PL.MP RM themselves.DAT for their.ACC.PL
 service.ACC.PL
 ‘Jacek and Wacek repaid service to each other [for their mutual help].’

10. It should be remarked that the reflexive possessive *swoje* is used here to mark reciprocity, too.

Syntactically they are comparable to “indirect” reciprocals if these are combined with autocausative derivation (see (53b) in 5.3.1).

Orthotonic forms can occur jointly also with the comitative marker *ze sobą*, which stresses reciprocity with lexical reciprocal verbs (see 6.2.1). Again, regular ambiguity with the reflexive proper meaning and the “exclusive collective” reading (see 5.1.2) arises; cf.:

- (57) a. *Przyjaciele rozmawiali [ze sobą].*
 ‘The friends were talking [with each other].’
 b. *Przyjaciele rozmawiali ze sobą o sobie.*
 ‘The friends were talking *with each other*’ (i.) ‘*about each other*.’
 (ii.) ‘*each about him/herself*’ / (iii.) ‘*exclusively about themselves*.’

6. Adverbial reciprocity markers

6.1 The adverbs *nawzajem*, *wzajemnie* ‘mutually’

To make the reciprocal relation explicit one of the two synonymous adverbs *nawzajem* and *wzajemnie* is applied. Although *wzajemnie* is directly related to the adjective *wzajemny* ‘mutual’, it is used less frequently than *nawzajem*, which does not have an adjectival counterpart. (If not indicated otherwise, all that will be said about *nawzajem* in principle holds for *wzajemnie*, too.) As often as not these lexemes are used in dictionaries to explicate the reciprocal meaning of formally reflexive verbs with a plural subject. However, more often than not they are not obligatory explicants of reciprocity in natural discourse and are often felt to be redundant (but see (61) below).

These markers can be employed only jointly with the reflexive pronoun, either *się* (58) or *sobie* (50)–(51), or with the reflexive possessive *swój* (see (61b) below), but regardless of the syntactic valency structure.

- (58) a. *Oni bronili się przed wrogami.*
 ‘They defended themselves against enemies.’
 → b. *Oni bronili się wzajemnie przed wrogami.*
 ‘They defended each other against enemies.’
 c. **Oni bronili wzajemnie przed wrogami* (same intended meaning).
 (59) a. *Chłopcy złorzeczyli sobie (nawzajem).*
 ‘The boys cursed each other.’
 b. **Chłopcy złorzeczyli nawzajem* (same intended meaning).
 (60) a. *Bracia przekazali sobie (wzajemnie) pozdrowienia.*
 ‘The brothers conveyed greetings to each other.’
 b. **Bracia przekazali wzajemnie pozdrowienia* (same intended meaning).

Nawzajem usually is a necessary marker of reciprocity in possessive constructions, both with alienable and inalienable objects (see 5.2.3). Sentences with alienable objects, encoded by the possessive pronoun *swój*, by default (61a) have a reflexive meaning, but the addition of *nawzajem* (61b) annuls this default to render a reciprocal reading:

- (61) a. *Marek i Jan nakarmili swoje konie.*
 ‘Marek and Jan fed their (own) horses.’
 → b. *Marek i Jan nakarmili nawzajem swoje konie.*
 ‘Marek and Jan fed each other’s horses.’

Basically the same holds for inalienable objects, indicated by the dative *sobie* (see 5.2.3).

Generally, *nawzajem*, *wzajemnie* cannot be used with inherently reciprocal predicates (see Section 8); cf.:

- (62) a. *Oni obradują (*nawzajem).* ‘They conferred (*mutually).’
 b. *Oni naradzili się *nawzajem.* ‘They counselled (with each other).’

They can be used neither with reflexive derivatives of object-oriented lexical reciprocals (63a) nor with their resultative derivatives (63b):

- (63) a. *Oni sprzymierzyli się (*nawzajem).* ‘They allied (with each other).’
 b. *Oni są (*nawzajem) skoliżaceni.* ‘They are related by marriage.’

Along with this, *nawzajem* cannot be employed in discontinuous constructions (see 8.1.2, 8.2.2); cf.:

- (64) *Piotr powitał się (*nawzajem) z Marysią.* ‘Peter exchanged greetings with Mary.’

6.1.1 Diachronic remarks

Both *nawzajem* and *wzajemnie* derive ultimately from the verb **jąć* ‘to take’, from which first the now archaic noun *zajem* ‘loan’ was formed. This, in turn, rendered *wzajem*, which in the 15th–16th centuries came to be used as an adverbial complement with nouns of exchange to denote lending/borrowing sth for some time on condition of return (*Słownik Staropolski* 1993:603; Brückner 1970:202). The form *wzajemnie* is considerably older than *nawzajem*, which only by the 19th century came into use in its contemporary meaning (originally as *na wzajem* ‘on condition of mutual obligation’; cf. Linde ²1860: 662f.). The form *wzajem* has now become obsolete. Native speakers’ judgements concerning the interchangeability of *nawzajem* and *wzajemnie* (and *jeden drugiego*; see Section 7) in the above contexts vary quite considerably, though *nawzajem* is clearly preferred. Both adverbs form part of certain petrified formulae of greeting, thanksgiving, wishing etc.; cf.:

- (65) – *Wesołych Świąt!* ‘Merry Christmas!’
 – *Nawzajem / Wzajemnie.* ‘Same to you’ (lit. ‘Mutually’).

6.2 Prepositional phrases

In Polish two prepositional constructions with the reflexive pronoun and plural subjects exist.

6.2.1 *Ze sobą* ‘with each other’

This construction, with the literal meaning ‘with oneself/oneselves’, is, in general, to be considered a comitative marker. If used with inherently reciprocal predicates its meaning

becomes sociative, regardless of the derivational history of the reciprocal (for object-oriented lexical reciprocals see 8.2.2); cf.:

- (66) a. *Jan umówił się z Magdą.* ‘Jan made an agreement with Magda.’
 → b. *Oni umówili się ze sobą.* ‘They made an agreement with each other.’

Analogous examples are:

- (67) a. *Oni spotykali się ze sobą / *nawzajem.* ‘They met (repeatedly).’
 b. *Oni pertraktowali ze sobą / *nawzajem.* ‘They negotiated (with each other).’

With many lexical reciprocals, however, *ze sobą* is usually felt to be wholly superfluous and hardly acceptable. This seems to be true especially of lexicalized reflexive reciprocals. But there is no straightforward connection with the way the second participant is encoded, since many, albeit not all, of these verbs sound natural with a discontinuous phrase (*z + INST*); cf.:

- (68) a. *Oni pobrali się [?]ze sobą.* ‘They married.’
 a’. *[?]On pobrał się z nią.* lit. ‘He got married with her.’
 b. *Oni się [?]ze sobą ożenili.* ‘They married.’
 b’. *On się z nią ożenił.* ‘He married her.’
 c. *Wymieniliśmy się [?]ze sobą wrażeniami.* ‘We exchanged our impressions.’
 c’. *Ona wymieniła się z nim wrażeniami.* ‘She exchanged impressions with him.’

Ze sobą shows almost identical distribution with discontinuous constructions (see 8.1.2, 8.2.2), but not with simple constructions – neither with the comitative subject construction, which, as we have seen (4.4), is less restricted than ordinary discontinuous constructions, nor with reciprocal simple constructions being the topic of Sections 4–5; cf.:

- (69) a. *Oni lubili się *ze sobą.* ‘They liked each other.’
 b. *Oni pomagali sobie *ze sobą.* ‘They helped each other.’

Thus, from a lexical and a syntactic viewpoint, *ze sobą* and the adverbs discussed in 6.1 are distributed complementarily. Note, however, that neither *ze sobą* nor *nawzajem* collocate with reciprocal verbs derived from verbs of directed motion discussed in 8.4. This holds not solely with regard to verbs denoting motion into different directions (70), but concerns also their antonyms; compare *zejść się* with its near synonym *spotkać się* (71):

- (70) *Uczniowie rozbiegli się *nawzajem / *ze sobą.*
 ‘The pupils dispersed running.’
 (71) a. *Uczniowie zeszli się *nawzajem / *ze sobą.*
 ‘The pupils came together.’
 b. *Uczniowie spotkali się *nawzajem / ze sobą po lekcjach.*
 ‘The pupils met with each other after school lessons.’

In cases when the denoted situation lacks mutual interaction lexemes indicating sociativity have to be used, i.e. *razem*, *wspólnie*, more rarely *współ* ‘together, jointly’; cf.:

- (72) *Dzieci razem / *ze sobą chodzą do szkoły.*
 ‘The children went to school together.’

These lexemes, however, cannot be used with inherently reciprocal predicates¹¹ (see above).

6.2.2 *Między sobą* ‘with, among each other’

The other prepositional marker used with reciprocal predicates is *między sobą*. The preposition itself means not only ‘among’, but first of all ‘between’. The meaning of *między sobą* is more complex than that of *ze sobą*, since in addition to reciprocity it implies a particular notion of exclusiveness (on German *unter* ‘under’ see Wiemer & Nedjalkov, Ch. 10, §7.4). This meaning can be explicated as ‘distributive relation of more than two participants taking part in one event’ or ‘repetition of an identical event type distributed over a certain closed group of (two or more) participants’. That such a twofold explication is adequate (and necessary) can be demonstrated by the following examples (compare with (68)–(70) in 6.2.1):

- (73) a. *?Oni umówili się*(PFV) *między sobą*.
 ‘They made an agreement’ (lit. ‘between each other’).
 b. **Oni spotkali się*(PFV) *między sobą*.
 lit. ‘They met between each other’ (once).
 c. **Oni pobrali się*(PFV) *między sobą*.
 lit. ‘They married between each other’ (once).

If instead of the perfective verb in (73b) its imperfective counterpart were used (*spotykali się*) we would interpret it as an iterative event (‘used to meet’) and could use *między sobą*, since in such a case the denoted state of affairs concerns several events involving all the time the same set of persons (most likely more than two and probably at different places). With *pobierać się*, the imperfective equivalent of *pobrać się* in (73c), this alternative reading seems rather excluded, unless we induce about the (quite strange) distributive, and felicitous, marrying among the members of two (or a few) families. Finally, even (73a), denoting a singular event, would sound quite strange, if it were to mean an arrangement between just two and not more persons.¹²

The affinity of the preposition *między* to distributiveness is confirmed by its use with the accusative of the reflexive pronoun (*między siebie*), which is applied with some verbs of the generalized meaning ‘to distribute’, such as *rozdąć* or *rozdzielić* (*podzielili jabłka między siebie* ‘(they) distributed/shared apples among themselves/between each other’). The feature of exclusiveness is corroborated by the fact that those lexical reciprocals, like *dzielić się* (*czymś*) ‘to share sth (with each other)’, which presuppose rather a closed number of participants, often sound better with *między sobą* than with *ze sobą*. With such

11. This distinguishes them from their German counterpart *gemeinsam* (cf. Wiemer & Nedjalkov, Ch. 10, 7.3).

12. For this reason the difference between *ze sobą* and *między sobą* can be compared to the distinction made by English *between* vs. *among* (cf. Todaka 1996: 32f.). With regard to the number of presupposed participants, also the Lithuanian and Russian equivalents of *między sobą* show very similar behaviour (cf. Geniušienė, Ch. 14, Section 9; Knjazev, Ch. 15, Section 5.3).

predicates exclusiveness can pertain even to just two, and not more, referents. In any case *ze sobą* does not rule out a collective reading, whereas *między sobą* does:

- (74) *Wszyscy / dwaj podróżnicy dzielili się między sobą /² ze sobą wrażeniami.*
 ‘All / (the) two travellers exchanged their impressions among / between themselves /² with each other.’

Predicates of a static, unagentive character usually do not permit *między sobą*, since they typically do not imply a notion of an “every-member-to-every-member” exclusiveness:

- (75) *Wszystkie te / owe dwie sprawy nie mają *między sobą / ze sobą nic wspólnego.*
 ‘All these / those two matters don’t have anything in common with one another.’

6.3 Minor markers

Other notable, albeit lexically considerably restricted, explicit markers of reciprocal relations are the adverbials *na przemian* ‘by turns’, *naprzeciw(ko)* ‘vis-à-vis, from the opposite side’, *po kolei*, *kolejno* ‘in a row, successively’, *obopólnie*, *obustronnie* ‘bilaterally’. The last three have semantically identical adjectives (*kolejny*, *obopólny*, *obustronny*; compare with *wzajemnie* in 6.1). *Na przemian* serves to express a constant, more or less regular alternation of referents or events. The referents have to belong to one unchanging set (76). *Po kolei* and *kolejno*¹³ differ in the latter respect, since they presuppose an alternation of referents (events) of a principally open set (77). What all three adverbials share is that they specify reciprocity in the temporal domain (see 10.3 on chain relations):

- (76) *Tego dnia wciąż na przemian to się pokazywało słońce, to znów deszcz padał.*
 ‘All that day the weather alternated between rain and sunshine.’
 (lit. ‘rain and sun-shine appeared alternately’).
- (77) *Każdy uczeń musiał po kolei odpowiadać na pytania nauczyciela.*
 ‘Every pupil had one after the other to answer the teacher’s questions.’

The adverb *naprzeciw* refers to the locative domain. It mainly denotes motion directed towards one another.¹⁴ Its variant *naprzeciwko* occurs with a properly locative meaning. This expression indicates that two referents are placed opposite to one another.¹⁵ It, therefore, expresses reciprocity in a more straightforward way than *naprzeciw*, since one can use the latter also in situations when only one referent is moving towards the other (e.g., *Gdy nas zobaczył, ruszył (nam) naprzeciw* ‘When (he) caught sight of us, (he) went towards us’ – for analogies in German see Wiemer & Nedjalkov, Ch. 10, §7.1).

13. Both lexemes derive etymologically from the noun *kolej* meaning ‘row, turn, change of life’ (beside ‘rail’).

14. If *naprzeciw* occurs with a (pro)noun it is often postposed and can be syntactically cut off from the noun, the latter being in the dative (e.g., *Gdy się zobaczyliśmy, ruszyliśmy sobie naprzeciw*. ‘As we saw each other, we went to meet half-way.’).

15. It can be used only preposed, the noun being in the genitive (e.g., *Obydwie grupy stanęły naprzeciwko siebie*. ‘Both groups stood opposite to each other.’).

Table 6. Adverbial markers of reciprocity

Domain		Multiple (iterated) events only
temporal		<i>na przemian; po kolei, kolejno</i>
locative	<i>naprzeciw(ko)</i>	
social	<i>obopólnie, (obustronnie)</i>	

Obopólnie encodes reciprocal relations in the social domain inasmuch as it refers to the sphere of understanding, agreement etc. between humans. Cf. such common collocations like *obopólne zobowiązanie* ‘bilateral obligation’, *obopólna życzliwość* ‘mutual warm-heartedness, disposition’. *Obustronnie* is almost totally synonymous to it, though it may be used also in a concrete spatial sense (e.g., *U pacjenta stwierdzono obustronne zapalenie płuc.* ‘They ascertained that both of the patient’s lungs were inflamed’ (= that the patient suffered from double pneumonia).

Table 6 subsumes what has just been shown.

7. The syntactic marker *jeden drugiego* ‘one another, one the other’

The phrase *jeden drugiego* has the same etymology, internal structure and inflectional paradigm as its Russian equivalent *odin drugogo*, described in Knjazev (Ch. 15, §7.2), and in many respects it behaves like the latter. For this reason the following remarks will be limited to the differences with regard to the Russian counterpart.

7.1 Main differences with regard to Russian equivalents

The most important difference is that Polish *jeden drugiego* ‘one another’ does not have an alternative (and more frequent) reciprocal marker, like Russian *drug druga* ‘each other’ alongside *odin drugogo* ‘one another’. *Jeden drugiego* is employed much more rarely than Russian *drug druga*, and there are almost no cases where this marker would not be replaceable by another, more idiomatic one (see below). It is therefore not the main means of encoding reciprocal relations in speech, though it is frequently used in dictionary explanations of reciprocal meanings, just like *nawzajem* and *wzajemnie* (see 6.1). It is mutually interchangeable with these adverbs and the reflexive pronoun:

- (78) a. *Jan i Piotr pomagali sobie nawzajem.* ‘Jan and Peter helped each other.’
 = b. *Jan i Piotr pomagali jeden drugiemu.* ‘Jan and Peter helped one another.’

But it cannot co-occur with the reflexive pronoun nor with *nawzajem, wzajemnie*:

- (79) a. *Jan i Piotr pomagali *sobie jeden drugiemu.*
 b. *Jan i Piotr pomagali *nawzajem jeden drugiemu.*

7.2 Diathesis types

Jeden drugiego can be used in most subject-oriented diathesis types (as for object-oriented constructions see 8.2): in “canonical” reciprocals, both transitive (see (80)) and intransitive (see (78b)), and in “indirect” reciprocals (see (81)):

- (80) *Magda i Marta lubiły jedna drugą.*
‘Magda and Marta liked one another.’
- (81) *Ania i Asia przekazują jedna drugiej wszystkie wiadomości.*
‘Ania and Asia convey all the news to each other.’

It is unidiomatic, and for many native speakers unacceptable, to use *jeden drugiego* in “possessive reciprocals” (see (82b)), at least if the “possessed” object is alienable:

- (82) a. *Marek sprzedał Piotrowi [swoj] dom.*
M_i.NOM sell.PFV-PAST.3SG.M P.DAT his_i.ACC.SG.M house.ACC.SG.M
- b. *?Marek i Piotr sprzedał-i domy jeden drugiego.*
M.NOM and P.NOM sell.PFV-PAST-3PL.MP house.ACC.PL one other.GEN
‘Marek and Peter sold each other’s houses.’
lit. ‘Marek and Peter sold the houses one of the other.’

Somewhat more acceptable are sentences with inalienable objects requiring the dative case of *jeden drugiego* (see 4.6.3); cf.:

- (83) a. *Marek szczotkował Piotrowi plecy.*
M.NOM brush.IPFV-PAST.3SG.M P.DAT back.ACC.PL (plural only)
- b. *Marek i Piotr szczotkował-i jeden drugiemu plecy.*
M.NOM and P.NOM brush.IPFV-PAST-3PL.MP one other.DAT back.ACC.PL
‘Marek and Peter were brushing each other’s backs.’
(lit. ‘... one the other(DAT) the back’ = ‘...the backs to one another?’).

But even such sentences sound quite unusual. Informants prefer simple constructions with the reflexive pronoun, despite the potential interference of a reflexive interpretation:

- c. *Marek and Paweł szczotkowali sobie plecy.*
(translation as in (83b) vs. ‘were brushing each his back’).

For the sake of clarity one can always add *nawzajem* (see 6.1), and this is the normal way of avoiding ambiguity. The same holds if the reflexive pronoun would render a benefactive-reflexive reading (see 5.2.4); cf.:

- (84) a. *Oni robią sobie zdjęcia.* ‘They take photos for each other/themselves.’
b. *Oni robią zdjęcia jeden drugiemu.* ‘They take photos for each other.’

7.3 Lexical restrictions and preferences

Jeden drugiego can hardly be used instead of the non-clitic form of the reflexive pronoun in constructions with two forms of the reflexive pronoun (85) (see 5.3) and with predicates denoting naturally reciprocal events (86):

- (85) a. *Oni zachwycają się sobą.* ‘They are ravished by each other.’
 b. ²*Oni zachwycają się jeden drugim.* (same).
- (86) *poznać się / ²jeden drugiego* ‘to make acquaintance of one another’
całować się / ²jeden drugiego ‘to kiss (each other)’
spotkać się / ²jeden drugiego ‘to meet.’

If *jeden drugiego* is possible at all, a slight shift in meaning occurs (see 10.1 below).

On the contrary, *jeden drugiego* turns out to be preferable or even necessary if a derived verb with the RM has a meaning other than reflexive proper; *jeden drugiego* then marks an otherwise blocked or obliterated reciprocal reading. Especially autocausative predicates can be cited here:

- (87) a. *Jan i Piotr ukrywali się.*
 ‘Jan and Peter hid themselves’ (repeatedly or for a long time).
 ≠ b. *Jan i Piotr ukrywali *się nawzajem / jeden drugiego.*
 lit. ‘Jan and Peter were hiding one another’ (alternately).

7.4 *Jeden drugiego* in subject position

Although *jeden drugiego* cannot be used jointly with the RM within one clause, it can be used as an afterthought, i.e. in a syntactically disintegrated construction, after a predicate with the RM:

- (88) *Oni się nie znosili↓, jeden drugiego↓ / ²nawzajem / ²wzajemnie.*
 ‘They didn’t stand each other.’
 (lit. ‘they themselves not stand.IPFV.PAST.3PL.MP, one.other.GEN’),

or as topicalizer to be “picked up” by the RM (see (89b–c)), being possible continuations of (89a) (cf. with example (52) in Ch. 10 on German, §4.6):

- (89) a. *Piotr i Jan kochali się w Asi.* ‘Both Peter and Jan loved Asia.’
 b. *Jeden drugiego↑ oni się nie cierpieli.* ‘They couldn’t stand one another.’
 = c. *Nawzajem/Wzajemnie↑ oni się nie cierpieli.* ‘Mutually they couldn’t stand each other.’

7.5 Object-oriented constructions

Native speakers are not unanimous about the encoding of the first part of *jeden drugiego* in object-oriented constructions. This demonstrates that this marker is not really grammaticalized. Compare the two possibilities of encoding the first component:

- (90) a. *Komendant wymienił żołnierzy jeden(NOM) na drugiego.*
 = b. *Komendant wymienił żołnierzy jednego(ACC) na drugiego.*
 lit. ‘The commander replaced the soldiers one by/for the other.’

Some informants abandon the second possibility, while others prefer it (if at all; see above and 8.2.2).

7.6 Diachronic remark

Some evidence exists that – in distinction to modern Polish (see 7.1, 7.4) – *jedyn drugiego* and “reciprocal adverbs” (*wzajemnie, nawzajem*) could be used together within one clause in earlier stages of the language. Compare the following example from a religious text written in a mixture of Latin and 15th century Polish (cited after *Słownik Staropolski* 1993:603; cf. with the German translation of the same Bible fragment in Wiemer & Nedjalkov, Ch. 10: (103) in 5.5.5.4):

- (91) (...) *et nos debemus altervtrum diligere wzajemnye geden drugiego mylowacz.*
lit. ‘and we should be diligent to love mutually one another.’
(from the Johannes Gospel, Book 1, Ch.4, Verse 11).

8. Lexical reciprocals (two- and three-place)

Since lexical reciprocals are generally extremely “capricious” in their derivational and syntactic behaviour, I can but mention the most relevant features here, leaving aside really idiosyncratic ones.

8.1 Subject-oriented constructions (including *reciproca tantum*)

Let us begin with the statistics (Table 7).

The number of reflexive *reciproca tantum* in group B is 46 (including the 10 “defective” anticausatives listed in (95) below).

Subject-oriented lexical reciprocals can be divided into three types:

1. Verbs that do not take the reflexive clitic for derivational functions, e.g.

- (92) a. *harmonizować* ‘to harmonize’
b. *obradować* ‘to counsel’
c. *obcować* ‘to be in contact with’
d. *współżyć* ‘to have sexual intercourse.’

2. Verbs with the clitic, formally derived from transitive bases. Within this group we should further distinguish between those which have a formal transitive equivalent, but do not show a regular semantic relation to it, e.g. (cf. also the verbs discussed in 8.4):

Table 7. Two-place (subject-oriented) lexical reciprocals

A without <i>się</i>	B with <i>się</i> and with an irregular semantic relation to a base transitive verb	C derivatives of three-place (object-oriented) lexical reciprocals (see 8.3–4)	Total
26 (9%)	86* (33%)	152 (58%)	264 (= 100%)

*This number includes 29 items from Table 9 in 8.4.

- (93) *policzyć* ‘to count’ → *policzyć się* ‘to settle accounts (with sb)’
spróbować ‘to try’ → *spróbować się* (*z kimś na rękę*) ‘to arm-wrestle’

and *reciproca tantum* (94). To the latter belong also confixed verbs to be discussed in 8.4 (29 items):

- (94) a. *czubić się* i. ‘to tease each other’, ii. ‘to scuffle each other (for)’
 b. *droczyć się* ‘to tease one another’
 c. *rozstać się* ‘to separate, leave each other’
 d. *zżyć się* ‘to become familiar with each other.’

3. Reflexive derivatives from object-oriented lexical reciprocals (see 8.3–4): some anticausatives have only potential causative base verbs, which are not used in practice. For this reason I have included these anticausatives among the *reciproca tantum* (see column B in Table 8). Their list in (95) is probably exhaustive. To these we ought to add totally lexicalized items like *pobrać się* ‘to marry’ (← *pobrać* (*należność*) ‘to take (the due amount, fee)’) and those discussed in 8.4:

- (95) a. *bratać się* (IPFV) ‘to fraternize’
 b. *klócić się* (IPFV) i. ‘to quarrel’, ii. ‘to be in contradiction with’
 c. *koligacić się* (IPFV) ‘to become related by marriage’
 d. *kumać się* (IPFV) ‘to hob-nob’
 e. *parzyć się* (IPFV) ‘to mate/copulate’ (about animals)
 f. *przyjaźnić się* (IPFV) ‘to be friends/good colleagues’
 g. *spokrewnić się* (PFV) ‘to become related’
 h. *sprzymierzyć się* (PFV) ‘to ally/unite’
 i. *zazębiać się* (IPFV) ‘to dovetail/be interrelated.’

Curiously enough, the perfective equivalents of the imperfective *bratać się*, *klócić się*, *koligacić się* do have object-oriented lexical reciprocal counterparts: *po/zbratać (się)*, *skłócić (się)*, *skoligacić (się)* (see 8.3).

Table 8 (see 8.2) does not include those subject-oriented reciprocals which come very close to verbs denoting naturally reciprocal events (groups B and C; cf. Kemmer 1993: 102ff.). This intermediate group comprises about 30 items, e.g. *całować się* ‘to kiss’, *dotykać się* ‘to touch each other’, *widzieć/widywać się* ‘to meet (regularly, on purpose)’. I shall dwell on them in 8.1.2.

8.1.1 *Semantic subtypes*

The most prominent lexical subgroup consists of verbs denoting competition (in a broad sense; 49 items), in particular fighting (29 items; e.g., *bić się*, *boksować się*, *prać się* all meaning ‘to fight (with fists)’, *szarpać się*, *targać się* ‘to pluck each other’s hairs, beard’) and quarelling (11 items; see (94a–b, 95b, 96, 98)). Within this subgroup only two verbs, encoding less concrete action, do not take the reflexive clitic, namely: *walczyć* and *wojować* with the common meaning ‘to fight/participate in a war (battle)’.

Less numerous lexical subgroups are formed by verbs denoting

1. Conversational collaboration; e.g., *rozmawiać* ‘to talk (with each other)/converse’, *negocjować* ‘to negotiate’.

2. Harmony or harmonizing; e.g., *porozumieć się* ‘to come to an agreement’, see also (92a, 94d, 95a, d, f–h).
3. Contrast; e.g., *kontrastować* ‘to contrast’, see also the second meaning of (95b).
4. Geographical, local contact; e.g., *graniczyć* ‘to border’; *przylegać*, *sąsiedować* ‘to adjoin’.

The bulk of all verbs with the RM belong to the imperfective aspect, they by lexical default encode activities or states (for the terminology see Section 10).

8.1.2 Syntactic subtypes (*discontinuous vs. simple constructions*)

With some particular exceptions (see 8.4), lexical reciprocals allow both a comitative subject (see 4.5) and discontinuous constructions. The latter are almost always replaceable by a construction containing *ze sobą* or *między sobą* (see 6.2.1–2). Above it was stated that this construction and adverbial reciprocal markers (see 6.1) are distributed complementarily. Now this statement should be partly modified, since verbs with *się* and a general meaning of competition (see 8.1.1) permit both markers (of course, one at a time). They therefore occupy an intermediate position between *reciproca tantum* and verbs denoting naturally reciprocal events, on the one hand, and prototypical reciprocals which were the subject of 4.2.1 (“canonical” reciprocals of transitive verbs), on the other.¹⁶

1. *Nawzajem, wzajemnie* ‘mutually’ not possible. Here belong reflexive verbs that can encode only reciprocal events, like those in (93)–(95). The discontinuous construction is replaceable by a simple construction with *ze sobą* (for exceptions see 6.2.1) – or, on the conditions discussed in 6.2.2, with *między sobą*; but the addition of *nawzajem* in a simple construction is ruled out. Compare the following set of synonymous sentences:

- (96) a. *Jacek sprzeczał się z Wackiem.*
 ‘Jacek was squabbling with Wacek.’
 = b. *Wacek sprzeczał się z Jackiem.*
 ‘Wacek was squabbling with Jacek.’
 = c. *Jacek i Wacek sprzeczali się [*nawzajem].*
 ‘Jacek and Wacek were squabbling [with each other].’
 = d. *Jacek i Wacek sprzeczali się ze sobą.*
 (same as (c)).

Lexical reciprocals without the reflexive clitic occur in the same types of construction (subtracting the clitic); cf.:

- (97) a. *Policjant walczył z włamywaczem.*
 ‘The policeman fought with the burglar.’
 = b. *Włamywacz walczył z policjantem.*
 ‘The burglar fought with the policeman.’
 = c. *Policjant i włamywacz walczyli ze sobą.*
 ‘The policeman and the burglar fought with each other.’

16. More on the difference between both types of reciprocals cf. Kemmer (1993: 100, 109ff.).

2. All constructions (*simple + adverb, discontinuous, comitative*) possible. Verbs denoting fighting or quarrelling which do not belong to *reciproca tantum* and have transitive counterparts (see 8.1.1) are peculiar insofar as they permit not only for discontinuous marking, but also for adverbial intensifiers of reciprocity; cf. the following synonymous sentences:

- (98) a. *On się z nią tłukł.* lit. ‘He was beating with her’ (= fighting).
 = b. *Oni się ze sobą tłukli.* lit. ‘They were beating with each other.’
 ≈ c. *Oni się [nawzajem] tłukli.* ‘They were beating [each other].’

3. *Discontinuous construction hardly possible.* Among verbs denoting naturally reciprocal events, central and peripheral representatives should be distinguished, since the peripheral deviate syntactically from the central ones. The central verbs do allow adverbial marking by *nawzajem* (see 1. above) only in particular contexts (on these see (136)–(137) in 10.1), whereas the peripheral constitute another intermediate group between class 2 and “canonical” transitive reciprocals (4.2), which altogether do not occur in discontinuous constructions. Compare the peripheral *całować się* ‘to kiss each other’ with the quite canonical *obejmować się* ‘to embrace each other’: the latter is hardly acceptable with *ze sobą* (b) or in a discontinuous construction (c), whereas with the former it is usual to choose just these two ways of saying:

- (99) a. *Dziewczyna i chłopak całowali się [nawzajem].*
 ‘The girl and the boy were kissing [mutually].’
 a’. *Dziewczyna i chłopak obejmowali się [nawzajem].*
 ‘The girl and the boy were embracing each other.’
 b. *Dziewczyna i chłopak całowali się ze sobą.*
 lit. ‘... with each other.’
 b’. *Dziewczyna i chłopak obejmowali się *ze sobą.*
 lit. ‘... with each other.’
 c. *Chłopak całował się z dziewczyną.*
 lit. ‘The boy was kissing +RM with the girl.’
 c’. *Chłopak *obejmował się z dziewczyną.*
 lit. ‘The boy was embracing +RM with the girl.’

By comparison with the previous classes we can thus assume a kind of semantic and syntactic continuum of cliticized verbs denoting naturally reciprocal events: verbs deriving from normal transitives can behave like “canonical” reciprocals (e.g., *obejmować się*) or be close to natural reciprocals (e.g., *całować się*, *tluc się* – see above). It remains an open question here to which degree each verb with a high degree of “natural reciprocity” should be split up into two lexical items, depending on the absence/presence of the reflexive clitic (for an analogous problem in German cf. Wiemer & Nedjalkov, Ch.10, §8.1).

8.2 Object-oriented constructions

There are about 256 object-oriented lexical reciprocal verbs.¹⁷ They are morphologically dominated by verbs prefixed with *z-* (84 items) and *roz-* (106 items), the first group contributing to verbs meaning ‘connecting’ (129 items), the latter being the main stock of verbs denoting ‘disconnecting’ (123 items). From this we can see that the ‘disconnecting’ group, though slightly less numerous, is morphologically more homogeneous than the ‘connecting’ group. Only five verbs form a small group of items naming situations of exchange. The bulk of all these groups are derivatives from verbal stems (*simplicia*); other verbs are in the definite minority (e.g., (100d), (101a, b), (102b), 1.4; 2.3, (111b–e), (112b); compare also with 8.4). Among them there are usually loans of Latin, French or German origin (e.g., *harmonizować* ‘to harmonize’, *koordynować* ‘to coordinate’, see (100d), (101b)).

8.2.1 Semantic subtypes

1. *Verbs of connecting* fall into six lexical groups.

1.1. Verbs of joining, e.g.:

- | | | | |
|-------|----|--|-----------------------------|
| (100) | a. | <i>połączyć, złączyć</i> | ‘to join/tie together’ |
| | b. | <i>szepić</i> | ‘to couple/fasten together’ |
| | c. | <i>sprząc (konie)</i> | ‘to team (horses)/couple’ |
| | d. | <i>ześrubować</i> (← <i>śruba</i> ‘screw’) | ‘to screw together.’ |

1.2. Verbs of assembling, e.g.:

- | | | | |
|-------|----|--|--------------------------------------|
| (101) | a. | <i>scalić</i> (← <i>cały</i> ‘whole/entire’) | ‘to unite/merge sth’ |
| | b. | <i>skadrować</i> (← <i>kadr</i> ‘frame (in a film)’) | ‘to make frames from a film’ |
| | c. | <i>skupić</i> | i. ‘to concentrate’, ii. ‘to buy up’ |
| | d. | <i>zebrać</i> | ‘to assemble/collect.’ |

1.3. Verbs denoting contraction or diminishing, either of a single object (102) or of a plural or collective one (103), e.g.:

- | | | | |
|-------|----|---|-------------------------------|
| (102) | a. | <i>skręcić</i> | ‘to twist’ |
| | b. | <i>skulić</i> (← <i>kula</i> ‘ball’) | ‘to curl up’ |
| | c. | <i>zgiąć</i> | ‘to bend (together)/curve’ |
| | d. | <i>zwinąć</i> | ‘to roll up/furl.’ |
| (103) | a. | <i>spędzić</i> | ‘to gather/bring together’ |
| | b. | <i>zbić</i> | ‘to tap into a mass, to nail’ |
| | c. | <i>zegnać</i> | ‘to gather/to bring together’ |
| | d. | <i>zgrabić</i> (← <i>grable</i> ‘rake’) | ‘to rake up (together).’ |

1.4. Verbs of comparison. Characteristic of this subgroup is that there is only a single, and now obsolete, verb (see (104a)) which is derived from a (non-reciprocal) verbal

17. Many of these verbs have been taken from SJP Dor and lists in Śmiech (1986: 29f., 69ff.), which are, however, totally unknown to many native speakers or are used nowadays only in another than reciprocal meaning. A thorough diachronical examination of the origin and semantics of these items would be necessary here.

stem with the “reciprocal” prefix *z/s-*, the other being derived from inherently reciprocal adjectival stems:

- | | | |
|----------|--|-------------------------------|
| (104) a. | <i>sczytać</i> (← <i>czytać</i> ‘to read’) | ‘to collate’ |
| b. | <i>porównać</i> (← <i>równy</i> i. ‘equal/even’) | ‘to compare’ |
| c. | <i>upodobnić</i> (← <i>podobny</i> ‘similar’) | ‘to liken/make similar’ |
| d. | <i>utożsamić</i> (← <i>tożsamy</i> ‘identical’) | ‘to identify/make identical.’ |

1.5. Verbs of mixing (up), e.g.:

- | | | |
|-------|-----------------------------|-----------------------------|
| (105) | <i>po-/prze-/wy-mieszać</i> | ‘to mix (up)’ |
| | (<i>po</i>) <i>mylić</i> | ‘to mistake sb for sb else’ |
| | (<i>s</i>) <i>plątać</i> | ‘to ravel.’ |

1.6. Only three verbs denote acquainting sb with sb else, these are:

- | | | |
|-------|-------------------------|--|
| (106) | <i>poznać, zapoznać</i> | ‘to acquaint, introduce (to each other)’ |
| | <i>zaprzyjaźnić</i> | ‘to make, cause to become friends.’ |

These are semantically relatable to verbs denoting matrimonial events, which are

- | | | |
|-------|-------------------------------|-------------------------------------|
| (107) | (<i>o</i>) <i>żenić</i> | ‘to marry (X with Y)’ |
| | (<i>za</i>) <i>swatać</i> * | ‘to (begin to) act as a matchmaker’ |
| | <i>zaruczyć</i> | ‘to betroth, to affiancé.’ |

* The imperfective verb is also used intransitively in the meaning ‘to act as a matchmaker’ or as a non-reciprocal transitive: *swatać córce*(DAT) *syna*(ACC) *sąsiadów* ‘to match one’s daughter with the neighbours’ son’. The perfective counterpart of the latter takes another prefix (*wy-swatać*).

Many of the above verbs, especially those belonging to subgroup 1.3, have homonyms rendering not a notion of connecting, but a spatial or figurative meaning ‘from downwards’ or ‘off, away’. For instance, *zbić* (cf. (103b)) can also mean ‘to smash/break down’, *zegnać* (103c) also ‘to drive away’ (cf. footnotes 18 and 19). In yet other cases the prefix *z-* serves only as a marker of perfective aspect, adding nothing or only very little to the lexical meaning of the verb (e.g., *rym* ‘rhyme’ → *rymować*(1PFV) → *zrymować*(PFV) ‘to rhyme’), or it has no motivating simplex verb, but an imperfective counterpart with another suffix (e.g., *bliski* ‘nearby’ → *zbliżyć*(PFV) → *zbliżyć*(1PFV) ‘to bring nearer, closer to one another’).

2. Verbs of disconnecting can be sub-classified as follows:

2.1. Verbs naming *decontraction* of a formerly contracted (diminished) object, taken either as one (maybe collective) whole (108) or as consisting of distinct similar parts (109):

- | | | |
|-------|---|---|
| (108) | <i>rozkurczyć</i> [<i>pięść</i>] | ‘to unclench’ |
| | <i>rozłożyć</i> [<i>gazetę</i>] | ‘to unfold (a newspaper)’ |
| | <i>rozewrzeć</i> [<i>usta</i>] | ‘to open/widen one’s mouth’ |
| | <i>rozwinąć</i> [<i>dywan</i>] | ‘to unfold (a carpet).’ |
| (109) | <i>rozczapierzyć</i> [<i>skrzydła, palce</i>] | ‘to spread (out) one’s fingers (wings)’ |
| | <i>rozdmuchać</i> [<i>liście</i>] | ‘to blow about (leaves)’ |
| | <i>rozepchać</i> [<i>przechodniów</i>] | ‘to push aside (passers-by)’ |
| | <i>rozgałęzić</i> [<i>przewody</i>] | ‘to ramify, to branch out.’ |

It is not difficult to notice that this subgroup consists of antonyms of the ‘connecting’ subgroup 1.3. Antonymous relationships are often coupled with morphological parallelism, e.g., *s-piąć* ‘to buckle/clasp together’ – *roz-piąć* ‘to unbuckle/unbutton’, *s-pędzić* ‘to gather’ – *roz-pędzić* ‘to disperse/scatter’.

2.2. Verbs of the previous subgroup are often not distinguishable from verbs with a more clear-cut *distributional* meaning, e.g.:

- | | | |
|-------|---|---|
| (110) | <i>rozdać</i> [<i>role aktorom</i>] | ‘to deal out (parts to actors)’ |
| | <i>rozesłać</i> [<i>listy, zaproszenia</i>] | ‘to send right and left, to distribute’ |
| | <i>rozkrzyczeć</i> [<i>wiadomość</i>] | ‘to shout right and left (news)’ |
| | <i>rozzucić</i> [<i>papiery po biurku</i>] | ‘to throw about.’ |

2.3. Only a few verbs with a general meaning of ‘*distinguishing* (between one another)’ could be found. Similarly to verbs of comparison (see above 1.4), this subgroup is particular in that all verbs with this meaning derive from nominal stems, and only one (111d) has the prefix *roz-*; one, (111a), is a borrowed verb. Here is their presumably exhaustive list:

- | | | | |
|-------|----|--|----------------------------------|
| (111) | a. | <i>konfrontować</i> | ‘to confront’ |
| | b. | <i>przeciwwstawić</i> (← <i>przeciw</i> ‘against’) | ‘to confront’ |
| | c. | <i>odróżnić</i> (← <i>różny</i> ‘different’) | ‘to distinguish/differentiate’ |
| | d. | <i>rozróżnić</i> (see (111c)) | ‘to differentiate’ |
| | e. | <i>różnić</i> (see (111c)) | ‘to make different/make differ.’ |

2.4. Verbs conveying a meaning of *destruction*. This meaning is surely the most peripheral of all reciprocal meanings presented here. As with verbs of decontraction, predicates with singular and plural objects should be kept apart, but I will not differentiate them here; cf.:

- | | | | |
|-------|----|--|--|
| (112) | a. | <i>rozbić</i> [<i>talerz</i>] | ‘to shatter/break (a plate)’ |
| | b. | <i>rozetrzeć</i> [<i>papier</i>] | ‘to tear into pieces (paper, documents)’ |
| | c. | <i>rozkruszyć</i> [<i>chleb</i>] (← <i>kruchy</i> ‘fragile/crisp’) | ‘to crumble (bread)’ |
| | d. | <i>rozpiłować</i> (← <i>piła</i> ‘saw’) | ‘to saw into pieces.’ |

3. *Verbs of exchange*. The only verbs encoding this separate meaning are the following:

- | | | | |
|-------|----|---|--|
| (113) | a. | <i>luzować</i> | ‘to replace/relieve (the guard)’ |
| | b. | <i>rozmienić</i> [<i>banknot na drobne</i>] | ‘to change (a banknote into petty cash)’ |
| | c. | <i>wymienić</i> [<i>stare części na nowe</i>] | ‘to replace (old parts by new ones)’ |
| | d. | <i>zamienić</i> [<i>wizytówki</i>] | ‘to exchange (visiting-cards)’ |
| | e. | <i>zmienić</i> [<i>żołnierzy na posterunku</i>] | ‘to relieve/change (the sentry).’ |

Table 8 shows the statistics on the two main groups discussed in 1 and 2.

8.2.2 Syntactic subtypes

Verbs that cannot occur with discontinuous phrases (nor, consequently, with *ze sobą*) belong, as a rule, either to the contraction (1.3.) and decontraction (2.1.) subtypes, or to the assembling group; cf.:

- | | | | |
|-------|----|---|---|
| (114) | a. | <i>Dziekan zebrał wszystkich docentów i profesorów</i> (* <i>ze sobą</i>). | ‘The dean assembled all instructors and professors (*with each other).’ |
|-------|----|---|---|

Table 8. Object-oriented lexical reciprocals

1. Verbs denoting <i>connecting</i> : 129 (100%)						
joining	assembling	contraction	comparison	mixing	acquainting + matrimonial events	other
32 (25%)	25 (19%)	26 (20%)	11 (8%)	9 (7%)	6 (5%)	20 (16%)
2. Verbs denoting <i>disconnecting</i> : 123 (100%)						
decontraction/dispersion	distribution	distinguishing	distinguishing	destruction	other	
26 (21%)	29 (24%)	5 (4%)		19 (15%)	44 (36%)	

b. **Dziekan zebrał docentów z profesorami.*

*‘The dean assembled the instructors with the professors.’

Such verbs should be classified as two-place object-oriented reciprocal verbs requiring either a simple phrase with functionally identical plural objects (e.g., *rozchylić okiennice* ‘to half-open the shutters’). Or they have an object in the singular, denoting either a collective referent (e.g., *rozegnać stado* ‘to scatter the flock’) or a complex one, which is conceptualized as consisting of distinct and functionally different parts (e.g., *złożyć łóżko składane* ‘to fold, put together a folding bed’, *rozkleić kopertę* ‘to unstick an envelope’). Verbs of destruction allow only for non-complex referents either in the singular or in the plural (see (112)). Some verbs of distribution (2.2) show similarities to three-place predicates: although they cannot encode their objects discontinuously either, the prepositional phrase *między siebie*(ACC) ‘among, between themselves’ (see 6.2.2) or *po* + LOC may be added to the simple construction (e.g., *Franek rozkrzyczał wiadomość po okolicy / po znajomych* ‘Franek shouted about the news in all directions / among his acquaintances’).

Only verbs that denote joining (115), comparing, distinguishing, mixing (116) and acquainting permit discontinuous phrases (and *ze sobą*); they should therefore be considered true three-place verbs, e.g.:

- (115) a. *Elektryk połączył kable (ze sobą).*
‘The electrician joined the cables with one another.’
b. *Elektryk połączył jeden kabel z drugim.*
‘... joined one cable with the other.’
= c. *Elektryk połączył kable jeden z drugim.*
‘... joined the cables one with the other.’
- (116) *Jolanta rozbełtała żółtko z cukrem.*
‘Jolanta stirred up the yolk with sugar.’

As can be seen from (115b–c), the analytic marker *jeden drugiego* (*jeden z drugim* ‘one with the other’) is equally possible in cases when a discontinuous construction can be used. Mostly, however, this construction is felt to be “too heavy” and avoided (see 7.2, 7.5).

The four verbs of replacing which have the common stem *-mien-* (see (113)) permit a discontinuous construction with the preposition *na* (lit. ‘on’); a simple construction will be understood elliptically with the third argument lacking (see (117a)). *Zmienić*, as well as *luzować*, are used solely in this construction. The imperfective counterparts of *wymienić*,

zamienić and *zmienić* are also the only verbs among all lexical reciprocals that may be combined with the adverbial reciprocity intensifiers *nawzajem*, *wzajemnie* (see 6.1); cf.:

- (117) a. *Komendant zmienił żołnierzy* $\emptyset_{\text{na+ACC}}$
 b. *Komendant zmienił* (PFV) **nawzajem* *żołnierzy*.
 c. *Komendant zmieniał* (IPFV) *nawzajem* *żołnierzy*.

The reason is that imperfective verbs may refer to unrestricted iterative events. They thus do not block an interpretation of referents successively replacing one another (see 10.2.2).

8.3 Anticausative derivatives

On the one hand, there is a quite considerable number of lexicalized reciprocal anticausatives without a regular relation to causative verbs (see 8.4, but also (68a) in 6.2.1). On the other hand, among all 256 three-place object-oriented lexical reciprocals 114 verbs (= 44,5%), i.e. almost half of them, do not have anticausative counterparts. If both main groups, the verbs of connecting and disconnecting, are considered apart from each other it turns out that the percentages of verbs without anticausative derivatives are almost equal (47% for the connecting group, 43% among the disconnecting verbs). Among the verbs of the exchange group we find at best marginal cases of anticausatives: e.g., in (118b) the action is performed in obedience of a command (order) of a third person who is endowed with the respective social power (cf. Geniušienė 1987: 103f., who speaks of “distant causation”). But in other circumstances these reflexive derivatives can also be regarded as genuine subject-oriented reciprocals; see the two interpretations of (118b):

- (118) a. *Komendant luzował wartowników w regularnych odstępach czasu.*
 ‘The commander replaced the sentries at regular intervals.’
 → b. *Wartownicy luzowali się w regularnych odstępach czasu.*
 i. ‘The sentries were replaced by each other (by order of the commander at regular intervals).’
 ii. ‘The sentinels relieved each other at regular intervals.’ (autocausative).

Syntactically, regular anticausatives behave more or less the same way as their German equivalents (cf. Wiemer & Nedjalkov, Ch. 10, §8.2.3): they “inherit” their behaviour from their causative bases, but they also demonstrate more “freedom” for the adverbial intensifier *nawzajem* (119):

- (119) a. *Marysia poznała *nawzajem / ze sobą swoich przyjaciół.* (causative)
 ‘Marysia introduced her friends to each other.’
 → b. *Przyjaciele Marysi poznali się nawzajem / ze sobą.* (anticausative)
 ‘Marysia’s friends introduced themselves to each other.’

Anticausative verbs of assembling also can collocate with discontinuous phrases, though they remain incompatible with *ze sobą*; compare (114) with their anticausative derivatives (120):

Table 9. Verbs with confixes *z-* or *roz+*STEM+*się*

reciprocals denoting	<i>z-</i> +STEM+ <i>się</i> 'connecting'	<i>roz-</i> +STEM+ <i>się</i> 'disconnecting'	sum REC	vs. other
anticausative	32	11	43	141
from motion verbs	7	11	18	0
other	9	2	11	109
total	48	24	72 (22%)	250 (78%)

- (120) a. *Profesorowie i docenci zebrali się *ze sobą.*
 = b. *Profesorowie zebrali się z docentami.*
 'The professors assembled with the instructors.'

8.4 Object-oriented lexical reciprocals with confixes (*z-/roz-*(STEM) + *się*)

There exist two groups of antonymous verbs of *connecting* and *disconnecting*, which are morphologically more complex, albeit salient, and often semantically separated from the groups discussed in 8.2-3. They are characterized by an additional reflexive clitic. Their structure is therefore *z-*+STEM+*się* (with two morphological variants)¹⁸ for the connecting meaning and *roz-*+STEM+*się* for the disconnecting meaning, respectively. The connecting group corresponds to reciprocals with the prefix complex *su-si-* in Lithuanian and has the same general meanings 'to crowd/huddle together' and 'to come together' (cf. Geniušienė, Ch. 14, §§5.2.2–3). But whereas the Lithuanian verbs are classified as anticausatives, among Polish reciprocal verbs of this morphological type anticausatives prevail, for their derivational history, as a rule, is not STEM → STEM+RM (anticausative) → PREFIX+RM+STEM as in Lithuanian (see Geniušienė *ibid.*: example (66)), but STEM → PREFIX+STEM (causative) → PREFIX+STEM+RM (see (121)–(122) below). Furthermore, with Polish verbs denoting 'coming together' the reflexive marker (*się*) is obligatory.

Anticausatives with either confix form only small subgroups within highly productive morphological classes, in which many potential verbs can be derived *ad hoc*, not being attested by dictionaries (Dulewiczowa 1981:120f.; Ostromęcka-Frączak 1983:129). These are typically desubstantival or, to a lesser extent, deadjectival (cf. Grzegorzczkowska 1969:95, 99; Ostromęcka-Frączak *ibid.*:120). But from this productivity reciprocal meanings are evidently excluded (and no deadjectival derivatives are found; compare with 8.2). Reciprocal verbs are about 3.5 times less numerous than verbs with other meanings (see Table 9), and their percentage is probably even lower, accounting for the mentioned productivity of this derivational class with verbs that do not render reciprocal meanings. As for reciprocal verbs, items of the connecting group prevail considerably over items belonging to the disconnecting group (Table 9), and for the latter the disproportion between reciprocal

18. Note that *z-*, which is also widely applied to mark prefixed verbs of the perfective aspect, is here a genuinely derivational prefix (more precisely, part of a confix) changing the lexical meaning of the simplex (in addition to marking perfective aspect) or the syntactic category (with denominals).

and non-reciprocal verbs (24:175 > 1:7) is considerably larger than with verbs denoting crowding/huddling or coming together (48:75 ≈ 1,5).

It follows from the above that reciprocal verbs with the confixes *z-/roz-...się* became lexicalized a long time ago; cf.:

- (121) *rozproszyc się* ‘to disperse’ ← *rozproszyc* ‘to break up’ (← *proch* ‘powder’)
rozpruć się ‘to come unstitched’ ← *rozpruć* ‘to unstitch.’
- (122) a. *skrzyknąć się* ‘to assemble by shouting to each other’
 ← *skrzyknąć* ‘to call together’ (← *krzyk* ‘scream’)
 b. *złączyć się* ... ← *złączyć* ‘to join/connect.’ (vi ← vt).

Such anticausatives either do not allow singular participants to occupy subject position (e.g. **Jan się zjednoczył* ‘*Jan united.’), unless they are used in discontinuous constructions (see 8.3), or, if so, do not denote a properly reciprocal event (e.g. *Koperta się rozkleiła* ‘The envelope got unstuck’).

Beside anticausatives there are two further very small groups: one consists of a closed set of intransitive reflexives deriving from verbs of directed motion (Śmiech 1986: 29, 69) with zero valency change (following Geniušienė 1987: 137, 156ff.; this vol., Ch. 14, §3.1). Since they have no base verbs (cf. (123)) or the latter have unrelated meanings (cf. (124)), they belong to *reciproca tantum*; cf.:

- (123) *rozejść się* ‘to separate, to radiate, to spread’ ← **rozejść*
 (124) *zbiec się* i. ‘to come together (running)’, ii. ‘to coincide’ ← *zbiec* ‘to run away.’¹⁹

The third group consists of verbs derived from other diverse intransitive bases, which are also non-existent without the RM or have unrelated meanings (see (126c)); cf.:

- (125) a. *rozpierzchać się* ‘to scamper off’ ← **rozpierzchać*
 b. *rozpaść się* ‘to break up’ ← **rozpaść*
 c. (only two examples, see Table 9).
- (126) a. *zgadać się* ‘to chance to talk’ ← **zgadać*
 b. *zrosnąć się* ‘to accrete’ ← **zrosnąć*
 c. *zmówić się* ‘to come to an agreement’ ← *zmówić* [*pacierz*] ‘to recite (a prayer).’

9. Reciprocals in analytic causative constructions

As has been said in 3.3.2, the verb *dać* (PFV)/*dawać* (IPFV) lit. ‘to give’, can be exploited as a kind of causative auxiliary together with the RM. The usual polysemy of reciprocity and reflexivity proper holds also for such analytic reflexive causatives, but only on condition that the infinitive is a lexical three-place reciprocal. Thus, one may occasionally say (127b):

19. Actually, even the hypothetical derivation of *zbiec się* from *zbiec* is probably not correct, since there are two homonymous prefixes *z-* which merged from ancient Slavonic *s* ‘together’ and *iz-* ‘from downwards, away’ (Śmiech 1986: 29, 35). Only the first participates in the meaning of the reciprocal verb.

- (127) a. *Sąsiedzi*(NOM) *skłócili Jacka i Wacka*(ACC).
 ‘The neighbours set Jacek and Wacek at variance (with each other).’
 → b. *Jacek i Wacek*(ACC) *dali się skłócić sąsiedom*(DAT).
 ‘Jacek and Wacek let themselves be set at variance (with regard to each other) by the neighbours.’

Otherwise a reflexive reading prevails over reciprocity by default; cf.:

- (128) a. *Jacek uczesał Wacka, a Wacek uczesał Jacka*.
 ‘Jacek combed Wacek, and Wacek combed Jacek.’
 ≠ b. *Jacek i Wacek dali się uczesać (komuś innemu)*.
 ‘Jacek and Wacek let themselves be combed (by a third person).’

Among explicit reciprocity markers only *jedyn drugiemu* is accepted by some informants in order to modify the reflexive default. The dative reflexive *sobie* and, all the more, *nawzajem* are rejected by almost all informants:

- c. *Jacek i Wacek dali się jeden drugiemu / *sobie (nawzajem) uczesać*.
 ‘Jacek and Wacek let themselves be combed one by the other.’

10. Simultaneity and succession of reciprocal events

Whenever dealing with actionality in Polish one has to account for grammatical aspect (see 1.3). Here I cannot go into any details. However, generally speaking, Slavonic perfective aspect has to be regarded as the grammaticalization of events that cannot be partitioned into subevents or phases. Prototypical verbs of this aspect encode such events by default, though they do not at all preclude the possibility of indicating internal fragmentation with the aid of certain lexical (adverbial etc.) modifiers of the sentence (see below). Thus a typical context of a perfective verb is an episodic singular event in the past (cf. (129a)), while imperfective verbs encode states (without temporal limitations) (cf. (130)) or processes (cf. (131))²⁰ without focussing on (pragmatically probable) limits in time (beginning or end). They can also denote iterative events (129b):

- (129) a. *Siostry zobaczyły się*(PFV) *na przyjęciu*.
 ‘The sisters saw each other at the banquet.’
 b. *Siostry widziały się*(IPFV) *na przyjęciach*.
 ‘The sisters saw each other at banquets.’
 (130) *Chłopcy znali się*(IPFV) *od szkolnej ławki*.
 ‘The boys knew each other since school.’
 (131) *Widzowie szturchali się*(IPFV) *łokciami*.
 ‘The spectators were prodding one another with their ellbows.’

20. The terms ‘state’, ‘process’ (= ‘activity’), ‘accomplishment’ and ‘achievement’ will be used here in the traditional Vendlerian sense (Vendler 1957: 146f.).

10.1 Obligatory simultaneity (“coincidence”)

We can distinguish three main groups of verbs:

1. Numerous lexical reciprocals, especially those encoding achievements, since their subevents must coincide totally. Cf. the situations encoded by the following perfective verbs:

(132)	<i>spotkać się</i>	‘to meet’
	<i>porozumieć się</i>	‘to come to an agreement’
	<i>rozminąć się</i>	‘to fail to meet’
	<i>sprzysiąc się</i>	‘to vow to each other (for conspiracy)’
	<i>założyć się</i>	‘to (agree on a) bet’
	<i>zderzyć się</i>	‘to bump into each other/collide.’

2. Imperfective counterparts of these verbs typically encode either only repetitive achievements (133) or denote a state or property holding between two (or more) subjects (cf. (134); see also (130) above):

- (133) *Spotykamy się co tydzień.* ‘We meet every week.’
- (134) a. *Porozumiewamy się świetnie.*
 ‘We understand each other splendidly.’
- b. *Porozumiewamy się za pomocą języka angielskiego.*
 ‘We (normally) communicate in English.’

3. Simultaneity can also be denoted by verbs encoding processes, i.e. homogeneous activities (see (131)). This group, however, should be considered more peripheral, because these verbs encode neither logical coincidences, as do reciprocal achievement verbs (see above), nor unfractionable states of affairs with a *necessarily* symmetrical relation between the participants. This peripheral status holds for activity verbs with a regular polysemy of reflexive vs. reciprocal reading discussed in 4.3 and 5.2.1–2; compare such reciprocal predicates as the following:

- | | | | |
|-------|----|---|---|
| (135) | a. | <i>ganią się</i> | ‘(they) criticize each other’ |
| | b. | <i>oskarżali się</i> | ‘(they) accused one another’ |
| | c. | <i>krzyczą na siebie (nawzajem)</i> | ‘(they) shout/yell at each other’ |
| | d. | <i>opierali się o siebie (nawzajem)</i> | ‘(they) were leaning against each other.’ |

An exception are cliticized verbs of competition mentioned in 8.1.1 (*bić się*, *klócić się* and their respective synonyms), which usually denote simultaneous reciprocal activities. This can be explained by the fact that, though derivationally belonging to the “canonical” type, they are semantically very close to naturally reciprocal events. The same holds for verbs encoding naturally reciprocal events only occasionally, e.g. *całować się* ‘to kiss (each other)’ (see (99)). By and large, the possibility of a simultaneous interpretation increases with the decrease of concreteness of the denoted action: the larger the internal fragmentation of an interval becomes, the worse the respective sub-actions can be distinguished and the more they become “simultaneous” in a more global sense (e.g., *pilnować się [nawzajem]* ‘to watch, guard each other’, *narzekać na siebie* ‘to complain about each other’, *doskwierać*

sobie ‘to worry one another’, *folgować sobie* ‘to relieve each other’, *popierać się* ‘to support one another’).

The addition of the adverbial reciprocal *nawzajem* or the syntactic marker *jeden drugiego*, where they are at all possible, does not have any impact on the internal temporal structure of the described event, the only exception being once more verbs on the periphery of those encoding naturally reciprocal events: with either of these markers the subevents become distinguishable in such a way that an interpretation of repeated reciprocal sequences becomes very likely (see 10.2.2; cf. Kemmer 1993: 112ff.); cf.:

- (136) a. *Pijacy bili się [zażarcie].* ‘The drunks fought [grimly].’
(simultaneous, without fragmentation)
b. *Pijacy bili jeden drugiego.* ‘The drunks beat each other.’
(alternation of particular subevents: ‘first X, then Y...’).
- (137) a. *On i ona całowali się.* ‘He and she kissed.’
(simultaneous, without fragmentation)
b. *On i ona całowali się nawzajem.* ‘He and she kissed one another.’
(alternation of kisses: ‘first she, then he...’).

By contrast to the markers just mentioned, discontinuous constructions – which are possible only with naturally reciprocal events and some lexical reciprocals (see 4.4, 8.1.2) – do not influence the simultaneous character of the denoted activity.

10.2 Types of sequences

These may be subdivided into singular and repetitive sequences of subevents.

1. *Singular subsequences* can be denoted only by a very limited number of verbs. Because of the correlation of grammatical aspect with situation types and temporal locatedness (\pm episodicity) only perfective verbs typically denote singular subsequences. The most common situation where one can conceive of both a non-repeated and non-simultaneous reciprocal event are social encounters like conveying greetings, introducing each other etc., which imply a more or less preconceived order of speech acts (and are often likely to be preconceived as necessarily reciprocal events and encoded by lexical reciprocals; see (138b)):

- (138) a. *Jan i Staś przedstawili sobie swoje żony.*
‘Jan_i and Staś_j introduced their_{i+j} wives to each other_{i+j}.’
b. *Asia i Ania wymieniły pozdrowienia.*
‘Ania and Asia exchanged greetings.’

Nothing changes with the addition of explicit reciprocity markers. Discontinuous phrases (with or without *ze sobą*) are possible with verbs of exchange (e.g., *Asia wymieniła z Asią pozdrowienia*, compare with (138b)²¹).

21. It should be remarked that two verbs of exchange (*wymienić, zamienić*) show an alternative possibility of discontinuous coding, namely by a derived diathesis of the deaccusative type. Thus, it is usual to say *X i Y wymienili się adresami (zamienili się miejscami)* ‘X and Y exchanged their addresses (= gave each other their addresses) (changed

2. *Repeated sequences* (“*dovetailing*”) are much more widespread. Almost any activity verb among those discussed in 4.2 and 5.2 is able to denote a situation of multiple reciprocal action. The addition of *nawzajem* or *jeden drugiego* would not change the internal temporal structure (an exception being verbs of competition; see 10.1):

- (139) a. *Odpowiadaliśmy sobie na pytania.* ‘We answered each other’s questions.’
 b. *Oni wyznaczali sobie terminy.* ‘They fixed, set one another dead-lines.’
 c. *Dziewczyny egzaminowały jedna drugą.* ‘The girls examined one the other.’

Perfective verbs can refer to repeated reciprocal events only if the embracing time interval is, in one way or another, marked as limited; cf.:

- (140) a. *W ciągu tygodnia kierownik wymienił swoich współpracowników między sobą.*
 ‘In the course of one week the supervisor replaced his collaborators with one another.’
 b. *Podczas spotkania odpowiedzieliśmy sobie na wszystkie pytania.*
 ‘During our meeting we answered each other all questions.’

With reflexive derivatives of exchange verbs, adverbial reciprocity markers are merely optional. Only these few verbs and their object-oriented base verbs allow discontinuous constructions (see (68c), (113b, c, e) and 8.2.2).

10.3 Uni-directional succession of events (chaining)

Another very limited group of verbs is able to denote situations of succeeding one after another provided there are more than two participants. In order to mark an observable temporal succession, one has to use an imperfective verb. For this reason almost only such verbs will be quoted below. If a perfective verb can be used the respective event is envisaged as consisting of successively ordered subevents summarized to one global event (see (144)).

First of all, the core group of “chaining verbs” comprises lexemes that primarily or exclusively refer to the temporal domain. With the exception of the intransitive *następować* ‘to follow (one another), happen’ these are reflexive verbs with a regular relation to transitive base verbs (“canonical” subtype):

- (141) *doganiać się* ‘to catch up/overtake’
łapać się ‘to catch/seize, grasp one another, to race’
łowić się ‘to hunt each other, to race’
przeganiać się ‘to outstrip/surpass one another’
prześcigać się ‘to outvie each other’
ścigać się ‘to race/vie with each other’
wyprzedzać się ‘to outstrip/overtake one another.’

places), which is to be interpreted as derived from the discontinuous *X wymienił się z Y(INST) adresami (zamienił się z Y(INST) miejscami)* (see (33b)), meaning the same. These sentence types are synonymous with sentences of type (138b). But such cases are idiosyncratic and, thus, lexicalized.

With the exception of *doganiać się*, all verbs of (141) can also be used to denote repeated sequences (see 10.2.2), regardless whether there are two or more subjects (e.g., *Oba psy / Wszystkie dzieci łąpały się na łące* ‘The two dogs / All children were clutching one another on the meadow’). A similar polysemy holds for the verbs below. *Pędzić się* ‘to drive/hurry each other’ is peculiar in that it derives from a three-place *pędzić* (*kogo*(ACC) *do pracy, do domu*) ‘to hurry sb up to work, home’, but there is also an intransitive *pędzić* ‘to rush’ as a near synonym of *biec, gnać* ‘to run quickly, hurry’.

Another set of verbs, which primarily refers to the spatial domain, can be used to indicate a temporal succession as well. These are:

(142)	<i>ciągnąć się</i>	‘to run/extend (of mountains, etc.)’
	<i>literować</i>	‘to spell (out)’
	<i>nanizywać się</i>	‘to string’ (intr.)
	<i>nawlekać</i>	‘to string (pearls etc.)’
	<i>nizać</i>	‘to thread (beads etc.)’
	<i>prowadzić się</i> [za rękę]	‘to lead each other by the hand’
	<i>prześladować się</i>	‘to persecute/oppress each other’
	<i>rozciągać się</i>	‘to extend/stretch (of hills etc.)’
	<i>szeregować się</i>	‘to line up/be lined up’ (intr.)
	<i>ustawiać się</i> [<i>Y_{P1}</i> w szereg, obok siebie]	‘to draw up, to form ranks.’

The reflexive verbs derive regularly from two-place transitives, with the exception of *ustawiać się*, which derives from the three-place *ustawiać* (*w szereg*) ‘to align, to draw up’, and *ciągnąć się*, which has semantically separated from its base verb *ciągnąć* ‘to pull’ (see below). The non-reflexive verbs *nawlekać* and *nizać* do not have reflexive derivatives.

To stress temporal succession no discontinuous construction can be employed. For this purpose one has to use the adverbials *po kolei* ‘by turns’ (more rarely its synonym *kolejno*; see 6.3), *po sobie* ‘after each other’ (temporal), *za sobą* ‘behind each other’ (spatial) and *jeden po drugim, jeden za drugim* ‘one (after) the other’ (temporal, spatial), respectively. With regular reflexive derivatives of two- and three-place transitives (e.g., *ścigać się, ustawiać się*; see above) *jeden za drugim, jeden po drugim* can be used (on the same conditions which have been discussed above), but the orthotonic *siebie* occurs to be possible only jointly with the adverbial *nawzajem* (e.g., *?łowili siebie* lit. ‘were catching themselves’ (reflexive, fig.) vs. *łowili się/siebie nawzajem* ‘were catching one another’). *Nawzajem*, in turn, is outruled for reciprocal diatheses other than the “canonical” one (e.g., *wydarzenia następowały *nawzajem po sobie* lit. ‘the events succeeded mutually after each other’). Furthermore, it favours rather a collective-simultaneous reading than a successive-reciprocal one; cf.:

- (143) a. *Dzieci prowadziły się nawzajem za rękę* (= *wszyscy razem*).
 ‘The children led each other, holding by the hand’ (= all together).
- ≠ b. *Dzieci prowadziły się jedno drugie za rękę* (= *kolejno, szeregiem*).
 ‘The children led one another by the hand’ (= one after another, in a row).

With perfective verbs these markers happen to be even necessary, because otherwise a lack of internal fragmentation would result. Compare perfective (a–b) and imperfective verb (c):

- (144) a. *Wydarzenia nastąpiły*(PFV) *w ciągu tygodnia.*
 ‘The events happened within one week.’ (simultaneously or successively?)
 b. *Wydarzenia nastąpiły*(PFV) *po sobie w ciągu tygodnia.* (only successive reading)
 c. *Wydarzenia następowały*(IPFV) *w ciągu tygodnia.* (only successive reading)
 ‘The events happened (= unfolded) one after another in the course of one week.’

With verbs of motion proper one can also use the expression *szeregiem* ‘in a row’, which is a lexicalized instrumental of the noun *szereg* ‘row’. It can be used jointly neither with *za sobą* nor with *jeden za drugim*; cf. (143b) and the following:

- (145) *Taternicy posuwali się* [**za sobą*, **jeden za drugim*] *szeregiem.*
 ‘The mountaineers proceeded [one after another] in a file.’

1. Introduction

1.1 French

French, a Romance language, is the official language of France. It is spoken by 58 million inhabitants of France, Monaco and Corsica. It is also used by 60 million speakers in France's overseas territories and outside France: in parts of Belgium (5 million), Switzerland (2 million), Luxembourg, Canada (6 million), and in the Val d'Aosta (Italy). It is often the official language of former French and Belgian colonies in North, Central and West Africa, and in Southeast Asia.

Eight other languages are spoken indigenously in France: Occitan (southern third of France, 10,000; the most closely related to French), Breton (Lower Brittany, 500,000), Flemish (by the Belgian frontier, 90,000); in the Northeast, the Germanic varieties Alsacian (1,200 000) and Lorrain (170,000); in the Southeast, Monaco and the Bonifacio district of Corsica, Ligurian is spoken; in the Department of Pyrénées Orientales 200,000 inhabitants speak Catalan, and in the Southwest, 80,000 speak Basque. Corsican, a variety of Tuscan is spoken by 160,000 speakers.

1.2 Expression of reciprocity – an overview

French can express reciprocity in two different ways.

1. The first possibility is the so-called plural reflexive pronouns in enclitic position (except for affirmative imperative) which have a specific form only in the 3rd p. *se* (*s'* before vowel-initial words, see 2.4); these pronouns will be further referred to as clitic *se* and their resulting constructions as reflexive reciprocals.

Generally, reflexive constructions are highly polysemous (see 3.3) and their semantic values depend exclusively on the context in which they occur. For instance, (1b) is assigned the value of proper reflexive in context (1c), and the value of reciprocal in context (1d), respectively:

- (1) a. *Pierre aim-e Marie et Marie aim-e Pierre.*
 Pierre love-3SG Marie and Marie love-3SG Pierre
 'Pierre loves Marie and Marie loves Pierre.'
- b. *Pierre et Marie s' aim-ent.*
 Pierre and Marie REFL love-PRES.3PL
 i. 'Pierre and Marie love *each other*.'
 ii. 'Pierre and Marie love *themselves*.'
- c. *Pierre et Marie s'aiment plus qu'ils n'aiment les autres.*
 'Pierre and Marie love themselves more than they love the others.'
- d. *Pierre et Marie s'aiment éperdument.*
 'Pierre and Marie love each other wildly.'

This means of marking reciprocity is affected by few restrictions (cf. (3b); see 11.1.3). French reflexive reciprocals are typologically similar to the respective formal type of reciprocals in Bulgarian (see Penchev, Ch. 13) and German (Wiemer & Nedjalkov, Ch. 10).

There is a special small group of reflexive reciprocals in which the prefix *entre-* ‘between’ is attached to the verb, for example, *s’entredévorer* ‘to devour one another’, *s’entretuer* ‘to kill one another’, etc.:

- (2) a. *Les pauvres aident les pauvres.* ‘The poor help the poor.’
 b. *Les pauvres s’aident entre eux.* ‘The poor help each other.’
 c. *Les pauvres s’entraident.* ‘The poor help each other.’

It should be pointed out that some verbs with the prefix *entre-*, like the verb *s’entraimer* ‘to love each other’, though mentioned in dictionaries, are now out of usage:

- (1) e. **Pierre et Marie s’entraiment.* ‘Pierre and Marie love each other.’

2. The compound reciprocal pronoun *l’un l’autre* ‘each other’ (marked for gender and number, and taking prepositions which are inserted between the two components, see Section 7). When applied to two relatively small groups of two-place intransitives, i.e. verbs with a prepositional object, it produces reciprocal constructions. The use of the compound reciprocal pronoun is the only way for two-place intransitives to express reciprocity, either because they are incompatible with reflexive pronouns ((3), see also 7.2.2):

- (3) a. *Pierre pense à Marie.*
 ‘Pierre thinks about Marie.’
 b. **Pierre et Marie se pensent.*
 ‘Pierre and Marie think about each other’ (intended meaning)
 c. *Pierre et Marie pensent l’un à l’autre.*
 ‘Pierre and Marie think about each other.’

or because they represent *reflexiva tantum* verbs (see (4)) which are interpreted exclusively as reflexives (see 7.2.1.1). In no case (whether it be *reflexivum tantum* or a derived reflexive) is the repetition of the reflexive pronoun allowed (see (4d)):

- (4) a. *Pierre s’est amouraché de Marie.*
 ‘Pierre fell in love with Marie.’
 b. **Pierre et Marie se sont amourachés.*
 ‘Pierre and Marie fell in love with each other.’
 c. *Pierre et Marie se sont amourachés l’un de l’autre.*
 ‘Pierre and Marie fell in love with each other.’
 d. **Pierre se s’est amouraché de Marie.*
 Pierre REFL REFL-fell.in.love with Marie.

The compound reciprocal pronoun cannot replace the reflexive pronoun in constructions like (1b) and (2b) (see below (1f) and (2d)). In this, French is similar to Bulgarian (see Penchev, Ch. 13) and different from German (Wiemer & Nedjalkov, Ch. 10):

- (1) f. **Pierre et Marie aiment l’un l’autre.* ‘Pierre and Marie love one another.’
 (2) d. **Les pauvres aident les uns les autres.* ‘The poor help one another.’

The compound pronoun often co-occurs with the reflexive pronoun, thus resolving the possible polysemy of a construction:

- (5) a. *Pierre a blessé Jean.*
 ‘Pierre hurt Jean.’
 b. *Pierre et Jean se sont blessés.*
 i. ‘Pierre and Jean got hurt.’ (‘anticausative’)
 ii. ‘Pierre and Jean hurt themselves.’ (reflexive proper)
 iii. ‘Pierre and Jean hurt each other.’ (reciprocal)
 c. *Pierre et Jean se sont blessés l’un l’autre.*
 ‘Pierre and Jean hurt each other.’

or just emphasizing the reciprocal meaning (cf. (2e)). In the latter case, the co-occurrence of the reflexive reciprocal and *l’un l’autre* is constrained (see (1g)):

- (2) e. *Les pauvres s’aident les uns les autres.* ‘The poor help each other.’
 (1) g. [?]*Pierre et Marie s’aiment l’un l’autre.* lit. ‘Pierre and Marie love each other.’

Similarly to *l’un l’autre*, the adverbs *mutuellement* ‘mutually’ and *réciroquement* ‘reciprocally’ can also resolve polysemy and emphasize the reciprocal meaning. Also like *l’un l’autre*, they display a kind of co-occurrence selectivity which cannot be provided with a satisfactory explanation so far (see Section 8).

The use of the reciprocal pronoun *l’un l’autre* is naturally incompatible with discontinuous reciprocal constructions (i.e. constructions in which one of the reciprocal arguments takes an object position). As to reflexive reciprocals, only a very small group of standard (non-lexical) reciprocals may occur in discontinuous constructions:

- (6) a. *Pierre bat Jean.* ‘Pierre beats Jean.’
 ≠ a’. *Jean bat Pierre.* ‘Jean beats Pierre.’
 b. *Pierre et Jean se battent.* i. ‘Jean and Pierre are fighting.’
 ii. ‘Pierre and Jean fight each other.’
 c. *Pierre se bat avec Jean.* ‘Pierre fights (with) Jean.’
 = c’. *Jean se bat avec Pierre.* ‘Jean fights with Pierre.’

Lexical reciprocals can be subdivided into subject-oriented (two-place transitive, two-place intransitive) and object-oriented reciprocals (see Section 11). All the three syntactic types occur in discontinuous constructions. Simple reciprocal constructions can be formed either with or without the reflexive pronoun; cf. respectively:

- (7) a. *Pierre a rencontré Marie.* ‘Pierre met Marie.’
 = a’. *Marie a rencontré Pierre.* ‘Marie met Pierre.’
 = b. *Pierre et Marie se sont rencontrés.* ‘Pierre and Marie met.’
 (8) a. *Pierre rivalise avec Jean.* ‘Pierre competes with Jean.’
 = a’. *Jean rivalise avec Pierre.* ‘Jean competes with Pierre.’
 = b. *Jean et Pierre rivalisent l’un avec l’autre.* ‘J. and P. compete with each other.’
 = b’. **Jean et Pierre se rivalisent.* (same intended meaning).

2. Grammatical notes

2.1 Sentence structure

The basic word order in French is SVO. It is relevant for the interpretation of the function of the arguments. There is no case marking on the nouns.

French has lost the Latin case marking affixes for nouns and adjectives and has only preserved three forms (inherited from Latin case-marking affixes): “nominative”, “accusative” and “dative” – in the 3rd p. singular and plural (see 2.4.1).

Nouns have gender (masculine or feminine) and vary in number (singular and plural). Adjectives agree with head nouns in gender and number. This is also true of participles in periphrastic verb forms with the auxiliary *être* ‘to be’ (cf. *amouraché* in (4a) and *amourachés* in (4b–c)).

2.2 Tense and aspect system

Verbs are inflected for number and person, as well as gender in periphrastic forms. There are “simple” (Présent, Passé simple, Imparfait, Futur) and periphrastic tense forms (Passé composé, Passé antérieur, Plus-que-parfait, Futur antérieur). The latter are formed with the help of two auxiliary verbs: *avoir* ‘to have’ and *être* ‘to be’. The auxiliary *être* occurs in four cases: (1) with a limited number of intransitive verbs (e.g. *il est venu* ‘he has come’, cf. **Il a venu*); (2) with *reflexiva tantum*; (3) with verbs combined with the clitic *se*, regardless of meaning (cf. (5a) and (5b), see also Section 3); (4) in passive constructions (cf. *Elle est aimée de Pierre* ‘She is loved by Pierre’).

2.3 Verb classes

For the purposes of this paper, it is sufficient to distinguish the following verb classes (a verb can naturally change its class membership with a possible change of meaning):

1. One-place intransitives, e.g. *dormir* ‘to sleep’, *vivre* ‘to live’, *tomber* ‘to fall’...:

(9) *Pierre est tombé.* ‘Pierre fell down.’

2. Two-place intransitives, taking an obligatory prepositional object:

(10) *Pierre a nui à Jean.* ‘Pierre harmed Jean.’

Verbs with non-standard formation of reciprocal constructions are prevalent in both of these classes of verbs (cf. (3), (4), and (7)).

3. Two-place transitives, i.e. verbs which take a direct object. These verbs can occur in reciprocal constructions with *se* without any restrictions: they are formed from all transitives whose lexical meaning allows reciprocal use (which is a trivial restriction; in other words, verbs with an inanimate object cannot be used reciprocally).

4. Three-place transitives, i.e. verbs which take a direct and an indirect object, e.g. *donner* ‘to give’, *offrir* ‘to offer’, *envoyer* ‘to send’, etc.

2.4 Personal pronouns and reflexives

Personal pronouns have number (singular and plural) and gender (masculine and feminine). The latter is only expressed in the 3rd person. Personal pronouns fall into two large sets, conjunctive (unstressed) and disjunctive (stressed, see Table 1). Conjunctive forms precede the verb (with two exceptions, imperative and some interrogative sentences) and can be separated from it by other conjunctive pronouns only; disjunctive forms behave like nouns (cf. *Il pense souvent à Marie/à elle* ‘He often thinks about Marie/about her’).

The forms *me*, *te*, *se* lose their vowel before vowel-initial verbs. In Table 1, if two pronouns are placed in the same slot, the first one is masculine, the second feminine.

Pronouns which mark reflexive verb forms are given in Table 2. French uses only one pronominal form to express the reflexive – the pronoun *se*, which appears in the 3rd p. It does not vary in gender or number, it has not retained any morphological case-marking distinctions. Since the reflexive pronoun lacks forms in the 1st and 2nd person singular and plural, its function is taken over by the respective forms of the personal pronouns. Given that simple reciprocal constructions have only three forms, viz. plural forms, the pronominal forms are repeated twice, once as reflexive and once as reciprocal. In the right column we present the reflexive forms of the verb *se blesser* ‘to hurt oneself/each other’. Sentences (a, b, c) have a reflexive meaning only, while (d, e, f) have two readings, reflexive and reciprocal.

Table 1. Personal pronouns

	CONJUNCTIVE			DISJUNCTIVE
	“nominative”	“accusative”	“dative”	
SG 1	<i>je</i>		<i>me</i>	<i>moi</i>
2	<i>tu</i>		<i>te</i>	<i>toi</i>
3	<i>il, elle</i>	<i>le, la</i>	<i>lui</i>	<i>lui, elle</i>
PL 1	<i>nous</i>		<i>nous</i>	<i>nous</i>
2	<i>vous</i>		<i>vous</i>	<i>vous</i>
3	<i>ils, elles</i>	<i>les</i>	<i>leur</i>	<i>eux, elles</i>

Table 2. The reflexive pronouns

	REFLEXIVE	RECIPROCAL	examples
SG 1: <i>je</i>	<i>me</i> ‘myself’		a. <i>Je me suis blessé(e) / Je me suis dit</i>
2: <i>tu</i>	<i>te</i> ‘yourself’		b. <i>Tu t’es blessé(e) / Tu t’es dit</i>
3: <i>il/ elle</i>	<i>se</i> ‘him/it//herself’		c. <i>Il s’est blessé / elle s’est blessée / Il (elle) s’est dit</i>
PL 1: <i>nous</i>	<i>nous</i> ‘ourselves’	<i>nous</i> ‘each other’	d. <i>Nous nous sommes blessé(e)s</i>
2: <i>vous</i>	<i>vous</i> ‘yourselves’	<i>vous</i> ‘each other’	e. <i>Vous vous êtes blessé(e)s</i>
3: <i>ils elles</i>	<i>se</i> ‘themselves’	<i>se</i> ‘each other’	f. <i>Ils se sont blessés / elles se sont blessées</i>

2.5 The compound pronoun *l'un(e) l'autre* 'each other'

The compound pronoun *l'un(e) l'autre* lit. 'the one the other' is composed of two pronouns. The first component of this complex is inflected for gender and number and the second for number. The reciprocal meaning of the compound pronoun is due to the capacity of its components to denote elements that form an already fixed set. Each of the two components is associated with one of the two arguments involved in a reciprocal relationship:

l'un l'autre (M.SG) if the arguments are of the masculine or of different genders;
les uns les autres (M.PL) (idem);
l'une l'autre (F.SG) if the arguments are of the feminine gender;
les unes les autres (F.PL) (idem).

The compound pronoun allows the insertion of prepositions between its two components: *l'un à l'autre*, *l'un de l'autre*, *l'un vers l'autre*, etc. These prepositions are determined generally by the syntactic and semantic properties of the verb.

3. Polysemy of reflexive constructions

The same reflexive construction can often be assigned different meanings. Yet, the boundaries between these meanings are not always clearly defined. Very small modifications of the context can entail different interpretations: the various semantic values form a continuum (Desclés et al. 1986; Geniušienė 1987; Gerritsen 1990; Kemmer 1993; Rivière 1995, 1997). The major values are organised in semantic types such as proper reflexives, reciprocals, quasi-passives, potential-passives, etc.

3.1 Subject-oriented reflexive constructions

Verbs with the clitic *se* that belong to this type have the following meanings:

1. *The reflexive proper.* The meaning of the proper reflexive is based upon the co-reference of the agent and the patient. The subject, which is the only argument in the construction, denotes an animate referential entity capable of controlling the activity carried out on itself. The possibility to substitute a personal pronoun which plays the role of an object for the reflexive pronoun sets off the parallelism between the reflexive construction and its transitive counterpart.

- | | | |
|---------|-------------------------------------|---------------------------------------|
| (11) a. | <i>Les parents lavent l'enfant.</i> | 'The parents are washing the child.' |
| b. | <i>Les parents le lavent.</i> | 'The parents are washing him/her.' |
| c. | <i>Les parents se lavent.</i> | 'The parents are washing themselves.' |

In the transitive construction the verb *lavent* acts as a two-place predicate. The two arguments are clearly distinguished and play different semantic roles, the agent and the patient respectively. In the reflexive construction proper, the predicate *se lavent* acts as a one-place complex predicate. Being coindexed with the subject the reflexive pronoun does not distinguish the agent and the patient clearly.

2. *The reflexive-possessive and reflexive-benefactive meanings.* Unlike the reflexive proper, these closely related meanings are not based on argument deletion. The first meaning expresses a possessive relation (inalienable, quasi-inalienable) and is realized by two-place transitive verbs with two arguments. One of the arguments represents the possessor and occupies the position of the subject whereas the other stands for the possessed entity and has the syntactic position of an object. The relation between the two arguments is considered as “intrinsic”, which determines partial co-reference of the subject and the object: in fact, the agent “effects by affecting himself” (Benveniste 1966: 173) On the one hand, the clitic *se* establishes a relation between the possessor-agent and possessed-patient. On the other hand, it fails to distinguish between the possessor and the beneficiary (or detrimentally affected), as is discussed in Rivière (2000). This construction is very similar to the true-reflexive construction, but it is affected by some constraints (cf. (13b)):

- (12) a. *Il a ouvert ses veines avec un rasoir.*
‘He cut his (own) veins with a blade.’
b. *Il s’est ouvert les veines avec un rasoir.*
lit. ‘He cut himself the veins with a blade.’
c. **Il s’est ouvert ses veines avec un rasoir.*
lit. ‘He cut himself his (own) veins with a blade.’
- (13) a. *Il a ouvert ses yeux.* ‘He opened his eyes.’
b. **Il s’est ouvert les yeux.* lit. ‘He opened himself his eyes.’

If the relation of possession involves an alienable property, the *se* clitic denotes that the agent is the beneficiary of the activity which he is carrying out:

- (14) a. *Il lui a acheté un chapeau.* ‘He bought him/her a hat.’
b. *Il s’est acheté un chapeau.* ‘He bought himself a hat.’

3. *The reciprocal meaning* (see (1)).

4. *The absolutive meaning.*¹ These reflexive constructions require a complement of space or time or an appreciative adverb (cf. (16c)) in order to construct a well-formed sentence and/or to obtain an absolutive interpretation (cf. (15b)):

- (15) a. *Jean pousse les autres.* ‘Jean elbows the others.’
b. *Jean se pousse dans le monde.* ‘Jean elbows his way in the world.’
- (16) a. *Jean bat les autres.* ‘Jean beats the others.’
b. *Jean se bat souvent/toujours.* ‘Jean beats (very often/always).’

5. *The autocausive meaning.* These constructions express situations where the agent changes his position. The change can be perceived as a change of location or as a change of state:

- (17) a. *Jean a déplacé les meubles.* ‘Jean moved the furniture.’
b. *Jean s’est déplacé.* ‘Jean moved.’

1. This type of construction, as well as the following one, has been generally analysed as ‘middle’ in the French voice system (Stéfanini 1962; Mélis 1990; Desclés et al. 1986; Rivière 1995, 1997).

3.2 Object-oriented constructions

According to the context, verbs with the clitic *se* that belong to this group have the following meanings:

1. *The quasi-passive meaning.* Passive reflexive constructions occur only in the 3rd. p. Unlike the periphrastic passive (*être* ‘to be’ + past participle) (18b), the passive reflexive does not allow the formal expression of the agent. The latter can appear only as a metonymic circumstantial expression (cf. (18e)). Yet, the quasi-passive meaning implies a non-specified or potential or generic agent which, in turn, entails the presence of a patient and relates a quasi-passive sentence to its active counterpart with the indefinite pronoun *on* in subject position (cf. (18f)):

- | | | |
|---------|--|---|
| (18) a. | <i>L'éditeur a bien vendu ce livre.</i> | ‘The editor sold this book well.’ |
| b. | <i>Ce livre a été bien vendu.</i> | lit. ‘This book was sold well.’ |
| c. | <i>Ce livre s'est bien vendu.</i> | ‘This book sold well.’ |
| d. | <i>*Ce livre s'est bien vendu par les libraires.</i> | lit. ‘This book sold well by the bookstores.’ |
| e. | <i>Ce livre s'est bien vendu en librairie.</i> | ‘This book sold well in the bookstores.’ |
| f. | <i>On a bien vendu ce livre.</i> | lit. ‘This book was sold well.’ |

2. *The potential-passive meaning.* In potential-passive constructions, the only argument in subject position denotes an entity which can undergo changes or be affected by a “change-of-state” process. This entity can neither control nor carry out the “change-of-state” process which is often perceived as an intrinsic property of this entity. No agent may be either formally expressed or semantically implied:

- | | | |
|---------|----------------------------------|---|
| (19) a. | <i>La laine se feutre.</i> | ‘Wool felts.’ |
| b. | <i>Le blanc se salit vite.</i> | ‘White clothes get dirty very quickly.’ |
| c. | <i>Les fruits se dessèchent.</i> | ‘Fruit dry.’ |

3. *The anticausative meaning.* In this case the causative sense is subtracted from the meaning of a lexically causative verb, the underlying object taking subject position in the derivative (cf. Haspelmath 1993:91):

- | | | |
|---------|--------------------------------|-------------------------|
| (20) a. | <i>Jean a ouvert la porte.</i> | ‘Jean opened the door.’ |
| b. | <i>La porte s'est ouverte.</i> | ‘The door opened.’ |

(See also (5b.i), (59b), (98), (103b), and 11.2).

3.3 Overlapping of reflexive significations

In most cases the range of polysemy depends on the semantic and syntactic properties of the base verb as well as the semantic properties of the participant(s) involved in the described situation. Thus, according to the context, the same reflexive construction will be assigned different interpretations. For instance, the verb *apercevoir* ‘to see’, which is a two-place transitive, can occur in a proper reflexive, a reciprocal, a possessive-reflexive, or a quasi-passive sense, cf. respectively:

- (21) a. *Pierre s'est aperçu dans la glace.*
 'Pierre saw himself in the mirror.'
 b. *Pierre et Marie se sont aperçus dans la rue.*
 'Pierre and Marie saw each other in the street.'
 c. *Elle s'est aperçue de son erreur.*
 'She saw her error.'
 d. *Ce détail s'aperçoit à peine.*
 'That detail shows hardly.'

4. Diathesis types of reciprocal constructions with the clitic *se*

In this section we will discuss constructions with *se* and constructions in which *se* can co-occur, optionally or obligatorily, with *l'un l'autre* 'each other'. Constructions with *l'un l'autre* as the only marker of the reciprocal meaning will be considered in Section 7.

4.1 Subject-oriented constructions

4.1.1 "Canonical" reciprocals

We take it for granted that the relations between the participants are congruent with a reciprocal relationship.

4.1.1.1 Derived from two-place transitives. These reciprocals are quite numerous. It is in this type of reciprocals that polysemy is most highly developed. Two groups can be distinguished: in Group A *l'un l'autre* 'each other' is optional or redundant; in Group B, due to polysemy either *l'un l'autre* or contextual support is necessary.

A. Due to the verb meaning, reflexive constructions containing a subject in the plural (formally or semantically) are usually considered as reciprocal situations (the situation can be naturally simultaneous or sequential). The following list (which partially overlaps with the one proposed by Penchev for Bulgarian (Ch. 13)), is not exhaustive; neither is it based on a semantic verb typology:²

- | | |
|------------------------------------|--------------------------------|
| (22) <i>Ils se sont appréciés.</i> | 'They appreciated each other.' |
| <i>Ils se sont attirés.</i> | 'They attracted each other.' |
| <i>Ils se sont admirés.</i> | 'They admired each other.' |
| <i>Ils se sont complétés.</i> | 'They completed each other.' |
| <i>Ils se sont consultés.</i> | 'They consulted each other.' |
| <i>Ils se sont dénigrés.</i> | 'They denigrated each other.' |
| <i>Ils se sont détestés.</i> | 'They hated each other.' |
| <i>Ils se sont épaulés.</i> | 'They supported each other.' |
| <i>Ils se sont embrassés.</i> | 'They kissed.' |
| <i>Ils se sont soutenus.</i> | 'They helped each other.' |
| <i>Ils se sont supportés.</i> | 'They backed up each other.' |

2. For some semantic classes see Kordi (1978).

<i>Ils se sont salués.</i>	‘They greeted each other.’
<i>Ils se sont caressés.</i>	‘They stroked each other.’
<i>Ils se sont congratulés.</i>	‘They congratulated each other.’
<i>Ils se sont dévisagés.</i>	‘They stared at each other.’
<i>Ils se sont engueulés.</i>	‘They bawled at each other.’
<i>Ils se sont acceptés.</i>	‘They accepted each other.’
<i>Ils se sont choisis.</i>	‘They chose each other.’
<i>Ils se sont connus.</i>	‘They got to know each other.’
<i>Ils se sont chatouillés.</i>	‘They tickled each other.’
<i>Ils se sont mordus.</i>	‘They bit each other.’
<i>Ils se sont respectés.</i>	‘They respected each other.’
<i>Ils se sont ignorés.</i>	‘They ignored each other.’
<i>Ils s’estiment.</i>	‘They esteem each other.’
<i>Ils s’épiaient.</i>	‘They spied on each other.’

B. The meaning of these verbs entails ambiguous constructions. In order to activate the reciprocal meaning, a specifier is to be added:

1. *Reflexive / reciprocal ambiguity:*

- | | | | | |
|------|----|--|-----------------------------|--------------|
| (23) | a. | <i>Ils se vantent.</i> | ‘They boast.’ | (reflexive) |
| | b. | <i>Ils se vantent mutuellement.</i> | ‘They praise each other.’ | (reciprocal) |
| (24) | a. | <i>Ils s’accusent.</i> | ‘They blame themselves.’ | (reflexive) |
| | b. | <i>Ils s’accusent l’un l’autre.</i> | ‘They blame each other.’ | (reciprocal) |
| (25) | a. | <i>Ils se sont empoisonnés.</i> | ‘They poisoned themselves.’ | (reflexive) |
| | b. | <i>Ils se sont empoisonnés l’un l’autre.</i> | ‘They poisoned each other.’ | (reciprocal) |

2. *Autocausative / reciprocal ambiguity:*

- | | | |
|------|----|--|
| (26) | a. | <i>Jean et Marie se redressent.</i>
‘Jean and Marie straighten up.’ |
| | b. | <i>Jean et Marie se redressent l’un l’autre.</i>
‘Jean and Marie help each other to straighten up.’ |

3. *Absolutive / reciprocal ambiguity:*

(27) = (6b).

4.1.1.2 *Derived from three-place transitives.* There are several verbs whose syntactic structure is more complex than that of the verbs presented above. In fact, the following transitive verbs can appear both in “indirect” reciprocal, proper to three-place transitives, and in “canonical” subject-oriented reciprocal. The latter use is possible provided that their three arguments refer to agentive entities:

- | | | |
|------|-----------------------------------|---------------------------------|
| (28) | <i>recommander</i> ‘to recommend’ | <i>décrire</i> ‘to describe’ |
| | <i>présenter</i> ‘to present’ | <i>dénoncer</i> ‘to give away.’ |
| | <i>introduire</i> ‘to introduce’ | |

Unlike the “indirect” reciprocal, the participant in the indirect object position is not concerned and the derived reflexive is ambiguous. Hence, in order to obtain the reciprocal interpretation, it is necessary to resort to *l’un l’autre*:

- (29) a. *Jean a dénoncé le collaborateur à la police.*
 ‘Jean gave the collaborator away to the police.’
 b. *Ils se sont dénoncés à la police.*
 i. ‘They gave themselves up to the police.’
 ii. ‘They gave each other away to the police.’
 c. *Ils se sont dénoncés l’un l’autre à la police.*
 ‘They gave each other away to the police.’

4.1.1.3 *Derived from two-place intransitives.* These verbs fall into three groups.

1. The following verbs (the list is exhaustive) in some of their uses require a particular preposition which is omitted in a derived construction. They can appear in reflexive constructions with reciprocal interpretation (for reciprocal lexical verbs of this class, like *coïncider* ‘to coincide’, see 11.1.1):

- | | | | | |
|------|--------------------|--------------------|-------------------|---------------------|
| (30) | <i>complaire à</i> | ‘to try to please’ | <i>obéir à</i> | ‘to obey’ |
| | <i>plaire à</i> | ‘to appeal’ | <i>résister à</i> | ‘to resist’ |
| | <i>mentir à</i> | ‘to lie’ | <i>suffire à</i> | ‘to be sufficient.’ |
| | <i>nuire à</i> | ‘to harm’ | | |

Compare:

- (31) a. *Pierre ment à son ami.* ‘Pierre is lying to his friend.’
 b. *Pierre se ment.* ‘Pierre is fooling himself.’
 c. *Ils se mentent.* i. ‘They are fooling themselves.’
 ii. ‘They are lying to each other.’

The possible confusion of the two interpretations can be easily avoided by the introduction of *l’un l’autre* in which the preposition reappears:

- (32) a. *Il plait à Marie.*
 ‘Marie likes him.’ (lit. ‘He appeals to Marie’).
 b. *Il se plait dans son nouveau costume.*
 ‘He likes himself in his new suit.’
 c. *Ils se plaisent dans leurs nouveaux costumes.*
 i. ‘They like themselves in their new suits.’
 ii. ‘They like each other in their new suits.’
 d. *Ils se plaisent l’un à l’autre.*
 ‘They like each other.’

2. A small group of verbs of motion can also form reciprocal constructions (both in the literal and in the figurative meanings. This is possible if the two arguments in the basic construction denote or are assimilated to agentive entity, the second argument occurring as a prepositional group with a locative complement function:

- | | | |
|------|--------------------------------------|---------------------------------------|
| (33) | <i>tomber (sur)</i> ‘to fall over’ | <i>sauter (sur)</i> ‘to jump on’ |
| | <i>marcher (sur)</i> ‘to walk on’ | <i>bondir (sur)</i> ‘to jump on’ |
| | <i>rentrer (dans)</i> ‘to bump into’ | <i>courir (après)</i> ‘to run after.’ |

There are two possible constructions: a simple one (34e) (with plural subject) whose reciprocal meaning is due to the compound pronoun (see 7.2.1.) and a reflexive construction (34c) related to a derived construction (34b). The latter contains a conjunctive form of the personal pronoun representing the second participant and the prepositions *dessus* ‘over’, *dedans* ‘in’,³ or *après* ‘after’ (but never *dessous* ‘under’ and *dehors* ‘out’). As prepositions (*sur* ‘on’, *dans* ‘in’, *après* ‘after’), in the basic construction, they introduce the locative complement:

- | | | | |
|------|-----|---|--|
| (34) | a. | <i>Jean est tombé sur Pierre.</i> | ‘Jean fell on Pierre.’ |
| | b. | <i>Jean lui est tombé dessus.</i> | ‘Jean fell on him.’ |
| | b’. | <i>Pierre lui est tombé dessus.</i> | ‘Pierre fell on him.’ |
| | c. | <i>Jean et Pierre se sont tombé dessus (à bras raccourcis).</i> | ‘Jean and Pierre fell on each other (with all their might).’ |
| | c’. | <i>*Jean et Pierre se sont tombé.</i> | lit. ‘Jean and Pierre fell on.’ |
| | d. | <i>Jean et Pierre se sont tombé l’un sur l’autre.</i> | ‘Jean and Pierre fell on each other.’ |
| | e. | <i>Jean et Pierre sont tombés l’un sur l’autre.</i> | ‘Jean and Pierre fell on each other.’ |

The verbs expressing socially disapproved acts and behaviour, like *cracher* ‘to spit’ (both in figurative and in literal meanings) can be added to this group:

- | | | | |
|------|-----|---|---|
| (35) | a. | <i>Pierre a craché par terre.</i> | ‘Pierre spat on the ground.’ |
| | a’. | <i>Jean a craché à la figure de Pierre.</i> | ‘Jean spat at Pierre’s face.’ |
| | b. | <i>Pierre a craché à la figure de Jean.</i> | ‘Pierre spat at Jean’s face.’ |
| | c. | <i>Pierre et Jean se sont craché à la figure.</i> | ‘Jean and Pierre spat at each other’s faces.’ |

4.1.2 “Indirect” reciprocals

“Indirect” reciprocals are derived from three place transitives. The reciprocal relation does not affect the patient (the direct object), but the participant which is in indirect object position in the underlying construction. Thus, the preposition *à* which introduces the indirect object is omitted in the reciprocal construction. “Indirect” reciprocals can be organized in three groups:⁴

A. Reflexive constructions which allow reciprocal interpretation without syntactic markers like *l’un l’autre*:

3. Formerly, *dessus* and *dedans* integrated the prepositions *de* and *sur* or *dans*, respectively, and could be used as true prepositions as well as adverbs.

4. In Tesnière (1959:256) they constitute two groups (group of *giving* and group of *saying*).

- | | | |
|------|-----------------------------|----------------------------------|
| (36) | <i>céder</i> 'to yield' | <i>rapporter</i> 'to report' |
| | <i>concéder</i> 'to grant' | <i>refiler</i> 'to palm off' |
| | <i>léguer</i> 'to bequeath' | <i>rendre</i> 'to give back' |
| | <i>passer</i> 'to pass' | <i>transmettre</i> 'to transmit' |
| | <i>prêter</i> 'to lend' | <i>vendre</i> 'to sell.' |

In some cases the object should always be in the plural:

- (37) a. *Pierre a prêté des livres à Marie.*
 'Pierre lent some books to Marie.'
 b. *Pierre et Marie se sont prêté des livres.*
 'Pierre and Marie lent some books to each other.'
 c. **Pierre et Marie se sont prêté un livre.*
 lit. 'Pierre and Marie lent a book to each other.'

The verbs *présenter* 'to present' and *recommander* 'to recommend' can be added to the list of the reciprocals derived from three-place transitives (see 4.1.1.2); an object-oriented passive reciprocal construction is also possible (see 7.2.2.3):

- (38) a. *Jean a présenté Marie au public et Marie a présenté Jean au public.*
 'Jean introduced Marie to the public and Marie introduced Jean to the public.'
 b. *Ils se sont présentés au public.*
 i. 'They introduced themselves to the public.'
 ii. 'They introduced each other to the public.'
 c. *Ils se sont présentés l'un l'autre au public.*
 'They introduced each other to the public.'
- (39) a. *Jean a présenté ses amis à Marie et Marie a présenté ses amis à Jean.*
 'Jean introduced his friends to Marie and Marie introduced her friends to Jean.'
 b. *Jean et Marie se sont présenté leurs amis.*
 'Jean and Marie introduced their friends to each other.'

B. The second group contains verbs which allow reflexive or reciprocal interpretation when considered out of context. The reciprocal reading is usually either derived from the context, or determined by the pronoun *l'un l'autre*:

- | | | | |
|------|---------------------------------|-------------------------------|------------------------------|
| (40) | <i>accorder</i> 'to grant' | <i>consentir</i> 'to consent' | <i>imposer</i> 'to impose' |
| | <i>allouer</i> 'to allot' | <i>donner</i> 'to give' | <i>infliger</i> 'to inflict' |
| | <i>assigner</i> 'to assign' | <i>envoyer</i> 'to send' | <i>laisser</i> 'to let' |
| | <i>attribuer</i> 'to attribute' | <i>fixer</i> 'to set' | <i>octroyer</i> 'to grant' |
| | <i>consacrer</i> 'to dedicate' | <i>fournir</i> 'to provide' | <i>offrir</i> 'to offer.' |

Some cases manifest the same constraint as the one discussed above, namely, that the object should be plural:

- (41) a. *Pierre a donné des claques à Jean.* 'Pierre slapped Jean.'
 b. *Jean a donné des claques à Pierre.* 'Jean slapped Pierre.'
 c. *Ils se sont donné des claques.*
 i. 'Jean and Pierre slapped *themselves*.'
 ii. 'Jean and Pierre slapped *each other*.'

C. The third group contains *verba dicendi* (see 11.3):

- | | | |
|------|-------------------------------------|-------------------------------------|
| (42) | <i>affirmer</i> ‘to assert’ | <i>dire</i> ‘to say’ |
| | <i>assurer</i> ‘to assure’ | <i>proclamer</i> ‘to proclaim’ |
| | <i>chuchoter</i> ‘to whisper’ | <i>promettre</i> ‘to promise’ |
| | <i>communiquer</i> ‘to communicate’ | <i>raconter</i> ‘to tell (stories)’ |
| | <i>confier</i> ‘to entrust’ | <i>répéter</i> ‘to repeat’ |
| | <i>crier</i> ‘to shout’ | <i>révéler</i> ‘to disclose’ |
| | <i>déclarer</i> ‘to declare’ | <i>souffler</i> ‘to prompt.’ |
| | <i>dévoiler</i> ‘to reveal’ | |

The expression of reciprocity does not require any syntactic marker and the use of *l’un l’autre*, though possible, is redundant:

- (43) a. *Il a raconté des histoires drôles à son ami.*
 ‘He told funny stories to his friend.’
 b. *Ils se sont raconté des histoires drôles [l’un à l’autre].*
 ‘They told each other funny stories.’

4.1.3 “Possessive” reciprocals

4.1.3.1 *Inalienable possession.* The name of a body part in object position can be preceded by a possessive adjective (cf. (44a)) or co-occur with a complement introduced by the preposition *de* (cf. (44a’)). In the latter case, due to the solidarity between the whole and its parts, the semantic roles of the possessor and the beneficiary become confused. This is why in some cases “possessive” reciprocals can be replaced by semantically equivalent constructions with the preposition *à* (cf. (44a’)). In these constructions the object is pronominalised by personal pronouns in their disjunctive form which rules out the use of possessive adjectives (cf. (44b’)):

- | | | | |
|------|-----|---|--------------------------------|
| (44) | a. | <i>J’ai teint ses cheveux.</i> | ‘I dyed her hair.’ |
| | a’. | <i>J’ai teint les cheveux de Marie.</i> | ‘I dyed Marie’s hair.’ |
| | a’. | <i>J’ai teint les cheveux à Marie.</i> | ‘I dyed Marie’s hair for her.’ |
| | b. | <i>Je lui ai teint les cheveux.</i> | ‘I dyed her hair for her.’ |
| | b’. | <i>*Je lui ai teint ses cheveux.</i> | ‘I dyed her hair.’ |

Reflexive constructions with plural subjects are ambiguous and, out of context, suggest the reflexive interpretation. Yet, a syntactic marker like *l’un l’autre* is enough to assign them a reciprocal reading. The co-occurrence of *l’un l’autre* and possessives within the same construction makes the sentence unacceptable (cf. (44d’)):

- (44) c. *Nous nous sommes teint les cheveux.*
 i. ‘We dyed our hair.’
 ii. ‘We dyed each other’s hair.’
 d. *Nous nous sommes teint les cheveux l’une l’autre.*
 ‘We dyed each other’s hair.’
 d’. **Nous nous sommes teint nos cheveux l’une l’autre.*
 lit. ‘We dyed each other’s our hair.’

It must be pointed out that, contrary to our expectations, (44d) lacks a preposition between the two components of the compound pronoun. However, the following example shows that this is not a general rule:

- (45) a. *Tu as coupé les ongles de Marie.* 'You clipped Marie's nails.'
 a'. *Tu as coupé ses ongles.* 'You clipped her nails.'
 b. *Elle lui a coupé les ongles.* 'She clipped her/his nails.'
 b'. **Elle lui a coupé ses ongles.* 'You clipped her/his nails.'
 c. *Vous vous êtes coupé les ongles.* i. 'You clipped your nails.'
 ii. 'You clipped each other's nails.'
 d. *Vous vous êtes coupé les ongles l'une à l'autre.*
 'You clipped each other's nails.'
 d'. **Vous vous êtes coupé vos ongles l'une à l'autre.*
 lit. 'You clipped your nails to each other.'

It is difficult to explain the absence of the preposition between the two components of *l'un l'autre*, as in (44d). Some authors consider the preposition as redundant in the presence of the clitic *se* (Grevisse & Goosse 1993: 1486). We would propose another hypothesis: given the fact that the form of the compound pronoun analyses the plural subject argument and expresses a double semantic role (agent and beneficiary in (57d)), the absence of the preposition sets off the agentive role.

The compound pronoun *l'un l'autre* is not always compatible with this type of reciprocal:

- (46) a. *Pierre a serré la main de son ami.*
 'Pierre shook his friend's hand.'
 b. *Les deux amis se sont serré la main.*
 'The two friends shook hands.'
 c. **Les deux amis se sont serré la main l'un à l'autre.*
 'The two friends shook each other's hands.'

Many set phrases with names of body parts give rise to reciprocal constructions:

- (47) a. *Elles se sont crêpé le chignon.*
 'They had a dust-up.'
 b. *Elles se sont pris aux cheveux.*
 'They pulled at each other's hair.'

4.1.3.2 *Alienable possession.* It can be expressed by a reciprocal construction with an indefinite pronoun (see (112)).

4.1.4 *Reciprocals from comitative/sociative constructions*

Constructions of this type will be divided into two groups:

A. A very limited number of one-place intransitives like *danser* 'to dance', *chanter* 'to sing', *jouer* 'to play', *dormir* 'to sleep', *vivre* 'to live' can increase their valency by taking an internal object as a direct object. As a rule, the use of the internal object is subject to a certain number of constraints. For instance, *vivre* and *dormir* require determination:

**vivre une vie* lit. 'live a life' – *vivre sa vie* lit. 'to live one's life' / *vivre une vie agréable* lit. 'to live a nice life'.

The verbs *chanter* and *danser* are the only ones which allow a second participant expressed by a noun phrase with the preposition *avec* 'with' (see (48c)). Thus, they combine the two valency-increasing techniques; the derivation is a discontinuous comitative construction:

- | | | | |
|------|----|--|-------------------------------------|
| (48) | a. | <i>Pierre a dansé.</i> | 'Pierre danced.' |
| | b. | <i>Pierre a dansé une danse.</i> | 'Pierre danced a dance.' |
| | c. | <i>Pierre a dansé avec Marie.</i> | 'Pierre danced with Marie.' |
| | d. | <i>Pierre a dansé une danse avec Marie.</i> | 'Pierre danced a dance with Marie.' |
| (49) | a. | <i>Pierre a chanté.</i> | 'Pierre sang.' |
| | b. | <i>Pierre a chanté une chanson.</i> | 'Pierre sang a song.' |
| | c. | <i>Pierre a chanté avec Marie.</i> | 'Pierre sang with Marie.' |
| | d. | <i>Pierre a chanté une chanson avec Marie.</i> | 'Pierre sang a song with Marie.' |

Without using the clitic *se*, the two verbs allow the following derived constructions:

(a) a reciprocal construction with plural subject + *l'un l'autre*:

- | | | |
|------|----|--|
| (48) | e. | <i>Pierre et Marie ont dansé une danse l'un avec l'autre.</i>
lit. 'Pierre and Marie danced a dance each with the other.' |
| (49) | e. | <i>Pierre et Marie ont chanté une chanson l'un avec l'autre.</i>
'Pierre and Marie sang a song each with the other.' |

(b) A sociative construction with the marker *ensemble* 'together':

- | | | |
|------|----|---|
| (48) | f. | <i>Pierre et Marie ont dansé une danse ensemble.</i>
'Pierre and Marie danced a dance together.' |
| (49) | f. | <i>Pierre et Marie ont chanté une chanson ensemble.</i>
'Pierre and Marie sang a song together.' |

If the two verbs occur with the clitic *se* they form reciprocal constructions which impose some constraints on the realisation of the object. For instance, if the object is unspecified, the sentence becomes ill-formed:

- | | | |
|------|----|--|
| (48) | g. | * <i>Pierre s'est dansé une danse avec Marie.</i>
lit. 'Pierre danced himself a dance with Marie.' |
| | h. | * <i>Pierre et Marie se sont dansé une danse.</i>
lit. 'Pierre and Marie danced themselves a dance.' |
| | i. | * <i>Pierre et Marie se sont dansé une danse l'un avec l'autre.</i>
lit. 'Pierre and Marie danced themselves a dance together.' |
| (49) | g. | * <i>Pierre s'est chanté une chanson avec Marie.</i>
'Pierre sang himself a song with Marie.' |
| | h. | * <i>Pierre et Marie se sont chanté une chanson.</i>
lit. 'Pierre and Marie sang themselves a song together.' |
| | i. | * <i>Pierre et Marie se sont chanté une chanson l'un avec l'autre.</i>
lit. 'Pierre and Marie sang themselves a song together.' |

On the other hand, if the internal object refers to a particular kind of dance (*tango*, *mazurka* ... for the verb *danser*, or *duo* ‘duet’, *chant patriotique* ‘patriotic song’ ... for the verb *chanter*, respectively), the reflexive constructions are well-formed. The clitic *se* does not replace any word in the underlying construction; its role is limited to specifying that the participants are the beneficiaries of the situation. The reflexive construction can receive a reciprocal interpretation:

- (48) j. *Pierre et Marie se sont dansé un tango d'enfer.*
 ‘Pierre and Marie danced a fantastic tango together and for themselves.’
- (49) j. *Ils se sont chanté un de ces duo!*
 ‘They sang a fabulous duet together and for themselves.’

(c) A discontinuous construction with reciprocal and comitative interpretation at the same time:

- (48) k. *Pierre s'est dansé un tango d'enfer avec Marie.*
 ‘Pierre danced a fabulous tango for himself with Marie.’
- (49) k. *Pierre s'est chanté un de ces duo avec Marie!*
 ‘Pierre sang a fabulous duet for himself with Marie.’

B. The semantics of the verbs *partager* ‘to share’ and *répartir* ‘to share out, to divide up’ is more complex. These two two-place transitives can take an extra argument and increase their valency. Let us consider the verb *partager*: its extra argument is introduced by the preposition *avec* ‘with’ and the resulting construction is a comitative discontinuous one (50b). The conjunction of two constructions defined as comitative discontinuous (50b) and (50b’) can be considered as a starting point for two different constructions with reciprocal interpretation (50c) and (50d); in both cases the base constructions retain the direct object:

- (50) a. *Jean a partagé l'héritage.*
 ‘Jean shared the inheritance.’
- b. *Jean a partagé l'héritage avec Marie.*
 ‘Jean shared the inheritance with Marie.’
- b’. *Marie a partagé l'héritage avec Pierre.*
 ‘Marie shared the inheritance with Pierre.’
- c. *Jean et Marie ont partagé l'héritage entre eux.*
 ‘Jean and Marie shared the inheritance between them.’
- d. *Jean et Marie se sont partagé l'héritage.*
 ‘Jean and Marie shared the inheritance between them.’

Gaetone (1971:217sq) points out rightly that the syntactic constraint which allows to derive *se* from a construction with direct or indirect objects does not apply to these verbs. In fact, (50c) is a simple two-place transitive with a plural subject whose reciprocal interpretation is determined by the expression *entre* + personal pronoun (see 9.1) which is coreferent with the subject. On the other hand, the reciprocal meaning in (50d) is due to the clitic *se*, but rules out *P'un l'autre* (see 8.3.4.):

- (50) e. **Jean et Marie se sont partagé l'héritage l'un avec l'autre.*
lit. 'Jean and Marie shared the inheritance the one with the other.'

4.2 Object-oriented constructions

Verbs like *faire* 'to do/make', *laisser* 'to let', *inciter* 'to incite', *obliger* 'to oblige', etc., can occur in causative reciprocal object-oriented constructions. The reciprocal arguments which are never coreferent with each other enter a double syntactic relation: they behave both as the objects of the causative verbs and as the subjects of the subordinate verbs. Compare the reciprocal (51a) and the causative constructions (51b–c):

- (51) a. *Pierre et Marie se sont embrassés.* 'Pierre and Marie kissed.'
b. *Jean les a fait s'embrasser.* 'Jean made them kiss.'
c. *Jean les a obligés à s'embrasser.* 'Jean forced them to kiss.'

5. Reciprocals with the verbal prefix *entre-* 'among'

Attached to a certain number of verbs this prefix can either emphasize the reciprocity (*croiser* 'to cross' – *entrecroiser* 'to intertwine'), or simply mark it, if it co-occurs with the clitic *se* (*s'entre-*verbs) (*tuer* 'to kill' – *s'entretuer* 'to kill each other'). When used with some verbs, it denotes attenuation (*entrevoir* 'to catch a glimpse of', *entraapercevoir* 'to catch a faint glimpse of') or the notion of "between" (*entrelarder* 'to interlard', *entretisser* 'to put a brace between two beams'). Although the creation of new *s'entre-*verbs is still possible and made use of by the speakers, even in the cases where the reciprocity is implied by the meaning of the verb or by the syntactic environment, the number of the verbs which remain in active usage has been decreasing over the last centuries.

5.1 Subject-oriented constructions: *Verba reflexiva tantum* (*s'entre-*verbs)

In the list of verbs given below which can be considered as synchronically exhaustive, *entre-* is used as a verbal prefix that imposes the presence of the clitic *se*.

- (52) *s'entradmirer* 'to admire each other'
s'entraider 'to help each other'
s'entre-déchirer 'to tear each other'
s'entre-détruire 'to destroy each other'
s'entre-dévoré 'to eat each other'
s'entre-égorger 'to tear each other's throats'
s'entre-nuire 'to harm each other'
s'entre-regarder 'to look at each other'
s'entre-tuer 'to kill each other.'

These verbs occur exclusively in reciprocal constructions, the subject is in the plural or denotes a set of individuals when it is expressed by a form in the singular:

- (53) *Les parents et les enfants s' entre-déchir-ent.*
 the parents and the children REFL between-tear-PL
 'The parents and the children tear one another to pieces.'
- (54) *Le ménage s'entredéchire.*
 'The couple tear each other to pieces.'

The *s'entre*-verbs given above are derived from two-place transitives, except for *s'entre-nuire* 'to harm each other' from a two-place intransitive whose usage is considered as literary:

- (55) a. *Pierre a nui à Marie.* 'Pierre harmed Marie.'
 a'. *Marie a nui à Pierre.* 'Marie harmed Pierre.'
 b. *Ils se sont entre-nui.* 'They harmed each other.'

The constructions with *s'entre*-verbs can be compared to those which follow the "canonical" derivation: given a transitive base verb the reciprocity requires that *se* and *entre*-be present simultaneously. Nevertheless, *entre* can always occur as a preposition and introduce a pronoun referring to the complex subject (see 8.4):

- (56) a. *Les loups s' entre-dévor-ent.*
 the wolves REFL between-devour-PL
 'The wolves devour one another.'
- b. *Les loups se dévor-ent entre eux.*
 the wolves REFL devour-PL between them
 'The wolves devour one another.'

Two verbs of perception *voir* 'to see' and *apercevoir* 'to notice' can alternate *entre*- / *s'entre*- and express attenuation or reciprocity which is otherwise excluded by the reflexive construction:

- (57) a. *J'ai à peine entrevu mon ami.* 'I hardly saw my friend.'
 b. *Nous nous sommes à peine entrevus.* 'We hardly saw each other.'

5.2 Object-oriented constructions (*entre*-verbs)

Reciprocity is expressed lexically: see 11.2.

5.3 Non-reciprocal verbs with the prefix *entre*-

Here belong the following *entre*-verbs:

- (58) *entrecouper* 'to intersperse'
entrelarder 'to interlard'
entretôiser 'to put a brace between two beams'
entrevoûter 'to put plaster between two joists'
entreposer 'to store'
entreprendre 'to undertake.'

These verbs form a very heterogeneous class. Some of them express a reciprocal meaning in very specific conditions. Thus, the verbs *entrebâiller* ‘to half open’ and *entrouvrir* ‘to half open’ where the prefix *entre-* expresses the idea of attenuation, denote an object-oriented reciprocity if the object refers to a pair. These constructions have their reflexive counterparts:

- (59) a. *Elle a entrebâillé ses lèvres.* ‘She half opened her lips.’
 b. *Ses lèvres se sont entrebâillées.* ‘Her lips half opened.’

Entrelarder ‘to put fat into the meat’ has a metaphoric meaning which denotes an alternating sequence (see 10.3). The reflexive construction is not possible with this verb:

- (60) a. *Elle a entrelardé la volaille.*
 ‘She put fat into the bird.’
 b. *Elle a entrelardé son discours de citations.*
 ‘She interspersed her speech with quotations.’
 c. **Elle s’entrelardait le discours de citations.*
 lit. ‘She REFL-interspersed her speech with quotations.’

6. Expression of reciprocal arguments with reflexive reciprocals

Expression of reciprocal arguments in simple constructions is the same for different types of reciprocals. As regards discontinuous constructions, the problem of expressing reciprocal arguments is relevant only for reflexive reciprocals and lexical reciprocals. If a reciprocal construction contains the pronoun *l’un l’autre* ‘each other’ a simple construction alone is possible.

6.1 Simple reciprocal constructions

These constructions presuppose a plural subject. The semantic roles of agent and patient are not distinguished and are assumed by the sole syntactic subject. It is expressed in the same ways as a plural subject in non-reciprocal constructions. In a sentence with a subject-oriented reciprocal interpretation, the subject argument occurs as a plural nominal, as a noun phrase with coordination, as a collective noun; cf. respectively:

- (61) a. *Ces deux enfants s’apprécient.* ‘These two children appreciate each other.’
 b. *Le mari et la femme s’apprécient.* ‘The husband and wife appreciate each other.’
 c. *Le couple s’apprécie.* lit. ‘The couple appreciate each other.’

If the plural subject refers to more than two individuals, the reciprocity can be fuzzy or collective. Thus:

- (62) *Les élèves de ma classe se sont congratulés.*
 ‘The pupils in my class congratulated each other’

expresses “a collective movement [...] and leaves it to the context to suggest the number of established relations” (Stefanini 1962:424). In order to obtain a strictly reciprocal

meaning, it is indispensable that the expression *deux à deux* ‘two by two’ be used, which expresses multiple coreference and reciprocity:

- (63) *Les garçons de ma classe se sont congratulés deux à deux.*
 ‘The boys in my class congratulated each other two by two.’

Reciprocals, like other verbs with a human subject referent, can be used with the indefinite-personal pronoun *on*. The reciprocal interpretation of a sentence containing *on* is due to the meaning of the verb, to the clitic *se* and to the context at the same time:

- (64) *On s’est aimé pendant deux ans et on s’est détesté pendant quarante.*
 = *Nous nous sommes aimés pendant deux ans et nous nous sommes détestés pendant quarante.*
 ‘We loved each other for two years and hated each other for forty years.’

In sentences like (65), *on*, according to the context, can replace each of the three persons in plural and in singular:

- (65) *Alors on se bat?*
 i. *Alors nous nous battons?* ‘So, we’re going to fight, aren’t we?’
 ii. *Alors vous vous battez?* ‘So, you’re are fighting, aren’t you?’
 iii. *Alors ils se battent?* ‘So, they’re fighting, aren’t they?’

6.2 Discontinuous reciprocal constructions

These are reciprocal constructions in which the second argument is expressed by an object. In standard reciprocals considered in Section 4, it can only be a comitative object with the preposition *avec* ‘with’. Non-lexicalized standard reciprocals do not as a rule form this type of constructions (see, however, (68)). The verbs under (66) are lexicalized reciprocals not semantically related to the base verbs in a standard way, therefore they may be interpreted as a kind of semantic *reciproca tantum* and placed in section 11.1.2 (concerned with lexical reciprocals that have lost the base verbs). It is these verbs that form discontinuous constructions with a comitative object. The list is not exhaustive:

- | | | | |
|---------|--|-----|--|
| (66) a. | <i>s’entendre avec</i>
‘to get along with’ | cf. | <i>entendre qqn</i>
‘to hear sb’ |
| b. | <i>s’arranger avec</i>
‘to come to an agreement with’ | cf. | <i>arranger qqn</i>
‘to suit sb’ |
| c. | <i>s’accommoder avec</i>
‘to come to an agreement with’ | cf. | <i>accommoder un plat</i>
‘to prepare a dish’ |
| d. | <i>se concerter avec</i>
‘to consult sb’ | cf. | <i>concerter un plan</i>
‘to devise a plan.’ |

These verbs also authorize simple reciprocal constructions. However, neither they nor the comitative discontinuous constructions can be semantically related to the base two-place transitive in a standard way:

- (67) a. *Je l’entends bien.* ‘I can hear him/her/it well.’
 b. *Nous nous entendons bien.* ‘We get along.’
 c. *Je m’entends bien avec elle.* ‘I get along with her.’

Discontinuous constructions seem to be characteristic only of some verbs of confrontation, like (68). These verbs have a slight degree of lexicalization.

- | | | | |
|---------|--|---|---------------------------------------|
| (68) a. | <i>s'engueuler avec</i> 'to quarrel with' | ← | <i>engueuler</i> 'to scold' |
| b. | <i>s'affronter avec</i> 'to confront' | ← | <i>affronter</i> 'to protest against' |
| c. | <i>s'accrocher avec</i> 'to have a clash with' | ← | <i>accrocher</i> 'to clash with' |
| d. | <i>se battre avec</i> 'to fight with' | ← | <i>battre</i> 'to beat/hit' |
| e. | <i>s'empoigner avec</i> 'to have a row with' | ← | <i>empoigner</i> 'to grasp.' |

In the case of *se battre avec* 'to fight with', the preposition can entail a double reading (Borillo 1971): "opposed to" or "together with", for example:

- (69) *Pierre se bat avec Jean.*
 i. *Pierre se bat avec Jean contre Paul.*
 'Pierre fights with Jean against Paul.'
 ii. *Pierre et Jean se battent l'un contre l'autre.*
 'Pierre and Jean fight each other.'

As mentioned above, the discontinuous construction is generally incompatible with reflexive reciprocals:

- | | | |
|---------|---|------------------------------------|
| (70) a. | * <i>Pierre s'embrasse avec Marie.</i> | lit. 'Pierre kisses with Marie.' |
| b. | * <i>Pierre s'aime avec Marie.</i> | lit. 'Pierre loves with Marie.' |
| c. | * <i>Pierre se respecte avec Marie.</i> | lit. 'Pierre respects with Marie.' |

However, some rare examples of *s'embrasser* or *s'aimer* can be found in the literature (Grevisse & Goosse 1993:1134). However, these examples clearly represent either metaphorical usages (71a), or meanings which can hardly be considered as a part of the verb's meaning (71b):

- (71) a. *La plupart des communistes voudraient s'embrasser avec vous sur une joue, et avec les Russes sur l'autre.* (Malraux)
 'Most communists would like to be on kissing terms with you on one cheek, and with the Russians on the other.'
 b. *Je sais bien que je me suis aimé avec toi.* (Barbusse)
 'I know well that I made love to you.'

7. *L'un l'autre* 'each other' as the only marker of reciprocity (restrictions on reflexive reciprocals)

One of the functions of the configuration *l'un l'autre* 'each other/one another' is to mark the opposition between two protagonists in two parallel predications (*l'un dit blanc, l'autre dit noir*, lit. 'the one says white, the other says black'). If *l'un l'autre* appears with a plural subject, it underlines and/or expresses reciprocity. Traditional grammars consider "these configurations as elliptic propositions, *l'un* standing either for subject, or for direct object and *l'autre* always representing the complement" (Grevisse 1964:519).

As French lacks specialized non-pronominal markers of reciprocity, the compound pronoun proves to be the only means to express reciprocity in certain constructions. The reciprocal constructions are derived from two-place verbs, either transitives or intransitives.

7.1 Subject-oriented constructions

7.1.1 Two-place intransitive constructions

7.1.1.1 *Constructions with reflexiva tantum.* In their base form, the *reflexiva tantum* verbs appearing in this construction take a complement introduced by *à*, *de* or *contre*. The following list is exhaustive:

(72) <i>Ils se sont amourachés l'un de l'autre.</i>	'They became infatuated with each other.'
<i>Ils se sont engoués l'un de l'autre.</i>	'They became infatuated with each other.'
<i>Ils se sont enamorés l'un de l'autre.</i>	'They fell in love with each other.'
<i>Ils se sont épris l'un de l'autre.</i>	'They fell in love with each other.'
<i>Ils se sont fiés l'un à l'autre.</i>	'They trusted each other.'
<i>Ils se sont gaussés l'un de l'autre.</i>	'They derided each other.'
<i>Ils se sont rebellés l'un contre l'autre.</i>	'They rebelled against each other.'
<i>Ils se sont rebiffés l'un contre l'autre.</i>	'They bridled up against each other.'
<i>Ils se sont souvenus l'un de l'autre.</i>	'They remembered each other.'

In a reciprocal construction the prepositional group is omitted, and *l'un l'autre* remains the only means to express reciprocity (see Section 8). As the preposition inserted between the two components introduces the prepositional complement, it cannot be omitted:

(73) a. <i>Jean se méfie de Marie.</i>	'Jean is wary of Marie.'
b. <i>Jean et Marie se méfient l'un de l'autre.</i>	'Jean and Marie are wary of each other.'
c. * <i>Jean et Marie se méfient l'un l'autre.</i>	lit. 'J. and M. are wary one of the other.'

7.1.1.2 *Constructions with reflexive derivatives.* These are constructions derived from reflexive constructions with autocausative interpretation, which are themselves derived:

(74) <i>se jeter</i> 'to hurl oneself'	← <i>jeter</i> 'to throw'
<i>se lancer</i> 'to launch'	← <i>lancer</i> 'to pitch, to throw'
<i>se précipiter</i> 'to rush'	← <i>précipiter</i> 'to speed, to throw down.'

In this construction the reciprocal interpretation is not determined by the clitic *se* (75b–c), and requires a syntactic marker (75d):

(75) a. <i>Jean a précipité Pierre par terre.</i>	'Jean threw Pierre down to the ground.'
b. <i>Jean s'est précipité vers Pierre.</i>	'Jean rushed towards Pierre.'
c. <i>Jean et Pierre se sont précipités l'un vers l'autre.</i>	'Jean and Pierre rushed towards each other.'

7.2 Constructions with two-place intransitive non-reflexive verbs

7.2.1 *Constructions with verbs of motion*

Regardless of their capacity to express oriented motion, certain verbs of motion can take an argument that denotes an animate entity as a locative prepositional phrase. The list of verbs presented below (prepositions may vary) completes the one given in 4.1.1.3:

- (76) *avancer vers* ‘to move towards’ *marcher vers* ‘to walk towards’
courir vers ‘to run towards’ *foncer sur* ‘to charge at’.

When these verbs take a single compound subject which represents animate entities, they can combine with *l’un l’autre* (with the appropriate preposition) and express reciprocity. If the clitic *se* occurs in this construction, it makes the sentence ill-formed:

- (77) a. *Pierre court vers Marie.*
 ‘Pierre runs towards Marie.’
 b. *Pierre et Marie courent l’un vers l’autre.*
 ‘Pierre and Marie run towards each other.’
 c. **Pierre et Marie se courent l’un vers l’autre.*
 lit. ‘Pierre and Marie (REFL) run one towards the other.’
- (78) a. *Jean est tombé sur Pierre.* ‘Jean fell on Pierre.’
 b. *Ils sont tombés l’un sur l’autre.* ‘They fell on each other.’
 c. **Ils se sont tombés l’un sur l’autre.* lit. ‘They (REFL-)fell one on the other.’

For the difference between this construction and reciprocals expressed by the clitic *se*, see 4.1.1.3.

7.2.2 *Constructions with other verbs*

These constructions represent two-place intransitive verbs whose complements are introduced by fixed prepositions.

- (79) *compter sur* ‘to count on’ *raffoler de* ‘to be keen on’
dépendre de ‘to depend on’ *recourir à* ‘to resort to’
parler de ‘to speak about’ *renoncer à* ‘to give up’
penser à ‘to think about’ *rêver à* ‘to dream of’
profiter de ‘to profit from’

These verbs fall into the group of French verbs that are incompatible with the clitic *se* (80b), but can express reciprocity by means of *l’un l’autre* with an inserted preposition (see also 8.3.1):

- (80) a. *Jean compte sur Marie et Marie compte sur Jean.*
 ‘Jean counts on Marie and Marie counts on Jean.’
 b. **Jean et Marie se comptent.*
 lit. ‘Jean and Marie (REFL-)count.’
 c. **Jean et Marie se comptent l’un sur l’autre.*
 ‘Jean and Marie (REFL-)count on each other.’
 d. *Jean et Marie comptent l’un sur l’autre.*
 ‘Jean and Marie count on each other.’

7.2.3 Passives from object-oriented reciprocals

With several three-place transitives (Kayne (1975:360) also mentioned the verb *représenter* ‘to represent’), the passive construction with a plural subject can receive a reciprocal interpretation, provided that the compound pronoun *l’un l’autre* is present in the sentence:

- (81) *dresser qqn contre qqn* ‘to drive sb against sb’
exciter qqn contre qqn ‘to turn sb against sb’
monter qqn contre qqn ‘to set sb against sb’
pousser qqn contre / vers qqn ‘to push sb against sb’
présenter qqn à qqn ‘to introduce sb to sb.’
- (82) a. *Marie a dressé Jean contre Hélène et Marie a dressé Hélène contre Pierre.*
 ‘Marie set Jean against Hélène and Marie set Hélène against Pierre.’
 b. *Marie a dressé Jean et Hélène l’un contre l’autre.*
 ‘Marie set Jean and Hélène against each other.’
 b’. *Marie les a dressés l’un contre l’autre.*
 ‘Marie set them against each other.’
 c. *Jean et Hélène ont été dressés l’un contre l’autre par Marie.*
 ‘Jean and Hélène were set against each other by Marie.’

8. Similarities and differences between *l’un l’autre* ‘each other’, *mutuellement* ‘mutually’, *récioproquement* ‘reciprocally’; their use with reflexive reciprocals

L’un l’autre ‘each other’ is not the only syntactic specifier that makes it possible to distinguish reciprocal from non-reciprocal interpretations. Though obeying some constraints, the adverbs *récioproquement* ‘reciprocally’ and *mutuellement* ‘mutually’ can also play the role of reciprocity specifiers. Statistically, *l’un l’autre* is much more frequent than *mutuellement*, which, in its turn, is more frequent than *récioproquement*.

8.1 *Mutuellement*

This adverb stresses that reciprocity expressed through other means in the utterance does not imply simultaneity or strict equivalence of the reciprocal activity. The following example does not necessarily mean that the participants do each other a favour in strict alternation (that is, by returning a favour for each received favour):

- (83) *Ils se rendent service mutuellement.* ‘They do favours to each other.’

Since *mutuellement* does not imply an absolute symmetry between the act of giving and the act of receiving, it is usually used with verbs involving emotional attitudes:

- (84) *Les deux jeunes s’apprécient mutuellement.*
 ‘The two young people like each other.’
 (85) *Les époux se doivent mutuellement fidélité.*
 ‘The husband and wife shall be faithful to each other.’

In many contexts *mutuellement* can replace *l'un l'autre* (with or without an inserted preposition) without significantly changing the meaning of the construction (see 8.3.1 and 8.3.3). However, the fact that this adverb denotes alternating acts in a very general way makes it incompatible with contexts where such acts are countable:

- (86) b. *Ils se rendent service l'un l'autre.* 'They do favours to each other.'
 (87) a. *Ils s'écrivent l'un à l'autre.* 'They write to each other.'
 b. **Ils s'écrivent mutuellement.* lit. 'They (REFL-)write mutually.'

8.2 *Réciproquement*

This adverb insists on strict equivalence between what is done and what is returned: the act of giving implies the act of receiving. Unlike *mutuellement*, the reciprocity expressed by *réciproquement* should be absolutely symmetrical:

- (88) *Les deux amis s'accusent réciproquement de vol.*
 'The two friends accuse each other of the robbery.'
 (89) *L'enseignement et la recherche se gênent réciproquement.*
 'Teaching and research hamper each other.'

Due to the strict symmetry, *réciproquement* can replace an entire sentence if it denotes a response action. The response action is analogous to the action that precedes it and is conceived of as the second half of a reciprocal situation. In these expressions *réciproquement* is preceded by a conjunction of coordination *et* 'and' which highlights the identity of two relations of the same types. This is the most common usage of this adverb:

- (90) A: *Je vous souhaite de bonnes vacances!* 'I wish you happy holidays!
 B: *Et réciproquement!* 'Same to you!'

Due to its exact symmetry, *réciproquement* is widely used in scientific texts. In the following example it means that every property of the first equation with respect to the second is also true of the second equation with respect to the first:

- (91) *Ces deux équations s'associent réciproquement l'une à l'autre.*
 'The two equations are reciprocal.'

8.3 The pronoun *l'un l'autre* vs. the adverbs *mutuellement* and *réciproquement*

Rules are hardly to be expected here, as it would require a subtle and intricate semantic analysis. According to the types of constructions, there are four possibilities of co-occurrence.

8.3.1 *Interchangeability of l'un l'autre, mutuellement and réciproquement*

This case involves the following constructions:

1. Some "canonical" subject-oriented constructions of group A (4.1.1.1) where the lexical meaning of the base verb does not entail a reflexive polysemous construction.

Substitution of one specifier for another, in these cases, may bring about a more or less perceptible change of meaning (see 8.1, 8.2), all of them emphasizing reciprocity:

- (92) a. *Ils se supportent l'un l'autre / mutuellement / réciproquement.*
 'They put up with each other.'
 b. *Ils se sont engueulés l'un l'autre / mutuellement / réciproquement.*
 'They had a row.'
 c. *Ils se dévisagent l'un l'autre / mutuellement / réciproquement.*
 'They stare at each other.'

2. Some "canonical" subject-oriented constructions of group B (4.1.1.1) where the use of the marker resolves the polysemy of the reflexive construction:

- (93) a. *Ils se vantent l'un l'autre / mutuellement / réciproquement.*
 'They praise each other.'
 b. *Ils s'accusent l'un l'autre / mutuellement / réciproquement.*
 'They accuse each other.'
 c. *Ils se sont blessés l'un l'autre / mutuellement / réciproquement.*
 'They hurt each other.'

3. "Indirect" reciprocals (see 4.1.2): for group A, a syntactic specifier sets off the reciprocal meaning; for the majority of reciprocals in group B it resolves the ambiguity; for several reciprocals of group C it is redundant (the impossible constructions are discussed in 8.3.2):

- (94) a. *Ils se sont légué leurs biens l'un à l'autre / mutuellement / réciproquement.*
 'They left their property to each other.'
 b. *Ils se sont alloué une indemnité l'un à l'autre / mutuellement / réciproquement.*
 'They granted each other an allowance.'
 c. *Ils se sont promis une récompense l'un l'autre / mutuellement / réciproquement.*
 'They promised a reward to each other.'

8.3.2 *L'un l'autre* alone is possible

This concerns the following:

1. Some "canonical" subject-oriented constructions of group A (4.1.1.1) due to the lexical base verb meaning. In some cases *l'un l'autre* is an emphatic marker or indicates the non-simultaneity of two reciprocal activities:

- (95) a. *Ils se complètent l'un l'autre / *mutuellement / *réciproquement.*
 'They complete each other.'
 b. *Ils se sont connus l'un l'autre / *mutuellement / *réciproquement.*
 'They got to know each other.'
 c. *Ils se sont embrassés l'un l'autre / *mutuellement / *réciproquement.*
 lit. 'They kissed each other.'

2. The two-place intransitive ambiguous *reflexiva tantum* (type *se méfier* 'to be wary of', see 7.1):

- (96) *Ils se méfient l'un de l'autre / *mutuellement / *réciproquement.*
 'They are wary of each other.'

3. The vast majority of *verba dicendi*:

- (97) *Ils se communiquent les nouvelles l'un l'autre / *mutuellement / *réciproquement.*
 'They pass on the news to each other.'

4. Some anticausatives derived from lexical reciprocals denoting connecting or disconnecting (type *mélanger* 'to mix', *séparer* 'to split up', see 11.1.3).

- (98) a. *Ils se sont mélangés l'un l'autre / *mutuellement / *réciproquement.*
 'They mixed.'
 b. *Ils se sont séparés l'un de l'autre / *mutuellement / *réciproquement.*
 'They split up.'

5. *Reflexiva tantum s'entre-* verbs expressing subject-oriented reciprocity (cf. 5.1):

- (99) *Ils s'entraident les uns les autres / *mutuellement / *réciproquement.*
 'They help each other.'

8.3.3 *L'un l'autre and mutuellement only are possible*

This case concerns:

1. "Canonical" subject-oriented constructions derived from transitives listed in (22):

- (100) a. *Ils se sont choisis l'un l'autre / mutuellement / *réciproquement.*
 'They chose each other.'
 b. *Ils s'estiment l'un l'autre / mutuellement / *réciproquement.*
 'They hold each other in high esteem.'
 c. *Ils s'acceptent l'un l'autre / mutuellement / *réciproquement.*
 'They accept each other.'

2. "Possessive" reciprocals expressing body-care (type *se teindre les cheveux* 'to dye one's hair'; see 4.1.3.1) which are ambiguous. One can point out two particularities in these constructions: the absence of the preposition *de* between the two components of *l'un l'autre*, on the one hand, and on the other, the position of the direct object after the adverb *mutuellement* (examples (b)):

- (101) a. *Elles se sont teint les cheveux l'une l'autre / *réciproquement.*
 b. *Elles se sont mutuellement teint les cheveux.*
 'They dyed each other's hair.'
 (102) a. *Ils se sont massé les pieds l'un l'autre / *réciproquement.*
 b. *Ils se sont mutuellement massé les pieds.*
 'They massaged each other's feet.'

8.3.4 *The syntactic specifiers are impossible*

This case applies to all *entre-*verbs, both object-oriented lexical reciprocals (103a) and derived subject-oriented anticausatives, when the reciprocal arguments are in subject position (103b). (For the alternation of *entre-/s'entre-*, see 11.3).

- (103) a. *Pierre a entrechoqué les tasses *l'une contre l'autre / *mutuellement / *réciproquement.*
 'Pierre banged the cups against each other.'

- b. *Les tasses se sont entrechoquées *l'une l'autre / *mutuellement / *réciproquement.*
 'The cups clinked against each other.'

Constructions with the lexical reciprocals *partager* 'to share' and *répartir* 'to share out' (there might be many more of them, though) must be added to this group (see B in 4.1.4):

- (104) *Jean et Marie se sont partagé l'héritage *l'un avec l'autre / *mutuellement / *réciproquement.*
 'Jean and Marie shared the inheritance between each other.'

9. Other syntactic specifiers

9.1 The phrase *entre eux* 'between them'

This specifier integrates the preposition *entre* and the disjunctive form of a plural personal pronoun (see Table 1): *entre nous* 'between us', *entre vous* 'between you', *entre eux* 'between them'. It does not express a reciprocal meaning on its own, but often limits or emphasizes the group of persons involved in a reciprocal (105), or non-reciprocal (106) situation, by sometimes opposing them to other people or presenting the action as a characteristic of these people:

- (105) *Ils s'invitaient entre eux.* 'They (often) invited each other.'
 (106) *Nous restions toujours entre nous.* 'We always kept to ourselves.'

Sometimes *entre eux* is used to resolve the ambiguity between reciprocal and non-reciprocal interpretations in subject-oriented constructions:

- (107) a. *Ils se sont félicités du résultat.*
 i. 'They congratulated *themselves* on the result.'
 ii. 'They congratulated *each other* on the result.'
 b. *Ils se sont félicités du résultat entre eux.*
 'They congratulated each other on the result.'
- (108) a. *Ils se pardonnent tout.*
 i. lit. 'They forgive *themselves*.'
 ii. 'They forgive *each other*.'
 b. *Ils se pardonnent tout entre eux.*
 'They forgive everything to each other.'

9.2 Adverbial phrases

French uses a number of expressions which have obtained the status of adverbial phrases to describe a situation with only two protagonists. These phrases are either sociative or, less commonly, reciprocal in meaning; cf. (110c) and (110a) respectively:

- | | | |
|-------|---|---|
| (109) | <i>tête à tête</i> | ‘tête à tête’ |
| | <i>face à face</i> | ‘face to face’ |
| | <i>coude à coude</i> | ‘shoulder to shoulder’ |
| | <i>dos à dos</i> | ‘back to back’ |
| | <i>côte à côte</i> | ‘side by side’ |
| | <i>nez à nez</i> (informal) | ‘face to face’ (lit. ‘nose to nose’). |
| (110) | a. <i>Nous nous sommes trouvés nez nez.</i> | ‘We came face to face with each other.’ |
| | b. <i>Nous nous sommes promenés côte à côte.</i> | ‘We took a walk side by side.’ |
| | c. <i>Nous avons passé la soirée tête à tête.</i> | ‘We spent the evening tête à tête.’ |

9.3 Indefinite reciprocal constructions

9.3.1 *The complex chacun(e)... (à) l’autre* ‘each one... the other’

This complex is made up of two indefinite pronouns: its first component – *chacun(e)* – is inflected for gender and its second component – *l’autre* – for number. The two components stand for the subject and the direct or indirect object, respectively. The reciprocal meaning of the construction is determined by the distributive meaning of the first component: *chacun (e)* ‘each one’, i.e. the member of a set taken in isolation (e.g. *chacun a parlé* ‘each one spoke’; *chacun pour soi* ‘everyone for himself’). Since the subject position is occupied by the indefinite pronoun, its referent is (naturally) recovered from the context. Compare:

- | | | |
|-------|---|----------------------------------|
| (111) | a. <i>L’élève a roulé son professeur.</i> | ‘The pupil cheated his teacher.’ |
| | b. <i>Chacun a roulé l’autre.</i> | ‘Each cheated the other.’ |

The complex also authorizes a construction with a “possessive” reciprocal involving alienable possession: the direct object is a noun and the second component *l’autre*, which is preceded by the preposition *de*, represents the object’s possessor:

- | | | |
|-------|--|-----------------------------------|
| (112) | a. <i>Chacun d’eux a brûlé la maison de l’autre.</i> | ‘They burnt each other’s houses.’ |
| | b. <i>Chacun d’eux a lu l’article de l’autre.</i> | ‘They read each other’s papers.’ |

9.3.2 *The complex chaque + noun ... l’autre* ‘each + noun... the other’

This complex differs from the previous one in that the first component is an invariable (in number or gender) adjectival pronoun and thus occurs with a noun:

- | | | |
|-------|--------------------------------------|---------------------------------|
| (113) | <i>Chaque élève a roulé l’autre.</i> | ‘Each pupil cheated the other.’ |
|-------|--------------------------------------|---------------------------------|

10. Temporal and spatial relations

Strictly speaking, reciprocity is linked to a situation which is conceived of as a single event where two participants set up the same type of relation relatively to each other. However, the meaning of some verbs as well as the pragmatic conditions often require to consider reciprocity within a larger scope. The reciprocal activity in which the two protagonists are engaged is perceived or conceived of as two partially simultaneous relations, as successivity, or alternation, or as a reciprocal sequence.

10.1 Optional simultaneity

The two relations which lay the basis for reciprocity can be understood as simultaneity or sequentiality (including iterativity):

- (114) a. *Pierre et Marie se fusillaient du regard toute la journée.*
 ‘Pierre and Marie looked daggers at each other all day long.’

However, in the presence of a specifier (temporal or spatial) denoting the circumstances of an occurrence of the event, the meaning immediately shifts to strict simultaneity:

- (114) b. *Au moment de partir Pierre et Marie se sont fusillés du regard.*
 ‘Pierre and Marie looked daggers at each other *when they left*.’

10.2 Obligatory non-simultaneity

If two participants do not perform the activity referred to simultaneously or at the same place, the two activities are considered as symmetrical but successive. The aspect of such utterances can be habitual or iterative:

- (115) *Les deux garçons se lançaient le ballon.*
 ‘The two boys were throwing the ball to each other.’
- (116) *La Grande Catherine et Voltaire s’écrivaient des lettres.*
 ‘Catherine the Great and Voltaire used to write letters to each other.’

10.3 Chaining relations

In cases where there are several participants in the same event and where the relations of successivity, or sequentiality are predominant, the participants are perceived as coupled in pairs and the reciprocal relation as holding between the members of each pair. These ordered paired relations (or chaining relations) can be organised according to a temporal or a spatial order. They are rendered by a very small set of verbs which are semantically homogeneous and which most often define the same spatio-temporal domain:

- | | |
|---------------------------------------|---------------------------------------|
| (117) <i>se succéder</i> ‘to succeed’ | <i>s’enchaîner</i> ‘to chain up’ |
| <i>se suivre</i> ‘to follow’ | <i>se talonner</i> ‘to follow behind’ |
| <i>se poursuivre</i> ‘to chase’ | <i>s’emboîter</i> ‘to fit into.’ |

The arrangement of the participants in a chaining situation is such that each of them occupies a position in the chain (Lichtenberk 1985). Thus, all positions are relative and different every time and for every participant. However, they are ordered with regard to the others, except for the first one which “is followed” and the last one which “follows”:

- (118) *Les coureurs se talonnaient depuis le début.*
 ‘The racers had been hot on the heels of each other since the beginning.’
- (119) *Les enfants se sont alignés par taille.*
 ‘The children lined up by size.’

- (120) *Ils se sont transmis la consigne.*
 ‘They passed on the orders.’

Lichtenberk (1985:25) points out that “the only case where a chaining situation is at the same time reciprocal is one that consists of two relations in a closed chain [...]”. In French this situation can be rendered either by *s’enchaîner* ‘to chain’ + *l’un l’autre* or by the symmetrical verb *alterner* ‘to alternate’ which lacks reflexive forms (**s’alterner*).

- (121) *Les deux enfants se sont enchaînés l’un à l’autre.*
 ‘The two kids chained themselves together.’

Although each of the participants logically precedes another, the verb *précéder* ‘to precede’ cannot encode “chaining reciprocity” like its antonym *suivre* ‘to follow’:

- (122) a. *Les garçons se suivaient.* ‘The boys followed each other.’
 b. **Les garçons se précédaient.* ‘The boys preceded each other.’

We think that this constraint is due to the predominant value of each of the two verbs. The static meaning inherent in *précéder* is opposed to the notion of change which prevails in the meanings of *suivre* or *succéder* (for another explanation, see Gaatone 1975:216–20).

11. Lexical reciprocals

Lexical reciprocals are verbs which have an inherent reciprocal meaning and therefore can express reciprocity without additional markers. The notion of reciprocity is a constituent feature of their meaning, and is preserved in all derived constructions, regardless of the presence or absence of the clitic *se*. According to the syntactic features of the verb, the derived constructions can be subject-oriented or object-oriented. They share one common feature, namely, they can give rise to a discontinuous comitative variant.

This class incorporates a large part of “symmetrical” verbs defined on the basis of a syntactic pattern. In this pattern, the two subjects or the subject and the complement of these verbs can interchange without affecting the interpretation (Borillo 1971: 18).

11.1 Subject-oriented constructions: “Canonical” only

We will distinguish three types within this group: (1) the underlying discontinuous constructions do not contain the clitic *se*, while simple constructions contain it (i.e. formally, they are analogous to standard “canonical” reciprocals (see 4.1.1); (2) *reciproca tantum*, with the clitic *se* present in both discontinuous and simple constructions; (3) the clitic *se* is absent in both discontinuous and simple constructions.

11.1.1 A simple construction is formed with the clitic *se*

The underlying constructions are discontinuous. In the derived constructions both arguments occupy the subject position (the subject is in the plural) and the clitic *se* is obligatory

(cf. (124b) and (124c), and also (125b) and (125c)). According to the syntactic properties of the verb, we will distinguish three subgroups.

11.1.1.1 Derived from two-place transitives. These are constructions with symmetrical verbs where the second argument (the object) is prepositionless:

- (123) *rencontrer* ‘to meet’ *croiser* ‘to run into’
 retrouver ‘to meet’ *toucher* ‘to touch.’
 épouser ‘to marry’

Though the syntax sets up some sort of hierarchy between the two participants in (124a) and a perfect symmetry in (124b), the underlying discontinuous construction and the derived reflexive construction associated to it are synonymous. These verbs rule out a *comitative* discontinuous construction (124d), i.e. a construction derived from a simple one with the help of the preposition *avec* ‘with’:

- (124) a. *Jean a rencontré Marie à la cafétéria.*
 ‘Jean met Marie in the coffee shop.’
 b. *Jean et Marie se sont rencontrés à la cafétéria.*
 ‘Jean and Marie met in the coffee shop.’
 c. **Jean et Marie ont rencontré à la cafétéria.*
 (same intended meaning as in (b)).
 d. **Jean s’est rencontré avec Marie à la cafétéria.*
 lit. ‘Jean (REFL-)met with Marie in the coffee shop.’

A comitative discontinuous construction occurring with the verb *croiser* ‘to run into’ (125d) has been pointed out by several authors (Donaldson 1973; Mélis 1990:67). Though this construction (125d) appears in writers like V. Hugo (125e), it is marked from the synchronic point of view. In modern French it means “couple by crossbreeding” (125f):

- (125) a. *Jean a croisé Marie dans la rue.*
 ‘Jean ran into Marie in the street.’
 b. *Jean et Marie se sont croisés dans la rue.*
 ‘Jean and Marie ran into each other in the street.’
 c. **Jean et Marie ont croisé dans la rue.*
 (same intended meaning as in (b)).
 d. **Jean s’est croisé avec Marie dans la rue.*
 lit. ‘Jean (REFL-)ran into with Marie in the street.’
 e. *Il se croisa avec Courfeyrac sous les arcades de l’Odéon.* (Hugo)
 ‘He met Courfeyrac under the arcs of Odeon.’
 f. *Le loup peut se croiser avec le chien.*
 ‘Wolves can crossbreed with dogs.’

The verb *retrouver* ‘to meet’ authorizes discontinuous constructions with noun phrases introduced by the preposition *avec* ‘with’, but the meaning of the verb is slightly altered, cf. (126d) and (126b):

- (126) a. *Jean a retrouvé Marie à l’entrée du théâtre.*
 ‘Jean met Marie at the entrance of the theatre.’

- b. *Jean et Marie se sont retrouvés à l'entrée du théâtre.*
'Jean and Marie met at the entrance of the theatre.'
- c. **Jean et Marie ont retrouvé à l'entrée du théâtre.*
lit. 'Jean and Marie met at the entrance of the theatre.'
- d. *Jean s'est retrouvé avec Marie à l'entrée du théâtre.*
'Jean found himself with Marie at the entrance of the theatre.'

The verb *toucher* which plainly demonstrates the polysemy of French verbs falls into the group of lexical reciprocals when it receives the interpretation "to be in contact with something/somebody":⁵

- (127) a. *La maison touche l'église.*
'The house is right next to the church.'
- b. *La maison et l'église se touchent.*
'The house and the church are right next to each other.'

11.1.1.2 Derived from two-place intransitives

A. There are three symmetrical verbs which form a base construction with an object introduced by the preposition *à*:

- | | | |
|-------|-----------------------|-----------------|
| (128) | <i>ressembler à</i> | 'to resemble' |
| | <i>correspondre à</i> | 'to correspond' |
| | <i>équivaloir à</i> | 'to amount to' |

In the derived pronominal construction the prepositional complement is in the position of co-ordinated subject (the two arguments can also be rendered by a plural subject expressed by a pronoun). The use of *se* in these constructions is obligatory:

- (129) a. *Jean ressemble à Marie et Marie ressemble à Jean.*
'Jean looks like Marie and Marie looks like Jean.'
- b. *Marie et Jean se ressemblent.*
'Jean and Marie resemble each other.'
- c. **Marie et Jean ressemblent.*
lit. '*Marie and Jean resemble.'

B. The two-place intransitives of communication like *causer* 'to chat', *parler* 'to speak', *correspondre* 'to communicate' also follow this derivation type (130). However, the only basic construction which is capable of indicating communication between two participants and which allows the reciprocal interpretation of the derived pronominal construction, is the one whose second argument is introduced by the preposition *avec* 'with':

5. When the arguments refer to animate entities (and to human beings, in particular), *toucher* 'to touch' will be considered as "canonical" reciprocal which is highly ambiguous out of context (Boons et al. 1976):

- (1) *Les garçons se touchent.* i. 'the boys touch each other'
ii. 'the boys play with themselves'

- (130) a. *Jean parle avec Pierre* implies a'. *Pierre parle avec Jean.*
 'Jean speaks with Pierre.' 'Pierre speaks with Jean.'
 b. *Jean et Pierre se parlent.*
 'Jean and Pierre speak to each other.'

11.1.1.3 *Reciproca tantum*. Needless to say, both simple and discontinuous constructions contain *se*. The following four verbs, whose meaning is characteristic of *reciproca tantum* cross-linguistically, belong here. Discontinuous constructions contain a comitative object with the preposition *avec* 'with'.

- (131) *se chamailler* (**chamailler*) 'to squabble'
se disputer (**disputer*) 'to quarrel'
se quereller (**quereller*) 'to bicker'
se bagarrer (**bagarrer*) 'to fight'; cf.:
- (132) a. *Pierre et Marie se sont disputés.* 'Jean and Marie quarrelled.'
 b. *Pierre s'est disputé avec Marie.* 'Jean quarrelled with Marie.'

It must be pointed out that in informal speech as well as in some regional usages a transitive version of *se disputer* 'to quarrel' and *se quereller* 'to bicker' is still preserved, for example, *disputer qqn* 'to tell sb off' and *quereller qqn* 'to scold sb'.

Broadly speaking, lexicalized reciprocals which have underlying verbs to which they are semantically related in a non-standard way, can also be included here (see 6.2).

11.1.2 Constructions formed without the clitic *se*

There are two possible syntactic patterns for these constructions: (i) a simple construction where the two arguments in reciprocal relation are in subject position; (ii) a discontinuous construction where one of the arguments is in subject position and the other appears as a prepositional complement. Both constructions are incompatible with the clitic *se*. We will distinguish three sub-groups.

A. Symmetrical verbs which authorize the use of the preposition *avec* 'with'. These verbs are either denominal derived verbs (133a–d), or verbs with the prefix *con-* ((133e–l), or a variant of *con-*, see Section 12):

- (133) *alterner* 'to alternate' *communiquer* 'to communicate'
fraterniser 'to fraternise' *commuter* 'to commute'
rivaliser 'to compete' *concorder* 'to agree'
sympathiser 'to sympathise' *coopérer* 'to cooperate'
coexister 'to coexist' *converger* 'to converge'
cohabiter 'to live together' *pactiser* 'to take sides with'
coïncider 'to coincide' *parlementer* 'to negotiate'
collaborer 'to collaborate' *permuter* 'to permute.'
- (134) a. *Le directeur et les ouvriers ont fraternisé.* (simple construction)
 'The director and the workers fraternised.'
 b. **Le directeur et les ouvriers se sont fraternisé.*
 lit. 'The director and the workers (REFL-)fraternised.'

<i>associer</i> ‘to associate’	<i>joindre</i> ‘to join’
<i>assortir</i> ‘to match’	<i>lier</i> ‘to link’
<i>attacher</i> ‘to tie’	<i>mélanger</i> ‘to mix’
<i>combiner</i> ‘to combine’	<i>marier</i> ‘to marry’
<i>connecter</i> ‘to connect’	<i>mêler</i> ‘to mix’
<i>comparer</i> ‘to compare’	<i>réunir</i> ‘to put together’
<i>confronter</i> ‘to confront’	<i>souder</i> ‘to weld’
<i>emmêler</i> ‘to tangle up’	<i>unir</i> ‘to unite.’

The reciprocal arguments in a simple construction can occur either as a plural direct object (single noun phrase or co-ordinated noun phrases), or as a direct object plus a prepositional object:

- (141) a. *Il a mélangé la farine et le sel.* ‘He mixed the flour and the salt.’
 b. *Il a mélangé la farine avec le sel.* ‘He mixed the flour with the salt.’
 c. *Il a mélangé la farine au sel.* ‘He added the flour to the salt.’

There are two possible reflexive constructions which decrease the verb valency:

- a simple construction where both reciprocal arguments occur in subject position (141d);
- a discontinuous construction where one of the arguments is in the subject position and the other is represented by an object with the preposition *avec* ‘with’:

- (141) d. *La farine et le sel se sont mélangés.* ‘The flour and the salt mixed.’
 e. *La farine s’est mélangée avec le / au sel.* ‘The flour mixed with the salt.’

Other examples:

- (142) a. *Le maire a marié Jean et Hélène.* ‘The mayor married Jean and Hélène.’
 b. *Jean et Hélène se sont mariés.* ‘Jean and Hélène got married.’
 c. *Jean s’est marié avec Hélène.* ‘Jean married Hélène.’
- (143) a. *Il a soudé les tuyaux.* ‘He welded the pipes.’
 b. *Il a soudé la lampe et l’étagère.* ‘He welded the lamp and the shelf.’
 c. *Il a soudé la lampe à l’étagère.* ‘He welded the lamp to the shelf.’

B. Verbs with the meaning of disconnecting:

- (144) *désassembler* ‘to disassemble’ *distinguer* ‘to distinguish’
désunir ‘to take a part’ *diviser* ‘to divide’
détacher ‘to detach’ *écarter* ‘to move apart’
différencier ‘to differentiate’ *isoler* ‘to isolate’
disjoindre ‘to disconnect’ *séparer* ‘to separate’
dissocier ‘to dissociate’ *opposer* ‘to oppose.’

The number of these verbs (approximately 20) is much more limited than the number of connecting verbs, and they manifest heterogeneous behaviour and impose several constraints which interact:

(a) Some of these constraints block the possibility of formally expressing reciprocal arguments in the form of prepositional complements when the verb takes the prefix *de-* (*dé, des-, dés-*) which denotes estrangement, separation or removal:

- (145) a. *Elle a réussi à désunir le jeune ménage.*
 ‘She managed to disunite the young couple.’
 b. **Elle a réussi à désunir Pierre et Marie.*
 lit. ‘She managed to disunite Pierre and Marie.’
 c. **Elle a réussi à désunir Pierre de Marie.*
 lit. ‘She managed to disunite Pierre of Marie.’

(b) Other constraints concern the semantic properties of the arguments. Compare the following examples:

- (146) a. *Il a séparé les garçons et les filles.* ‘He separated the boys and the girls.’
 b. *Il a séparé les garçons des filles.* ‘He separated the boys from the girls.’
 c. *Les garçons et les filles se sont séparés.* ‘The boys and the girls separated.’
 d. *Les garçons se sont séparés des filles.* ‘The boys separated from the girls.’
 (147) a. *Le juge a séparé l’enfant de son milieu familial.*
 ‘The judge separated the child from his/her family.’
 b. **Le juge a séparé l’enfant et son milieu familial.*
 ‘The judge separated the child and his/her family.’
 (148) a. *Il a détaché l’affiche du mur.* ‘He detached the poster from the wall.’
 b. *L’affiche s’est détaché du mur.* ‘The poster got detached from the wall.’
 c. **L’affiche et le mur se sont détachés* lit. ‘The poster and the wall REFL-got detached.’

11.3 *Entre-verbs*

The following verbs express object-oriented reciprocity lexically. They denote the connecting of two or more entities in the reciprocal relation (cf. (69g)):

- (149) *entrechoquer (les tasses)* ‘to clink against each other (cups)’
entrecroiser (les rubans) ‘to intertwine (ribbons)’
entrelacer (les branches) ‘to interweave (branches)’
entremêler (les fils) ‘to entangle (threads)’

All these verbs are used with a plural direct object which is obligatorily inanimate ((150a) and (151a)). Except for *entremêler* ‘to entangle’ (151c), the reciprocal arguments cannot be dissociated (examples (b)):

- (150) a. *Marie entrecroisait les rubans.*
 ‘Marie intertwined the ribbons.’
 b. **Marie a entrecroisé le ruban vert et le rouge.*
 lit. ‘Marie intertwined the green ribbon and the red one.’
 (151) a. *Les arbres entremêlaient leurs branches.*
 ‘The trees entangled their branches.’
 b. **Les arbres entremêlaient une branche avec une autre.*
 lit. ‘The trees entangled one branch to/ with another one.’

- c. *La fille entremêlait les fleurs blanches aux fleurs rouges.*
 ‘The girl interwove the white with the red flowers.’

The addition of the clitic *se* to these verbs changes the orientation of the predicate and allows formation of a derived object-oriented construction (also reciprocal) where both reciprocal arguments move to subject position:

- (152) a. *Pierre entrechoquait des cailloux dans sa main.*
 ‘Pierre clinked pebbles in his hand.’
 b. *Les cailloux s’entrechoquaient.*
 ‘The pebbles clinked.’

11.4 Symmetric predicates and related meanings

These constructions may have the form either of *être* ‘be’ + relational noun (expressing kinship, affective relationships or status) or of *être* ‘be’ + lexically reciprocal noun.

A. The relational noun is followed by a noun introduced by the preposition *de*:

1. Nouns which denote symmetrical reversible relations, e.g. *collègue de* ‘colleague of’, *ami de* ‘friend of’, *cousin de* ‘cousin of’, *parent de* ‘relative of’, *voisin de* ‘neighbour of’:

- (153) a. *Jean est le cousin de Marie.* ‘Jean is Marie’s cousin.’
 = b. *Marie est la cousine de Jean.* ‘Marie is Jean’s cousin.’
 = c. *Jean et Marie sont cousins.* ‘Jean and Marie are cousins.’

2. Nouns which express reciprocity only if both participants occur in subject position:

- (154) a. *Jean est l’ennemi de Michel.* (non-symmetrical) ‘Jean is the enemy of Michel.’
 b. *Jean et Michel sont ennemis.* (reciprocal) ‘Jean and Michel are enemies.’

3. Pair nouns where the second member of the pair expresses a relation which is the converse of the relation expressed by the first member: *femme de – mari de* ‘wife of – husband of’, *employé de – patron de* ‘employee – employer’, *père de – fils de* ‘father of – son of’, etc.

B. Lexically reciprocal nouns.

1. Nouns derived from verbs:

- | | | |
|--------------------------------------|---|------------------------------------|
| (155) <i>associer</i> ‘to associate’ | → | <i>association</i> ‘association’ |
| <i>échanger</i> ‘to exchange’ | → | <i>échange</i> ‘exchange’ |
| <i>joindre</i> ‘to join’ | → | <i>jonction</i> ‘junction’ |
| <i>unir</i> ‘to unite’ | → | <i>union</i> ‘union’ |
| <i>additionner</i> ‘to add’ | → | <i>addition</i> ‘addition’ |
| <i>relier</i> ‘to relate’ | → | <i>relation</i> ‘relation’ |
| <i>soustraire</i> ‘to subtract’ | → | <i>soustraction</i> ‘subtraction.’ |

2. Non-derived nouns: some nouns use the prefix *inter-* (a variant of *entre-*; see also Section 12) to denote reciprocity. Though these nouns have a deverbal suffix, the corresponding verbs do not exist. This phenomenon is still very productive:

- | | | |
|-------|--|-------------------------------------|
| (156) | <i>intercommunication</i> (* <i>intercommuniquer</i>) | ‘intercommunication’ |
| | <i>interdépendance</i> (* <i>interdépendre</i>) | ‘interdependence’ |
| | <i>interrelation</i> (* <i>interrelier</i>) | ‘interrelation’ |
| | <i>interlocuteur</i> (* <i>interlocuter</i>) | ‘interlocutor.’ |
| (157) | <i>Jean est l’interlocuteur du ministre</i> | ‘Jean has the ear of the minister.’ |

12. Notes on diachrony

12.1 Latin

In classical (1st c. BC–2nd c. AD) and post-classical (3rd–4th cc. AD) Latin, reciprocals did not form a grammatical class (Flobert 1975:393). Latin expressed reciprocity in two different ways:

1. The phrase *inter se* (lit. ‘between themselves’) ‘each other, mutually’ already appeared in the first known texts and represented the most common and frequent marker. The preposition *inter* introduces the reflexive pronouns (*inter nos*, *inter vos*, *inter se*) and thus denotes the plural referent of the subject (also indicated by the verb forms). Subject-oriented reciprocals are formed by this means:

- | | | | |
|-------|----|--|--|
| (158) | a. | <i>colent inter se ac diligent.</i> (Cicero, <i>Lae.</i>) | ‘[they] will have respect and affection for each other.’ |
| | b. | <i>inter nos conjuncti sumus.</i> (Cicero, <i>Fin.</i>) | ‘We are united together.’ |
| | c. | <i>inter se mortales mutua vivunt</i> (Lucrece) | ‘The mortals live off each other.’ |

Reflexive 3rd p. pronouns which stand for an object complement and refer to the subject cannot co-occur with *inter se* (even with two-place transitives):

- | | | | |
|-------|----|---|---|
| (159) | a. | <i>se amant.</i> | ‘They love each other.’ |
| | b. | * <i>se amant inter se.</i> | REFL love between REFL |
| | c. | <i>Pueri et nos et inter se amant.</i> (Cicero) | ‘The children have love for us and for each other.’ |

2. The indefinite pronouns *alius* ‘the other’ (of more than two persons) or *alter* ‘the other’ (of two persons) are repeated in different cases (once in the nominative and once in the case required by the verb) and occur with all types of verbs:

- | | | | | |
|-------|----|--|--|-------------------------------------|
| (160) | a. | <i>Alios alii deinceps excipiebant.</i> (Caesar) | others.ACC.PL others.NOM.PL in.turn replaced | ‘They replaced each other in turn.’ |
| | b. | <i>Alter ab altero adjutus.</i> (Cicero) | | ‘Each helped by the other.’ |

Reciprocity can be rendered also by a reduplication of the noun; cf. (161a) and (161b):

- (161) a. *conciliare homines* (Cicero)
 ‘to reconcile the men’
 b. *Natura homin-em* (ACC) *conciat homin-i.* (DAT) (Cicero)
 ‘Human nature brings men closer to each other.’

Besides, reciprocity is relatively frequent with reflexives and even with deponent reflexives in the plural. Yet, as Flobert (1975:395) points out, “it is due to the sociative meaning of the verb (*fruor, osculor, utor*, etc.) and to a play on prefixes (*ad-*, *am-*, *com-*), as well as to the addition of *iunucem* ‘in turn’, *mutua* ‘mutually’, *alterutrum* ‘reciprocally’ which accentuates even more the reciprocal interpretation”:

- (162) a. *se contuebantur* (Ammianus)
 ‘They watched each other.’
 b. *olores mutua carne vescuntur inter se.* (Plinius Sec.)
 ‘The swans devour each other.’

In order to express reciprocity a small number of deponent verbs combine with the phrases *inter se* or *cum* ‘with’+ N (*cum* means ‘joint action’):

- (163) a. *amplectari* ‘to embrace sb’
 a’. *amplectari + inter se* ‘to embrace each other’
 b. *osculari* ‘to kiss sb’
 b’. *osculari + inter se* ‘to kiss each other’
 c. *luctari* ‘to fight, to resist against’
 c’. *luctari + cum + N* ‘to compete in wrestling’
 d. *altercari* ‘to argue, to struggle’
 d’. *altercari + cum + N* ‘to argue with’
 e. *fabulari* ‘to speak’
 e’. *fabulari + cum + N* ‘to speak with.’

The prefix *cum-* ‘with’ (variants *con-*, *com-*, *col-*) can be attached to a lexical reciprocal in a middle-passive form and emphasize the reciprocal meaning:

- (164) a. (*col-*)*loqui cum aliquo* (Cicero)
 ‘to speak with somebody.’
 b. *Col-loqui-mur inter nos.* (Cicero)
 with-speak-1PL.PASS between us
 ‘We speak with each other.’
- (165) a. *fabulari cum aliqui* (Suetone) ‘to speak to sb’ (*fabular*: the narrator)
 b. *con-fabulari* ‘to speak with sb’ (*confabulator*: the hearer).
- (166) a. *plectere* ‘to weave’ (Lucrece)
 b. *com-plectari* ‘to embrace sb’
 c. *complectari + inter se* ‘to be clasped in each other’s arms.’

This configuration can also express object-oriented reciprocity with lexically reciprocal verbs, but in the active (167) or in the passive voice (168):

- (167) a. *conciliare homines inter se* (Cicero) ‘to bring men closer to each other’
 b. *conciliare aliquos inter se* (Cicero) ‘to make sb friends.’

- (168) a. *congregari inter se* (Tacite)
 ‘to be brought together.’
 b. *Dextris inter se datis* (T. Livius)
 ‘Having given each other the right hand’ (when parting).

Post-classical Latin retains the same means of expressing reciprocity. But this function was gradually taken over by the reflexive (pronominal) form which succeeded the middle form, then was confused with the passive. This process takes place in the classical period and affects lexical reciprocals. In the following examples, the reciprocal meaning is expressed by means of the middle-passive form (169a) and the reflexive with *cum* (169b):

- (169) a. *Ciconiae abiturae congregantur in certo loco.* (Plinius Caecilius Secundus)
 ‘Departing storks gather in a definite place.’
 b. *Congregare se cum aequalibus.* (Cicero)
 ‘To unite with equals.’

During this period the clitic *se*, though rarely, can be combined with lexical reciprocals, thus achieving a step towards its integration into the means of expressing reciprocity (170d). Compare the following four cases which are roughly synonymous (examples borrowed from Referovskaja 1980:72–6):

- (170) a. *pugnare* ‘to fight’
 b. *inter se pugnare* ‘to fight against each other’
 c. *inter se compugnare* ‘to fight against each other.’
 d. *se fortiter compugnantes Chlodoreo, Gundobado...* (Liber Hist. Fr., 9th c. AD)
 ‘Chlodoreo, Gundobado... fight each other bravely.’

12.2 Expression of reciprocity in Old French

Old French has the following means to express the reciprocal meaning, some of them can be used simultaneously:

1. The reflexive pronoun *se* is quite frequent in Old French texts (though extremely rare during the same period in vulgar Latin). It occurs mostly under certain contextual conditions and often with the support of lexical means. In (171) the verb is two-place transitive; in (172) it is two-place intransitive (see 7.1.1 in modern French):

- (171) *Freres estoient, molt se durent aimer.* (Charroi de Nîmes, 12th c.)
 brother were much REFL MUST.PAST love
 ‘They were brothers, they must have loved each other a lot.’
 (172) *Li dui frère se cor-ent sore.* (Roman de Thèbes, 12th c.)
 the two brother REFL RUN-PL upon
 ‘The two brothers rush towards each other.’

2. The compound pronoun *li uns l’autre* (variant *l’autre*) lit. ‘the one the other’. This means was used more frequently than the first one. In vulgar Latin (Grégoire de Tours, 9th c.) the compound pronoun replaces the classical opposition *alius/alter* (see (160)). *Uns* (from Latin *unus* ‘one’) is a subjective singular case and with a singular verb form

agreement. *L'autre* is anaphoric and refers to the second participant and in most cases is preceded by a preposition. As the verb-subject agreement is singular, if the context establishes a hierarchy of participants, the interpretation is non-reciprocal. The reciprocal interpretation becomes possible in the absence of such a hierarchy or when the context makes it possible to resolve the ambiguity. According to the dictionary Le Robert (1992) and to Stéfani (1962:429) a sentence which contains *l'un* (or *li uns*)/*l'autre* could express reciprocity between two persons with singular agreement (cf. (173)). But the translators consider examples (174) and (175) as having two readings, reciprocal and non-reciprocal.

(a) The use of *li uns l'autre* without *se* in the case when Modern French requires *se*:

(173) *Li roys et la royne l'uns l'autre resgarda.* (Villehardouin, 13th c.)
 'The king and the queen looked at each other.'

(174) *Li un-s l'autre oceïst.* (Roman de Thèbes, 12th c.)
 the one-SG the other.SG kill-SG
 i. 'They killed each other.'
 ii. 'The one killed the other.'

(175) *A icel mot l'un a l'autre ad clinet.* (Chanson de Roland, 12th c.)
 with this word the.one to the.other to bow.PAST.SG
 i. 'Saying this, they bowed to one another.'
 ii. 'Saying this, one bowed to the other.'

(b) Joint use of *li uns l'autre* and *se*:

(176) *Li uns contre l'autre s'adresce.* (Erec)
 'They stand up to each other/one stands up to the other.'

The reciprocal interpretation is only definitely established after the early 15th c. when the plural verb form becomes regular and the prefix *entre-* (see 4) below) spreads:

(177) *Ceste entrevue fut pleine de louanges qu'ils s'entrefeirent l'un l'autre.* (Amyot, 16th c.)
 'That meeting was full of praise which they bestowed upon each other.'

3. The complex *chacun l'autre* (variant *cascun l'autre*) 'each one the other': it has a collective value and agrees with a verb in the singular. The following text describes the reaction of all the inhabitants of Saragozza who mourn for Marsile (Stéfani 1962:427):

(178) *Dist (sg) cascun a l'autre.* (Chanson de Roland, 12th c.)
 'Each says to the other', lit. 'says each to the other.'

4. The combination of *se* with the prefix *entre-*. In Gaul, under the influence of Celtic, *inter se amant* becomes *se interamant*. This phenomenon, which can be observed only in Gaul and not in Romania, seems to be the origin of the extension of *se* into constructions which receive a reciprocal interpretation: as a prefix, *entre-* combines with the auxiliary (a usage which has disappeared in modern French), or/and with the verb:

(179) *Il s'entrecommencent a regarder.* (Chrétien de Troyes, 12th c.)
 'They begin to look at each other.'

- (180) *Le peuple s'entrevooulaient tuer.* (Renart, 13th c.)
 'The people wanted to kill each other.'
- (181) *Il s'entresont mout doucement entracolé.* (Cochon, 15th c.)
 'They hugged each other softly.'
- (182) *Quant il s'entrecreuidaient ferir.* (Couronnement de Louis, 12th c.)
 'When they nearly hit each other.'

The combination of *se* + *entre*-V rapidly became a very productive derivational type for all verb classes which lasted until the 19th century (180 verbs in Littré's dictionary (1872)). However, 20th century French has preserved only a small number of *s'entre*-verbs (*reciproca tantum*; cf. Section 5).

In present-day Romance languages⁶ the reciprocal domain is typologically similar to that in French. The principal differences are observed in two languages. Rumanian retains the difference between the accusative (*se*) and dative (*si*) in the 3rd person reflexive pronoun. A more drastic development took place in Surselvan (one of the five Rhaeto-Romance languages), where the following three peculiarities are observed: (a) the reflexive clitic *se* has ousted the 1st and 2nd person pronouns and become the only marker of reflexivity, reciprocity and other meanings, whatever the person (cf. (183) where the subject is the 1PL pronoun *nus*); (b) this marker has become an undetachable verbal prefix (see (183)); (c) the reciprocal pronoun *in l'auter* 'each other', unlike its French counterpart *l'un l'autre*, may or must occur with verbs without *se* which obligatorily require this marker in French (cf. (184) and (1e); see Stimm 1973: 11, 39ff., 64):

- (183) *Nus sevesein lu aunc in di!* 'We shall see each other one day!'
- (184) *Els carezavan in l'auter.* 'They loved each other.' (see Stimm 1973: 84).

Acknowledgments

We wish to thank all the people whose precious remarks and comments enabled us to complete this study. In particular, we thank Vladimir Nedjalkov for all the passionate arguments and discussions we had while we were writing this paper. We also thank Mme Marié and M. Guy Serbat for their competent advice on the Latin reciprocals, and Mme H. Schøsler for her help with Old French. We are also grateful to Nikolay Vazov for the first version of the English text and to Claude Rivière who kindly read and revised the final version in English.

 - 6.2 Discontinuous reciprocal constructions. Comitative constructions only
 - 6.3 Comitative preposition in the subject

7. Syntactic reciprocal markers
 - 7.1 Syntactic markers with derived reciprocals
 - 7.1.1 Intonational characteristics of the markers *edin drug* ‘each other’ and *vzaimno* ‘mutually’
 - 7.1.2 Syntactic status of *edin drug* and *vzaimno*
 - 7.1.3 The phrase *pomeždu si* ‘between/among themselves’
 - 7.2 Syntactic reciprocal markers with non-reciprocal verbs
 - 7.2.1 With two-place *reflexiva tantum*
 - 7.2.2 With two-place derived non-reciprocal *se* verbs
 - 7.2.3 Subject- and object-oriented reciprocals derived from three-place transitives of motion
 - 7.2.4 Syntactic reciprocal markers with verbs without *se*. Adverbial reciprocal constructions
 - 7.3 Indefinite-personal reciprocal constructions
 - 7.4 Non-reciprocal contextual means of supporting reciprocal meaning
 8. Simultaneity and succession of reciprocal events
 - 8.1 Obligatory simultaneity: ‘to kiss each other’
 - 8.2 Optional simultaneity: ‘to fire at each other’
 - 8.3 Obligatory non-simultaneity: ‘to shave each other’
 - 8.4 Quasi-simultaneity: ‘to follow each other’
 9. Lexical reciprocals
 - 9.1 Two-place intransitives with a reflexive clitic. *Reciproca tantum*
 - 9.2 Cliticized reciprocals derived from lexical reciprocals
 - 9.2.1 Reciprocals not used in comitative constructions
 - 9.2.2 Reciprocals used in comitative constructions
 - 9.3 Three-place lexical object-oriented reciprocals (of connecting and separating) and anticausatives derived from them
 10. Verbs of competition derived from transitives of “outdoing”
- References

1. Introduction

1.1 Bulgarian

Bulgarian is a South Slavic language spoken by over 9 million Bulgarians living in the Republic of Bulgaria and outside in the neighbouring and some remote countries.

Contemporary standard Bulgarian unites a great many dialects. The dialects of the three main regions of Bulgaria (Moesia, Thrace and Madeconia) share more common than they have distinct features, and they are easily identified as Bulgarian.

1.2 Overview

Reciprocity can be expressed by verbal and/or syntactic reciprocal markers. Verbal reciprocals are derived by means of the polysemous reflexive pronominal clitic *se* (accusative) or *si* (dative); cf.:

- (1) a. *Te me gledat.*
 they 1SG.ACC watch.3PL.PRES
 ‘They watch me.’
 b. *Te se gledat.*
 i. ‘They watch *each other*.’
 ii. ‘They watch *themselves*’ (in the mirror, etc.).

In the *Bălgarski tǎlkoven rečnik* (Andreičin et al. 1963), in which about 3630 verbs are registered, there are over 180 verbs with the reflexive clitics which have or can acquire the reciprocal meaning. This number includes lexical reciprocals (see Section 9) and non-polysemous reciprocals (see 4.1.1.1.1). A great number (over 550 items) are semantically either reflexive or reciprocal (cf. (1b)) depending on context. The syntactic reciprocal marker *edin drug* ‘each other’ can be added to resolve the ambiguity of a derivative, although by itself, without *se* on the verb, it cannot be used. Thus, in contrast to (1c), only (1d) is grammatical:

- c. **Te gledat edin drug (s ljubov).*
 they watch.3PL each other with love
 ‘They watch each other (with love).’
 d. *Te se gledat edin drug (s ljubov).*
 they REFL.ACC watch.3PL each other with love
 ‘They watch each other (with love).’

The reflexive clitics are moveable: they may be either (distantly) preposed to the verb or (distantly) postposed to it, with insertion of unstressed words (in certain cases):

- e. (...) *gledat li se*
 watch whether REFL.ACC
 ‘(...) whether they watch each other’; or ‘Do they watch each other?’

Verbal reciprocals cannot be derived by means of *se* from verbs taking a prepositional object (excepting the dative case with the preposition *na* ‘on, to, for ...’). To encode the reciprocal meaning on these verbs, only *edin drug* with the relevant preposition between the components is used:

- (2) a. *Te gledat kām Petār.* ‘They look at Peter.’
 b. *Te gledat edin kām drug.* ‘They look at each other.’

but not:

- c. **Te se gledat edin kām drug.* ‘They look at each other.’

The expression *edin drug* ‘each other’ is the unmarked form; if both reciprocal arguments are feminine or neuter the forms *edna druga* and *edno drugo* are used respectively.

It should be stressed that the reciprocal meaning is only one of the meanings of the highly polysemous clitic *se*, its other meanings (besides the reflexive already mentioned) being anticausative, reflexive-causative, passive, etc. (see 4.2). To a lesser degree this holds for the clitic *si* (see 3.2; see Andreičin 1956: 107–8; Penchev 1965: 249–54, 1972: 245–77;

Scatton 1993:235–7). It should be specially pointed out that there is a group of *se* verbs with a “competitive” meaning closely related to the reciprocal.

2. Grammatical notes

2.1 Some peculiarities of Bulgarian

There are grammatical categories and constructions in Bulgarian that are not attested in other Slavic languages.

A Balkan feature of Bulgarian is the morphologically marked definiteness: the post-posed definite article *-ta/-ăt*, etc. is incorporated in the first adjective (if there are any) or in the head noun of a noun phrase. Indefiniteness can be marked by the word *edin* lit. ‘one’ preposed to a noun group. Both articles agree in gender (masculine, feminine, neuter) and number (singular, plural) with the head noun.

Another Balkan feature is the doubling of some syntactic categories, namely, the subject, direct or indirect object, possessive attribute, etc, e.g.:

- (3) *Na Ivan mu kazax novini-te.*
 to Ivan he.DAT told.1SG news-DEF.PL
 ‘I told the news to Ivan’ (see also (4)).

Bulgarian belongs to the type of languages with extensive use of subject pro-drop (dropping an unstressed subject pronoun; see (3)).

Nouns and adjectives have lost all case forms (except the vocative).

The verb has a rich morphology, but no infinitive. In fact, the infinitive has developed into a subordinate predicate in *da*-clauses. Finite verb forms are marked for tense, person and number, and voice.

There are the perfective and the imperfective aspect. From every perfective verb, an imperfective form can be derived.

The tense system in the verb is highly developed, with as many as nine simple and periphrastic tenses distinguished in grammars: Present, Past Imperfect, Past Aorist, Future, Present Perfect, Past Perfect, Future Perfect, Past Future, Past Future Perfect. Both aspects of any verb can be used in each tense form.

There is at least one mood more in Bulgarian, viz. the renarrated, than in other Slavic languages.

Word order is relatively free despite the absence of cases (except in some pronominal classes).

2.2 Personal pronouns and position of clitics

Personal non-possessive pronouns have nominative, accusative and dative forms. Non-nominative (reflexive and non-reflexive) personal pronouns appear in two forms, long and

short (clitics). Enclitic pronouns are customary direct and indirect objects. The reflexive forms function as objects, like non-reflexive pronouns.

The personal non-possessive long and short forms of the same pronoun can co-occur in the same sentence, as a kind of object doubling:

- (4) *Mene me vidjaha.*
 I.ACC 1SG.ACC see.3PL.AOR
 ‘[They] saw me.’ (cf. (3)).

The long possessive forms are inflected like adjectives. The short possessive forms appear in definite noun phrases only:

- (5) a. *Te gledat kniga-ta mi.*
 they watch.3PL.PRES book-DEF my
 ‘They look at my book.’
 b. **Te gledat kniga mi* (see also (10)).

As is shown in Table 1, the short possessive non-reflexive and reflexive forms are identical with the short dative non-possessive forms. One might say the latter forms function as possessive pronouns.

Table 1. Personal pronouns

	Personal non-reflexive			Possessive non-reflexive		
	Nominative	Accusative	Dative			
1SG	<i>az</i>	<i>mene – me</i>	<i>na mene – mi</i>	<i>moj – mi</i>		
2SG	<i>ti</i>	<i>tebe – te</i>	<i>na tebe – ti</i>	<i>tvoj – ti</i>		
3SG	<i>toj, M; to, N</i> <i>ja, F</i>	<i>nego – go</i> <i>neja – ja</i>	<i>na nego – mu</i> <i>na neja – i</i>	<i>negov – mu</i> <i>nein – i</i>		
1PL	<i>nie</i>	<i>nas – ni</i>	<i>na nas – ni</i>	<i>nas – ni</i>		
2PL	<i>vie</i>	<i>vas – vi</i>	<i>na vas – vi</i>	<i>vas – vi</i>		
3PL	<i>te</i>	<i>ijax – gi</i>	<i>na tjax – im</i>	<i>texen – im</i>		
	Reflexive non-possessive			Possessive reflexive		
For all persons, genders and numbers		Accusative	Dative			
		<i>sebe si – se</i>	<i>na sebe – si</i>	<i>svoj – si</i>		

3. Grammatical status of the clitics *se* and *si*

3.1 The accusative clitic *se*

It has three functions:

A. The function of a reflexive pronoun as a direct object, when it is interchangeable with the proper reflexive object *sebe si* (see the relevant long form in Table 1). This sort of substitution is impossible for the other two functions. Compare:

- (6) a. *Tja mie deteto.* 'She washes the child.'
 b. *Tja mie nego. = Tja go mie.* 'She washes him.'
 c. *Tja mie sebe si. = Tja se mie.* 'She washes herself.'

The long reflexive pronoun can be coordinated with a noun object, while the short form cannot:

- d. *Tja mie sebe si i deteto.* 'She washes herself and the child.'
 e. **Tja se mie i deteto.*

B. The function of a derivational marker with a number of meanings, e.g. reciprocal, autocausative, anticausative, reflexive-causative, etc. (see 4.2); e.g.:

- (7) a. *Baštata sčupi präckata.* 'The father broke the stick.'
 b. *Präckata se sčupi.* 'The stick broke' (anticausative).

C. The function of an inflectional marker of the passive voice, both personal and impersonal; cf. (8d).

There seems to be no clear-cut borderline between **A** and **B**, as in both cases the clitic *se* is unstressed. Moreover, in the context of numerous derivatives of the **B** type, verbs with the clitic *se* of type **A** tend to be perceived as derivatives with the reflexive meaning proper, especially if we take into account the polysemy of concrete *se* verbs; cf.:

- (8) a. *Te me lekuvat.* 'They treat me (for an illness).'
 b. *Te se lekuvat sami.* 'They treat themselves.' (reflexive proper)
 c. *Te se lekuvat v bolnica* lit. 'They let themselves be treated (undergo treatment) in a hospital.' (reflexive-causative)
 d. *Te se lekuvat ot dobär lekar.* 'They are treated by a good doctor.' (passive)
 e. *Te se lekuvat vzaimno* 'They treat each other.'

As we see, the clitic *se* is a direct object in (8b), a derivational marker in (8c, 8e) and an inflectional marker in (8d). The latter two functions can be jointly referred to as middle.

3.2 The dative clitic *si*

It has four principal functions:

A. It may be a reflexive pronoun functioning as an indirect object (cf. **A** under 3.1).

B. It is used as a derivational marker of reciprocal verbs (cf. **B** in 3.1); it is much less productive in this function than *se*.

C. It functions as an emphatic particle, cf.:

- (9) *Peja si.* 'I am just singing (for myself, for my own pleasure).'

D. It is also used as a possessive pronoun in attributive function:

- (10) *Te tärsjat knjigata si.* 'They look for their own book' (cf. (5a)).

See also Tagamlicka (1970: 177–87); Norman (1971: 179–93).

4. Reciprocal constructions with the accusative clitic *se*

4.1 Diathesis types of reciprocal constructions

4.1.1 Subject-oriented constructions. “Canonical” reciprocals only

4.1.1.1 *Derived from two-place transitives.* All reciprocals of this (“canonical”) type are intransitive. This is the most common type among reciprocals. The referent of the underlying object is included in the subject of the reciprocal construction as is the referent of the reflexive object. This is why constructions with these reciprocals look like those with a reflexive object expressed by *se*. If it is possible for a given underlying verb to occur with a proper reflexive object, i.e. *sebe si*, nothing should prevent forming a reciprocal from it, it seems. Intuitively, if one can perform an action upon oneself or another person, there may be a respective reciprocal situation. The constraints have to be external for such a reciprocal situation to not occur - when the reciprocal interpretation is subnormal or physically impossible. A situation like

- (11) *Te se mijat vzaimno.* ‘They wash each other.’

is rather unlikely though possible. On the other hand, reciprocals are much less likely to have a reflexive interpretation, for which reason a syntactic marker of reciprocity is redundant, although it is often added. In other words, a derived construction without a syntactic marker may have both a reflexive and a reciprocal reading. In order to disambiguate it, one of the meanings has to be suppressed. In most cases it is reciprocity that is marked syntactically, the reflexive meaning being thus suppressed. Reciprocal constructions with a syntactic marker (*edin drug* ‘one another’, *vzaimno* ‘mutually’, etc.) are therefore quite common.

4.1.1.1.1 *Reciprocals which do not need a syntactic marker (edin drug ‘each other’, etc.).* Thus, reflexive reading of the verb in (12b) is rather unlikely, unless in a very special context:

- (12) a. *Te go razljubixa.* ‘They fell out of love with him.’
 b. *Te se razljubixa.* ‘They fell out of love with each other.’

Here is a list of reciprocals that belong to this type:

- (13) *Te se izpokaraxa.* ‘They have quarrelled with one another (all of them).’
Te se ritat. ‘They kick each other.’
Te se pozdravjavat. ‘They congratulate each other.’
Te se razglezdat. ‘They stare at each other.’
Te se rugajat. ‘They scold each other.’
Te se slušat. ‘They listen to each other.’
Te se tãrsjat. ‘They look for each other.’
Te se kãlvat. ‘They peck each other.’
Te se obiçat. ‘They love each other.’
Te se opipvat. ‘They touch/feel each other.’
Te se agitirat. ‘They agitate each other.’
Te se bodat. ‘They butt each other.’ (cf. (17a))

<i>Te se bijat.</i>	‘They beat each other.’
<i>Te se sreštnaxa.</i>	‘They met (each other).’
<i>Te se čakat.</i>	‘They wait for each other.’
<i>Te se poznavat.</i>	‘They know each other.’
<i>Te se celuvat.</i>	‘They kiss each other.’
<i>Te se gādeličkat.</i>	‘They tickle each other.’
<i>Te se štīpījat.</i>	‘They pinch each other’, etc.

4.1.1.1.2 *Reciprocals which usually need a syntactic marker.* Without a syntactic marker, these verbs may have either a reflexive, or anticausative, or absolutive, etc. reading (cf. (8)).

The polysemy “reciprocal – reflexive” holds in the case of the following *se* verbs if they are used without a syntactic marker of reciprocity:

(14) <i>Te se xvaljāt vzaimno.</i>	‘They praise each other.’
<i>Te se ubodoxa edin drug.</i>	‘They pricked each other.’
<i>Te se sresaxa edna druga.</i>	‘They combed each other.’
<i>Te se risuvat vzaimno.</i>	‘They draw (make drawings of) each other.’
<i>Te se ubivat vzaimno.</i>	‘They kill each other.’
<i>Te se otrovixa vzaimno.</i>	‘They poisoned each other.’

The polysemy “reciprocal – anticausative” is suppressed by syntactic markers in the following *se* verbs:

(15) <i>Te se bezpokojāt vzaimno.</i>	‘They bother each other.’
<i>Te se vāzmuštavat vzaimno.</i>	‘They are indignant at each other.’
<i>Te se plašāt edin drug.</i>	‘They scare each other.’
<i>Te se radvat edin drug.</i>	‘They make each other glad.’
<i>Te se sābuždat edin drug.</i>	‘They awaken each other.’
<i>Te se jadosvat edin drug.</i>	‘They make each other angry’, etc.

The polysemy “reciprocal – autocausative” is characteristic of the following verbs (derived mostly from verbs of motion) when they are used without a syntactic marker:

(16) a. <i>Te se povozixa edin drug.</i>	‘They gave a ride to each other.’
b. <i>Te se izpravjāt vzaimno.</i>	‘They set each other upright’, etc.

The polysemy “reciprocal – absolutive” is characteristic of verbs like the following:

(17) a. <i>Te se bijāt.</i>	i. ‘They fight’; ii. ‘They are pugnacious.’
b. <i>Te se zakačāt.</i>	i. ‘They tease each other’; ii. ‘They (like to) tease.’

Needless to say, polysemy of verbs with the reciprocal meaning is only possible if the subject is plural.

4.1.1.2 *Derived from three-place transitives.* This type is limited to a few verbs. Compare:

(18) a. <i>Te gi predstavixa na direktora.</i>	‘They introduced them to the director.’
b. <i>Te se predstavixa edin drug na direktora.</i>	‘They introduced each other to the director.’

4.1.2 *Object-oriented constructions*

These are periphrastic causative constructions derived from subject-oriented reciprocals.

All the reciprocals under 4.1.1 can occur as subordinate constructions with their subject co-referential with the object of the main clause:

- (19) a. *Te se razljubvat.*
 ‘They fall out of love with each other.’
 b. *Toj gi nakara (te ‘they’ = gi) da se razljubjat.*
 ‘He made them fall out of love with each other.’

4.2 Non-reciprocal meanings of the clitic *se*

I have shown above that the marker of reciprocity *se* is a highly polysemous clitic. It is expedient to list all its meanings together, in order to show the semantic system the reciprocal meaning belongs to and interacts with. As can be seen from this list, the range of semantic variation of the clitic *se* basically coincides with that of polysemous markers genetically descended from markers with the initial reflexive meaning (see, for instance, Löttsch et al. 1976:63–94; Geniušienė 1987; Kemmer 1993; Wehr 1995). These functions are subdivided into two syntactic types according to the correlation of the derived subject with the subject or with the object of the underlying verb.

4.2.1 *Subject-oriented meanings*

Here belong the following meanings:

1. Reflexive proper, see (8b), (1b).
2. Autocausative, cf.:
 (20) a. *Tja go izpravi.* ‘She set him upright (straightened him up).’
 b. *Tja se izpravi.* ‘She set herself upright (straightened herself up).’ (cf. (16b)).
3. Reflexive-causative, see (8c).
4. Absolutive, see (17).

The reciprocal meaning is also of this syntactic type.

4.2.2 *Object-oriented meanings*

These are the following meanings:

1. Anticausative, see (7b).
2. Converse, cf.:
 (21) a. *Vodata predava zvuka.* ‘Water carries sound.’
 b. *Zvukāt se predava po vodata.* ‘Sound carries in water.’
3. Modal-potential meaning:
 - i. With respect to the subject (propensity), e.g.:
 (22) a. *Az jam čereši.* ‘I eat cherries.’
 b. *Jadat mi se čereši.* ‘I feel like eating cherries.’
 - ii. With respect to the object (necessity or possibility), e.g.:

- (23) a. *Toj ogležda cvetjata na toplo.* ‘He keeps flowers in a warm place.’
 b. *Cvetjata se ogleždat na toplo.* ‘Flowers must be kept in warmth.’

4. Passive proper, see (8d).

Some of the less prominent meanings are omitted here.

4.3 The use of *edin drug*, etc. with rare monosemous reciprocals

I have in mind reciprocals denoting pragmatically rare situations. Thus cases like *Te se agitirat* in (13) are more common with *edin drug*, etc., although even without it they can be interpreted as reciprocals only.

5. Reciprocal constructions with the dative clitic *si*

5.1 Diathesis types of reciprocal constructions

5.1.1 Subject-oriented constructions

Reciprocals with the dative *si* have all the three diathesis types, in contrast to *se* reciprocals.

5.1.1.1 “Canonical” reciprocals. These derive from two-place intransitives only; e.g.:

- (24) a. *Te im pomagat.* ‘They help them.’
 b. *Te si pomagat.* ‘They help each other.’
- (25) a. *Te si xodjat na gosti.* ‘They visit each other.’
 b. *Te si prostixa [edin na drug].* ‘They forgave each other.’
 c. *Bratjata si govorjat.* ‘The brothers talk to each other.’
 d. *Te si otmaštavat [edin na drug].* ‘They revenge on each other.’

5.1.1.2 “Indirect” reciprocals. They derive from three-place transitives and retain their transitivity. It is easy to see that in the following cases the reflexive reading ‘for themselves’ is also possible:

- (26) a. *Te im pravjat podarāci.* ‘They give them presents.’
 b. *Te si pravjat podarāci.* i. ‘They give presents to each other.’
 ii. ‘They give themselves presents.’
- (27) a. *Te predstavixa bratjata si na tjax.*
 ‘They introduced their brothers to them.’
 b. *Te si predstavixa bratjata [edin na drug].*
 ‘They introduced their brothers to each other.’

Constructions with possessive clitics, both non-reflexive and reflexive (appearing, as was indicated above, in definite noun phrases only) are ambiguous, which can be resolved by means of syntactic markers or by the long possessive forms (*svoj* ‘one’s own’, etc.).

- (28) a. *Te im kupixa kartinite.* i. ‘They bought them the pictures.’
 ii. ‘They bought their pictures.’
 b. *Te si kupixa kartinite.* i. ‘They bought the pictures *for each other*.’
 (also if *edin na drug* or *vzaimno* is added)
 ii. ‘They bought the pictures *for themselves*.’
 iii. ‘They bought *their own* pictures’ (this requires a special context or situation).

5.1.1.3 “Possessive” reciprocals. They derive from two-place transitives on condition that the direct object of the underlying construction has a possessive attribute. In the reciprocal construction the possessive *si* substitutes for the possessive attribute, and the syntactic structure is retained:

- (29) a. *Te im zapalixa kăštite.* ‘They set their (not their own) houses on fire.’
 b. *Te si zapalixa kăštite.* i. ‘They set their own houses on fire.’
 ii. ‘They set each other’s houses on fire.’
 (30) a. *Te im prostreljaxa răcete.* ‘They shot through *their* (not own) hands.’
 b. *Te si prostreljaxa răcete.* i. ‘They shot through *their own* hands.’
 ii. ‘They shot through *each other’s* hands.’
 (also, if *edin na drug* or *vzaimno* is added).

I stress again the formal identity of “indirect” and “possessive” reciprocal constructions.

5.1.2 Object-oriented constructions

To save space, we give no examples, since these constructions are formed in the same way as those in 4.1.2.

5.2 Non-reciprocal meanings of the clitic *si*

They are listed in Section 3.2.

6. Means of marking reciprocal arguments

6.1 Simple reciprocal constructions

In this case both arguments are expressed by the subject in one of the two principal ways: (a) homogeneously, by the plural number of a noun or pronoun, or (b) heterogeneously, by a coordinated group (like ‘Ivan and Peter’), i.e. in the same ways as the plural subject in non-reciprocal constructions. In simple constructions, reciprocals have three forms only: 1st, 2nd and 3rd person plural. Here are examples with the verbs ‘to kiss [each other]’ and ‘to cure each other’:

- (31) a. *Nie se celuvame.* ‘We kiss each other.’
 b. *Vie se celuvate.* ‘You kiss each other.’
 c. *Te se celuvat.* ‘They kiss each other.’

- (32) a. *Nie se lekuvame [vzaimno].* 'We cure each other.'
 b. *Vie se lekuvate [vzaimno].* 'You cure each other.'
 c. *Te se lekuvat [vzaimno].* 'They cure each other.'

It is in these *se* forms that polysemy of the reciprocal and a non-reciprocal meaning can be observed (see (8) and 4.1.1.1.2).

6.2 Discontinuous reciprocal constructions. Comitative constructions only

Only a very limited number of non-lexical reciprocals (about lexical reciprocals see 9.1, 9.2.2), namely about 10 to 20 items out of more than 550 of the types discussed above, can be used in comitative constructions with a singular subject while retaining their reciprocal meaning, although the functional sentence perspective changes, of course. These verbs are lexicalized, to a certain degree. In this case the reciprocals have six (both singular and plural) personal forms in each tense. This is possible for the reciprocal in (33):

- (33) a. *Az se celuvam s nego.* 'I and he kiss', lit. 'I kiss with him.'
 b. *Ti se celuvaš s nego.* 'You and he kiss', lit. 'You kiss with him.'
 c. *Tja se celuva s nego.* 'She and he kiss', lit. 'She kisses with him.'
 d. *Nie se celuvame s nego.* 'We and he kiss', lit. 'We kiss with him', etc.

Here belong reciprocals like *sreštam se* 'meet', *bija se* 'fight', and the like.

In type (33) constructions, the syntactic reciprocal markers *edin drug*, *vzaimno*, etc. are ungrammatical.

In constructions of the (33a–c) type, a comitative group, which is a prepositional object, is obligatory, while in type (34) constructions it is an optional adverbial:

- (34) *Az se razxoždam s drugarja si.* 'I stroll with my friend.'

(For other meanings see (8c–d).)

6.3 Comitative preposition in the subject

There are some (non-rigid) restrictions which are characteristic not only of reciprocal constructions, it seems. Thus (33e) is quite acceptable, (33f) is questionable (more rare?) and (33g) is ungrammatical (K. Ivanova, p.c.):

- (33) e. *Nie s nego/s Ivan se celuvame.* lit. 'We with him/with Ivan are kissing.'
 f. *Az s nego/s Ivan se celuvame.* lit. 'I with him/with Ivan are kissing.'
 g. **Ivan sās Sofia se celuvat.* lit. 'Ivan with Sofia are kissing.'

7. Syntactic reciprocal markers

7.1 Syntactic markers with derived reciprocals

As noted above, the syntactic markers of reciprocity resolve the ambiguity of some cliticized forms. It has also been shown that this problem arises in the plural form only and it does not concern some groups of *se* verbs which commonly have a reciprocal reading (see 4.1.1.1.1).

7.1.1 Intonational characteristics of the markers *edin drug* ‘one another’ and *vzaimno* ‘mutually’

There is an intonational difference between these two markers: the former is usually unstressed or has a weak stress, it is pronounced at a low pitch and at a faster tempo, and it cannot receive sentential stress. As often as not, it occurs in pre-final position, being followed by a prepositional noun phrase or an adverb (most of the relevant examples above are given without the latter for the sake of brevity). Thus, (35a) is more natural than (35b):

- (35) a. *Te se gledat edin drug s ljubov.* ‘They look at each other with love.’
 b. *Te se gledat edin drug.* ‘They look at each other.’

The marker *vzaimno* ‘mutually’ is usually rhematic and heavily stressed:

- c. *Te se gledat vzaimno.* lit. ‘They look at each other mutually.’

7.1.2 Syntactic status of *edin drug* and *vzaimno*

The marker *edin drug* is of pronominal origin and is inflected for gender and number. In the above examples, both components occur in the masculine singular form, while in (36) below they acquire a different form, to agree with the subject in number and gender:

- (36) a. *Student-i-te se gledaxa edn-i drug-i.*
 student-PL-DEF.PL REFL looked one-PL another-PL
 ‘The students looked at one another.’
 b. *Dve-te student-k-i se gledaxa edn-a drug-a.*
 two.F-DEF student-F-PL REFL looked one-F.SG another-F.SG
 ‘Two girl-students looked at each other.’
 c. *Vsički-te student-k-i se gledaxa edn-i drug-i.*
 all-DEF.PL student-F-PL REFL looked one-PL another-PL
 ‘All the girl-students looked at each other.’

The marker *edin drug* behaves like a predicative attribute that can be compared to the function of *sama* ‘alone’ in (37):

- (37) *Tja dojde sama.* ‘She came alone,’

but it refers to both reciprocal arguments. Besides, it is never used as a nominal modifier. Thus one cannot translate ‘They love each other’s children’ into Bulgarian as (38a), but only as (38b):

- (38) a. **Te obiçat decata edin na drug.*

- b. *Vseki [ot tjax] običa decata na drugite.*
lit. 'Everyone loves the children of the other(s).'

The marker *vzaimno* 'mutually' is clearly an adverb functioning as an adverbial adjunct.

7.1.3 The phrase *pomeždu si* 'between/among oneself'

It occurs as a syntactic marker of reciprocity with certain *se* and *si* verbs, usually when the participants are thought of as a group. It is much less common than the other two syntactic markers although it is interchangeable with them. I shall confine myself to a few examples.

- (39) a. *Te se podozirat pomeždu si/edin drug.* 'They suspect each other.'
b. *Te se uprekvat pomeždu si/vzaimno.* 'They reproach each other.'
c. *Te se plašat pomeždu si/edin drug/vzaimno.* 'They scare each other.'
d. *Te se okradoxa pomeždu si/edin drug.* 'They robbed each other.'
- (40) *Te si razmenjat knigi pomeždu si.* 'They exchange books with each other.'

7.2 Syntactic reciprocal markers with non-reciprocal verbs

7.2.1 With two-place reflexiva tantum

Since these verbs have no direct object but only a prepositional one, they cannot take the second accusative clitic *se*; in this case a syntactic marker is the only means of expressing reciprocity, if necessary. The preposition of the underlying object is always placed between the components of the marker *edin drug*:

- (41) a. *Ivan se straxuva ot Sofia.*
'Ivan is afraid of Sofia.'
b. *Ivan i Sofia [*se] se straxuvat edin ot drug.*
'Ivan and Sofia are afraid of each other.'

Other syntactic reciprocal markers cannot be used here:

- c. **Ivan i Sofia se straxuvat vzaimno.*
lit. 'Ivan and Sofia are mutually afraid.'
d. **Ivan i Sofia se straxuvat pomeždu si.*
lit. 'Ivan and Sofia are afraid between themselves.'

7.2.2 With two-place derived non-reciprocal *se* verbs

I have in mind some anticausative (or converse) *se* verbs (cf. 4.2.2). In this case the latter may be synonymous to the underlying transitive constructions (cf. (42a) and (43a)).

- (42) a. *Sofia se razočarova ot Ivan.*
'Sofia got disappointed in Ivan.'
b. *Sofia i Ivan se razočarovaxa edin ot drug.*
'Sofia and Ivan got disappointed in each other.'

In (41) and (42) we find "canonical" reciprocal constructions derived from two-place intransitives. They differ from those of 5.1.1.1 in that they are formed without the clitic *si*.

The type illustrated by (42) has a parallel synonymous reciprocal construction derived from the respective transitive verb:

- (43) a. *Ivan razočarova Sofia.* 'Ivan disappointed Sofia.'
 b. *Ivan i Sofia se razočarovaxa edin drug.* 'Ivan and Sofia disappointed each other.'

7.2.3 Subject-oriented and object-oriented reciprocal constructions derived from three-place transitives of motion

The following two sentences are parallel to (41) and (42):

- (44) a. *Marko se izpravi do Ivan.*
 'Mark stood up next to Ivan.'
 b. *Marko i Ivan se izpravixa edin do drug.*
 'Mark and Ivan stood up one beside the other.'

But they are not synonymous with type (45) constructions:

- (45) a. *Stojan izpravi Ivan [do prozoreca].*
 'Stojan set Ivan upright [by the window].'
 b. *Petăr i Stojan se izpravixa edin drug.*
 'Stojan and Ivan set each other upright.'

An object-oriented reciprocal construction can be formed from a three-place transitive of motion by means of a syntactic reciprocal marker only, namely, by means of *edin drug*:

- (46) a. *Stojan izpravi Ivan do Sofia.*
 'Stojan set Ivan upright next to Sofia.'
 b. *Stojan izpravi stolovete edin do drug.*
 'Stojan set the chairs upright next to each other.'
 b'. *Stojan izpravi butilkite edna do druga.*
 'Stojan set the bottles upright one beside the other.'

7.2.4 Syntactic reciprocal markers with verbs without *se*. Adverbial reciprocal constructions

Here, as well as in the above cases, we have in mind reciprocal constructions formed from verbs with prepositional phrases in the function of an object or an adverbial. Reciprocal formation in this case is no different from all the above cases, i.e. a syntactic marker of reciprocity can replace any prepositional object or adverbial on condition that the lexical meaning of the verb allows it. But *se* verbs are considered separately above in order to show that the clitic *se* has nothing to do with reciprocity.

- (47) a. *Te stojat do tjax.* 'They stand beside them.'
 b. *Te stojat edin do drug.* 'They stand one beside the other/next to each other.'

7.3 Indefinite-personal reciprocal constructions

This term is used here to refer to constructions like (48c) which, as well as (48b), are syntactic reciprocals from (48a):

- (48) a. *Te gi udovletvorjavat [tjax].*
‘They satisfy them.’
- b. *Te se udovletvorjavat vzaimno.*
lit. ‘They satisfy each other mutually.’
- c. *Vsek-i [ot tjax] udovletvorjava drugi-ja.*
each-M.SG from them satisfies other-DEF.M
‘They satisfy each other’, lit. ‘Each [of them] satisfies the other.’
- d. *Edin [ot tjax] udovletvorjava drugi-ja.*
one from them satisfies other-DEF.M
‘They satisfy each other’, lit. ‘One satisfies the other.’

In sentences of the type under consideration, the first component of the reciprocal phrase *edin/vseki ... drug* is in subject position (the second component being in object position), therefore its use is likely to be restricted to the indefinite-personal meaning. The subject referent may be implied in the context. A few more examples:

- (49) a. *Te se predpočetoxa edin drug/vzaimno.*
‘They have preferred each other.’
- b. *Vseki ot tjax predpočete drugija.*
(same translation) lit. ‘Each of them has preferred the other.’

Variant (49b) is noted as the more common one (but it also has an elliptic interpretation, e.g. ‘Each of them has preferred the other [chair].’).

- (50) *Te se spomenavat edin drug v pismata si.*
‘They mentioned each other in their letters.’

In the following instance this construction is the only one possible:

- (51) *Vseki ot tjax zapoznava drugija säs svoite prijateli.*
‘They introduced each other to their friends.’
lit. ‘Each of them acquainted the other with their friends.’

In (52d) this construction functions as a synonym of (52c), i.e. of the type discussed in Section 7.2.2:

- (52) a. *Toj ja udivljava [neja].*
‘He surprises her’ (cf. with (43a)).
- b. *Tja se udivljava ot nego / Tja mu se udivljava.*
‘She is surprised at him’ (cf. (42a)).
- c. *Te se udivljavat edin ot drug.*
‘They are surprised at each other’ (cf. (42b)).
- d. *Vseki udivljava drugija.*
lit. ‘Each surprises the other.’
- e. *Tja se väzxištava ot nego/Tja mu se väzxištava [na nego].*
‘She admires him.’

7.4 Non-reciprocal contextual means of supporting reciprocal meaning

For this purpose, various non-specialized means can be used instead of the syntactic markers of reciprocity; thus substitution of *v očite* ‘in (their) eyes’ for *edin drug* in (1d) helps to retain the reciprocal interpretation (K. Ivanova, p.c.).

8. Simultaneity and succession of reciprocal events

8.1 Obligatory simultaneity: ‘to kiss each other’

Some reciprocal verbs imply simultaneous participation of their argument referents in the situation described, while other reciprocals do not. This is not language dependent but is determined by the extra-lingual possibility of simultaneity. A classic and most frequently cited example is:

- | | | | |
|------|----|-----------------------|-------------------------|
| (53) | a. | <i>Toj ja celuva.</i> | ‘He kisses her.’ |
| | b. | <i>Tja go celuva.</i> | ‘She kisses him.’ |
| | c. | <i>Te se celuvat.</i> | ‘They kiss each other.’ |

In (53c), the actions described by (53a–b) commonly take place simultaneously for purely “technical” reasons, although in many other actions it is not necessarily so.

8.2 Optional simultaneity: ‘to fire at each other’

In this case, depending on the situation the actions of the argument referents within one event may be interpreted as either simultaneous or successive; moreover, both types of temporal sequence may occur within one event.

- | | | | |
|------|----|------------------------------------|------------------------------------|
| (54) | a. | <i>Te ni obstreljaxa.</i> | ‘They fired at us.’ |
| | b. | <i>Nie gi obstreljaxme.</i> | ‘We fired at them.’ |
| | c. | <i>Nie s tjax se obstreljaxme.</i> | ‘We and they fired at each other.’ |

8.3 Obligatory non-simultaneity: ‘to shave each other’

In some reciprocal events, the actions of the argument referents are necessarily successive:

- | | | | |
|------|----|--|-------------------------------------|
| (55) | a. | <i>Ivan bräsne Stojan.</i> | ‘Ivan shaves Stojan.’ |
| | b. | <i>Stojan bräsne Ivan.</i> | ‘Stojan shaves Ivan.’ |
| | c. | <i>Ivan i Stojan se bräsnať vzaimno.</i> | ‘Ivan and Stojan shave each other.’ |

Two persons cannot shave each other simultaneously, therefore reciprocity does not always bear upon the physical time. Reciprocal construction (55c) cannot refer to the real present moment: it necessarily refers to a habitual or iterative action.

It follows from (54) and (55) that simultaneity is of little importance for reciprocity. The meaning of (55c) covers the meanings of (55a) and (55b), which is also the case

in ((53) and (54). All the (c) examples meet the requirements of the diagnostic test for reciprocity.

8.4 Quasi-simultaneity: ‘to follow each other’

This concerns a small lexical set of reciprocals of the type mentioned:

- | | | | |
|------|----|---|---|
| (56) | a. | <i>Stojan goni Ivan.</i> | ‘Stojan runs after Ivan.’ |
| | b. | <i>Ivan goni Stojan.</i> | ‘Ivan runs after Stojan.’ |
| | c. | <i>Stojan i Ivan se gonjat [po livadata].</i> | ‘Stojan and Ivan run after each other [in the meadow].’ |

The actions described in (56a) and (56b) are not simultaneous with respect to the mutual position of both subject referents to each other. Therefore (56c) might be expected to be like (55c), but this is not the case, because in (56c) as well as in (56a–b) both participants are acting (i.e. running) simultaneously. Nevertheless, (56c) implies a succession of actions (56a) and (56b).

A different case is illustrated by (57c), where a change of relative position of the participants is not implied, it seems:

- | | | | |
|------|----|--|--|
| (57) | a. | <i>Stojan sledva Ivan na razstojanie.</i> | ‘Stojan follows Ivan at a distance.’ |
| | b. | <i>Ivan sledva Stojan na razstojanie.</i> | ‘Ivan follows Stojan at a distance.’ |
| | c. | <i>Stojan i Ivan se sledvaxa edin drug na razstojanie.</i> | ‘Stojan and Ivan followed behind one another at a distance.’ |

Sentence (57c) allows to avoid indicating the order in which one or the other participant follows the other if it is irrelevant. There is no reciprocity proper if the event is observed at a single moment of time. In such a case the verb cannot occur in Aorist (simple past) of the perfective aspect (it should be noted that in (57) the Imperfect of the imperfective aspect is used); cf.:

- | | | | |
|--|----|--|--|
| | d. | <i>*Stojan i Ivan se posledvaxa edin drug.</i> | lit. ‘Stojan and Ivan started following behind one another.’ |
|--|----|--|--|

9. Lexical reciprocals

In lexical reciprocals, reciprocity is part of their lexical meaning, which is to say that they are not related to any underlying non-reciprocal verbs, although they may contain a clitic which in other verbs may add the reciprocal meaning.

9.1 Two-place intransitives with a reflexive clitic. *Reciproca tantum*

The number of reciprocals of this type may exceed 100. These reciprocals either do not have respective underlying verbs without a clitic, or they are not related to them semantically in any standard way. This may be due to the loss of the underlying verb, or semantic deviation, or denominal origin, etc. This distinguishes them from regular reciprocals discussed in Sections 4, 5 and 6. Needless to say, deponential *se* verbs may also have other meanings, and they are even more numerous than those with the reciprocal meaning (e.g. *smeja se* ‘laugh’, *vgleždam se* ‘gaze’, etc.; see also 7.2.1). The reciprocals in question usually occur with a comitative object, when used in discontinuous constructions (see 6.2). Here are diagnostic examples to specify this type of reciprocals in which all the three sentences are synonymous, the difference being purely communicative:

- (58) a. *Stojan se rākuva s Ivan.* ‘Stojan shakes hands with Ivan.’
 b. *Ivan se rākuva s Stojan.* ‘Ivan shakes hands with Stojan.’
 c. *Stojan i Ivan se rākuvat.* ‘Stojan and Ivan shake hands.’
- (59) a. *Az se ugovorix s nego.* ‘I came to an agreement with him.’
 b. *Toj se ugovori s mene.* ‘He came to an agreement with him.’
 c. *Az i toj se ugovorixme.* ‘I and he came to an agreement.’
 d. *Nie se ugovorixme edin s drug/pomeždu si.*
 ‘We came to an agreement with each other/between ourselves.’

Here belong the following verbs:

- (60) *Te se džavkat.* ‘They yap at each other.’
Te se dogovarjat. ‘They come to an agreement.’
Te se dublirat. ‘They duplicate each other.’
Te se konkurirat. ‘They compete with each other.’
Te se sbivat. ‘They get into a fight with each other.’
Te se prepirat. ‘They argue [with each other].’
Te se spogaždat. ‘They come to terms with each other.’
Te se sporazumjavat. ‘They strike a bargain with each other.’
Te se sāveštavat. ‘They confer with each other.’
Te se spobutvat. ‘They nudge each other.’
Te se spogleždat. ‘They glance at each other.’
Te se borjat. ‘They fight.’
Te se obzalagat. ‘They argue.’
Te se pazarjat. ‘They bargain with each other.’
Te se sražavat. ‘They fight/struggle.’
Te se karat. ‘They quarrel’, etc.

So far, I have found only one lexical reciprocal with the clitic *si*:

- Te si vzaimodejstvat.* ‘They interact with each other.’

The following verbs can be added to the list of lexical reciprocals with the clitic *se*: *zdrav-
isvam se* ‘greet each other’, *sboguvam se* ‘say good-bye to each other’, *rodeja se* ‘be related’,
sdumam se ‘come to an agreement’, *sdārpvam se* ‘come to loggerheads’, *srobotvam se*

‘achieve harmony in work (with)’, *izprovārvjam se* ‘walk in file one after another’, *sgleždam se* ‘catch sight of each other’, etc.

9.2 Cliticized reciprocals derived from lexical reciprocals

Two subtypes can be distinguished here.

9.2.1 *Reciprocals used in comitative constructions*

They differ from reciprocals discussed in Sections 4 and 5 in that they satisfy the test exemplified by (58)–(59) where all the three constructions are synonymous and imply each other, but they are analogous to standard reciprocals under 5.1.1.1 in that the reflexive clitic is obligatory in the simple (non-discontinuous) constructions (see 6.1):

- | | | | |
|------|----|--|---|
| (61) | a. | <i>Bratāt priliča na sestra si.</i> | ‘The brother resembles his sister.’ |
| | = | b. <i>Sestrata priliča na brat si.</i> | ‘The sister resembles her brother.’ |
| | = | c. <i>Bratāt i sestrata si priličat.</i> | ‘The brother and sister resemble each other.’ |
| (62) | a. | <i>A protivoreči na B.</i> | ‘A is contrary to B.’ |
| | = | b. <i>B protivoreči na A.</i> | ‘B is contrary to A.’ |
| | = | c. <i>A i B si protivorečat.</i> | ‘A and B are contrary to one another.’ |
| (63) | a. | <i>A podxožda na B.</i> | ‘A corresponds to B.’ |
| | = | b. <i>B podxožda na A.</i> | ‘B corresponds to A.’ |
| | = | c. <i>A i B si podxoždat [edin na drug].</i> | ‘A and B correspond to each other.’ |

9.2.2 *Reciprocals used in comitative constructions*

In this type a reciprocal verb can be used in both sets of constructions in which each sentence implies, as is noted above, the other. Here is an example parallel to (61):

- | | | | |
|------|----|---------------------------------------|------------------------|
| (64) | a. | <i>Stojan sreštna Ivan.</i> | ‘Stojan met Ivan.’ |
| | = | b. <i>Ivan sreštna Stojan.</i> | ‘Ivan met Stojan.’ |
| | = | c. <i>Stojan i Ivan se sreštnaxa.</i> | ‘Stojan and Ivan met.’ |

Verbs of this type are a semantic subtype of reciprocals considered in 4.1.1, where this verb is also mentioned.

The second set of constructions is analogous to that illustrated by (58):

- | | | | |
|------|----|---------------------------------------|----------------------------------|
| (65) | a. | <i>Stojan se sreštna s Ivan.</i> | lit. ‘Stojan met with Ivan.’ |
| | = | b. <i>Ivan se sreštna sās Stojan.</i> | lit. ‘Ivan met with Peter.’ |
| | = | c. <i>Stojan i Ivan se sreštnaxa.</i> | ‘Stojan and Ivan met’ (= (64c)). |

The reciprocal in (65a–b) also belongs to the group discussed in 6.2.

9.3 Three-place lexical object-oriented reciprocals (of connecting and separating) and anticausatives derived from them

These lexical reciprocals seem to be able to combine with syntactic reciprocal markers:

- (66) a. *Stojan ženi Sofia za Ivan.*
 ‘Stojan married Sofia to Ivan.’
 = b. *Stojan ženi Ivan za Sofia.*
 ‘Stojan married Ivan to Sofia.’
 c. *Stojan ženi Ivan i Sofia [edin za drug].*
 ‘Stojan married Ivan and Sofia [to each other].’
 d. *Stojan gi ženi edin za drug.*
 ‘Stojan married them to each other.’

With the help of the accusative *se*, we can form an anticausative verb from a lexical reciprocal like (66): the derived anticausative “inherits” the reciprocal meaning from the latter and the clitic marks the anticausative derivation only. The resultant anticausative reciprocal can be used in a set of synonymous constructions like (58) and (65) above:

- (67) a. *Sofia se oženi za Ivan.* ‘Sofia (got) married (to) Ivan.’
 b. *Ivan se oženi za Sofia.* ‘Ivan married Sofia.’
 c. *Ivan i Sofia se oženixa edin za drug.* ‘Ivan and Sofia married [each other].’
 c’. *Te se oženixa edin za drug.* ‘They married each other.’

A few more examples:

- (68) a. *Te pomirjavat Ivan sās Stojan.* ‘They reconcile Ivan and Stojan.’
 b. *Ivan i Stojan se pomirjavat.* ‘Ivan and Stojan get reconciled.’
 (69) a. *Te zapoznavat Ivan sās Stojan.* ‘They introduce Ivan and Stojan to each other.’
 b. *Ivan i Stojan se zapoznavat.* ‘Ivan and Stojan get acquainted.’
 (70) a. *Toj oplete koncite.* ‘He entwined the ends together.’
 b. *Koncite se opletoxa.* ‘The ends got entwined.’
 (71) a. *Toj različava X i Y.* ‘He distinguishes between X and Y.’
 b. *X i Y se različavat.* ‘X and Y differ from each other.’
 (72) a. *Toj smesva X i Y.* ‘He mixes X and Y.’
 b. *X i Y se smesvat.* ‘X and Y mix [with one another].’

10. Verbs of competition derived from transitives of “outdoing”

This is a meaning closely related to the reciprocal and obligatorily presupposing at least two contestants. The meaning of competition itself is reciprocal, and the Bulgarian verb *sāstezavam se* ‘compete’ is a lexical reciprocal (*reciproca tantum*) that satisfies the diagnostic test under (58) and (59):

- (73) a. *Stojan se sāstezava s Ivan.* ‘Stojan competes with Ivan.’
 = b. *Ivan se sāstezava sās Stojan.* ‘Ivan competes with Stojan.’
 = c. *Stojan i Ivan se sāstezavat.* ‘Stojan and Ivan compete [with each other].’

The meaning of the verbs of competition does not meet the requirements of the diagnostic test for the standard reciprocal meaning, as has been pointed out in specialist literature (Ivanova 1973:172–3); cf.:

- (74) a. *A nadbjagva B.* 'A outruns B.'
 # b. *B nadbjagva A.* 'B outruns A.'
 # c. *A i B se nadbjagvat.* 'A and B compete in running.'

If a *se* verb of this type can be used in a comitative construction, a set of constructions of type (73) seems possible;

- (75) a. *A se nadbjagva s B.* 'A competes in running with B.'
 = b. *B se nadbjagva s A.* 'B competes in running with A.'
 = c. *A i B se nadbjagvat.* 'A and B compete in running' (= (74c)).

The meaning of type (74a–b) and (75a–b) constructions probably differs from that of (74c) and (75c) respectively not only pragmatically. This requires verification for all the *se* verbs of competition.

The meaning 'to surpass, to outdo in the activity denoted by the root' of the underlying transitive verbs seems to be ousted by the meaning of competition in some (probably as many as half) of the "competition" verbs listed below (in the *Bălgarsko-ruski rečnik* (Bernštein 1975), about 25 verbs of this type are registered). Therefore, the Aorist of the perfective aspect of some verbs of this type may sound somewhat unnatural, as both contestants cannot win in the same event. But sentences denoting uncompleted actions and sentences like 'They wanted to surpass each other' may be more natural. Below, *se* verbs of competition are listed. Nearly all of them contain the prefix *nad-* 'out(do)'. Most of the verbs denote activities in which sporting events are held, such as wrestling, running, jumping, swimming, etc., and a few denote other kinds of activities, such as outdoing somebody in working, arguing, shouting, playing a musical instrument, and the like.

Verbs of sporting activities (to save space, the cliticized verbs alone are given):

- (76) *Te se nadbjagvat.* 'They compete in running.'
Te se nadvärvat. (dial.) 'They compete in wrestling.'
Te se nadborvat. 'They compete in wrestling.'
Te se nadbärzvat. 'They compete in speed.'
Te se nadskačvat. 'They compete in jumping.'
Te se nadtičvat. 'They compete in running.'
Te se nadxvärljat. 'They compete in throwing.'
Te se nadprepuskvat. 'They compete in horse-racing.'
Te se nadprevarvat. 'They compete in running.'
Te se nadpripkvat. 'They compete in running.'
Te se nadmjatvat. 'They compete in throwing.'
Te se nadpluvvat. 'They compete in swimming.'
Te se nadborvat. 'They compete in wrestling.'

There are no cliticized verbs of competition from the following transitives, although the latter are semantically similar to the underlying verbs of the derivatives in (76):

(77) <i>Te go izprevarvat.</i>	‘They outrun him.’
<i>Te go nadminavat.</i>	‘They outdistance him.’
<i>Te go nadvivat.</i>	‘They overcome him.’
<i>Te go nadxoždat.</i>	‘They outwalk him.’
<i>Te go nadstrelvat.</i> (rare)	‘They outshoot him.’

The following are *se* verbs of other than sporting activities:

(78) <i>Te se nadxitrjat.</i>	‘They compete in cunning.’
<i>Te se nadlāgvat.</i>	‘They compete in telling lies.’
<i>Te se naddumvat.</i>	‘They compete in debating.’
<i>Te se nadigravat.</i>	‘They compete in dancing, playing.’
<i>Te se nadvikvat.</i>	‘They compete in shouting.’
<i>Te se nadsvirvat.</i>	‘They compete in playing (a musical instrument).’
<i>Te se nadrabotvat.</i>	‘They compete in work.’
<i>Te se nadžānvat.</i>	‘They compete in reaping.’
<i>Te se nadpivat.</i>	‘They compete in drinking.’
<i>Te se nadpjavat.</i>	‘They compete in singing.’

1. Introduction

1.1 Lithuanian and Latvian

Lithuanian is one of the two surviving Baltic languages, the other language being Latvian. Lithuanian is the state language of the Republic of Lithuania spoken natively by 83.4 per cent of the population (2,907,293 out of 3,483,972; census of 2001). Latvian is the native language of 54 per cent (1,390,000) of the population of Latvia. There are also large communities of Lithuanians and Latvians in the U.S.A., Australia, etc., with an ever decreasing number of native speakers.

Another known Baltic language is Prussian, extinct since ca. 1700. It occupied the territory of the former East Prussia (at present the Kaliningrad region of Russia) and adjacent territories. The most representative remaining texts are translations of passages from the Catechism.

Lithuanian is one of the most archaic Indo-European languages. It retains more archaic features than Latvian. In fact, it is the closest to the “classical” reconstructed Indo-European language. There is evidence, such as place names and other substratum phenomena, that a now-extinct Baltic language occupied territories as far east as Moscow (see IEL, Vol. 1: 155).

1.2 Overview

In Lithuanian, reciprocity is expressed either morphologically by the reflexive morpheme *-si/-s* on the verb, as in

- (1) a. *Petr-as bučiuoja On-q.*
 Peter-NOM kisses Ann-ACC
 ‘Peter kisses Ann.’
 b. *Petr-as ir On-a bučiuoja-si.*
 Peter-NOM and Ann-NOM kiss-REC¹
 ‘Peter and Ann kiss each other’,

or syntactically by the phrase *vien-as* (NOM) *kit-q* (ACC) lit. ‘one another’, as in:

- (2) a. *Petr-as gerbia On-q.*
 P.-NOM respects A.-ACC
 ‘Peter respects Ann.’
 b. *Petr-as ir On-a gerbia vien-as kit-q.*
 P.-NOM and A.-NOM respect one-NOM.M other-ACC
 ‘Peter and Ann respect each other.’

The latter reciprocal phrase may co-occur with a (very limited) number of reflexively marked reciprocals (henceforth reflexive reciprocals) for disambiguation or emphasis (see 8.6.1), e.g.:

1. The reflexive marker is glossed as REC when used in the reciprocal meaning, and as REFL in other cases.

- (3) *Jie vien-as kit-q erzina-si.*
 they.NOM.M. one-NOM.M other-ACC tease-REFL
 ‘They tease each other.’

The reflexive morpheme *-si/-s* is traditionally called a particle in Baltic linguistics and here it is termed a reflexive-middle marker due to its origin and range of functions (see Nedjalkov, Ch. 3, §1.1). This marker is highly polysemous in Lithuanian, its wide range of semantic functions including the reflexive proper, autocausative, anticausative, potential-passive, etc. (see 3.2). It is worth stressing that Lithuanian differs from other languages which use the same formal marker to express the reflexive and the reciprocal senses in that it displays practically no verbs with *-si/-s* that might have both meanings (see 4.3).

Although reflexively marked reciprocals are quite numerous (about 255 verbs in my verb-list), their reflexive derivation is not an active process in contemporary Lithuanian.

Reciprocity is also encoded by the complex *su-si-* comprised of a prefix with the meaning ‘together (with)’ and obligatory reflexive-middle marker, on a limited number of derived verbs, cf.:

- (4) *žvelgti* ‘to glance’ → *su-si-žvelgti* ‘to exchange glances/glance at each other’
švilpti ‘to whistle’ → *su-si-švilpti* ‘to exchange whistles/whistle to each other’
šnekėti ‘to talk’ → *su-si-šnekėti* ‘to (begin to) understand each other.’

The prefix *su-* (with an optional reflexive-middle marker) is also used to derive verbs denoting convergent motion (from different directions to the same point) from a number of intransitive verbs of motion, e.g.:

- (5) *bėgti* ‘to run’ → *su[-si]-bėgti* ‘to come together/to gather running.’

The sociative sense is expressed exclusively by the adverbs *kartu* ‘together, jointly’ and *drauge* with the same meaning.

Alongside marked reciprocals, Lithuanian displays a variety of lexical reciprocals, i.e. verbs with an inherent reciprocal meaning; e.g.:

- (6) a. *Petr-as draugauja su Jon-u.* (INST) ‘Peter is friends with John.’
 = b. *Jon-as draugauja su Petr-u.* ‘John is friends with Peter.’
 = c. *Petr-as ir Jon-as draugauja.* ‘Peter and John are friends.’

Lexical reciprocals may contain the reflexive-middle marker, but it does not mark reciprocity since this sense is inherent in the base word; cf. (7), where the reciprocal is derived from the reciprocal noun *broli-is* ‘brother’:

- (7) a. *Petr-as broliuoja-si su Jon-u.* (INST) ‘Peter fraternizes with John.’
 b. *Jon-as broliuoja-si su Petr-u.* ‘John fraternizes with Peter.’
 c. *Petr-as ir Jon-as broliuoja-si.* ‘Peter and John are fraternizing.’

Both reflexive and lexical reciprocals can be used in the simple as well as in the discontinuous construction without restrictions.

Explicit expressions of the reciprocal meaning are the phrases *tarpusavyje/tarp savęs* lit. ‘between selves’ containing the reflexive pronoun *savo* (see 2.1), and *savo tarpe* lit. ‘in our/your/their own midst’, but they can be used with reciprocal verbs (formally reflexive and lexical) exclusively, to intensify or specify the reciprocal meaning (see Section 9); e.g.

- (8) a. *Mes baramė-s tarpusavyje.* lit. 'We quarrel between ourselves.'
 b. *Jie draugauja tarpusavyje.* lit. 'They are friends between themselves.'

Lithuanian reciprocals occupy an intermediate position among reciprocals of areally more or less contiguous languages (see Section 10). To complete the picture, the entire lists of reciprocal verbs registered in Kruopas (1972) (excepting their affixed derivatives) are given in this chapter.

1.3 Database

The data on Lithuanian are drawn from the *Dictionary of Contemporary Lithuanian* (Kruopas (ed.) 1972; about 60,000 entries; the total number of verb entries is approximately 19,000), in which about 480 verbs with the reciprocal meaning are registered. The quantitative characteristics in this chapter are based on this verb list. Additional data have been drawn from a number of other dictionaries and from present-day written texts. Valuable information on the use of reciprocals and restrictions has been obtained from native informants.

The data on Latvian are drawn from the *Latvian-Lithuanian Dictionary* (Balkevičius & Kabelka 1977; about 42,000 entries). In this dictionary, about 260 verbs with the reciprocal meaning are registered.

The system of reciprocals in Latvian is essentially no different from that in Lithuanian, the only perceptible difference being the quantitative characteristics of various subtypes of reciprocals. The system of reflexives, i.e. verbs with the reflexive-middle marker, however differs with regard to the class of transitive reflexives: it is extremely numerous in Lithuanian and almost non-existent in Latvian. To show Lithuanian reflexives and reciprocals in relief, quantitative characteristics below are given for both languages.

2. Grammatical notes

2.1 The noun and pronoun

Nouns have gender (masculine or feminine) and they are inflected for number (singular and plural) and case (nominative, genitive, dative, accusative, instrumental, locative). There are five declensions (12 paradigms) in the noun.

Personal pronouns are differentiated for number in the 1st and 2nd persons and for number and gender in the 3rd person. Lithuanian also retains dual pronouns which are marked for gender.

(9)		Singular	Plural	Dual
	1 p. M	<i>aš</i> 'I'	<i>mes</i> 'we'	<i>mudu</i> 'we.two'
	F			<i>mudvi</i> 'we.two'
	2 p. M	<i>tu</i> 'thou'	<i>jūs</i> 'you'	<i>judu</i> 'you.two'
	F			<i>judvi</i> 'you.two'
	3 p. M	<i>jis</i> 'he'	<i>jie</i> 'they'	<i>juodu/jiedu</i> 'they.two'
	F	<i>ji</i> 'she'	<i>jos</i> 'they'	<i>jiedvi</i> 'they.two'

Dual pronouns are comparatively rarely used in Standard Lithuanian. With reciprocal verbs, they seem to be more common than generally.

Lithuanian also has a reflexive pronoun *savo* (ACC) 'oneself, myself, yourself ... themselves' (analogous to the Russian *sebjā*) used to refer reflexively to all the three persons, both singular and plural. It has all the case forms except the nominative. The possessive reflexive pronoun is *savo* 'one's (my, your, ... their)'.

2.2 The verb

2.2.1 Aspect and tense

Two aspects are distinguished, perfective and imperfective. Each verb is either perfective, or imperfective, or of dual aspectual nature. Imperfective verbs are commonly perfectivized by prefixes (the latter may at the same time modify or change the lexical meaning of the verb).

There are four tenses: present, simple past, frequentative past and future, each represented by a non-perfect (simple) and perfect (periphrastic) form. Any verb of either aspect can assume all these eight forms.

The predicate verb agrees with the subject in number in the 1st and 2nd persons. In the 3rd person the verb is not marked for number:

- (10) a. *Jis / ji rašo* 'He / she writes.' – b. *Jie / jos rašo*. 'They(M) / they(F) write.'

The infinitive marker is the suffix *-ti* often abbreviated to *-t* in colloquial Lithuanian.

2.2.2 Verb classes

The relevant syntactic verb classes are one-place and two-place intransitives, the latter taking a non-direct object with or without a preposition, and two-place and three-place transitives, the latter usually taking an indirect dative object. A direct object is expressed by the accusative or genitive, in the case of indefiniteness.

2.2.3 Valency changing categories

2.2.3.1 Means of valency increase: The causative suffix *-(d)in-* and vowel alternation. The only regular process of increasing verbal valency is the highly productive causative derivation by means of the suffix *-(d)in-*, vowel alternation, or both; cf. respectively:

- (11) *aug-ti* 'to grow' → *aug-in-ti* 'to cause to grow'
trump-ė-ti 'to become short(er)' → *trump-in-ti* 'to make short(er).'

- (12) *kis-ti* ‘to change’ → *keis-ti* ‘to cause to change’
link-ti ‘to bend, to stoop’ → *lenk-ti* ‘to cause to bend.’
- (13) *grįž-ti* ‘to return’ → *graž-in-ti* ‘to cause to return, to give back’
būg-ti ‘to get scared’ → *baug-in-ti* ‘to scare.’

2.2.3.2 *Means of valency decrease: The reflexive-middle marker and passive marker.* They are:

1. The marker *-si/-s*, being highly polysemous, changes verbal valency in a number of ways, or the valency may be retained (see Section 3.1); cf.:

- (14) a. *Petr-as prausia veid-q.* (ACC) ‘Petras washes (his) face.’
 b. *Petr-as prausia-si.* ‘Peter washes (himself).’

The meaning in (14b) is reflexive proper. In the case of the possessive-reflexive meaning the object is retained:

- c. *Petr-as prausia-si veid-q.* ‘Peter washes *his* face.’

The reflexive-middle can derive reflexive verbs from marked causatives (e.g. *baug-in-ti* ‘to scare (sb)’ → *baug-in-ti-s* ‘to be/get scared’), but causatives cannot be derived from verbs with *-si/-s*.

2. The passive voice form, composed of the auxiliary *bū-ti* ‘to be’ assuming all the four tense forms, and present passive participle (marked with the suffix *-m-*) or past passive participle (marked with the suffix *-t-*), decreases valency in the following way:

- (15) a. *Petr-as raš-ė laišk-q.*
 P.-M.NOM write-PAST.3 letter-ACC.SG
 ‘Petras wrote/was writing a letter.’
- b. *Laišk-as buvo rašo-m-as [Petr-o].*
 letter-NOM.M.SG be.PAST.3 write-PRES.PASS-NOM.M.SG P.-GEN
 ‘The letter was being written [by Peter].’
- c. *Laišk-as buvo rašy-t-as Petr-o.*
 letter-NOM.M.SG be.PAST.3 write-PAST.PASS-NOM.M.SG P.-GEN
 ‘The letter was written by Peter.’

The agentive object in passive constructions is expressed by the genitive case form. (On the verbal categories in the passive voice see Geniušienė 1974: 252–62.)

2.2.4 *The place of the reflexive-middle marker -si/-s*

It takes the final position after inflection on unprefixed verbs, in which case it has two allomorphs *-si-* and *-s*, their choice being governed by rather complicated rules (see Geniušienė 1987: 19); cf.:

- (16) *muš-ti-s* ‘to fight’
muš-a-si ‘(he) fights’
muš-ė-si ‘(he) fought’
muš-i-s ‘(he) will fight’
muš-ki-s ‘fight!’ (IMP).’

On prefixed verbs the full form *-si-* alone is used, and it is placed between the prefix and root:

- (17) *su-si-muš-ti* ‘to have / begin a fight’
pa-si-muš-ti ‘to fight for a while.’

If an unprefixed verb occurs with the negative particle *ne-* the reflexive-middle marker is placed between the negation and root:

- (18) *ne-si-muš-a* ‘(he) does not fight.’

In Latvian, the reflexive marker *-s* is always placed finally after inflection on the verb.

2.3 Word order

Word order is free, the syntactic functions of noun phrases being case marked. The basic word order is however SVO.

3. Polysemy of the reflexive-middle marker

Marking reciprocity is one of the many functions of the marker *-si-/s* in Lithuanian. To show the place of reflexive reciprocals which form the core of the class of reciprocal verbs in Lithuanian (and in Latvian), I will begin with a survey of the main syntactic and semantic functions of *formally* reflexive verbs, i.e. verbs containing the reflexive-middle marker.

Reflexive derivation is highly productive both in Lithuanian and in Latvian: in Kruopas (1972) about 5,700 verbs with the reflexive-middle marker are registered, and Balkevičius & Kabelka (1977) register 3,560 reflexive verbs. This covers all formal types of reflexives: those derived from verbs by means of the reflexive-middle marker alone or by means of a prefix and this marker, denominal reflexives, cases of intra-class derivation (affixation of formally reflexive verbs), and *reflexiva tantum*. Of further interest are deverbal reflexives derived by attaching the reflexive marker alone and characterized by regular semantic relations with the underlying verb: they comprise 65% (3,680 items) of the Lithuanian list and 55% (1,960 items) of the Latvian list of formal reflexives.

The dictionaries mentioned differ in the number of entries and in the number of registered reflexives, but it may be assumed that the ratio of different types of reflexives (as well as reciprocals) reflects their actual ratio in the two languages.

3.1 Syntactic classes of formal reflexives

The latter term applies here to verbs derived from underlying non-reflexive verbs by attaching the reflexive marker *-si-/s*, as in (19a), and their prefixed counterparts, as in (19b):

- (19) a. *reng-ti* ‘to dress sb’ (IPFV) → *reng-ti-s* ‘to dress oneself’
 b. *ap-reng-ti* ‘to dress sb’ (PFV) → *ap-si-reng-ti* ‘to dress oneself’

The reflexive-middle marker decreases verbal valency in three principal ways, or it may not change it, thus yielding four syntactic classes of formal reflexives.

1. Subject-oriented intransitive reflexives, with object deletion or demotion, the subject of the derived construction being identical with the subject of the underlying (base) construction; cf. (14a–b) above. Reflexive reciprocals belong in this syntactic class.

2. Object-oriented intransitive reflexives, with subject deletion or demotion resulting in direct object promotion to subject position in the derived construction; cf.:

- (20) a. *Petras atī-darė duris.* ‘Peter opened the door.’
 b. *Durys at-sī-darė.* ‘The door opened.’

3. Subject-oriented transitive reflexives, with indirect (dative) object deletion, the subject of the derived construction subsuming the indirect object of the underlying construction; they may acquire a possessive-reflexive (see (14c)), benefactive-reflexive (cf. (21b–c)) and other meanings; cf.:

- (21) a. *Petr-as nupirko On-ai (DAT) knyg-q (ACC).* ‘Peter bought Ann a book.’
 b. *Petr-as nu-si-pirko knyg-q.* ‘Peter bought himself a book.’
 c. *Jie nu-si-pirko knyg-q.* ‘They bought themselves a book.’

Note that the reciprocal interpretation of (21c) is not possible, in contrast to other languages with analogous constructions.

4. Reflexives with retained valency: on a number of verbs (both transitive and intransitive) the reflexive-middle marker does not change their syntactic valency: It is optional and adds the semantic component ‘for one’s own benefit/advantage/pleasure, in one’s own interests’ or it carries no meaning; e.g.:

- (22) a. *Petr-as [ī-si-]kvėpė oro.* ‘Peter inhaled some air.’
 b. *Petr-as at[-si-]keršijo Jon-ui (DAT).* ‘Peter revenged [himself] on John.’

Table 1 summarizes quantitative characteristics of the syntactic classes in question.

Table 1.

Syntactic type	Lithuanian	Latvian
1. Subject-oriented intransitive	26.9% (990)	41.5% (810)
2. Object-oriented intransitive	31.2% (1,150)	49.0% (960)
3. Subject-oriented transitive	28.5% (1,050)	0.7% (14)
4. Reflexives with optional <i>-si-</i>	13.1% (480)	7.1% (140)
5. Residual reflexives	0.3% (10)	1.7% (30)
Total	100% (3,680)	100% (1,960)

3.2 Semantic classes of reflexive verbs

The first two syntactic classes of formal reflexives fall into a number of semantic classes distinguished according to the semantic relation between the underlying and derived verb.

3.2.1 Subject-oriented intransitive reflexives

These split into the following semantic types:

1. Reciprocal reflexives (or reflexive reciprocals); cf. (1).
2. Reflexives proper, or semantic reflexives, with agent-patient coreference, cf. (19).
3. “Partitive” reflexives, typically with a body-part object included in the meaning of the derivative; they are synonymous with the base verb; cf.:

- (23) a. *Petras už-merk-ė akis.*
 P. PREF-close-3.PAST eyes
 ‘Peter closed his eyes.’
 b. *Petras už-si-merk-ė.*
 P. PREF-REFL-close-3.PAST
 ‘Peter closed his eyes.’

4. “Absolutive” reflexives denoting habitual activity or a particular characteristic of the subject referent, due to generalization (usually) of the deleted object referent; e.g.:

- (24) a. *Petras keikia visus.* ‘Peter curses everyone.’
 b. *Petras keikia-si.* ‘Peter uses bad language.’

5. Autocausative, or body-move reflexives, with the subject referent causing its own motion or change of posture, e.g.:

- (25) a. *Ona supa vaiką.* ‘Ann is rocking the child.’
 b. *Ona supa-si.* ‘Ann is rocking [herself].’

6. Deaccusative reflexives, with direct object demotion to the status of a non-direct object with or without a preposition; e.g.:

- (26) a. *Petras lanko draugą.* ‘Peter visits his friend.’
 b. *Petras lanko-si pas draugą.* ‘Peter calls on his friend.’

Table 2 shows the quantitative characteristics of the semantic sets of subject-oriented reflexives in my verb list (residual reflexives are excluded from their total number).

Table 2.

Semantic classes	Lithuanian	Latvian
1. Reciprocals	17.4% (160)	10.8% (80)
2. Reflexives proper	31.5% (290)	25.7% (190)
3. “Partitive” reflexives	18.5% (170)	20.3% (150)
4. “Absolutives”	9.8% (90)	10.8% (80)
5. Autocausatives	15.2% (140)	28.3% (210)
6. Deaccusatives	7.6% (70)	4.1% (30)
Total	100.0% (920)	100.0% (740)

3.2.2 Object-oriented intransitive reflexives

In a construction with a formally reflexive verb, the underlying object is promoted to subject position, the underlying subject being deleted or, sometimes, demoted to an oblique object position. They fall into six semantic types.

1. Anticausative (or decausative) reflexives, which conspicuously lose the causative sense; cf. (20) and the following:

- (27) a. *Vejas sklaido rūką.* 'The wind disperses the fog.'
 b. *Rūkas sklaido-si.* 'The fog lifts/disperses.'

2. Autocausative reflexives, the referent of the underlying object acquiring the role of agent (causing a change in its own state) in subject position (cf. type 5) in 3.2.1):

- (28) a. *Petras at-rišo arklį.* 'Peter untied the horse.'
 b. *Arkllys at-si-rišo.* 'The horse got untied' (due to its own efforts).

3. Potential-passive reflexives, implying a human agent in the role structure, with the modal meaning, as in (29b) where the modifier cannot be omitted:

- (29) a. *Ona rakina duris.* 'Ann locks the door.'
 b. *Durys lengvai rakina-si.* 'The door locks easily.'

4. Perfective-passive reflexives, also with an implied human agent, derived from prefixed perfective verbs and commonly used in the simple past tense, as in

- (30) a. *Jis iš-eikvojo daug pinigų.* 'He spent a lot of money.'
 b. *Daug pinigų iš-si-eikvojo.* 'A lot of money got spent.'

5. Converse formal reflexives with demoted underlying subject, e.g.:

- (31) a. *Petras sapnavo keista sapną.*
 'Peter had (lit. 'dreamed') a strange dream.'
 b. *Petr-ui (DAT) sapnavo-si keistas sapn-as (NOM).*
 (same translation) lit. 'A strange dream dreamed itself to Peter.'

6. Reflexive-causative verbs, with the derived subject referent acquiring the role of causer, cf.:

- (32) a. *Kirpėjas ap-kirpo Petrą.* 'The barber gave Peter a hair-cut.'
 b. *Petras ap-si-kirpo [pas kirpėją].* 'Peter had his hair cut [at the barber's].'

The quantitative characteristics of the semantic classes of object-oriented reflexives (minus residual verbs) are shown in Table 3.

Table 3.

Semantic classes	Lithuanian	Latvian
1. Anticausatives	71.4% (800)	87.0% (810)
2. Autocausatives	4.5% (50)	2.2% (20)
3. Potential-passives	8% (90)	1.6% (15)
4. Perfective-passives	9% (100)	3.8% (35)
5. Converse reflexives	4.5% (50)	3.2% (30)
6. Reflexive-causative verbs	2.6% (30)	2.2% (20)
Total	100.0% (1120)	100.0% (930)

4. Reflexive reciprocals

As was mentioned above, this term is used here to refer to morphologically marked reciprocals derived from non-reciprocal verbs by means of the reflexive-middle marker alone, as in (1); cf. also:

- | | | | |
|------|--|---|--|
| (33) | <i>sveikinti</i> ‘to greet sb’ | → | <i>sveikinti-s</i> ‘to greet each other’ |
| | <i>pra-vardžiuoti</i> ‘to nickname sb’ | → | <i>pra-si-vardžiuoti</i> ‘to nickname each other.’ |

Prefixed reciprocals are included in the list of 160 reciprocals (see Table 2) if only they have no unprefixated correlates, like (33b). These reciprocals together with their affixed (“intra-class”) derivatives account for 53% (255 items) in my list of 480 reciprocal verbs of all types. The respective figures for Latvian are 42% (80 units, or about 110 with their affixed derivatives) of the entire number (260 reciprocals).

Reflexive reciprocals are much more numerous in Lithuanian than, for instance, in Russian (see Knjazev, Ch. 15). There are few, if any, *reciproca tantum* in Lithuanian. As often as not, the Russian equivalent of a Lithuanian reflexive reciprocal is a *reciprocum tantum*.

4.1 Diathesis types of reciprocal constructions: Subject-oriented “canonical” type only

Though quite numerous, Lithuanian reflexive reciprocals are rather homogeneous syntactically and the overwhelming majority are of the subject-oriented “canonical” type.

Most of the reciprocals in question derive from two-place transitives, and a few from two-place intransitives and three-place transitives.

4.1.1 Derived from two-place transitives

In this case, the underlying direct object is either deleted, its referent being included in the subject, or it is demoted to a comitative object. Thus all “canonical” reciprocals occur in two types of constructions, one-place intransitive (cf. (34b) and two-place intransitive comitative (cf. (34c) where *su* means ‘with’):

- | | | | |
|------|----|---|---|
| (34) | a. | <i>Petr-as stumdo Jon-q.</i> | ‘Peter pushes John.’ |
| | b. | <i>Petr-as ir Jon-as stumdo-si.</i> | ‘Peter and John push each other.’ |
| | c. | <i>Petr-as stumdo-si su Jon-u (INST).</i> | lit. ‘Peter pushes each other with John.’ |

4.1.2 Derived from two-place intransitives

These reciprocals, though far from numerous (only 11 items), fall into three groups.

1. Reciprocals derived from intransitives with a prepositionless object which happens to be in the dative case, including:

1a. Three synonyms with the meaning ‘to help each other’:

- | | | | |
|------|----|-------------------------------------|---|
| (35) | a. | <i>Mes talkinėjame jiems (DAT).</i> | ‘We help <i>them</i> .’ |
| | b. | <i>Jie talkinėja mums (DAT).</i> | ‘They help <i>us</i> .’ |
| | c. | <i>Mes su jais talkinėjamė-s.</i> | ‘We (lit. ‘we with <i>them</i> ’) help <i>each other</i> .’ |

- (36) *padėti* ‘to help sb’ → *pa-si-dėti* ‘to help each other’
pagelbėti ‘to help/aid sb’ → *pa-si-gelbėti* ‘to help/aid each other.’²

Note that the latter two reciprocals commonly occur with the reciprocal phrase *vien-as kit-am* (DAT) ‘to each other’ (see 8.5.2); moreover, with *pa-si-dėti* ‘to help each other’ this phrase seems to be obligatory.

1b. Two synonyms with the meaning ‘to beat/hit each other’:

- (37) a. *pilti* ‘to beat/whip sb’ → *pilti-s* ‘to beat each other’
 b. *smūgiuoti* ‘to deliver blows’ → *smūgiuoti-s* ‘to exchange blows.’

2. Assorted reciprocals derived from intransitives with a prepositional object; cf. (the preposition *ant* = ‘at’):

- (38) a. *Jis pyksta ant manęs* (GEN). ‘He is angry with me.’
 b. *Aš pykstu ant jo* (GEN). ‘I am angry with him.’
 c. *Mes pykstamės*. ‘We are angry with each other.’

The following reciprocals also belong here (*ko* = GEN and *ką* = ACC of *kas* ‘somebody, something’; *į* = ‘at’):

- (39) a. *kivirčyti ant ko* ‘to reproach’ → *kivirčyti-s* ‘to quarrel, abuse each other’
 b. *pa-žvilgčioti į ką* ‘to cast a glance at sb’ → *pa-si-žvilgčioti* ‘to cast glances at each other’
 c. *rėkti ant ko* ‘to shout at sb’ → *rėkti-s* ‘to shout at each other’
 d. *šaudyti į ką* ‘to shoot/fire at sb’ → *šaudyti-s* ‘to fire at each other’
 e. *žvairuoti į ką* ‘to look sideways at sb’ → *žvairuoti-s* ‘to look sideways at each other.’

4.1.3 Derived from three-place transitives. “Quasi-indirect” reciprocals

The resultant constructions correspond semantically to those with “indirect” reciprocals in some other languages, but they differ from the latter in that the direct object is deleted or demoted. Another restriction is that three-place verbs like ‘to give’, ‘to send’ with an indirect dative object do not yield reciprocals, the reciprocal meaning with the latter verbs being expressed syntactically by the phrase *vien-as kit-am* (DAT) ‘to each other’ (see 8.3.2). These reciprocals fall into three groups.

1. Reciprocals derived from verbs of speech (10 items). The underlying verbs take a dative object of human addressee and a direct object of the content of speech. In the reciprocal construction, the direct object is deleted or demoted to a prepositional object, and the subject subsumes the indirect object:

- (40) a. *Petr-as šnibžd-a kažk-ą On-ai*.
 P.-NOM whisper-PRES.3 something-ACC O.-DAT
 ‘Peter whispers something to Ann.’

2. Both verbs in (36) are prefixed and in the given meanings are not used without the prefixes; the unprefixed bases are *dėti* ‘to put’ and *gelbėti* ‘to save’ respectively.

- b. *Petras ir Ona šnibžda-si [apie kažką].*
 ‘Peter and Ann are whispering [about something].’

Here belong the synonyms of (40) given under (41) and also the verbs under (42) with the underlying prepositional object instead of the direct object of content which is optionally retained in the derived construction:

- (41) a. *ku(g)ždėti* → *ku(g)ždėti-s* c. *šnabždėti* → *šnabždėti-s*
 b. *čiučenti* → *čiučenti-s* d. *švagždėti* → *švagždėti-s*.
- (42) a. *kalbėti apie ką* ‘to speak/talk about sth’ → *kalbėti-s [apie ką]* ‘to talk to each other [about sth]’
 b. *šnekėti* ‘to talk’ → *šnekėti-s* ‘to talk to each other’
 c. *čiulbėti* ‘to chirp, (fig.) talk with love’ → *čiulbėti-s* ‘to talk to each other with love (like birds).’

This type also subsumes a number of dialectal reciprocals, like *kepešyti-s* ‘to quarrel, abuse each other’, *kerežyti-s* with the same meaning, etc.

2. Reciprocals derived from verbs of replacing and changing. Here belong verbs derived from the underlying verbs *keisti* ‘to change/replace’ and *mainyti* ‘to exchange’ taking an optional comitative human object along with a direct object (together with affixed derivatives this group comprises about 9 verbs). The syntactic structure undergoes a complex change in the process of reciprocal derivation; cf.:

- (43) a. *Petras ir Jonas pakeitė mažą lemputę (ACC) didelę (INST).*
 ‘Peter and John replaced a small electric bulb with (a) large (one).’
 b. *Petras ir Jonas pa-si-keit-ė lemput-ėmis.*
 P. and J. PREF-REFL-change-3.PAST bulb-INST.PL
 ‘Peter and John exchanged electric bulbs.’

In (43a) Peter and John perform together the same action of replacing one object with another, while in (43b) each of them is both agent and recipient of exchange. In (43b) the object must be necessarily plural.

As we see, the underlying verb is an object-oriented lexical reciprocal. The derived construction is a “double” reciprocal, relative to the human agents and the objects of exchange which have to be in possessive relation to the agents.

3. Reciprocals derived from three-place iterative verbs of throwing, viz. from transitives *mėtyti* ‘to throw’ (and its suffixed derivatives *mėtlioti* and *mėčioti* with the same meaning), *svaidyti* ‘to throw’, *blaškyti* ‘to throw’, *taškyti* ‘to splash (water)’ and their prefixed derivatives (10 items all in all) undergo the following syntactic changes:

- (44) a. *Petras mėtò akmen-is į Jon-ą.*
 Peter throws stone-ACC.PL at John-ACC
 ‘Peter throws stones at John.’
 b. *Petras ir Jonas mėtò-si akmen-imis.*
 Peter and John throw-REC stone-INST.PL
 ‘Peter and John throw stones at each other.’

4.2 Lexical range of reciprocals derived from two-place transitives

As this is the most numerous group of reciprocals discussed in 4.1, the range of their lexical meanings deserves special consideration. In fact, derivation of reciprocals from two-place transitives is limited to a number of lexical groups denoting situations that are likely to be reciprocal pragmatically. Some of the lexical groups include reciprocals with a slight shift of lexical meaning and those used figuratively; they are considered in 4.2.1 as cases of lexicalization, although the borderline between “regular” and lexicalized reciprocals is sometimes rather vague.

4.2.1 *Reciprocals with a standard change of meaning*

In this case the reciprocal marker, i.e. the reflexive-middle marker *-si/-s*, adds the meaning ‘each other’ to the lexical meaning of the underlying verb without modifying it in any other way (therefore the latter verb is not given below). There are 8 main groups. The lists contain practically all unprefixed and those prefixed reciprocals which do not occur without a prefix in the given meaning.

1. Reciprocals with the typical meanings ‘to beat each other’, ‘to fight’. They denote physical aggressive actions. This group contains about 90 items (including those listed in (45) and their prefixed (intra-class) derivatives, like *mušti-s* ‘to fight’ → *pa-si-mušti* ‘to fight for a while’, *su-si-mušti* ‘to start/have a fight’).

In fact, practically all transitive verbs with the meaning ‘to beat’ yield reciprocals on condition they are durative or iterative. The only exception found so far is the transitive verb *perti* ‘to beat/thrash/ flog’, probably due to the fact that it yields a reflexive proper, namely *perti-s* ‘to beat oneself (with a bundle of twigs in a bath house)’. Reciprocal actions tend to be repeated acts, therefore they do not derive from semelfactive verbs of beating, such as *smogti* ‘to deliver a blow’, *spirti* ‘to give a kick’, *stumti* ‘to push/give a push’, *žnybti* ‘to pinch/give a pinch’, etc., while their iterative derivatives do yield reciprocals.

The reciprocals below are grouped according to proximity of their lexical meanings:

- | | | |
|---------|-----------------------|---|
| (45) a. | <i>mušti-s</i> | ‘to beat each other/fight’ |
| | <i>lupti-s</i> | (same meaning) |
| | <i>kulti-s</i> | (same meaning) |
| | <i>kutuoti-s</i> | (same meaning; usu. about cocks, etc.) |
| | <i>kapoti-s</i> | (same meaning; often about birds) |
| | <i>plunkti-s</i> | fig. ‘to fight/beat each other’ |
| | <i>plunksnuoti-s</i> | ‘to fight’ (about cocks) |
| | <i>engti-s</i> | ‘to thrash each other/scuffle’ |
| | <i>ap-si-skaldyti</i> | ‘to have a fight/hit each other’ |
| | <i>smugiuoti-s</i> | ‘to hit each other/exchange blows’ |
| b. | <i>daužyti-s</i> | ‘to beat/thrash each other’ (with sticks, etc.) |
| | <i>pliekti-s</i> | ‘to beat/flog/thrash each other’ (with whips, etc.) |
| | <i>paivyti-s</i> | ‘to flog/thrash each other’ (with whips, etc.) |
| | <i>talžyti-s</i> | ‘to lash/flog/whip each other’ |
| | <i>kirsti-s</i> | ‘to hit each other/fight’ (with swords, etc.) |
| | <i>smaigstyti-s</i> | ‘to fight’ (with spears) |

c.	<i>kauti-s</i>	‘to fight/struggle’
	<i>grumti-s</i>	(same meaning)
d.	<i>rungti-s</i>	‘to wrestle/contend’
	<i>galuoti-s</i>	‘to wrestle’
	<i>maigyti-s</i>	‘to grapple with each other’
	<i>minkyti-s</i>	(same meaning)
	<i>niurkyti-s</i>	(same meaning)
	<i>kardyti-s</i>	(same meaning)
	<i>boksuoti-s</i>	‘to box/wrestle with fists’
e.	<i>grūsti-s</i>	‘to push/jostle one another’
	<i>stumdyti-s</i>	‘to push each other’
	<i>alkūniuoti-s</i>	‘to push each other with elbows’
	<i>badyti-s</i>	‘to butt each other’
	<i>baksnoti-s</i>	‘to punch/poke each other (usu. with fists)’
	<i>bakinti-s</i>	(same meaning)
	<i>baksėti-s</i>	(same meaning)
	<i>basčioti-s</i>	(same meaning)
	<i>gnaibyti-s</i>	‘to pinch each other’
	<i>kumščioti-s</i>	‘to punch/strike each other with fists’
	<i>nykščioti-s</i>	‘to jab each other with thumbs’
	<i>niukinti-s</i>	‘to punch each other’
	<i>spardyti-s</i>	‘to kick each other’
	<i>žnaibyti-s</i>	‘to pinch each other’
f.	<i>ausuoti-s</i>	‘to hit each other on the ear’
	<i>snukiuoti-s</i>	‘to hit/beat each other on the face.’

2. Reciprocals with typical meanings ‘to abuse each other’, ‘to quarrel’. They denote aggressive verbal behaviour. This group contains at least 55 verbs (including those listed in (46) and their affixed derivatives). Subgroup (46b) are prefixed perfective verbs with a reciprocal meaning which have no unprefixed counterparts, or the latter are not used reciprocally.

(46) a.	<i>barti-s</i>	‘to abuse each other/quarrel’
	<i>plūsti-s</i>	‘to abuse/curse each other’
	<i>koneveikti-s</i>	‘to scold/abuse each other’
	<i>keikti-s</i>	‘to curse each other’
	<i>rieti-s</i>	‘to bicker/scold each other’
	<i>pravardžiuoti-s</i>	‘to nickname each other’
	<i>graužti-s</i>	‘to abuse each other/quarrel’
	<i>vainoti-s</i>	‘to curse/abuse each other’
	<i>žodžiuoti-s</i>	‘to exchange words/abuse each other’
b.	<i>ap-si-skųsti</i>	‘to complain about each other’
	<i>ap-si-šnekėti</i>	‘to slander each other’
	<i>iš-si-bjauroti</i>	‘to abuse/curse at each other’
	<i>iš-si-darkyti</i>	‘to abuse/swear at each other’
	<i>iš-si-dergti</i>	‘to curse/swear at each other’
	<i>iš-si-dirbti</i>	‘to scold/abuse each other’
	<i>iš-si-vadinti</i>	‘to call each other names’

	<i>iš-si-kvailinti</i>	‘to call each other a fool’
c.	<i>erzinti-s</i>	‘to tease/annoy each other’
	<i>kirkinti-s</i>	‘to tease each other’
	<i>cyptinti-s</i>	‘to make each other squeak/scream’
	<i>rėkinti-s/rėkdyti-s/rikdyti-s</i>	‘to make each other cry’
	<i>siundyti-s</i>	‘to make each other cry, egg each other on.’

3. Reciprocals with the general meaning ‘to caress/hug each other’. They denote manifestations of love and friendly feelings (15 items including intra-class derivatives).

(47)	<i>bučiuoti-s</i>	‘to kiss each other’
	<i>mylėti-s</i>	‘to love/make love to each other’
	<i>myluoti-s</i>	‘to caress each other’
	<i>malonėti-s</i>	‘to caress/hug each other’
	<i>glamonėti-s</i>	‘to hug/caress each other’
	<i>glėbiuoti-s</i>	‘to hug/caress each other’
	<i>ap-si-imti</i>	‘to hug/embrace each other’
	<i>ap-si-kabinti</i>	‘to hug/embrace each other’
	<i>pa-si-raginti</i>	‘to urge each other on.’

4. Reciprocals with the typical meanings ‘to greet each other’, ‘to meet’, ‘to invite each other’ and the like (15 items all in all). They denote social contacts, i.e. meeting and greeting each other, being acquainted, parting and taking leave. The second reciprocal in the list under (48a) is a prefixed derivative of the first verb of the list, included here because of antonymous change of lexical meaning.

(48)	a.	<i>sveikinti-s</i>	‘to greet each other’
		<i>at-si-sveikinti</i>	‘to say goodbye to each other’
		<i>labinti-s</i>	‘to say hello to each other’
		<i>matyti-s</i>	‘to see/meet (each other)’
		<i>su-si-tikti</i>	‘to meet’
		<i>pa-si-žinti</i>	‘to keep in touch with each other’
		<i>pa-si-žinoti</i>	‘to be acquainted with each other’
		<i>pa-si-mesti</i>	‘to part/leave each other’
	b.	<i>prašyti-s</i>	‘to invite each other (to one’s place)’
		<i>vadinėti-s</i>	(same meaning)
		<i>už-si-prašyti</i>	‘to invite each other in advance.’

Compare:

- (49) a. *Kad ir giminės, bet nebe-si-praš-o.*
 although and relatives but not-REC-ask-3.PRES
 ‘Although they are relatives, they do not visit (lit. ‘invite’) each other.’
- b. *Jie vadinėja-si savo tarp-e.*
 they invite-REC their midst-LOC
 ‘They invite each other to pay visits *mutually*.’

5. Reciprocals with the general meaning ‘to stand in for each other’ (in situations of doing something alternately, by turns) (5 verbs), which are typically prefixed, their unpre-

8. Reciprocals denoting contiguous position or intersection of typically inanimate objects (13 derivatives all in all). They occur in constructions like (56):

- (56) a. *Vien-as keli-as kerta kit-q.*
 one-NOM.SG.M road-NOM.M cut.3.PRES other-ACC.M.SG
 ‘One road intersects another.’
- b. *Čia keliai kerta-si.*
 here road.NOM.PL cut.3.PRES-REC
 ‘The roads intersect here.’
- c. *Vienas kelias kerta-si su kit-u.*
 one road.NOM.M.SG cut.3.PRES-REC with other-INST.M.SG
 lit. ‘One road intersects with another.’
- (57) *siekti-s* ‘to touch/reach each other’
riboti-s ‘to adjoin each other/be contiguous’
siekti-s ‘to touch (each other)’
liesti-s ‘to be contiguous/touch’
kirsti-s ‘to cross/intersect (about roads, etc.)’
skersuoti-s (same meaning).

In fact, the underlying verbs are lexical reciprocals (because if *A kerta B* ‘A intersects B’ then *B kerta A* ‘B intersects A’), but the derivatives are entered here because their use in the simple as well as in the discontinuous comitative construction (cf. (56b) and (56c) respectively) requires *-si/-s* on the verb, which distinguishes them from other two-place lexical reciprocals and makes them similar to reflexive reciprocals.

4.2.2 Lexicalized reciprocals

Two cases can be distinguished here:

- lexicalization occurs in the process of derivation resulting in a reciprocal verb;
- a reciprocal verb is further lexicalized due to figurative use.

4.2.2.1 *Lexicalization in the process of reciprocal derivation.* This is characteristic of reciprocals denoting fighting and verbal quarrelling (groups 1 and 2 in 4.2.1). In this case reciprocal derivation is combined with a shift in the lexical meaning of the root verb and/or figurative use. The following are regarded here as lexicalized reciprocals. It should be noted that the two subgroups partly overlap, due to proximity of their lexical meaning. Thus, the reciprocals *kapoti-s*, *kirsti-s*, *ravėti-s* and *regzti-s* (included in the second subgroup below) may denote both physical and verbal fighting.

1. Reciprocals with the resultant meanings ‘to beat each other’, ‘to fight’ (12 items):

- (58) *pešti* ‘to pluck/pull’ → *pešti-s* ‘to fight/scuffle’
rauti ‘to pull with roots’, coll. ‘to do sth (run, drink, etc.) with all one’s might’ → *rauti-s* coll. ‘to fight/scuffle’
tąsyti ‘to pull/tug’ → *tąsyti-s* ‘to fight/scuffle’
imti ‘to grasp/clutch’ → *imti-s* ‘to wrestle/grapple’
minti ‘to knead/work up’ → *minti-s* ‘to wrestle/grapple’
risti ‘to push, to roll’ → *risti-s* ‘to wrestle/grapple.’

2. Reciprocals with the meanings ‘to abuse each other’, ‘to quarrel’ (20 items):

(59) <i>pjauti</i> ‘to cut’	→ <i>pjauti-s</i> ‘to squabble/bicker’
<i>kirsti</i> ‘to sting/peck’	→ <i>kirsti-s</i> fig. ‘to abuse each other’
<i>ėsti</i> ‘to eat/guzzle’	→ <i>ėsti-s</i> ‘to quarrel/bicker’
<i>draskyti</i> ‘to tear/scratch’	→ <i>draskyti-s</i> fig. ‘to quarrel/bicker’
<i>kapoti</i> ‘to hack/peck’	→ <i>kapoti-s</i> ‘to quarrel/abuse each other’
<i>ardyti</i> ‘to rip up’	→ <i>ardyti-s</i> ‘to squabble/quarrel’
<i>ravėti</i> ‘to weed’	→ <i>ravėti-s</i> coll. ‘to quarrel/abuse each other’
<i>regzti</i> fig. ‘to talk nonsense’	→ <i>regzti-s</i> ‘to quarrel/squabble’
<i>smaugti</i> ‘to strangle’	→ <i>smaugti-s</i> ‘be angry with each other/bicker’

4.2.2.2 *Lexicalization of reciprocals.* The following reciprocals undergo further lexicalization through expansion when used figuratively with an inanimate object in the instrumental case with the preposition *su* ‘with’: the latter constructions may be tentatively termed *discontinuous tantum*. Compare:

(60) <i>grumti-s</i> ‘to fight’	→ <i>grumti-s su gyvenimu</i> ‘to struggle with life’
<i>galuoti-s</i> ‘to wrestle’	→ <i>galuoti-s su liga</i> ‘to struggle with an illness’
<i>su-si-durti</i> ‘to collide’	→ <i>su-si-durti su sunkumais</i> ‘to meet with difficulties’
<i>su-si-pažinti</i> ‘to get acquainted’	→ <i>su-si-pažinti su literatūra</i> ‘to get acquainted with literature.’

4.3 Overlapping of reflexive reciprocals with other semantic types of reflexive verbs

The overwhelming majority of reflexive reciprocals have no homonyms. Overlapping with other semantic types of reflexives is rather insignificant and mostly individual.

Characteristically, *reciprocals do not overlap with semantic reflexives*: although both types are derived from transitives with two animate (typically human) actants, each derives from a distinct set of lexical groups.

The only systemic case is the overlapping with “absolute” reflexives. The following reflexive is (a) reciprocal when used in a comitative construction, as in (61a), (b) “absolute” when used with a singular subject, as in (61b), and (c) ambiguous when used with a plural subject, as in (61c), unless there is contextual indication of one or the other meaning:

(61) a.	<i>Vaikas muša-si su draugu.</i>	‘The boy fights with his friend.’	(reciprocal)
b.	<i>Vaikas muša-si.</i>	‘The boy likes to fight/is pugnacious.’	(“absolute”)
c.	<i>Vaikai muša-si.</i>	i. ‘The boys are fighting <i>with each other</i> .’	
		ii. ‘Boys like to fight/ <i>are pugnacious</i> .’	

Here belong:

(62) a.	<i>mušti-s</i>	i. ‘to fight’	ii. ‘to be pugnacious’
	<i>badyti-s</i>	i. ‘to butt each other’	ii. ‘to butt/be in the habit of butting’
	<i>spardyti-s</i>	i. ‘to kick each other’	ii. ‘to kick/be in the habit of kicking’
	<i>kandžioti-s</i>	i. ‘to bite each other’	ii. ‘to bite’
	<i>stumdyti-s</i>	i. ‘to push each other’	ii. ‘to push/be in the habit of pushing’
	<i>alkūniuoti-s</i>	i. ‘to elbow each other’	ii. ‘to elbow (other people)’

	<i>gnaibyti-s</i>	i. 'to pinch each other'	ii. 'to pinch (other people)'
	<i>žnaibyti-s</i>	i. 'to pinch each other'	ii. 'to pinch (other people)'
b.	<i>barti-s</i>	i. 'to abuse each other'	ii. 'to swear/curse'
	<i>keikti-s</i>	i. 'to abuse each other'	ii. 'to curse/use bad language'
	<i>plūsti-s</i>	i. 'to abuse each other'	ii. 'to curse/use bad language'
c.	<i>ardyti-s</i>	i. 'to squabble/quarrel'	ii. 'to bawl/exert oneself'
	<i>draskyti-s</i>	i. 'to quarrel/bicker'	ii. 'to rave/rage.'

In most other cases homonymy is due to the polysemy of the underlying verb, the reciprocal and the other reflexive verb(s) being derived from its different meanings; cf.:

(63)	a.	<i>graužti</i> 'to torment'	→	<i>graužti-s</i> 'to grieve'	(anticausative)
		<i>graužti</i> coll. 'to scold/abuse'	→	<i>graužti-s</i> 'to abuse each other'	(reciprocal)
	b.	<i>lupti</i> 'to skin/peel'	→	<i>lupti-s</i> 'to peel/come off'	(anticausative)
		<i>lupti</i> 'to beat/flog'	→	<i>lupti-s</i> 'to beat each other'	(reciprocal)

5. Reciprocals with the prefix *su-* and complex *su-si-*

5.1 Introductory

The prefix *su-* which contributes to derivation of reciprocals is highly polysemous. It may be useful to list some of its principal meanings. It may denote:

- (a) joining or placing two or more things together (see 5.2.1);
- (b) moving from different directions to one place (see 5.2.3);
- (c) the inchoative meaning (e.g. *sirgti* 'to be ill' → *su-sirgti* 'to fall ill'; see also 5.3.2);
- (d) a momentary action (cf. *cypti* 'to squeak' → *su-cypti* 'to give a squeak');
- (e) a completed action (cf. *valgyti* 'to eat' → *su-valgyti* 'to eat up'); etc.

The first two meanings can yield reciprocals from verbs of the lexical types discussed below.

The Latvian counterpart of *su-* is the prefix *sa-*.

The data are considered here along a continuum from reciprocals formed by the prefix *su-* alone (see 5.2.1) to reciprocals formed by means of the complex *su-si-* (see 5.3). The cases considered in 5.2.2 (where *su-* is attached to *-si-* verbs) and 5.2.3 (where the prefix *su-* combines with an optional *-si-*) can be regarded as intermediate. These derivational types account for 20% (95 items) in the Lithuanian list of reciprocals. Their Latvian counterparts derived by means of the complex *sa-...-s* or the prefix *sa-* alone comprise 21% (about 55 verbs).

The most generalized meaning of reciprocals may be said to be spatial contact and convergence of entities (often connected with the diminishing of the space taken up by these entities; this spatial contiguity or proximity takes form of "ideal" proximity in verbs that denote non-physical actions).

5.2 Reciprocals with the prefix *su-*5.2.1 *The prefix su- without -si-. Object-oriented reciprocals with the general meaning 'to bring/place sth together'*

The prefix *su-* is attached to three-place transitive verbs of moving objects to render the meaning of putting a number of objects together with each other in one place, gathering or moving them to one place, or joining them together; the object-oriented derivatives are transitive analogues of intransitives under (69); cf.:

- (64) a. *Ona dėjo knyg-q* (ACC.SG) *ant stalo.*
'Ann put the book on the table.'
b. *Ona su-dėjo knyg-as* (ACC.PL) / **knyg-q* (ACC.SG) *ant stalo.*
'Ann put the books/*the book together on the table.'

The following list of 20 reciprocals is far from exhaustive:

- | | | |
|---------|--|---|
| (65) a. | <i>dėti</i> 'to put/place sth' | → <i>su-dėti</i> 'to put/place sth together' |
| | <i>artinti</i> 'to bring nearer' | → <i>su-artinti</i> 'to bring/draw together' |
| | <i>krauti</i> 'to load/ put/pile' | → <i>su-krauti</i> 'to load/put/pile together' |
| | <i>ginti</i> 'to drive (cattle)' | → <i>su-ginti</i> 'to drive together (into one place)' |
| | <i>kloti</i> 'to put/lay' | → <i>su-kloti</i> 'to put/lay together' |
| | <i>mesti</i> 'to throw' | → <i>su-mesti</i> 'to throw together into a heap' |
| | <i>nešti</i> 'to carry' | → <i>su-nešti</i> 'to bring (in) to one place' |
| | <i>sodinti</i> 'to make sit down' | → <i>su-sodinti</i> 'to make sit down all the persons' |
| | <i>statyti</i> 'make stand (up)/place' | → <i>su-statyti</i> 'to put/place together' |
| | <i>varyti</i> 'to drive (e.g. cattle)' | → <i>su-varyti</i> 'to drive together to one place' |
| | <i>vesti</i> 'to lead' | → <i>su-vesti</i> 'take/bring/lead (many) to one place' |
| | <i>vežti</i> 'to transport/cart' | → <i>su-vežti</i> 'to bring (many/much) to one place' |
| b. | <i>durti</i> 'to put/add on' | → <i>su-durti</i> 'to put together/join/connect' |
| | <i>nerti</i> 'to knit/weave' | → <i>su-nerti</i> 'to knit together/join/interlock' |
| | <i>jungti</i> 'to join' | → <i>su-jungti</i> 'to connect/link (up)/couple' |
| | <i>kalti</i> 'to hammer' | → <i>su-kalti</i> 'to knock/hammer together' |
| | <i>pinti</i> 'to weave/twine/tangle' | → <i>su-pinti</i> 'to intertwine/entangle' |
| | <i>siūti</i> 'to sew' | → <i>su-siūti</i> 'to sew sth and sth together' |
| | <i>kabinti</i> 'to hook/fasten' | → <i>su-kabinti</i> 'to hook together/couple' |
| | <i>rišti</i> 'to tie/bind' | → <i>su-rišti</i> 'to tie/bind together', etc. |

5.2.2 *The prefix su- added to -si- verbs. Subject-oriented reciprocals with the meaning 'to crowd/huddle together'*

In this case the prefix *su-* is added to *-si-* verbs (a) of motion or (b) of joint action, with the same resultant meaning as in (69), the reflexive-middle marker being obligatory in the derivative. These *-si-* verbs are autocausatives which are in their turn derived from transitives denoting concrete physical actions involving motion or change of position of the object (the verb *brauti-s* in (67a) is an exception in that is reflexive *tantum*, but in meaning it meets the description of this group). A typical derivational chain:

- (66) *glausti* [kə priə ko] 'to clasp/press [sth to sth]'
 → *glausti-s* [priə ko] 'to press oneself [to sth/sb]'
 → *su-si-glausti* 'to cuddle up to each other/together.'

The following 9 verbs are meant to give an idea of the range of this type (the first transitive verb in the derivational chain is omitted):

- (67) a. *brauti-s* 'to squeeze/force one's way through' → *su-si-brauti* 'to force one's way into one place (of many), huddle together'
brukti-s 'to force one's way through' → *su-si-brukti* 'to huddle up/together'
grūsti-s 'to force one's way through' → *su-si-grūsti* 'to crowd into a place, to huddle together'
mesti-s 'to rush, to throw oneself' → *su-si-mesti* 'to huddle together'
sprausti-s 'to squeeze oneself (in(to))' → *su-si-sprausti* 'to crowd together'
- b. *burti-s* 'to unite/rally' → *su-si-burti* 'unite/rally, crowd/gather'
glausti-s 'to press oneself (to)' → *su-si-glausti* 'cuddle up to each other'
spausti-s 'press/squeeze oneself (into)' → *su-si-spausti* 'to squeeze together'
spiesti-s 'to swarm/crowd' → *su-si-spiesti* 'swarm/flock together', etc.

5.2.3 The prefix *su-* with optional *-si-*. Subject-oriented reciprocals with the meaning 'to come together'

They are derived exclusively from intransitive verbs of motion or change of position and they denote convergent action of a multiple agent (all agents or many gathering to one point by coming from different directions); the reflexive-middle marker is attached to prefixed verbs for emphasis or to render the sense 'for their own purposes'. Compare:

- (68) *Su[-si]-važiavo visi giminės.* 'All the relatives gathered from far and wide.'

There are at least 10 derivatives of this type in my verb-list.

- (69) *bėgti* 'to run' → *su-[si-]bėgti* 'come running together/gather running'
eiti 'to go, to walk' → *su-[si-]eiti* 'to come together', 'to meet/converge'
lėkti 'to fly', 'to run' → *su-[si-]lėkti* 'to come flying/running together'
skristi 'to fly' → *su-[si-]skristi* 'to come flying together'
lipti 'to climb (up, into)' → *su-[si-]lipti* 'to climb (up, into) together'
slinkti 'to sneak/creep' → *su-[si-]slinkti* 'to gather sneaking'
gulti 'to lie down' → *su-[si-]gulti* 'to lie down (of all the persons)'
sėsti[-s] 'to sit down' → *su-[si-]sėsti* 'to sit down (of all the persons)'
šokti 'to jump/leap' → *su-[si-]šokti* 'to jump/leap into one place'
važiuoti 'to go/drive/ride' → *su-[si-]važiuoti* 'to come together, to gather.'

5.3 Reciprocals with the complex *su-si-*. Subject-oriented reciprocals only

This complex, comprised of the prefix *su-* and reflexive-middle marker, sometimes adds either a reciprocal or contiguous meaning to the underlying verb, depending on the lexical meaning of the latter and that of the prefix. There are about 30 derivatives with this complex that may be regarded as reciprocals.

This complex may serve as a single derivational element in such cases as the following where intermediate derivatives with the reflexive marker alone or with the prefix are non-existent:

- (70) a. *žvelgti* 'to glance'
 b. **su-žvelgti*
 c. **žvelgti-s*
 d. *su-si-žvelgti* 'to exchange glances.'

Some verbs with this complex may have correspondences of the (70b) or (70c) type, and they may be related or not related to them semantically, e.g.:

- (71) a. *šnairuoti* 'to look at sb sideways'
 b. *su-šnairuoti* 'to cast a look sideways at sb'
 c. ?*šnairuoti-s*
 d. *su-si-šnairuoti* 'to exchange glances sideways.'

Two semantic subtypes can be distinguished here, without a clear-cut borderline between them, since both meanings can be combined in one verb (in such cases a verb is entered twice according to each meaning in the respective groups); e.g.:

- (72) a. *kalbėti* 'to talk' (→ *kalbėti-s* 'to talk with each other')
 b. *su-si-kalbėti* i. 'to understand each other' (see 5.3.1)
 ii. 'to come to an understanding/agreement' (see 5.3.2).

As we see, this type of derivation may involve a degree of predictable lexicalization (cf. Russian *govorit* 'to talk' → *s-govorit'-sja* 'to come to an agreement').

Further below, a number of small groups of verbs are included that formally belong to the previous cases but in meaning they are closer to those under discussion.

5.3.1 Reciprocals with the meaning 'to communicate with each other'

Most of the derivatives acquire the meaning of communication, usually in the manner specified by the underlying verb which may be a one- or two-place intransitive or, rarely, a two- or three-place transitive. In the latter case a direct object is omitted; cf.:

- (73) a. *Petr-as rašo [laišk-us] Jon-ui.*
 P.-NOM writes letter-ACC.PL J.-DAT
 'Peter writes [letters] to John.'
 b. *Jon-as rašo [laišk-us] Petr-ui.*
 J.-NOM writes letter-ACC.PL P.-DAT
 'John writes [letters] to Peter.'
 c. *Petr-as ir Jon-as su-si-rašo [*laiškus].*
 P.-NOM and J.-NOM write letter-ACC-PL
 'Peter and John correspond with each other.'

A more common predicate used instead of (73c) is same stem with the iterative suffix *-inè-*:

- d. *Petr-as ir Jon-as su-si-raš-inè-ja.*
 (same translation).

Here is a list of this type of reciprocals (13 items):

(74) <i>žvelgti</i> ‘to glance’	→	<i>su-si-žvelgti</i> ‘to exchange glances’
<i>rašinėti</i> ‘to write’	→	<i>su-si-rašinėti</i> ‘to correspond/exchange letters’
<i>šnekėti</i> ‘to talk’	→	<i>su-si-šnekėti</i> ‘to understand each other’
<i>kalbėti</i> ‘to talk’	→	<i>su-si-kalbėti</i> ‘to understand each other’
<i>žinoti</i> ‘to know’	→	<i>su-si-žinoti</i> ‘communicate/get in touch with each other’
<i>šaukti</i> ‘to shout’	→	<i>su-si-šaukti</i> ‘to communicate by shouting to each other’
<i>ūkauti</i> ‘to halloo’	→	<i>su-si-ūkauti</i> ‘to communicate by hallooming’
<i>švilpti</i> ‘to whistle’	→	<i>su-si-švilpti</i> ‘communicate by whistling to each other’
<i>rodyti</i> ‘to make signs’	→	<i>su-si-rodyti</i> ‘to communicate by signs’
<i>skambinti</i> ‘to phone’	→	<i>su-si-skambinti</i> ‘to communicate by phone’
<i>siekti</i> ‘to try to reach’	→	<i>su-si-siekti</i> ‘to communicate (with each other)’
<i>šnairuoti</i> ‘to look side-ways’	→	<i>su-si-šnairuoti</i> ‘to exchange angry glances’
<i>merkti</i> ‘to wink’	→	<i>su-si-merkti</i> ‘to communicate by winking.’

The following reciprocal is also of this formal type, but it differs from the verbs under (74) semantically (cf. the analogous place of the Russian derivative *pere-strelivat’-sja* ‘to exchange fire’ (← *streljat’* ‘to shoot’) among reciprocals denoting communication of the type *pere-gljadjvat’-sja* ‘to exchange glances’; see Knjazev, Ch. 15):

(75) <i>šaudyti</i> ‘to shoot/fire’	→	<i>su-si-šaudyti</i> ‘to exchange fire/shots.’
-------------------------------------	---	--

5.3.2 *Reciprocals with the inchoative meaning*

The derivatives denote coming to an understanding or agreement, usually in the manner described by the underlying verb, this meaning being in some cases contiguous to that of the group discussed in 5.3.1. This group is rather heterogeneous lexically, and some of the verbs are lexicalized. Thus reciprocals under (77) denote concerted actions but they are given here because they are close to (76) with regard to the inchoative meaning.

(76) <i>kalbėti</i> ‘to talk’ (→ <i>kalbėti-s</i> ‘to talk with each other’)	→	<i>su-si-kalbėti</i> ‘to come to an understanding’
<i>šnekėti</i> ‘to talk’ (→ <i>šnekėti-s</i> ‘to talk to each other’)	→	<i>su-si-šnekėti</i> ‘to come to an understanding’
<i>šnibždėti</i> ‘to whisper’ (→ <i>šnibždėti-s</i> ‘to whisper to each other’)	→	<i>su-si-šnibždėti</i> ‘to come to an understanding by whispering to each other’
<i>ku(g)ždėti</i> ‘to whisper’ (→ <i>ku(g)ždėti-s</i> ‘to whisper to each other’)	→	<i>su-si-ku(g)ždėti</i> (same as in (c))
<i>čiulbėti</i> fig. ‘to bill and coo’	→	<i>su-si-čiulbėti</i> ‘to come to an understanding’
<i>burkuoti</i> ‘to bill and coo’	→	<i>su-si-burkuoti</i> fam. ‘to fall in love with each other’
<i>uostyti</i> ‘to sniff at, smell’	→	<i>su-si-uostyti</i> coll. fig. ‘to become friends.’

- | | |
|--|---|
| (77) <i>žaisti</i> ‘to play’ | → <i>su-si-žaisti</i> ‘to start playing in harmony’ (of a team) |
| <i>dainuoti</i> ‘to sing’ | → <i>su-si-dainuoti</i> ‘to start singing in unison’ |
| <i>giedoti</i> ‘to sing/chant’ | → <i>su-si-giedoti</i> ‘to begin to sing/chant in unison’ |
| <i>groti</i> ‘to play (musical instruments)’ | → <i>su-si-groti</i> ‘to start playing in unison.’ |

The following 4 verbs with the complex *su-si-* are related to lexical reciprocals with an optional reflexive marker (which thus becomes obligatory):

- | | |
|--|--|
| (78) <i>bendrauti[-s]</i> ‘to be friends’ | → <i>su-si-bendrauti</i> ‘to become friends’ |
| <i>broliauti[-s]</i> ‘to be like brothers’ | → <i>su-si-broliauti</i> ‘to become like brothers’ |
| <i>bičiuliauti[-s]</i> ‘to be close friends’ | → <i>su-si-bičiuliauti</i> ‘to become close friends’ |
| <i>draugauti[-s]</i> ‘to be friends’ | → <i>su-si-draugauti</i> ‘to become friends’ |

6. Lexical reciprocals

This term is used here to refer to verbs with an inherent reciprocal meaning not marked by any derivational means, i.e. to semantically reciprocal verbs without the marker *-si-/-s* (cf. *kovoti* ‘to struggle/fight (with each other)’, *sąveikauti* ‘to interact, to influence each other’) and verbs with the reflexive-middle marker which does not mark the reciprocal meaning (cf. *giminiuoti-s* ‘to be relatives (with each other)’). With regard to their lexical meanings, they only slightly overlap with *-si-* reciprocals denoting fighting.

Formally, lexical reciprocals can be simple (underived) and derived, in which case they may be denominal or deverbal derivatives. Contrary to reciprocals derived by means of the marker *-si-/-s*, they are of two syntactic types: simple lexical reciprocals happen to be mostly object-oriented (see 6.1), while derived verbs happen to be mostly subject-oriented (see 6.2).

The list of 480 reciprocals registered in Kruopas (1972) contains about 27% lexical reciprocals (130 verbs, including 58 items listed below and about 70 affixed intra-class derivatives); for comparison, the Latvian list of 260 reciprocals contains 37% (97) lexical reciprocals.

6.1 Object-oriented lexical reciprocals

They are causative transitive verbs taking an object that names the reciprocal arguments, i.e. two or more (usually) identical or similar entities in reciprocal relation. The reciprocal arguments can be expressed (a) homogeneously by a plural nominal, as in (79a), or (b) heterogeneously, either by a conjoined noun group, both components in the accusative case, as in (79b), or (c) by a comitative group comprised of a nominal in the accusative and the second nominal in the instrumental case with the preposition *su* ‘with’, as in (79c–d) (the prefix *su-* in the verb here and in (83) has perfectivizing force only):

- (79) a. *Kunigas sutuokė juos.* 'The priest married them.'
 b. *Kunigas sutuokė Petrą ir Oną.* 'The priest married Peter and Ann.'
 c. *Kunigas sutuokė Petrą su Ona.* lit. 'The priest married Peter with Ann.'
 d. *Kunigas sutuokė Oną su Petru.* lit. 'The priest married Ann to Peter.'

Most of these verbs denote connecting or joining together, sometimes disconnecting two or more entities (cf. 5.2.1). Here belong the underived lexical reciprocals (13 unprefixed items) under (80) and two denominal derivatives under (81):

- (80) *jungti* 'to join/connect (two or more entities)'
derinti 'to match', 'to co-ordinate'
burti 'to unite/rally'
kaityti 'to change/alternate'
maišyti 'to mix (sth with sth)'
rišti 'to bind/connect'
sieti 'to link/bind'
skirti 'to separate/distinguish', 'to divorce'
spiesti 'to concentrate/assemble'
tuokti 'to marry (sb to sb)'
taikinti 'to reconcile'
telkti 'to assemble/rally'
piršti 'to propose (sb and/to sb).'
- (81) *kryži-us* 'a cross' → *kryži-uo-ti* 'to cross (e.g. one's arms)'
por-a 'a pair' → *por-uo-ti* 'to pair sb off, to couple.'

6.2 Subject-oriented lexical reciprocals: "Canonical" type only

These are verbs that can be used in simple and discontinuous constructions; cf. (82b–c), (83c–d) and (82a), (83a–b) respectively:

- (82) a. *Petras rungtyniauja su Jon-u (INST).* 'Peter competes with John.'
 b. *Petras ir Jonas rungtyniauja.* 'Peter and John compete with each other.'
 c. *Petras su Jon-u (INST) rungtyniauja.* lit. 'Peter with John compete with each other.'
- (83) a. *Jon-as su-si-tuokė su On-a (INST).* 'John married Ann.'
 b. *On-a su-si-tuokė su Jon-u (INST).* 'Ann married John.'
 c. *Jon-as ir On-a (NOM) su-si-tuokė.* 'John and Ann got married.'
 d. *Jon-as su On-a (INST) su-si-tuokė.* lit. 'John with Ann got married.'

With only one exception, all subject-oriented lexical reciprocals in my verb-list are derived either from nouns (and one adjective) or from object-oriented lexical reciprocals, the means of derivation being suffixation alone or with the reflexive marker.

1. *Denominal derivatives* (26 items listed below). In this case lexical reciprocals are relatable to nouns which are also lexical reciprocals, viz. names of reciprocal situations (cf. (84)), or names of participants in a reciprocal situation (cf. (85)). Two derivational patterns are employed.

1a. A verbal suffix alone:

- | | | | |
|---------|---|---|---|
| (84) a. | <i>kov-a</i> ‘struggle, a fight’ | → | <i>kov-o-ti</i> ‘to struggle, to fight’ |
| | <i>kar-as</i> ‘war’ | → | <i>kar-i-au-ti</i> ‘to be at war’ |
| | <i>lenktyn-ės</i> ‘races/competition’ | → | <i>lenktyn-i-au-ti</i> ‘to compete’ |
| | <i>rungtyn-ės</i> ‘contest/competition’ | → | <i>rungtyn-i-au-ti</i> ‘to contend, to compete’ |
| | <i>santyk-is</i> ‘relation(ship)’ | → | <i>santyk-i-au-ti</i> ‘to be related/correlate’ |
| | <i>sąveik-a</i> ‘interaction’ | → | <i>sąveik-au-ti</i> ‘to interact, influence each other’ |
| | <i>panaš-us</i> ‘alike/similar’ | → | <i>panaš-au-ti</i> ‘to be alike/similar’ |
| | | → | <i>panaš-ė-ti</i> ‘to become alike/similar.’ |

The following two borrowed pairs can be added to this list:

- | | | | |
|------|---|---|--|
| b. | <i>konkur-encija</i> ‘competition’ | → | <i>konkur-uo-ti</i> ‘to compete, to rival’ |
| | <i>polemik-a</i> ‘polemics, dispute’ | → | <i>polemiz-uo-ti</i> ‘to dispute/hold an argument.’ |
| (85) | <i>bendradarb-is</i> ‘colleague/collaborator’ | → | <i>bendradarb-i-au-ti</i> ‘to be colleagues, collaborate’ |
| | <i>bendrinink-as</i> ‘participant, accomplice’ | → | <i>bendrinink-au-ti</i> ‘to participate, be an accomplice/accomplices’ |
| | <i>sėbr-as</i> coll. pej. ‘accomplice, partner’ | → | <i>sėbr-au-ti</i> ‘to be an accomplice/ accomplices, a partner/partners’ |
| | <i>kaimyn-as</i> ‘neighbour’ | → | <i>kaimyn-au-ti</i> ‘to be neighbours.’ |

1b. A suffix and reflexive-middle marker which is obligatory in (86a–b) and optional in (86c):

- | | | | |
|---------|---------------------------------------|---|--|
| (86) a. | <i>byl-a</i> ‘a (legal) case’ | → | <i>byl-inė-ti-s</i> ‘to litigate, be at law (with)’ |
| | <i>ginč-as</i> ‘dispute/argument’ | → | <i>ginč-y-ti-s</i> ‘to argue/dispute’ |
| | <i>galyn-ės</i> ‘wrestling’ | → | <i>galyn-ė-ti-s</i> ‘to wrestle’ |
| | <i>rungči-os</i> ‘contest, wrestling’ | → | <i>rungči-o-ti-s</i> ‘to compete, wrestle’ |
| | <i>vaid-as</i> ‘quarrel, squabbles’ | → | <i>vaid-y-ti-s</i> ‘to quarrel/squabble’ |
| | | → | <i>vaid-ėlio-ti-s</i> coll. ‘to quarrel/fall out (with)’ |
| | <i>vaizd-as</i> dial. ‘image, sight’ | → | <i>vaizd-au-ti-s</i> dial. ‘to love each other/meet, look at each other’ |
| b. | <i>brol-is</i> ‘brother’ | → | <i>brol-i-uo-ti-s</i> ‘to fraternize, be like brothers’ |
| | <i>gimin-ė</i> ‘kin, relatives’ | → | <i>gimin-i-uo-ti-s</i> ‘to be relatives’ |
| | <i>svain-is</i> ‘brother-in-law’ | → | <i>svaini-uo-ti-s</i> ‘to be relatives by marriage’ |
| | <i>žied-as</i> ‘a ring’ | → | <i>žied-uo-ti-s</i> ‘to exchange rings in betrothal’ |
| c. | <i>bičiul-is</i> ‘friend’ | → | <i>bičiul-i-au-ti[-s]</i> ‘to be friends’ |
| | <i>brol-is</i> ‘brother’ | → | <i>brol-i-au-ti[-s]</i> ‘treat each other like brothers’ |
| | <i>bendr-as</i> ‘friend, accomplice’ | → | <i>bendr-au-ti[-s]</i> ‘to be friends, to associate.’ |

The only underived subject-oriented lexical reciprocal in my verb-list is:

- | | | |
|------|---------------|---------------------------|
| (87) | <i>syjėti</i> | ‘to be linked/connected.’ |
|------|---------------|---------------------------|

2. *Deverbal derivatives* (17 items in the list below). This case is represented by anticausative derivatives from object-oriented causative lexical reciprocals (see 6.1), anti-

causativization being marked by the reflexive-middle marker. As it happens, these derivatives are subject-oriented reciprocals (both participants are named by the subject), but at the same time they belong to the syntactic class of object-oriented reflexive verbs with underlying object promotion to subject position (see 3.1). Here belong:

(88) <i>jungti</i> ‘to join, connect’	→	<i>jungti-s</i> ‘to unite, get united/connected’
<i>derinti</i> ‘to match, co-ordinate’	→	<i>derinti-s</i> ‘to be matched/ co-ordinated’
<i>burti</i> ‘to unite, rally’	→	<i>burti-s</i> ‘to gather together/rally’
<i>maišyti</i> ‘to mix’	→	<i>maišyti-s</i> ‘to get mixed up’
<i>kaityti</i> ‘to change, alternate’	→	<i>kaityti-s</i> ‘to alternate (with each other)’
<i>kaitalioti</i> ‘to alternate’	→	<i>kaitalioti-s</i> ‘to take turns/alternate’
<i>kryžiuoti</i> ‘to cross’	→	<i>kryžiuoti-s</i> ‘to intersect/cut across each other’
<i>poruoti</i> ‘to pair off/couple’	→	<i>poruoti-s</i> ‘to mate/copulate’
<i>rišti</i> ‘to tie/bind, connect’	→	<i>rišti-s</i> ‘to be bound/connected’
<i>sieti</i> ‘to link, bind’	→	<i>sieti-s</i> ‘to be linked/bound, touch each other’
<i>skirti</i> ‘to separate’, ‘to divorce’	→	<i>skirti-s</i> ‘to be distinct’, ‘to get divorced’
<i>taikinti</i> ‘to reconcile’	→	<i>taikinti-s</i> ‘to be/become reconciled’
<i>tuokti</i> ‘to marry (sb to sb)’	→	<i>tuokti-s</i> ‘to get married/marry each other’
<i>teisti</i> ‘to try (in court)’	→	<i>teisti-s</i> ‘to be at law (with sb)’
<i>spiesti</i> ‘to bring together’	→	<i>spiesti-s</i> ‘to crowd/throng (together)’
<i>telkti</i> ‘to assemble, rally’	→	<i>telkti-s</i> ‘to come/flock together.’

7. Expression of reciprocal arguments

In Lithuanian, reciprocal arguments can be expressed by the subject alone in the simple and by subject and comitative object in the discontinuous subject-oriented construction. In object-oriented constructions the reciprocal arguments are named by an object (see 6.1 above).

Practically all subject-oriented reciprocals, both reflexively marked and lexical and those with the complex *su-si-*, can be used without restrictions in the discontinuous as well as in the simple construction.

7.1 The simple reciprocal construction

The subject names both reciprocal arguments and it can be expressed in the same ways as in any construction:

- homogeneously, by the plural number of a noun or pronoun, cf. (3), (49), etc.;
- heterogeneously, in which case it is either (a) a coordinated nominative noun group, as in (1b), etc.; or (b) a comitative noun group comprised of a noun in the nominative case and a noun in the instrumental case with the preposition *su* ‘with’, as in (35c), etc.

7.2 The discontinuous reciprocal construction. The status of a preposed comitative noun phrase

Commonly, in discontinuous constructions one of the reciprocal arguments is expressed by the subject and the other by a comitative object (a noun or its substitute in the instrumental case with the preposition *su* ‘with’), the only exception being discontinuous constructions with a direct object of type (56a) (see 4.2.1). A comitative object typically follows the predicate:

- (89) a. *Petr-as stumdo-si su Jon-u.*
 P.-NOM push.3.PRES-REC with J.-INST
 lit. ‘Peter is pushing [each other] with John.’
 b. *Jon-as stumdo-si su Petr-u.*
 lit. ‘John is pushing [each other] with Peter.’

If the noun phrase with *su* is preposed to the predicate, it is usually the second part of a comitative subject group, the sentence being interpreted as a simple reciprocal construction. But it is not always as straightforward as that. If the first argument is a 1st or 2nd person singular pronoun and the verb agrees with it in number, as in (90a), the construction has to be interpreted as discontinuous with a preposed comitative object:

- (90) a. *Aš su Petr-u stumd-au-si.*
 I with Peter-INST push-1SG.PRES-REC
 lit. ‘I with Peter push [each other].’

In the case of a comitative subject group the predicate has to agree in number with the plural subject and the first component of the subject group has to be a plural pronoun:

- b. *Mes su Petr-u stumdo-mė-s.*
 we with Peter-INST push.PRES-1PL-REC
 ‘Peter and I push each other’, lit. ‘We with Peter push each other.’

The matter is somewhat more complicated if the first component is a 3rd person pronoun, as in this case the verb is not inflected for number:

- c. *Jis su Petr-u stumdo-si.* lit. ‘He with Peter push each other.’
 d. *Jie su Petr-u stumdo-si.* lit. ‘They with Peter push each other.’

I prefer to interpret (90c) as discontinuous, by analogy with (90a), and to translate it as ‘He is pushing [each other] with Peter’, and (90d) as ambiguous with two meanings:

- i. discontinuous: ‘He is pushing [each other] with Peter’,
 ii. simple: ‘They and Peter are pushing each other’, by analogy with (90b).

8. The syntactic reciprocal marker *vienas kitą* ‘each other’

8.1 Introductory

The marker *-si-/-s* is not used to express reciprocity on all the verbs that semantically allow reciprocal use. Formation of reflexive reciprocals is limited to the lexical groups discussed in Section 4, and within those groups there seem to be only individual exceptions. As has been mentioned, reflexive derivation of reciprocals is not an active process in Lithuanian in the sense that no new reflexive reciprocals are formed.

According to my estimates, in Kruopas (1972) at least 300 more two-place transitives and 100 two-place intransitives are registered that meet the principal semantic requirement for reciprocal derivation (that both actants should belong to the same semantic class, usually of humans) but do not form reflexive reciprocals. This must be due to the decline of the activity of the reciprocal function of the reflexive-middle marker.

If the reciprocal sense cannot be expressed by the marker *-si-/-s* with a given verb, the reciprocal phrase *vien-as* (NOM) *kit-ą* (ACC) lit. ‘one another’ (and its rarely used colloquial synonyms *vienas antrą* lit. ‘one (the) second’ and *kitas kitą* lit. ‘other another’) serves as an alternative device. This phrase has no lexical restrictions on its use; it occurs with two-place transitives and intransitives and with three-place transitives and intransitives. It can be used with a broader range and larger number of verbs than *-si-/-s* in the reciprocal sense, but in fact the actions these verbs express seldom happen to be reciprocal, while reciprocals with the reflexive-middle marker denote actions that are often reciprocal: they belong to the basic word stock and are much more frequent in texts.

Reflexive reciprocals and verbs with the phrase *vienas kitą* can enter into the following relations:

1. A reflexive reciprocal alone is used in speech.
2. There is no reflexive reciprocal and a base verb with the syntactic marker alone is used (see 8.3 and 8.4).
3. There are both a reflexive reciprocal and the underlying verb with the phrase *vienas kitą* in parallel use (see 8.5).

Thus both markers of reciprocity are in overlapping distribution.

8.2 Morphology of the phrase *vienas kitą*

The syntactic marker *vienas kitą* ‘each other’ is inflected for case, number and gender: (a) the first component is nominative and the second acquires the case form of the object whose position the phrase takes (e.g., accusative with transitive verbs); (b) each component agrees in gender with the subject, and (c) the number is determined by the situation denoted: if the subject refers to two persons (entities), each component of the phrase is singular, and if it refers to more than two participants each component is plural; cf.:

- (91) a. *Jie mato vien-as kit-ą.*
 they.M see one-NOM.M.SG another-ACC.M.SG
 ‘They see each other.’

- b. *Jos mato vien-a kit-q.*
 they.F see one-NOM.F.SG another-ACC.F.SG
 ‘They see each other.’
- c. *Jie mato vien-i kit-us.*
 they.M see one-NOM.M.PL other-ACC.M.PL
 ‘They see each other.’
- d. *Jos mato vien-os kit-as.*
 they.F see one-NOM.F.PL other-ACC.F.PL
 ‘They see each other.’

If the subject is a dual pronoun, the reciprocal phrase is in the singular, each component referring to one of the two participants:

- (92) a. *Juodu (M) mato vienas kitą (SG)/*vieni kitus (PL).* ‘They.two see each other.’
 b. *Jiedvi (F) mato viena kitą (SG)/*vienos kitas (PL).* ‘They.two see each other.’

The syntactic marker of reciprocity is used in two ways: (a) as the only marker of reciprocity with non-reciprocal verbs; (b) as a second marker with reciprocal verbs.

8.3 The phrase *vienas kitą* with non-reciprocal verbs. Diathesis types

The syntactic marker of reciprocity may replace a direct object of transitive verbs, a non-direct object of intransitives and the indirect dative object of three-place (mostly transitive) verbs. It can also be used attributively.

8.3.1 “Canonical” diathesis

8.3.1.1 *With two-place transitives.* The syntactic marker of reciprocity is used in the following cases:

1. If a given verb does not have a reflexive reciprocal counterpart due to lexical restrictions, e.g.:

- (93) a. *Jis mane aprėkė.* ‘He shouted at me.’
 b. **Mes ap-si-rėkėme.* ‘We shouted at each other (= quarrelled).’
 c. *Mes aprėkėme vienas kitą.* ‘We shouted at each other.’

2. If the base verb has a reflexive derivative with a non-reciprocal meaning, cf.:

- (94) a. *Jis gina mane.* ‘He defends me.’
 b. *Mes ginamė-s.* ‘We defend *ourselves*’ (reflexive proper)
 c. *Mes giname vienas kitą.* ‘We defend *each other*.’

3. If the base transitive verb is formally reflexive, i.e. it contains the marker *-si/-s*:

- (95) a. *Jis veja-si mane.* ‘He chases me.’
 b. *Mes vejamė-s vienas kitą.* ‘We chase *each other*.’

These restrictions also apply to two-place intransitives considered in 8.3.1.2.

8.3.1.2 *With two-place intransitives.* The second component of the syntactic marker assumes the case form required by the verb; e.g.:

- (96) a. *Petras įgriso Jon-ui* (DAT). 'Peter bores John.'
 b. *Jie įgriso vienas kit-am* (DAT). 'They bore each other.'
- (97) a. *Petras bodi-si Jon-u* (INST). 'Peter loathes John.'
 b. *Jie bodi-si vienas kit-u* (INST). 'They loathe each other.'

8.3.2 *“Indirect” diathesis. With three-place transitives (and intransitives)*

These are verbs that take an indirect object in the dative case denoting a human addressee or beneficiary. Three-place transitives, both with an obligatory and optional indirect object, are extremely numerous, while three-place intransitives are few in number; the subject and indirect object may enter into reciprocal relations practically in all these verbs. In this case the syntactic marker is the only means of expressing reciprocity, the second component assuming the dative case form; e.g.:

- (98) a. *Petras nupirko Jon-ui* (DAT) *dovaną*. 'Peter bought John a gift.'
 b. *Jie nupirko vienas kit-am* (DAT) *dovanas*. 'They bought each other gifts.'
- (99) a. *Petras paspaudė Jon-ui* (DAT) *ranką*. 'Peter pressed John's hand.'
 b. *Jie paspaudė vienas kit-am* (DAT) *rankas*. 'They shook hands.'
 lit. 'They pressed hands to each other.'

8.3.3 *“Indirect-possessive” diathesis*

If a two-place verb takes an object denoting a body part or alienable possession, the possessor is often expressed by an indirect dative object which is semantically determined by the direct (or non-direct) object while syntactically it is dependent on the predicate. To express reciprocal relations between subject and dative object referents, both in possessive relation to the object referent, the phrase *vienas kita* with the second component in the dative case is used. Thus the resultant construction is of the “indirect” diathesis type formally and “possessive” semantically; cf.:

- (100) a. *Petras išmušė Jon-ui* (DAT) *dantį*.
 lit. 'Peter knocked out a tooth to John.'
 b. *Jie išmušė vienas kit-am* (DAT) *dantis*.
 lit. 'They knocked out teeth to each other.'
- (101) a. *Tėvas pažvelgė sūn-ui* (DAT) *į akis*.
 lit. 'Father looked his son in the eyes.'
 b. *Jie pažvelgė vienas kit-am* (DAT) *į akis*.
 lit. 'They looked each other in the eyes.'
- (102) *Žmonės amžiau amžiais vienas kitam gerklės plėšė*.
 lit. 'For ages people cut throats to each other' (= 'cut each other's throats').

8.3.4 *“Possessive” diathesis. Attributive use of the syntactic marker*

An alternative way of expressing possessive relations is the attributive use of a noun (denoting possessor) in the genitive case on an object. The phrase *vienas kita* can be used attributively in order to express reciprocal possessive relations. Thus a construction with

this phrase replacing a possessive attribute to an object, its second component assuming the (possessive-)genitive case form, represents a “possessive” diathesis:

- (103) a. *Petras klausėsi Jon-o* (GEN) *kalbų.* ‘Peter listened to John’s talk.’
 b. *Jie klausėsi vienas kit-o* (GEN) *kalbų.* ‘They listened to each other’s talk.’

Compare also textual examples:

- (104) *Žmonės padeginėjo vienas kito namus.* ‘People set each other’s houses on fire.’
 (105) *Jos* (F) *prižiūrėjo viena kitos* (F) *vaikus.* ‘They looked after each other’s children.’

8.4 Verbs used with *vienas kitą* only. Restrictions on formation of reflexive reciprocals

As is mentioned above in 8.1, a large number of two-place transitives and intransitives can be used reciprocally with the syntactic marker *vienas kitą* only. In other words, there are restrictions on the formation of reflexive reciprocals imposed by lexical and pragmatic factors. To give an idea of the verbs and their lexical types that do not form reflexive reciprocals, it may be expedient to list all the verbs that have occurred in my corpus reciprocally with the syntactic marker.

1. Two-place transitives (note that only 6 of these verbs form reflexives proper with *-si/-s*, the reflexive pronoun *save* ‘oneself’ being used for this purpose with the other verbs; the verbs yielding reflexives proper are marked with two asterisks, and those taking *-si/-s* with other meanings with one asterisk):

- | | |
|--|--|
| (106) <i>apgauđinėti</i> ‘to deceive (repeatedly)’ | <i>neapkęsti*</i> ‘to hate’ |
| <i>apgauti*</i> ‘to deceive’ | <i>neigti</i> ‘to deny’ |
| <i>apkalbėti</i> ‘to slander’ | <i>nekęsti</i> ‘to hate’ |
| <i>aplenkti</i> ‘to overtake’ | <i>niekinti</i> ‘to ignore/disdain’ |
| <i>apžiūrėti*</i> ‘to look over’ | <i>paleisti*</i> ‘to let go’ |
| <i>apžiūrinėti</i> ‘to look over’ (iter.) | <i>pamilti</i> ‘to fall in love’ |
| <i>apžvelgti</i> ‘to look over’ | <i>pardavinėti</i> ‘to sell’ (iter.) |
| <i>atitikti</i> ‘to correspond’ | <i>parduoti**</i> ‘to sell’ |
| <i>atstumti</i> ‘to alienate/push away’ | <i>pa-si-laikyti</i> ‘to stick (to)’ |
| <i>gąsdinti*</i> ‘to scare’ | <i>pastebėti</i> ‘to notice’ |
| <i>gelbėti**</i> ‘to save’ | <i>pjaustyti*</i> ‘to cut/chop’ |
| <i>gerbti</i> ‘to respect’ | <i>saugoti*</i> ‘to protect’ |
| <i>ginti**</i> ‘to defend/protect’ | <i>skersti</i> ‘to slaughter/kill’ |
| <i>girdėti*</i> ‘to hear’ | <i>smerkti</i> ‘to condemn’ |
| <i>griebti*</i> ‘to seize’ | <i>sprogdinti**</i> ‘to explode’ |
| <i>guosti*</i> ‘to comfort/console’ | <i>stebėti*</i> ‘to watch’ |
| <i>išdavinėti</i> ‘to betray’ (iter.) | <i>suprasti*</i> ‘to understand’ |
| <i>išduoti*</i> ‘to betray’ | <i>surasti*</i> ‘to find’ |
| <i>išgelbėti**</i> ‘to save’ | <i>šaukti*</i> ‘to call/shout’ |
| <i>išgirsti</i> ‘to hear’ | <i>šmeižti</i> ‘to slander’ |
| <i>įtarinėti</i> ‘to suspect’ (iter.) | <i>tausoti</i> ‘to take care (of)’ |
| <i>įtarti</i> ‘to suspect’ | <i>užjausti</i> ‘to sympathize’ |
| <i>įtikinti*</i> ‘to persuade’ | <i>užkliudyti</i> ‘to knock (against)’ |
| <i>išvyti</i> ‘to drive/turn out’ | <i>užstoti*</i> ‘to stand up (for)’ |

*jausti** ‘to feel’
*kankinti** ‘to torture/torment’
*karti*** ‘to hang’
klausyti-s ‘to listen (to)’
*laikyti** ‘to hold’

*vadinti** ‘to call’
vaikyti-s ‘to pursue/run after’
*vyti** ‘to chase/drive away’
vyti-s ‘to pursue/chase.’

2. Two-place intransitives:

(107) *bodėti-s* (INST) ‘to loathe’
įgristi (DAT) ‘to bore’
įkyrėti (DAT) ‘to pester/bother’
laikytis (GEN) ‘to stick (to)’

pa-si-kliauti (INST) ‘to rely (on)’
priekaištauti (DAT) ‘to reproach’
priešinti-s (DAT) ‘to resist’
prieštarauti (DAT) ‘to contradict.’

8.5 Alternative use of the marker *-si/-s* and reciprocal phrase *vienas kitą*

With a number of verbs (for instance, those listed below), the reciprocal sense can be expressed either morphologically or syntactically. In most cases both expressions are entirely synonymous, the syntactic marker being more emphatic. Sometimes they differ slightly in the lexical meaning, as is shown in the translations (see (109)). The following expressions have been encountered in dictionaries and texts:

- | | | | | |
|-------|--|---|---|-------------------------------------|
| (108) | <i>ap-si-kabinti</i> | = | <i>apkabinti vieną kitą</i> | ‘to embrace/hug each other’ |
| | <i>barti-s</i> | = | <i>barti vieną kitą</i> | ‘to scold each other/quarrel’ |
| | <i>daužyti-s</i> | = | <i>daužyti vieną kitą</i> | ‘to beat/thrash each other’ |
| | <i>ėsti-s</i> | = | <i>ėsti vieną kitą</i> | ‘to quarrel/abuse each other’ |
| | <i>graužti-s</i> | = | <i>graužti vieną kitą</i> | ‘to abuse each other/quarrel’ |
| | <i>iš-si-plūsti</i> | = | <i>išplūsti vieną kitą</i> | ‘to scold each other’ |
| | <i>kandžioti-s</i> | = | <i>kandžioti vieną kitą</i> | ‘to bite each other’ |
| | <i>kapoti-s</i> | = | <i>kapoti vieną kitą</i> | ‘to fight/beat each other/quarrel’ |
| | <i>keisti-s</i> | = | <i>keisti vieną kitą</i> | ‘to take place of each other’ |
| | <i>kumščioti-s</i> | = | <i>kumščioti vieną kitą</i> | ‘to punch each other’ |
| | <i>pa-si-keisti</i> | = | <i>pakeisti vieną kitą</i> | ‘to stand in for each other’ |
| | <i>pa-si-plūsti</i> | = | <i>paplūsti vieną kitą</i> | ‘to scold each other (for a while)’ |
| | <i>pa-si-raginti</i> | = | <i>paraginti vieną kitą</i> | ‘to urge each other on’ |
| | <i>pjauti-s</i> | = | <i>pjauti vieną kitą</i> | ‘to squabble/bicker’ |
| | <i>plūsti-s</i> | = | <i>plūsti vieną kitą</i> | ‘to abuse/curse each other’ |
| | <i>rieti-s</i> | = | <i>rieti vieną kitą</i> | ‘to scold each other/bicker’ |
| | <i>spardyti-s</i> | = | <i>spardyti vieną kitą</i> | ‘to kick each other’ |
| | <i>stumdyti-s</i> | = | <i>stumdyti vieną kitą</i> | ‘to push each other’ |
| | <i>šaudyti-s</i> | = | <i>šaudyti vieną į kitą</i> | ‘to shoot/fire at each other.’ |
| (109) | <i>matyti-s</i> ‘to see each other/meet’ | – | <i>matyti vieną kitą</i> ‘to see each other’ | |
| | <i>mylėti-s</i> ‘to make love to each other’ | – | <i>mylėti vieną kitą</i> ‘to love each other’ | |
| | <i>pa-si-žinti</i> ‘to know/keep in touch with each other’ | – | <i>pažinti vieną kitą</i> ‘to know each other/be acquainted’ | |
| | <i>sveikinti-s</i> ‘to greet each other’ | – | <i>sveikinti vieną kitą</i> ‘to congratulate/greet each other.’ | |

In the latter case the parallel expressions may require different contexts; e.g.:

- | | | | |
|-------|----|--|--|
| (110) | a. | <i>Mes dažnai matèmè-s.</i> | ‘We often saw each other (= met).’ |
| | b. | <i>Mes matème vienas kitą iš tolo.</i> | ‘We saw (could see) each other from afar,’ |
| but: | c. | <i>Mes matèmè-s iš tolo.</i> | ‘One could see us from a distance.’ |

8.6 The phrase *vienas kitą* with reflexive reciprocals

This reciprocal marker does occur with some reflexive reciprocals and very seldom with lexical reciprocals, for disambiguation or emphasis. The second component may take either the accusative (or another case form depending on the case of the underlying object) or the comitative form, i.e. the instrumental case with the preposition *su* ‘with’.

8.6.1 *With the accusative case of the second component. “Canonical” diathesis*

It should be noted in the first place that this phrase occurs in very short sentences with omitted subjects, sometimes comprised of the predicate alone. Compare the following sentences collected from texts and dictionaries:

- | | | | |
|-------|----|---|--|
| (111) | a. | <i>Vienas kitą ap-si-skundè.</i> | ‘They made complaints against each other.’ |
| | b. | <i>Erzina-si vienas kitą.</i> | ‘They tease each other.’ |
| | c. | <i>Kam gi reikia vienas kitą už-si-gaudinèti?</i> | ‘Why humiliate each other?’ |
| | d. | <i>Kits kitą už-si-prašo į svečius.</i> | ‘They invite each other home.’ |
| | e. | <i>Iš-si-plūdo, iš-si-keikè vienas kitą.</i> | ‘They abused and cursed each other.’ |
| | f. | <i>Iš-si-ėdè vienas kitą.</i> | ‘They had a bitter squabble.’ |
| | g. | <i>Iš-si-dergè vieni kitus.</i> | ‘They abused one another.’ |
| | h. | <i>Iš-si-kvailino vienas kitą.</i> | ‘They called each other a fool.’ |

There may be a number of reasons behind the use of the phrase *vienas kitą* here:

1. It may be added for “weight”, thus it makes (111a–b, f–g) balanced enough for them to be able to function as completed sentences.

2. All these verbs are ambiguous semantically: for instance, the verbs in (111a, c, e) may have an “absolutive” reading and (111b) may be anticausative (see 4.3), etc.; therefore at least in some of these sentences, e.g. in (111c, e), the phrase *vienas kitą* may also serve as a means of disambiguation.

3. This phrase serves to indicate the number of participants: two, as in most of the examples, or more than two, as in (111g).

4. The accusative form of the second component of the phrase in question is not however explained by the above reasons: it may be due to the fact that all the *-si-* verbs in (111) are in fact interpreted as transitive reflexives and behave as such, the reflexive-middle marker being added for emphasis. This usage is practically identical with the use of non-reflexive transitives with *vienas kitą* discussed above, and it is facilitated by perfectivization, as Lithuanian prefixed verbs easily take on the marker *-si-* for emphasizing the sense ‘for one’s own pleasure/advantage/benefit’ (see 3.1).

However, in most cases with prototypical reflexive reciprocals, the form *vienas kitą* with the accusative second component is hardly acceptable, or it is at least redundant:

- (112) a. [?]*Bučiuoja-si vienas kita.* ‘They kiss each other.’
 b. [?]*Stumdo-si vienas kita.* ‘They push each other.’

But these reciprocals may acquire a comitative form of this phrase (see 8.6.3).

8.6.2 *With the dative case of the second component*

It should be noted that the verb *pa-si-dėti* ‘to help each other’ derived from a two-place intransitive with a dative object always occurs with this case form of the syntactic marker, most likely due to the fact that the underlying verb is highly polysemous and some of its meanings also yield derivatives with the reflexive-middle marker but distinct meanings; therefore these derivatives require contextual indication of the particular meaning they are used in, a sentence without such indication being incomplete; cf.:

- (113) a. *Broliai vienas kitam pa-si-deda.*
 ‘The brothers help each other.’
 b. **Broliai pa-si-deda.*
 c. *Broliai pa-si-deda* (← *padeda* ‘put’) *pinigus į banką.*
 ‘The brothers deposit their money in a bank.’

The synonymous reciprocal in (114), though monosemous, also always occurs with the phrase in question, probably by analogy with (113a):

- (114) a. *Juodu visados vienas kitam pa-si-gelbsti.* ‘They always help each other.’
 b. [?]*Juodu visados pa-si-gelbsti.* (same intended meaning).

8.6.3 *The comitative form vienas su kit-u ‘with each other’*

This comitative form for two participants, or plural *vieni su kitais* for more than two, is possible practically with all reflexive reciprocals, but it is very uncommon and hardly necessary: it may be added for emphasis, but for this purpose a combination of the underlying verb with *vienas kita*, or the marker *tarpusavyje* ‘between selves’ (see Section 9) is preferable, since the form *vienas su kitu* emphasizes the comitative rather than the reciprocal component of meaning; cf.:

- (115) a. *Seserys pa-si-bučiavo.* ‘The sisters kissed [each other].’
 b. *Seserys pabučiavo viena kita.* ‘The sisters kissed each other.’
 c. *Seserys pa-si-bučiavo viena su kita.* lit. ‘The sisters kissed with each other.’

The comitative form seems to be more acceptable with lexical reciprocals, especially if it is necessary to indicate the number of participants (two or more than two); cf.:

- (116) a. *Jie draugauja.* ‘They are friends.’
 b. *Jie draugauja vienas su kitu/vieni su kitais.* ‘They are friends with each other (of two persons)/among themselves (of many).’

The comitative reciprocal phrase is redundant and therefore not used with lexical reciprocals which imply either two participants only (cf. (117a)) or more than two (usually a considerable number of) participants only (cf. (117b)):

- (117) a. *tuokti-s* ‘to marry (each other)’
skirti-s ‘to divorce (each other)’
su-si-žieduoti ‘to be betrothed’
- b. *burti-s* ‘to gather together’
spiesti-s ‘to crowd/throng’
telkti-s ‘to come/flock together.’

With the following and similar lexical reciprocals this phrase, either in the singular or in the plural form, is quite acceptable as a specifier of the number of participants:

- (118) a. *bendrauti* ‘to associate/keep company’
draugauti ‘to be friends’
giminiuoti-s ‘to be relatives’
kaimynauti ‘to be neighbours’
poruoti-s ‘to pair off/couple’
- b. *galyñeti-s* ‘to wrestle’
lenkyniauti ‘to compete’
rungtyniauti ‘to compete/contend’
vaidyti-s ‘to quarrel/squabble’
kovoti ‘to fight/struggle’
kariauti ‘to be at war’
- c. *jungti-s* ‘to be joined/connected’
sąveikauti ‘to interact’
santykiauti ‘to correlate’
sieti-s ‘to be linked/bound’
- d. *derinti-s* ‘to match/be matched’
kaitalioti-s ‘to alternate’
maišyti-s ‘to get mixed’
su-si-pinti ‘to intertwine’; etc.

9. The reciprocal marker *tarpusavyje* ‘between/among ourselves/.../themselves’

This reciprocal adverb and its paraphrases *tarp savęs* with the same meaning and *savo tarpe* lit. ‘in our/your/their midst’ are never used with non-reciprocal verbs to express reciprocity. They can occur with reciprocals only. Contrary to the phrase *vienas kitą* ‘each other’, these phrases are used mostly for emphasis. They may refer to many as well as to two participants, cf.:

- (119) a. *Visi suėję giminiuoja-si tarpusavyje.*
 lit. ‘All those gathered are relatives between themselves.’
- b. *Jiedvi (F) bara-si tarp savęs.*
 lit. ‘They.two are abusing each other between themselves.’

These phrases are most common with reflexive reciprocals with the meaning ‘to scold each other’, ‘to quarrel’, ‘to fight’ and ‘to talk/whisper to each other’; here are a few typical examples from texts:

- (120) a. *Žmonės rieja-si, pjauna-si tarp savęs.* ‘People bicker, squabble among themselves.’
- b. *Muša-si tarpusavy.* ‘They fight between/among themselves.’
- c. *Graužia-si tarpusavyje.* ‘They bicker between/among themselves.’
- d. *Vyrai tarp savęs su-si-mušė.* ‘The men got into a fight among themselves.’
- e. *Jie vadinėja-si savo tarpe.* ‘They invite each other home between themselves.’
- f. *Moterys kalba-si tarpusavy.* ‘The women are talking among themselves.’
- g. *Jie pa-si-šnibždėjo tarp savęs.* ‘They whispered between/among themselves.’

However, straightforward reciprocals like the following do not as a rule accept this phrase and its paraphrases, especially if only two participants are involved; cf.:

- (121) a. **Jie myli-si tarpusavyje.* ‘They make love to each other between themselves.’
 b. **Jie pa-si-bučiaavo tarp savęs.* ‘They kissed between themselves.’

These phrases are common with reciprocals with the complex *su-si-*; e.g.:

- (122) a. *Juodu su-si-žvalgė tarpusavyje.* ‘They exchanged glances between themselves.’
 b. *Vyrai su-si-merkė tarp savęs.* lit. ‘The men winked to each other between themselves.’

As for lexical reciprocals, most of them accept these phrases with ease, excepting the following verbs which denote reciprocal actions presupposing two participants only:

- (123) a. **Jie su-si-tuokė tarpusavyje.* ‘They got married between themselves.’
 b. **Jie iš-si-skyrė tarpusavyje.* ‘They parted/got divorced between themselves.’
 c. **Jie su-si-žiedavo tarp savęs.* ‘They exchanged rings (got betrothed) between themselves.’

This restriction does not hold in generic sentences, of course; cf.:

- (124) *Giminės retai tuokia-si tarpusavyje.*
 ‘Relatives seldom intermarry’ (lit. ‘marry between themselves’).

Lexical reciprocals of concerted motion do not seem to combine with this adverb either:

- (125) a. **Paukščiai buria-si tarpusavyje.*
 ‘Birds are flocking together between themselves.’
 b. **Žmonės telkia-si tarp savęs į būrius.*
 ‘People gather into groups between themselves.’

As we see, the same rules seem to apply to the use of the adverbial *tarpusavyje* with reflexive as well as with lexical reciprocals.

10. Areal characteristics of Lithuanian reciprocals

With respect to the productivity of the morphological marker of reciprocal meaning (a reflexive-middle marker or an affix with the reflexive proper as one of its meanings), Lithuanian occupies an intermediate position among the geographically adjacent languages. In the languages to the south-east (Belorussian and genetically related Russian and Ukrainian) the number of reciprocals with a reflexive marker does not exceed 20–25 items. On the whole, productivity of reciprocals decreases to the north as well. Thus, in Latvian their number is smaller, they are not registered in Estonian and Finnish, and there are 15 reciprocals at the most in Swedish. In the south-western direction, productivity of the analogous type of reciprocals seems to have no restrictions: this concerns Polish and German (see Wiemer, Ch. 11; Wiemer & Nedjalkov, Ch. 10; cf. also Ureland 1977: 311–2; Dahl & Koptjevskaja-Tamm 1992: 17–24).

Acknowledgments

I am indebted to my informants Klementina Vosylytė and Nijolė Maskaliūnienė for their unstinting help and patience.

1. Introduction

1.1 Russian

Russian is the most widespread Slavic language belonging (alongside closely related Ukrainian and Belorussian) to the East Slavic subgroup. Russian is the native language of 137 million (in the 1979 census) ethnic Russians in the former USSR. Besides, according to this census, almost 80 million people of other ethnic groups either claimed Russian as their first language or declared themselves to be functional in Russian (Timberlake 1993:827). The total number of Russian speaking people all over the world is considered to exceed 250 million (Plungian 1996:233).

As regards the marking of reciprocity, the East Slavic languages show great similarity, whereas there is a striking contrast between these and other Slavic languages.

1.2 Overview

In the Russian language, the meaning of reciprocity is expressed in a variety of ways both related and unrelated to reflexive markers. These include the following marking patterns:

1. Reciprocals marked by the reflexive postfix *-sja* (see Section 3); cf.:

- (1) a. *On celu-et rebenk-a.*
 he.NOM kiss.IPFV-3SG.PRES child.M-SG.ACC
 ‘He kisses a child.’
- b. *Oni celu-jut-sja.*
 they.NOM kiss.IPFV-3PL.PRES-REFL
 ‘They kiss each other.’

2. Reciprocals with complex markers composed of the reflexive postfix *-sja* and a number of affixes (see Sections 4 and 6); cf.:

- (2) *kidat* ‘to throw’ – *pere-kid-yva-t’-sja* ‘to throw sth to each other (repeatedly)’
 (3) *zvonit* ‘to ring’ – *so-zvonit’-sja* ‘to get in touch on the telephone.’

3. The autonomous reflexive pronoun *sebjja* in the collocation *meždu soboj* lit. ‘between selves’ (see Section 5); cf.:

- (4) a. *On ne razgovariva-et s brat-om.*
 he.NOM not talk.IPFV-3SG.PRES with brother.M-SG.INST
 ‘He does not talk to his brother.’
- b. *Oni ne razgovariva-jut meždu sob-oj.*
 they.NOM not talk.IPFV-3PL.PRES between self-INST
 ‘They do not talk to each other.’

4. Two non-reflexive pronominal collocations with the reciprocal meaning *drug druga* lit. ‘other other’ and *odin drugogo* ‘one another’ similar both in form and in meaning to the English *each other* and *one another* (see Section 7); cf.:

- (5) a. *On ljub-it syn-a.*
 he.NOM love.IPFV-3SG.PRES son-SG.ACC
 ‘He loves his son.’
- b. *Oni ljub-jat drug drug-a.*
 they.NOM love.IPFV-3PL.PRES each.NOM other-ACC
 ‘They love each other.’

5. The comitative-sociative prefix *so-* alone or in combination with other affixes (see Section 8); cf.:

- (6) *besedovat* ‘to converse/have a talk’ – *so-besed-nik* ‘interlocutor.’

6. The adjectives *vzaimnyj* and *obojudnyj* both meaning ‘mutual, reciprocal’ used autonomously or in compounds (see Section 9):

- (7) *pomošč* ‘assistance’ – *vzaimo-pomošč* ‘mutual assistance.’

As will be shown below, neither of these means can be regarded as a universal way of expressing reciprocity. The occurrence of each of them in a sentence has to meet certain specific conditions. Nevertheless, on the whole, Russian (in contrast to South and West Slavic languages) demonstrates absolute predominance of the pronoun *drug druga* over all other markers for reciprocity.

2. Grammatical notes

2.1 Some morphological features of Russian

Like other Slavic languages, Russian has two verbal aspects: the perfective and the imperfective. The overall tense-aspect system is rather reduced. There are five tense-aspect forms only: three for imperfective verbs; e.g. *pisat* ‘to write’, *pisa-l* (PAST), *piš-u* (PRES), *budu pisat* (FUT), and two for the corresponding perfective verbs; e.g. *napisat* ‘to write’, *napisa-l* (PAST), *napiš-u* (FUT). As regards the active/passive voice distinction, Russian uses two forms to express the passive voice depending on the verbal aspect. Imperfective passive forms are marked by the reflexive postfix while perfective passive forms are analytical being composed of the auxiliary verb *byt* ‘to be’ (in the appropriate tense and mood; omitted in the present tense) and the *-n/-t* passive participle of a main verb; cf.:

- (8) a. *Knig-a piš-et-sja.*
 book.F-SG.NOM write.IPFV-3SG.PRES-REFL
 '[The] book is being written.'
- b. *Knig-a napis-an-a.*
 book.F-SG.NOM write.PFV-PASS-F.SG
 '[The] book [is] written.'

Nouns have gender (M, F or N) and are inflected for number (SG or PL) and case.

2.2 Reflexive markers *sebja* and *-sja*

Russian has two etymologically related reflexive markers: the syntactically autonomous reflexive pronoun *sebja* and the postfix *-sja* which occupies the final position in a verb after inflexion. In terms of J. Haiman (1983:781–819), who suggested distinguishing between concurrent grammatical markers with regard to their relative physical length and degree of boundness to neighboring morphemes, these markers may be called “heavy” and “light” respectively.

The “heavy” reflexive marker *sebja* takes nominal case endings (excepting the nominative case form) but does not change for gender and number. It is nearly monosemous with the main function of marking the true reflexive sense, i.e. that of co-reference of two participants of a situation.¹ There are, however, a few exceptions provided by certain fixed collocations with *sebja* including the reciprocal collocation *meždu soboj* (see Section 5; cf. Knjazev 1998:185–93, 2001:67–77).

The invariable “light” marker *-sja*² displays a broad range of functions briefly discussed in this volume (Knjazev, Ch. 2, §4.2.1). Its general syntactic function is valency decrease that manifests various semantic changes. These include, among others, reference to reciprocal situations (Knjazev 1996).

Having taken into consideration the type of reciprocal marker and its semantic contribution to the meaning of a predicate or a sentence as a whole, one should distinguish between the variants of employment of reflexive markers in reciprocal constructions which were mentioned above in 1.2 and in the following two cases:

- deponent and “semideponent” reflexive verbs with reciprocal meaning which either lack counterparts without the reflexive marker or deviate from them semantically in an individual way;³ e.g.: *rubit'sja* ‘to fight (with cold steel)’ ← *rubit'* ‘to chop’;
- reflexive anticausative verbs derived from three-place lexical reciprocals; e.g. *ssorit'* ‘to cause sb to quarrel’ → *ssorit'sja* ‘to quarrel’.

1. A detailed analysis of reflexivization in Russian is presented in Paducheva (1985:180–209).

2. In fact, the postfix *-sja* occurs in two forms, viz. *-sja* and *-s'*, but these variants are determined morphologically: the latter is used if a stem ends in a vowel.

3. These terms influenced by Kemmer (1988) are discussed in this volume (Ch. 2, §2.1).

2.2.1 Deponent and “semideponent” reflexive verbs

As can be seen from Knjazev (Ch. 2, §§3.3.1.2, 3.3.2.3, 3.3.3), deponent and semideponent reflexive verbs with reciprocal meanings in Russian can be, on the whole, subdivided into the following three lexical groups:

1. Verbs that denote establishing, breaking off or maintenance of kinship and companionship relations; cf.:

- | | | |
|-----|---------------------|--------------------------------------|
| (9) | <i>videt'sja</i> | ‘to meet’ (lit. ‘to see each other’) |
| | <i>rasstat'sja</i> | ‘to part with each other’ |
| | <i>zdorovat'sja</i> | ‘to greet each other’ |
| | <i>proščat'sja</i> | ‘to say goodbye to each other.’ |

2. Verbs denoting various kinds of rivalry and competition; cf.:

- | | | |
|------|-----------------------|-----------------------------|
| (10) | <i>drat'sja</i> | ‘to fight’ |
| | <i>borot'sja</i> | ‘to struggle’ |
| | <i>sorevnovat'sja</i> | ‘to compete’ |
| | <i>torgovat'sja</i> | ‘to haggle over the price.’ |

3. Verbs denoting verbal communication; cf.:

- | | | |
|------|---------------------|-------------------|
| (11) | <i>uslovit'sja</i> | ‘to agree upon’ |
| | <i>soveščat'sja</i> | ‘to confer with’ |
| | <i>prepirat'sja</i> | coll. ‘to argue.’ |

2.2.2 Reflexive anticausatives

In Russian, reflexive anticausatives derived from lexical reciprocals cover, mainly, the semantic scope of joining and separating either in physical space, as in (12), (13), or in social “space”, as in (14), (15):

- | | | |
|------|--|---|
| (12) | <i>sobrat'</i> (vt) | – <i>sobrat'sja</i> (vi) ‘to collect, gather’ |
| | <i>soedinjat'</i> (vt) | – <i>soedinjat'sja</i> (vi) ‘to join, connect’ |
| | <i>raz"edinjat'</i> (vt) | – <i>raz"edinjat'sja</i> (vi) ‘to separate, disconnect’ |
| | <i>skleivat'</i> (vt) | – <i>skleivat'sja</i> (vi) ‘to glue together.’ |
| (13) | a. <i>On klei-l list-y bumag-i.</i>
he.NOM glue.PFV-M.SG.PAST sheet-PL.ACC paper.F-SG.GEN
‘He glued the sheets of paper together.’ | |
| | b. <i>List-y bumag-i klei-l-i-s'.</i>
sheet-PL.NOM paper.F-SG.GEN glue.PFV-PAST-PL-REFL
‘The sheets of paper [have] glued together.’ | |
| (14) | <i>znakomit'</i> ‘to acquaint’ | – <i>znakomit'sja</i> ‘to get acquainted’ |
| | <i>mirit'</i> ‘to reconcile’ | – <i>mirit'sja</i> ‘to get reconciled’ |
| | <i>sdužit'</i> ‘to make sb friends’ | – <i>sdužit'sja</i> ‘to become friends.’ |
| (15) | a. <i>Nas sduži-l-a nevol-ja.</i>
we.ACC make.friends.PFV-PAST-F.SG captivity.F-SG.NOM
‘Captivity made us friends.’ | |
| | b. <i>My sduži-l-i-s'.</i>
we.NOM make.friends.PFV-PAST-PL-REFL
‘We became friends.’ | |

Irrespective of the type of usage, verbs with the “light” reciprocal marker *-sja* are syntactically intransitive and occur in subject-oriented constructions only.

2.3 Affixation and verbal aspect

The perfective aspect in Slavic languages has no unequivocal markers. Generally speaking, affixation of almost any prefix or the semelfactive suffix *-nu-* on an imperfective verb (besides its possible semantic input to the meaning of the verb) automatically results in perfectivization. The interesting thing is that one of the few exceptions to the rule is the prefix *so-* employed in derivation of a productive subclass of reciprocals with the comitative-sociative meaning (see Section 8).

In its turn, the imperfective aspect is commonly distinguished either by the absence of a prefix or by the presence of the suffix *-va-* (allomorphs *-iva-*, *-yva-*, *-va-*, *-a-*). Note that simultaneous affixation of both a prefix and the suffix *-va-* to an imperfective verb does not affect its aspect. This type of derivation may be again exemplified by a subtype of reciprocals, namely, by multiplicative reciprocals derived by means of a complex formant comprised of three components: the reflexive postfix *-sja*, prefix *pere-* and imperfectivizing suffix *-(y)va-*; e.g. *šeptat'* (1PFV) ‘to whisper’ – *pere-šept-yva-t'-sja* (1PFV) ‘to whisper’ to one another’ (see Section 4).

3. Reciprocals marked by the reflexive postfix *-sja*

Verbs in which the reciprocal component is expressed by the reflexive postfix are very scanty in Russian. Short lists presented below are nearly exhaustive with the exception, however, of a few substandard or coarse verbs. They are not uniform in respect of their diathesis type.

3.1 “Canonical” reciprocals

3.1.1 *Semantic groups*

“Canonical” reciprocals derived from transitive verbs fall into the following three semantic groups.

1. Verbs referring to elementary concrete physical actions that cause or can cause damage to their objects. These actions are performed either by animals only or by both humans and animals to the same extent; there are no actions characteristic of humans only among them:

- | | |
|-----------------------------------|--|
| (16) <i>bodat'</i> ‘to butt’ (vt) | – <i>bodat'sja</i> ‘to butt each other’ |
| <i>klevat'</i> ‘to peck’ (vt) | – <i>klevat'sja</i> ‘to peck each other’ |
| <i>kusat'</i> ‘to bite’ (vt) | – <i>kusat'sja</i> ‘to bite each other’ |
| <i>ljagat'</i> ‘to kick’ (vt) | – <i>ljagat'sja</i> ‘to kick each other’ (of horses) |
| <i>pinat'</i> ‘to kick’ (vt) | – <i>pinat'sja</i> ‘to kick each other’ (of humans) |
| <i>oblivat'</i> ‘to sluice’ (vt) | – <i>oblivat'sja</i> ‘to sluice each other’ |

<i>tolkat'</i> 'to push' (vt)	– <i>tolkat'sja</i> 'to push each other'
<i>carapat'</i> 'to scratch' (vt)	– <i>carapat'sja</i> 'to scratch each other'
<i>ščipat'</i> 'to pinch' (vt)	– <i>ščipat'sja</i> 'to pinch each other.'

These verbs typically designate multidirectional unordered actions that lack a predetermined endpoint and involuntarily turn out to be reciprocal; cf.:

- (17) *Oni stoja-l-i rjadom, na tramvajn-oj ostanovk-e,*
 they.NOM stand.IPFV-PAST-PL beside at tram-F.SG.LOC stop.M-F.LOC
proxoži-e tolka-l-i-s', zadeva-l-i ix
 passer.by-SG.NOM push.IPFV-PAST-PL-REFL brush.IPFV-PAST-PL they.ACC
pleč-ami. (M. Roščin)
 shoulder-PL.INST
 'They stood side by side at the tram stop, passers-by were pushing *one another* and brush-
 ing against them with shoulders.'

2. Verbs referring to certain unfriendly actions such as:

- (18) *rugat'* 'to abuse' (vt) – *rugat'sja* 'to abuse each other'
branit' 'to scold' (vt) – *branit'sja* 'to scold each other.'

Reflexive derivatives of verbs denoting more complicated speech acts such as *proklinat'* 'to curse', *oskorbljat'* 'to insult, offend', *osuždat'* 'to condemn', etc. rule out the reciprocal reading. It is worth noting that formerly reflexive reciprocals of this semantic class were far more numerous in Russian (Knjazev & Nedjalkov 1985:23–4).

3. Verbs referring to actions that can be regarded as visible manifestations of friendly or passionate feelings; e.g.:

- (19) *obnimat'* (vt) 'to hug/embrace' – *obnimat'sja* 'to hug/embrace each other'
celovat' (vt) 'to kiss' – *celovat'sja* 'to kiss each other.'

Note that reflexive reciprocals in modern Russian cannot denote love as an emotional state or attitude, although they can easily denote various stages of "physical" love-making; cf.:

- (20) [Donat] *probira-l-sja čerez okn-o v ee*
 D.M.NOM steal.IPFV-M.SG.PAST-REFL through window-SG.ACC into her
spal'n-ju, v dvuspal'n-uju postel'. Ljubi-l-i-s'
 bedroom.F-SG.ACC into double-SG.F.ACC bed.SG.ACC love.IPFV-PAST-PL-REFL
strastno, šeptal-i-s' – govori-l-i – nenavide-l-i –
 passionately whisper.IPFV-PAST-PL-REFL talk.IPFV-PAST-PL hate.IPFV-PAST-PL
proklina-l-i. (B. Pil'njak)
 curse.IPFV-PAST-PL
 'Donat used to steal into her bedroom, into her double bed. They made love (lit. loved
each other) passionately, whispered to *each other*, talked, hated, cursed *each other*.'

Interestingly enough, a century ago there were no such restrictions, it seems. For instance, the verb *ljubit'sja* derived from *ljubit'* 'to love' could easily appear in the meaning 'to have a mutual feeling of love'; cf.:

- (21) *Svad'b-a!* *Eto poetičesk-ij* *mig* *v žizn-i*
 wedding.F-SG.NOM it poetical-M.SG.NOM moment.SG.NOM in life.F-SG.LOC
ljubj-ašč-ix-sja, *venec* *ščast'-ja.* (I. Gončarov)
 love.IPFV-ACT-PL.GEN-REFL crown.SG.NOM happiness.N-SG.GEN
 'Wedding! That is a poetical moment in the life of those loving *each other*, the crowning
 point of happiness.'

In present-day Russian, we should use *ljubjaščix drug druga* instead of *ljubj-ašč-ix-sja* in (21) to render the same meaning.

3.1.2 Polysemy of direct reflexive reciprocals. Reflexive and absolutive meanings

Russian belongs to a numerous set of languages in which both reflexive and reciprocal meanings may be expressed by the same marker. Nevertheless, in contrast to many other languages sharing this marking property, the reflexive/reciprocal polysemy of the Russian postfix *-sja* does not entail the polysemy of verbs with this marker.

In its true reflexive use, this marker appears mostly on verbs indicating body care actions, as in (22), (23), and, by way of exception, a few more complicated actions, as in (24):

- (22) *myt'* 'to wash' (vt) – *myt'sja* 'to wash oneself'
odevat' 'to dress' (vt) – *odevat'sja* 'to dress oneself'
- (23) a. *On umy-l reben-ka.*
 he.NOM wash.PFV-M.SG.PAST baby.M-SG.ACC
 'He washed the baby.'
 b. *On umy-l-sja.*
 he.NOM wash.PFV-M.SG.PAST-REFL
 'He washed [himself].'
- (24) a. *On podgotovi-l drug-a k sorevnovani-jam.*
 he.NOM prepare.PFV-PAST friend.M-SG.ACC for contest.N-PL.DAT
 'He prepared his friend for the contest.'
 b. *On podgotovi-l-sja k sorevnovani-jam.*
 he prepare.PFV-M.SG.PAST-REFL for contest.N-PL.DAT
 'He prepared himself for the contest.'

As for the Russian verbs in *-sja* indicating reciprocal situations, they are very limited in number and meaning, being restricted either to affectionate actions such as *obnimat'sja* 'to embrace each other' and *celovat'sja* 'to kiss each other', or to a number of antagonistic actions such as *tolkat'sja* 'to push each other', *rugat'sja* 'to abuse each other'. There seems to be only one point of overlapping between the two underlying verb classes, namely, the verb *oblivat'* 'to sluice' referring to an event that may be treated either as an unpleasant (unfriendly) action or as a body care action. Consequently, its reflexive counterpart *oblivat'sja*, as an exception, combines both the reciprocal and the reflexive meanings; cf.:

- (25) a. *V rečk-e tolka-l-i-s' i obliva-l-i-s'*
 in river.F-SG.LOC push.IPFV-PAST-PL-REFL and sluice.IPFV-PAST-PL-REFL
det-i.
 child.PL-NOM
 'On the river children were pushing and sluicing *each other*.'

- b. *Po utr-am on obliva-et-sja xolodn-oj*
 in morning-PL.DAT he.NOM sluice.IPFV-3SG.PRES-REFL cold-F.SG.INST
vod-oj.
 water.F-SG.INST
 'In the mornings he sluices *himself* with cold water.'

Generally speaking, within the scope of meanings subsumed under the reflexive marker, semantic contiguity of the reciprocal meaning and the true reflexive meaning seems to be the most evident. In both instances, "the set designated by the subject is the same as (co-referential to) the set designated by the object" (Langacker 1977:69), the distinction being that the reciprocal relation pairs different individuals, while in the reflexive relation the two roles are assigned to the same entity.

Russian demonstrates another possibility, viz. a direct semantic relationship between reciprocals and so-called "absolutive" ("object-deletion" or "antipassive") uses of reflexives referring to situations with two participants, agent and patient, the latter being, however, only implied. It appears that almost all Russian reflexive reciprocals allow the absolutive use as well; cf.:

- (26) a. *Posmotr-i, dv-e korov-y boda-jut-sja*
 look.PFV-IMP two-F.NOM cow-PL.NOM butt-3PL.PRES-REFL
 'Look, two cows are butting *each other*.' (reciprocal)
- b. *Bud' ostorozhen, korov-y boda-jut-sja.*
 be.IMP careful.SG.M cow-PL.NOM butt.IPFV-3PL.PRES-REFL
 'Be careful, cows butt.' (absolutive)

In absolutive uses of type (26b), the patient is understood as generic or indefinite and, in any case, as pragmatically non-prominent. Semantic contiguity of the reciprocal and the absolutive uses seems to be due to the following fact: if the patient of an action is of no importance to its agent (as it is in the case of the "absolutive" use), it may easily turn out that the set of patients is the same as the set of agents (as it is with the reciprocal proper).

An intermediate link between the two meanings may be seen in denotation of a set of multidirectional unordered actions located in a concrete temporal interval, as in (17).

It is worth noting that, in contrast to their English counterparts, reflexive reciprocals belonging to this group do not collocate with the reciprocal pronoun *drug druga* or any other explicit markers of reciprocity, e.g. the adverbial *vzaimno* 'mutually, reciprocally'. As soon as such markers are inserted in a sentence like (26a), it becomes ungrammatical.

Hence, there is no easy way to distinguish between the absolutive ("object-deletion") and the reciprocal reading of these verbs.

3.2 "Indirect" reciprocals

This group of reciprocals includes the following three verbs designating some special kinds of speech acts:

- (27) *šeptat'* 'to whisper' – *šeptat'sja* 'to talk in whispers, whisper to one another'
šušukat' 'to whisper' – *šušukat'sja* 'to talk in whispers privately or secretly'
aukat' 'to shout "a-oo"' – *aukat'sja* 'to shout "a-oo" to each other.'

The most common of them is the verb *šeptat'sja* referring to situations with an addressee coreferential with the agent. The meaning of (28a) is thus expressed explicitly by (28b), the difference being that the direct object of *šeptat'* in (28b) corresponds to the indirect object of *šeptat'sja* in (28a):

- (28) a. *Oni o čem-to šepč-ut-sja.*
 they.NOM about something.LOC whisper.IPFV-3PL.PRES-REFL
 'They are talking in whispers.'
- b. *Ona čto-to šepč-et emu, a on čto-to*
 she.NOM something.ACC whisper.IPFV-3SG.PRES he.DAT and he.NOM something
šepč-et ej.
 whisper.IPFV-3SG.PRES she.DAT
 'She is whispering something to him and he is whispering back.'

The other two pairs of verbs are not widely used and thus the diathesis correlations between their constituents are far less evident.

Other speech verbs such as *govorit'* 'to speak', *kričat'* 'to cry/shout' or *bormotat'* 'to mutter' cannot take the reflexive postfix *-sja* in the reciprocal meaning. Nevertheless, some of them serve as base verbs for derived multiplicative reflexive reciprocals (see Section 4 below).

3.3 "Possessive" reciprocals

In Russian there are two reflexive constructions which seem to share some properties of "possessive" reciprocals.

The first to be mentioned is the collocation *brat'sja* (*deržat'sja*, *xvatat'sja*) *za ruki* 'to join hands, take each other's hand' with the base transitives *brat'* 'to take', *deržat'* 'to hold', *xvatat'* 'to grasp'.⁴ Sentence (29a) can be roughly re-worded as (29b) in which two pairs of symmetric arguments, i.e. "I" – "you", "my hand" – "your hand", are expressed explicitly:

- (29) a. *Voz'm-em-sja za ruk-i, druž'-ja.*
 take.PFV-IMP-REFL at hand-PL.ACC friend-PL.NOM
 'Let's join hands, my friends.'
- b. *Ty voz'm-i mo-ju ruk-u, a ja*
 you.NOM take.PFV-IMP my-F.SG.ACC hand-F-SG.ACC and I.NOM
voz'm-u tvo-ju.
 take.PFV-1SG.FUT your-F.SG.ACC
 'Take my hand and I'll take yours.'

4. Similar reciprocal collocations recur across languages; cf. the Icelandic reflexive form in *-st* in *haldast i hendur* 'they hold hands', the Latin passive form in *copulantur dexteras* 'they shake each other's right hands' (Baldi 1974: 17) or English unmarked intransitive verbs with the reciprocal meaning like *They hold/shake hands* mentioned in Wierzbicka (1980: 258).

The partitive object *za ruki* is a semantically and syntactically obligatory actant. Its deletion or replacement by the name of another body part rules out the reciprocal reading of a sentence. Thus, a sentence like (30) is understood in the true reflexive meaning only:

- (30) *Miš-a i Griš-a svvati-l-i-s' za golov-y (za
 M.-SG.NOM and G.-SG.NOM grasp.PFV-PAST-PL-REFL at head.F-PL.ACC at
 nog -i).
 leg.F-PL.ACC
 'Misha and Grisha each grasped his own head (leg).'*

Secondly, the properties of “possessive” reciprocals seem to be characteristic of collocations with the verb *obmenivat'sja* (*menjat'sja*, *obmenjat'sja*) ‘to exchange’ mentioned in this volume (Knjazev, Ch. 2, §3.2.2.3.). They refer to a symmetric situation in which there are two pairs of participants: (a) a recipient co-referential with the agent and (b) possessed entities changing their possessors; cf.:

- (31) *Miš-a s Griš-ej obmenja-l-i-s' fotografi-jami.
 M.-SG.NOM with G.-SG.INST exchange.PFV-PAST-PL-REFL photo-PL.INST
 'Misha and Grisha exchanged photos.'*

The meaning of this sentence can be rendered by a combination of two sentences with the non-reflexive base verb *obmenjat'* ‘to give and receive in return’:

- (32) a. *Miš-a obmenja-l svo-ju fotografi-ju na
 M.-SG.NOM exchange.PFV-PAST OWN-F.SG.ACC photo.F-SG.ACC for
 Griš-in-u.
 G.-POSS-F.SG.ACC
 'Misha exchanged his photo for Grisha's one.'*
- b. *Griš-a obmenja-l svo-ju fotografi-ju na
 G.-SG.NOM exchange.PFV-PAST OWN-F.SG.ACC photo.F-SG.ACC for
 Miš-in-u.
 M.-POSS-F.SG.ACC
 'Grisha exchanged his photo for Misha's.'*

The Russian non-reflexive verb *obmenjat'*, unlike its nearest English counterpart *to exchange*, does not permit overt designation of the second possessor and, besides, the names of possessed entities are not interchangeable. Thus there are no arguments linked by the symmetric relation in constructions such as (32).

The verb *obmenivat'sja* ‘to exchange’ easily combines with abstract nouns, too. Such collocations appear to be similar in meaning to corresponding reciprocal constructions of various diathesis types; cf.:

- (33) a. *Oni obmenja-l-i-s' pocelu-jami.
 they.NOM exchange.PFV-PAST-PL-REFL kiss-PL.INST
 lit. 'They exchanged kisses.'*
- b. *Oni pocelova-l-i drug drug-a
 they.NOM kiss.PFV-PAST-PL each.NOM other-ACC
 'They kissed each other.'*

- (34) a. *Oni obmenja-l-i-s' ulybk-ami.*
 they.NOM exchange.PFV-PAST-PL-REFL smile-PL.INST
 lit. 'They exchanged smiles.'
- b. *Oni ulybnu-l-i-s' drug drug-u.*
 they.NOM smile.PFV-PAST-PL-REFL each-NOM other-DAT
 'They smiled at each other.'
- (35) a. *Oni obmenja-l-i-s' podark-ami.*
 they.NOM exchange.PFV-PAST-PL-REFL present-PL.INST
 lit. 'They exchanged presents.'
- b. *Oni sdela-l-i drug drug-u podark-i.*
 they.NOM make.PFV-PAST-PL each other-DAT present-PL.ACC
 'They gave presents to each other.'

4. Multiplicative reciprocals marked by the confix *pere...-sja*

4.1 General characteristics

The term "multiplicative reciprocals" refers to a group of reflexive reciprocals (mentioned in 2.3) which are formed with the help a complex marker composed, apart from the reflexive postfix *-sja*, of the prefix *pere-* and the suffix *-(y)va-*; cf.:

- (36) *gljadet'* 'to look' – *pere-gljad-yva-t'-sja* 'to exchange glances.'

Derived multiplicative reciprocals designate actions composed of an indefinite number of uniform (micro)actions associated with (at least) two participants, each playing two roles in the event: each participant is both an agent of the (micro)action and also its addressee.⁵ These derivatives, thus, combine the reciprocal and the multiplicative meanings; cf.:

- (37) *Soldat-y korotko pere-govar-iva-l-i-s'.*
 soldier-PL.NOM briefly PREF-speak-IPFV-PAST-PL-REFL
 'The soldiers were exchanging brief remarks.'

As for the input of the prefix *pere-* in the meaning of multiplicative reciprocals, it should be noted that there are some similarities between the latter and the other two meanings: (a) the basic spatial meaning of the prefix *pere-*, which is to signal a change of position in space, e.g. *brošit'* 'to throw' – *pere-brošit'* 'to throw over sth' and (b) the distributive meaning, when an action is presented as a single whole but with an internal structuring, i.e. it either affects several objects one after another or is performed by several agents one after another. The meanings of reciprocity and distributiveness easily combine with each other; cf.:

5. Multiplicative reciprocals are a subtype of a wider class of Russian grammatical multiplicatives with complex formants comprised of various prefixes (*po-*, *na-*, *vy-*, etc.) and the suffix *-va-*. These verbs express the multiplicative meaning accompanied by a number of additional semantic features (see Knjazev 1989b: 134–5). The reflexive postfix *-sja* takes part in derivation of multiplicative reciprocals only.

- (38) *Pap-a pere-celova-l nas tro-ix, potom*
 daddy-SG.NOM DISTR-kiss-PAST.SG.M WE.ACC three-GEN then
objna-l mam-u. (V. Belov)
 embrace.PFV-PAST.SG.M mummy-SG.ACC
 ‘Daddy kissed the three of us and then hugged mummy.’

4.2 Diathesis types

In Russian there are about 20 reciprocals of this type. Verbs which permit derivation of multiplicative reciprocals are varied both in syntax and semantics. They are:

(a) Transitive verbs:

- (39) *branit’* ‘to scold’ – *pere-bran-iva-t’-sja* ‘to squabble’
brostat’ ‘to throw’ – *pere-bras-yva-t’-sja* ‘to throw to one another repeatedly’
govorit’ ‘to speak’ – *pere-govar-iva-t’-sja* ‘to exchange words’
kidat’ ‘to throw’ – *pere-kid-yva-t’-sja* ‘to throw to one another’
kričat’ ‘to shout’ – *pere-krik-iva-t’-sja* ‘to shout to one another’
pisat’ ‘to write’ – *pere-pis-yva-t’-sja* ‘to exchange letters’
rugat’ ‘to abuse’ – *pere-rug-iva-t’-sja* ‘to hurl abuse at each other.’

(b) Intransitive two-place verbs:

- (40) *gljadet’* ‘to look’ – *pere-gljad-yva-t’-sja* ‘to exchange glances’
šeptat’ ‘to whisper’ – *pere-šept-yva-t’-sja* ‘to whisper to each other’
zvonit’ ‘to phone’ – *pere-zvan-iva-t’-sja* ‘to phone each other from time to time’
migat’ ‘to wink’ – *pere-mig-iva-t’-sja* ‘to exchange winks’
streljat’ ‘to fire’ – *pere-strel-iva-t’-sja* ‘to exchange fire’
stučat’ ‘to tap’ – *pere-stuk-iva-t’-sja* ‘to communicate by tapping’
svistet’ ‘to whistle’ – *pere-svist-yva-t’-sja* ‘to whistle to each other.’

(c) Intransitive one-place verbs:

- (41) *smejat’sja* ‘to laugh’ – *pere-sme-iva-t’-sja* ‘to glance at each other and chuckle’
šutit’ ‘joke’ – *pere-šuč-iva-t’-sja* ‘to exchange jokes.’

From the lists presented above it can be seen that derived multiplicative reciprocals undoubtedly imply the presence of an addressee and convey the idea of an exchange of things or information.

Taking into account the correlations between the arguments of multiplicative reciprocals (which turn out to be cross-coreferential) and of their base verbs, we may regard reciprocals of groups (b) and (c) as indirect reciprocals; cf.:

- (42) a. *On často zvon-it podrug-e.*
 he.NOM often phone.IPFV-3SG.PRES girl-friend.F-SG.DAT
 ‘He often phones his girl-friend.’
 b. *Oni často pere-zvan-iva-jut-sja.*
 they.NOM often PREF-phone-IPFV-3PL.PRES-REFL
 ‘They often phone up *each other*.’

As for group (a), it includes both indirect, as in (37), and direct reciprocals, as in (43):

- (43) a. *Ona bran-it sosed-a.*
 she.NOM scold.IPFV-3SG.PRES neighbour.M-SG.ACC
 ‘She is scolding her neighbour.’
- b. *Ona pere-bran-iva-et-sja s sosed-om.*
 she PREF-SCOLD-IPFV-3SG.PRES-REFL with neighbour-SG.INST
 ‘She is squabbling with her neighbour.’

4.3 Comparison with other multiplicatives

Multiplicative reciprocals may be subdivided into two groups: (a) those derived from lexical multiplicatives, e.g. *stučat* ‘to tap’ – *perestukivat’sja* ‘to communicate by tapping’, and (b) those in whose meaning the multiplicative semantic component is gained due to the change of roles between the participants, e.g. *gljadet* ‘to look’ – *peregljadyvat’sja* ‘to exchange glances repeatedly’, *šutit* ‘to joke’ – *perešučivat’sja* ‘to exchange jokes’. Almost all multiplicative reciprocals (as is characteristic of multiplicatives in general) refer to easily perceptible situations that take place at relatively narrow temporal intervals. An exception are the verbs *perepisyvat’sja* ‘to exchange letters’ and *perezvanivat’sja* ‘to phone each other from time to time’ referring to habitual actions over an extended period of time.

An overwhelming majority of underived lexical multiplicatives in Russian (including those of the type *migat*’ or *stučat*’, which permit derivation of multiplicative reciprocals) have semelfactive counterparts with the suffix *-nu-* referring to a single event:

- (44) a. *mig-a-t’* ‘to wink (repeatedly)’ – b. *mig-nu-t’* ‘to wink (once).’

As well as underived multiplicatives, some multiplicative reciprocals may also have counterparts with the suffix *-nu-*; e.g.:

- (45) a. *peremig-iva-t’sja* ‘to wink at each other (repeatedly)’
 b. *peremig-nu-t’sja* ‘to wink at each other (once).’

The verb under (45a) refers to a temporally unrestricted sequential interchange of winks while the verb under (45b) refers to a single interchange. Consequently, the meaning of (46a) with the semelfactive reciprocal verb is semantically equivalent to the pair of sentences (b) and (c) containing non-reciprocal semelfactive verbs:

- (46) a. *On pere-mig-nu-l-sja s sosed-om.*
 he PREF-wink-PFV-PAST-REFL with neighbour-SG.INST
 lit. ‘He exchanged winks his neighbour.’
- b. *On mig-nu-l sosed-u.*
 he wink-PFV-SG.M.PAST neighbour.M-SG.DAT
 ‘He winked at his neighbour.’
- c. *Sosed mig-nu-l emu.*
 neighbour.M.SG.NOM wink-PFV-SG.M.PAST he.DAT
 ‘His neighbour winked at him.’

Since the suffix *-va-* is, in principle, a replaceable constituent part of this complex formant and is often interchangeable with the semelfactive suffix *-nu-*, derivation of these verbs may be seen as a two-stage process: the combination *pere-...-sja* contributes the reciprocal

component of their meaning while the suffix (*-va-* or *-nu-*) adds either the multiplicative or semelfactive aspectual component.

4.4 Comparison with other reflexive reciprocals

It is worth noting that multiplicative reciprocals unequivocally express the reciprocal meaning only, whereas reciprocals marked by the reflexive postfix alone easily appear in the absolutive use (see 3.1.2).

Thus sentence (47) with a plain reflexive reciprocal permits two readings depending on whether the carpenters are both agents and patients of abusing (reciprocal reading) or they serve as patients only (anti-accusative “object-demotion” reading); cf.:

- (47) *On ruga-l-sja s plotnik-ami.*
 he.NOM swear.IPFV-PAST-REFL with carpenter-PL.INST
 i. ‘He and the carpenters were swearing at *each other*’ (reciprocal)
 ii. ‘He was swearing at the carpenters’ (deaccusative)

Meanwhile, the only possible interpretation for (48) with the corresponding derived multiplicative reciprocal is reciprocal:

- (48) *On pere-rug-iva-l-sja s plotnik-ami.*
 he PREF-SWEAR-IPFV-PAST-REFL with carpenter-PL.INST
 ‘He and the carpenters were swearing at *each other*.’
 or: ‘He exchanged abuses with the carpenters.’

5. The reflexive pronoun *sebjja* in the reciprocal collocation *meždu soboj* lit. ‘between selves’

The autonomous (“heavy”) reflexive pronoun *sebjja* ‘oneself’ is only used to signal reciprocity in the fixed collocation *meždu soboj* lit. ‘between [our-/your-/them]selves’ and in its shortened form *mež soboj*. It should be noted that similar collocations repeatedly occur across languages and that the preposition *meždu* ‘between’ in itself is a lexical reciprocal (this vol., Ch 2, §3.2.2.2).

In comparison with the reciprocal pronoun *drug druga* (see Section 7 below), the collocation *meždu soboj* displays a number of peculiarities. There are several notable distinctions between them.

5.1 Type of reciprocal construction

The pronoun *drug druga* ‘each other’ is not compatible with predicates that occur in simple reciprocal constructions only, such as *različat’* ‘to distinguish’ (vt), *raz”edinjat’* ‘to disconnect’ (vt), *razdeljat’* ‘to divide’ (vt) and their reflexive anticausative counterparts *različat’ sja* ‘to distinguish’ (vi), *raz”edinjat’ sja* ‘to disconnect’ (vi), *razdeljat’ sja* ‘to divide’ (vi) (see also 7.1.3). The collocation *meždu soboj* does not share this feature. Its occur-

rence, on the opposite, tends to be confined to predicates allowed in simple reciprocal constructions.

As a consequence, the collocation *mež soboj* in the following fragment of Pushkin's "Jevgenij Onegin" is not interchangeable with *drug druga*:

- (49) a. *Voln-a i kamen', stix-i i proz-a,*
 wave.F-SG.NOM and stone.M.SG.NOM verse-PL.NOM and prose.F-SG.NOM
led i plamen' ne stol' različn-y mež sob-oj.
 ice.M.SG.NOM and fire.M.SG.NOM not so different-PL between self-INST
 lit. 'Wave and stone, verse and prose, ice and fire are not so different between themselves.'
- b. ... **različn-y drug ot drug-a.*
 different-PL each from other-GEN
 lit. '... *different from each other.'

And on the contrary, the verbs *otličat'* 'to distinguish' (vt) and *otličat'sja* 'to differ from' (vi) that are used in discontinuous reciprocal constructions only do not permit *meždu soboj* instead of *drug druga*, as in the following example (see also Knjazev, Ch 2, §4.1.3.):

- (50) *On ne otliča-et zolot-o i med' drug*
 he.NOM not distinguish.IPFV-3SG.PRES gold.N-SG.ACC and copper.F.SG.ACC each
ot drug-a.
 from other-GEN
 lit. 'He does not distinguish gold and copper from each other.'

Predicates which can be used in reciprocal constructions of both types are compatible with both pronominal reciprocal collocations; cf.:

- (51) *Oni poxož-i drug na drug-a (= meždu sob-oj).*
 they.NOM similar-PL each at other-ACC between self-INST
 lit. 'They look like each other.'

5.2 Meaning of the predicate

It seems that the occurrence of *meždu soboj* is mostly, if not always, confined to lexical reciprocals and their derivatives (see Yomdin 1981:103–4). Sentences (49) and (51) contain lexical reciprocals; sentence (52) allows inclusion of either the plain reflexive reciprocal *rugat'sja* 'to abuse each other' (see 3.1.1) or the reflexive anticausative *ssorit'sja* 'to quarrel' derived from the lexical reciprocal *ssorit'* 'to cause sb to quarrel' which is used in (53).

- (52) *Oni postojanno ruga-jut-sja i ssor-jat-sja*
 they.NOM always abuse.IPFV-3PL.PRES-REFL and quarrel.IPFV-3PL.PRES-REFL
meždu sob-oj.
 between self-INST
 'They are always swearing and quarrelling between themselves.'
- (53) *Ix peressori-l-i meždu sob-oj.*
 they.ACC make.quarrel.PFV-PAST-PL between self-INST
 'They were set at variance between themselves.'

These examples show, also, that *meždu soboj* occurs both in subject-oriented and object-oriented reciprocal constructions.

It seems reasonable to assume that the primary function of the collocation *meždu soboj* is to fill up the syntactic position of the second participant of a reciprocal situation described and thus to indicate that there are no other implied uncoded participants. In fact, the collocation *meždu soboj* is sometimes employed to emphasize this sense as opposed to “with someone else”; cf.:

- (54) *Kazaxsk-ij jazyk sta-l gosudarstvenn-ym, no*
 K.-M.SG.NOM language.SG.NOM become.PFV-SG.PAST state-SG.INST but
kazax-i, živ-ušč-ie v gorod-e, počti vs-e daže
 Kazakh-PL.NOM live.IPFV-ACT-PL.NOM in town.M-SG.LOC almost all-PL.NOM even
meždu sob-oj gov-or-jat po-russki. (Argumenty i fakty, 1996, 3)
 between self-INST speak.IPFV-3PL.PRES Russian
 ‘The Kazakh language has become the state language but almost all Kazakhs living in towns speak Russian to each other’ (lit. ‘between themselves’).

In this case, semantic restrictions on the use of *meždu soboj* seem to be somewhat less rigid: the verb *govorit* ‘to speak’, in contrast to *razgovarivat* ‘to talk’ can hardly be regarded as a lexical reciprocal.

5.3 Number of participants

The use of *meždu soboj* is sensitive to the number of participants of a reciprocal situation. Generally speaking, this collocation can refer to situations associated with both two participants and multiple participants; cf.:

- (55) a. *Et-i dv-a ugl-a ravn-y meždu sob-oj.*
 this-PL.NOM two-M.PL.NOM angle-SG.GEN equal-PL.NOM between self-INST
 ‘These two angles are equal to each other.’
 b. *Vs-e prjam-ye ugl-y ravn-y meždu sob-oj.*
 all-PL.NOM right-PL.NOM angle.M-PL.NOM equal-PL.NOM between self-INST
 ‘All right angles are equal to each other’ (lit. ‘between themselves’).

If, however, the predicate is predisposed to denote situations with only two participants, its co-occurrence with *meždu soboj* apparently turns out to be awkward; cf.:

- (56) **Oni pocelova-l-i-s’ (poznakomi-l-i-s’, poženi-l-i-s’)*
 they.NOM kiss.PFV-PAST-PL-REFL acquaint.PFV-PAST-PL-REFL marry.PFV-PAST-PL-REFL
meždu soboj.
 between self-INST
 lit. ‘*They kissed (got acquainted, married) between themselves.’

Elimination of such quantitative restrictions (for example, by virtue of the addition of a distributive sense) would make these combinations quite possible; cf.:

- (57) *Oni vs-e pere-celova-l-i-s' (pere-znakomi-l-i-s',*
 they.NOM all-PL.NOM DISTR-KISS-PAST-PL-REFL DISTR-acquaint-PAST-PL-REFL
pere-ženi-l-i-s') *među soboj.*
 DISTR-marry-PAST-PL-REFL between self-INST
 'They all kissed (got acquainted, intermarried) *between themselves*.'

6. Verbs of joining and separating

6.1 General characteristics

The meanings of joining and separating are inherently reciprocal and are expressed, in the first place, by a number of lexical reciprocals (see Knjazev, Ch. 2, §3.2.1.). Besides, in Russian (like in all other Slavic languages) there exist two antonymous prefixes *s-* (*so-*) and *raz-* (*razo-*, *ras-*) whose primary function is to indicate these two meanings, respectively. A distinctive feature of prefixed verbs of joining and separating is that their marking pattern depends on whether the base verb is transitive or not. Intransitive verbs take the prefix combined with the reflexive postfix *-sja*, while transitive verbs take the prefix without *-sja* and retain their transitivity; cf.:

- (58) a. *polzti* (vi) 'to crawl'
 → i. *s-polzti-s'* (vi) 'crawl to one point from different points'
 → ii. *ras-polzti-s'* (vi) 'to crawl away from one point in many directions.'
 b. *gnat'* (vt) 'to drive'
 → i. *so-gnat'* (vt) 'to drive to one point from different points'
 → ii. *razo-gnat'* (vt) 'to drive away from one point in many directions.'

Other prefixes, for example *vy-* 'out', do not cause such an effect; cf.:

- (59) a. *polzti* (vi) 'to crawl' – *vy-polzti* (vi) 'to crawl out'
 b. *gnat'* (vt) 'to drive away' – *vy-gnat'* (vt) 'to turn out.'

6.2 Spatial joining and separating

Derived prefixed verbs designating spatial joining and separating occur in two semantic subtypes.

6.2.1 "Free" ("non-fixed") adjoining

This is a label denoting the subtype of joining or separating in which the participants retain their autonomy; cf.:

- (60) a. *Polici-ja razo-gna-l-a tolp-u.*
 police-SG.NOM DVRS-drive-PAST-F.SG crowd.F-SG.ACC
 'The police dispersed the crowd.'

- b. *Vorob'-i s-leta-l-i-s' sjuda každyj večer.*
 sparrow-PL.NOM CISL-fly.IPFV-PAST-PL-REFL here every-M.SG.ACC
 evening.M.SG.ACC
 'Sparrows used to gather here every evening.'

These verbs denote situations associated with indefinitely multiple participants and thus are hardly compatible with the enumeration or exact numerical specification. This is illustrated by ungrammaticality of (61b) in contrast to the quite acceptable (61a):

- (61) a. *On raz-brosa-l igrušk-i.*
 he.NOM DVRS-throw-M.SG.PAST toy-PL.ACC
 'He scattered the toys.'
 b. [?]*On raz-brosa-l pjat' igrušek.*
 he.NOM DVRS-throw-PAST five toy.PL.GEN
 lit. 'He scattered five toys.'

6.2.2 "Fixed" adjoining

This is the case of correlations such as given below where (62) contains transitive verbs:

- (62) *kovat'* 'to forge' (vt) → i. *s-kovat'* 'to forge together' (vt)
 → ii. *ras-kovat'* 'to unforge' (vt)
plesti 'to weave' (vt) → i. *s-plesti* 'to weave together' (vt)
 → ii. *ras-plesti* 'to unweave' (vt)
kleit' 'to glue, stick' (vt) → i. *s-kleit'* 'to glue/stick together' (vt)
 → ii. *ras-kleit'* 'to unstick' (vt)

and (63) includes intransitives:

- (63) *rasti* 'to grow' (vi) → *s-rasti-s'* 'to grow into one' (vi)
merznut' 'to freeze' (vi) → *s-merznut'-sja* 'to freeze into a lump' (vi).

Strictly speaking, what these verbs signal is not simply a movement but rather a physical action accompanied by movement resulting in fixed and stable joining of entities or in breaking off of the latter. Unlike the previous group, they are typically associated with two participants that easily permit enumeration; cf.:

- (64) *Et-i dv-a derev-a s-ros-l-i-s'.*
 these two-N.NOM tree.N-SG.GEN CISL-grow-PAST-PL-REFL
 'These two trees have grown into one.'

As is shown in this volume (Knjazev, Ch. 2, §3.2.1), the prefixes *s-* and *raz-* are commonly attached to verbs that designate spatial joining and separating by themselves. Prefixed forms of these verbs, in which the meaning of a prefix parallels the sense of the base verb are far more commonly used than prefixless ones; cf.:

- (65) a. *vjazat'* (IPFV) 'to tie/bind' → *s-vjazat'* (PFV) → *s-vjaz-yva-t'* (PFV) 'to tie/bind together'
 b. *mešat'* (IPFV) 'to mix' → *s-mešat'* (PFV) → *s-meš-iva-t'* (IPFV) 'to mix together'
 c. *delit'* (IPFV) 'to divide' → *raz-delit'* (PFV) → *raz-del-ja-t'* (IPFV) 'to divide up.'

It should be added that a number of widely used verbs either lack prefixless counterparts or diverge from them in meaning (Ch. 2, §3.2.1.3).

6.3 Inter-personal relations

Russian also has a specific group of verbs derived by means of the confix *s-...-sja* and referring to certain kinds of interpersonal relations implying achievement of mutual consent; cf.:

- | | | | |
|------|---------------------------|---|--|
| (66) | <i>govorit'</i> 'to talk' | → | <i>s-govorit'-sja</i> 'to reach an understanding by talking' |
| | <i>zvonit'</i> 'to phone' | → | <i>so-zvonit'-sja</i> 'to get in touch over the telephone' |
| | <i>pisat'</i> 'to write' | → | <i>s-pisat'-sja</i> 'to get in touch by correspondence' |
| | <i>rabotat'</i> 'to work' | → | <i>s-rabotat'-sja</i> 'to achieve harmony in joint work' |
| | <i>igrat'</i> 'to play' | → | <i>s-ygrat'-sja</i> 'to make a good ensemble' |
| | <i>pet'</i> 'to sing' | → | <i>s-pet'-sja</i> 'to achieve harmony in singing together.' |

- (67) *My sume-l-i s-pisa-t'-sja, so-zvoni-t'-sja i*
 we.NOM manage.PFV-PAST-PL CISEL-write-INF-REFL CISEL-phone-INF-REFL and
reši-l-i sobra-t'-sja u nas na Issyk-Kul-e. (Č. Ajtmatov)
 decide-PAST-PL gather-INF-REFL at we.LOC on I.-K.-SG.LOC
 'We managed to *get in touch by correspondence and phone* and decided to gather at our place at the Issyk-Kul.'

What these verbs denote is a complex joint activity of a number of persons resulting in establishing or keeping up their contacts. It is worth noting that the most abstract verbs of motion, viz. *sojtis'* 'to come to one point from various points' and *razojtis'* 'to go away from one point in various directions, disperse', follow this metaphorical pattern, too (see Knjazev, Ch 2, §§3.1.1.1, 3.3.1.1). In addition to the cases demonstrated for lexical reciprocals, the following line from a song may be cited in which the verb *razojtis'* is used in both senses:

- (68) *My razo-š-l-i-s', kak v mor-e korabl-i.*
 we DVRS-go-PAST-PL-REFL as in sea.N-SG.LOC ship.M-PL.NOM
 'We have parted *from each other* like ships at sea.'

6.4 Relationship with reflexive anticausatives

By virtue of the additional marking of derivatives from intransitive verbs by the reflexive postfix *-sja*, one would not hesitate to distinguish between verbs derived from transitives and from intransitives. Nevertheless, it is not always easy to draw a borderline between them. This is due to the fact that transitive causative verbs of joining and separating themselves easily attach the reflexive postfix functioning in that case as an anticausative (or autocausative) marker; cf.:

- | | | | |
|------|--|---|--|
| (69) | <i>s-plesti</i> (vt) 'to weave <i>together</i> ' | → | <i>s-plesti-s'</i> (vi) 'to become interwoven' |
| | <i>s-tolknut'</i> (vt) 'to bring into contact' | → | <i>s-tolknut'-sja</i> (vi) 'to collide' |
| | <i>raz-vjazat'</i> (vt) 'to untie/undo' | → | <i>raz-vjazat'-sja</i> (vi) 'to come undone.' |

Since in derivatives in *-sja* such as these the causative component in the meaning of the base verb is eliminated or somehow altered (Knjazev, Ch. 2, §4.2.1.1), they turn out to be very close semantically to the verbs of joining and separating derived immediately from intransitive verbs by attaching a complex marker containing *-sja*. Both types of derivatives may be used to designate the same situation as in the following example where *sobrat'sja* 'to gather/assemble' (vi) is the intransitive reflexive counterpart to the transitive verb *sobrat* 'to gather/assemble (vt)' whereas *s'exat'sja* is derived by adding the complex marker *s-...-sja* to the intransitive verb *exat* 'to come/go (by conveyance)'; cf.:

- (70) *V izb-e sobra-l-i-s' bratc-y,*
 in cottage.F-SG.LOC gather.PFV-PAST-PL-REFL brother-PL.NOM
s'exa-l-i-s' s xutor-ov. (B. Pil'njak)
 CISL-go.PFV-PAST-PL-REFL from farmstead-PL.GEN
 'Brothers have gathered in the cottage, they have come *together* from their farmsteads.'

6.5 Relationship with reciprocals and sociatives

The position of verbs of joining and separating following this marking pattern with respect to reciprocals and sociatives is far from being clear. Mrázek (1988: 115) regards them as a peculiar sort of reciprocity going over to denoting collective actions, whereas Sheljakin (1991: 322) unreservedly calls them a particular variant of reflexive reciprocals.

Without getting into a discussion of the borderline between reciprocal and collective (sociative) situations, I shall proceed from Kemmer's (1988: 133) proposal according to which the most important difference between the two is that "the two roles played by each participant in the collective event are both Initiator roles: each participant is an Agent and also a "companion" of the other participant (or participants, in the case of the collective). None of the participants serve as an Endpoint; thus affectedness is not relevant as it is with situation types falling under the reciprocal proper".⁶

From this point of view, the verbs of joining and separating denoting spatial relatedness should be regarded as collective (sociative) predicates, while those denoting interpersonal relations appear as reciprocals proper.

We may, therefore, assume that the reflexive verbs of joining and separating demonstrate an exceptional case of a marker morphologically related to reflexives which is used to designate both reciprocal and collective situations.

These verbs, besides (or may be in the first place), are involved in the area of verbal plurality (see Dressler 1968), being the means of expression of diversative and cislocative situations similar to distributive situations (Xrakovskij 1989: 34–40; Knjazev 1989b: 137–8). The two meanings are repeatedly combined in a sentence; cf.:

6. Kemmer (1988: 58–65) uses the terms Initiator and Endpoint as generalizations over the cases of Agent-Patient and Experiencer-Stimulus co-reference in both cases of two-participant relations.

- (71) *Mužik-i po-raz”exa-l-i-s’, kto v Novosibirsk,*
 peasant-SG.NOM DISTR-DVRS-go-PAST-PL-REFL who.NOM to Novosibirsk.ACC
kto v Kuzneck, kto v Prokop’evsk. (I. Erenburg)
 who.NOM to Kuzneck.ACC who.NOM to Prokop’evsk.ACC
 ‘The peasants went away, some to Novosibirsk, some to Kuzneck, others to Prokopjevsk.’

7. Reciprocal pronouns *drug druga* ‘each other’ and *odin drugogo* ‘one another’

In Russian, there are two pronominal collocations functioning as anaphoric reciprocal pronouns, viz. *drug druga* lit. ‘other [the] other’ and *odin drugogo* lit. ‘one another’ (see Buslaev 1958 (1881):400–2; Roslovec 1964:179–89; Janko-Trinickaja 1975:68–71). The latter is far less common than the former.

7.1 The pronoun *drug druga* ‘each other’

The anaphoric reciprocal pronoun *drug druga* is the main and, in most cases, the only possible way of signalling the reciprocal reading of a sentence. It is employed as an indivisible collocation whose elements coincide with the case forms of the word *drug* ‘friend’ but are traced historically (just as the latter noun itself) to the so called “short” forms of the adjectival pronoun *drugoj* ‘other, another’ which have gradually fallen out of use. Native speakers of Russian interpret this collocation as a reduplication of the noun *drug* ‘friend’.

This pronoun has oblique case forms concurring with those of the word *drug* ‘friend’ but lacks the nominative case form and all plural forms being in this respect similar to the reflexive pronoun *sebjā* (see Section 3.1.); cf. *drug druga-a* (ACC) in (5), (21), (31), *drug druga-u* (DAT) in (34), (35), (72), *drug drugom* (INST) in (31), *drug o druga-e* (LOC) in (73).

- (72) a. *On pomoga-et syn-u.*
 he.NOM help.IPFV-3SG.PRES SON.M-SG.DAT
 ‘He helps his son.’
 b. *Oni pomoga-jut drug druga-u*
 they.NOM help.IPFV-3PL.PRES each other-DAT
 ‘They help *each other*.’
- (73) a. *On дума-et tol’ko o seb-e.*
 he.NOM think.IPFV-3SG.PRES only of self-LOC
 ‘He thinks only of himself.’
 b. *Oni vseгда дума-jut drug o druga-e.*
 they.NOM always think.IPFV-3SG.PRES each of other-LOC
 ‘They always think *of each other*.’
- (74) a. *On доволен svo-im syn-om.*
 he.NOM pleased.SG.M OWN-M.SG.INST SON-SG.INST
 ‘He is pleased with his son.’
 b. *Oni доволен-y drug drug-om.*
 they.NOM pleased-PL each other-INST
 ‘They are pleased *with each other*.’

These examples show that, firstly, both the preposition and the case inflexion are attached to the second part of the collocation, while its first part remains invariable, and, besides, the form of the pronoun *drug druga* duplicates the form which would be assumed by the object naming the second participant of the relationship described.

It should be added that in informal speech there occurs an expressive form of the reciprocal pronoun with the suffix *-k-* used to derive diminutive or hypocoristic nouns (e.g. *svin'ja* 'pig' – *svin-k-a* 'piggy'), which confirms the re-interpretation of the collocation as a denominal derivative from the noun *drug* 'friend'; cf.;

- (75) *Vne detdom-a oni vseгда prixod-jat drug druž-k-e na*
 outside orphanage-SG.GEN they.NOM always come-3PL.PRES each other-DIM-DAT to
pomošč. (V. Šefner)
 aid.F.SG.ACC
 'Outside the orphanage, they always come to *each other's* aid.'

This form in *-k-* is only employed in the reciprocal pronoun. The noun *drug* assumes a slightly different diminutive form: *družok* (NOM), *družku* (DAT), etc. (cf., however, *druž-k-a* 'best man' (at a traditional wedding)).

7.1.1 Diathesis types

There seem to be no restrictions on occurrence of the pronoun *drug druga* in reciprocal constructions of various diathesis types. It can be used in reciprocal constructions of all the basic types. They may be both subject-oriented, as in the examples given above, and object-oriented, as in (76):

- (76) a. *On postavi-l jaščik na pol.*
 he put.PFV-3SG.PAST box.M.SG.ACC on floor.SG.ACC
 'He put the box on the floor.'
 b. *On postavi-l jaščik-i drug na drug-a.*
 he put.PFV-3SG.PAST box.M-PL.ACC each on other-ACC
 'He put the boxes *one upon another*.'

Subject-oriented reciprocal constructions with the pronoun *drug druga* may be either of the direct ("canonical") type, as in (5), or of the indirect ("indirect") type, as in (72)–(75), depending on whether the second cross-coreferential actant is a direct or an indirect object.

The pronoun *drug druga* also occurs in "possessive" reciprocal constructions to describe situations in which there are two pairs of arguments cross-coreferential to each other: (a) a subject and an object, the latter covering the roles of patient, recipient or beneficiary; and (b) two "possessed" entities (in the broad sense), which may be regarded as inalienable or alienable property, i.e. body parts, something in contact with or on its "possessor", etc. "Possessive" reciprocal constructions can also be subdivided into the direct and indirect subtypes on the same grounds as simple subject-oriented constructions, cf. (77) and (78) respectively:

- (77) *Oni podelova-l-i-s', a potom kartinn-o, krest-nakrest podelova-l-i*
 they kiss.PFV-PAST-PL-REFL and then picture-ADV cross-wise kiss.PFV-PAST-PL
drug drug-u ruk-i. (V. Kaverin)
 each other-DAT hand-PL.ACC
 'They kissed *each other* and then kissed *each other's* hands like in a picture.'
- (78) *Gost-i, stara-ja-s' ne tolka-t'-sja i ne nastupi-t' drug*
 guest-PL.NOM try-CONV-REFL not push-INF-REFL and not tread.PFV-INF each
drug-u na nog-i, speš-at v stolovu-ju. (A. Čexov)
 other-DAT on foot-PL.ACC hurry-3PL.PRES to dining-room-SG.ACC
 'The guests hurry into the dining-room, trying not to push *one another* and not to tread
 on *each other's* toes.'

7.1.2 The pronoun *drug druga* 'each other' in deagentive constructions

The term "deagentive constructions" was introduced by Grepl (1973: 143) to refer to constructions of which the common syntactic feature is the removal (deletion or demotion) of the surface subject resulting either in a number of subjectless constructions or in passive constructions. The pronoun *drug druga* occurs in subjectless constructions of all types characteristic of Russian,⁷ i.e. impersonal, as in (79), "indefinite-personal" as in (80), and "generalized-personal", as in (81):

- (79) a. *Mne xorošo s nim.*
 I.DAT well with he.INST
 'I am happy with him.'
- b. *Im xorošo drug s drug-om.*
 they-DAT well each with other-INST
 'They are happy with *each other*.'
- (80) a. *Ego obmanyva-jut.*
 he.ACC deceive.IPFV-3.PL.PRES
 lit. '[They] are deceiving him.'
- b. *Neprijatno, kogda drug drug-a obmanyva-jut.*
 unpleasant when each other-ACC deceive.IPFV-3PL.PRES
 lit. 'It is unpleasant when [people] deceive *each other*.'
- (81) a. *On mne nra-v-it-sja.*
 he.NOM I.DAT like.IPFV-3SG.PRES-REFL
 'I like him.'
- b. *Kogda drug drug-u nra-v-iš'-sja, xod-iš' vsjudu*
 when each other-DAT like.IPFV-2SG.PRES-REFL walk.IPFV-2SG.PRES everywhere
vmeste. (Ružička 1978:22)
 together
 'When [you] like *each other* you go everywhere together.'

7. These constructions have been discussed repeatedly; see, among others, Knjazev (1978); Bulygina & Shmelev (1990); Mel'čuk (1995 [1974]). They are so widely used in Russian that Babby (1975: 186) assumes "that the subject NP in the phrase-structure rules of Russian is optional, i.e. S → (NP) VP, as opposed to S → NP VP for English".

Irrespective of the form of the predicate, all these sentences denote events performed by implied personal subjects. In their reciprocal variants, inverse relations link the constituents of the implied group subject. In this respect, the reciprocal pronoun is similar to the Russian reflexive pronoun *sebjā* which can also be used in such constructions. In the course of discussing the syntactic properties of reflexivization in Russian, Paduceva (1985:195–7) included the above mentioned subjectless sentences into a wider group of constructions with “implied controllers” (Russian “podrazumevaemye”) which includes, besides, various infinitival and imperative constructions. The latter allow insertion of the pronoun *drug druga*, too; cf.:

- (82) *Dlja nas bol'sha-ja radost' snova vide-t' drug druga-a.*
 for we.GEN great-F.SG.NOM joy.F.SG.NOM again see.IPFV-INF each other-ACC
 ‘It’s a great joy for us to see *each other* again.’
- (83) *Ljub-ite drug druga-a.*
 love.IPFV-IMP.2PL each other-ACC
 ‘Love *each other*.’

As regards passive constructions, occurrence of the pronoun *drug druga* in a sentence seems to be governed, in the first place, by the syntactic position of the antecedent. In almost every case it is a subject noun phrase alone which is cross-coreferential with the pronoun;⁸ cf.:

- (84) *Tol'ko čto vs-jo by-l-o svjaz-an-o, prikov-an-o drug k drug-u.* (V. Kaverin)
 moment.ago all-N.SG.NOM be-PAST-N.SG bind-PASS-N.SG chain-PASS-N.SG each to other-DAT
 ‘Just a moment ago everything was bound, chained *together*.’
- (85) *Jaščik-ov mnogo, oni naval-en-y drug na drug-a.* (V. Kaverin)
 box-PL.GEN many they heap-PASS-PL each on other-ACC
 ‘There are many boxes here, they are heaped up *one upon another*.’

On the other hand, it is usually awkward to employ the pronoun in the position of an agentive complement of a passive construction. Sentence (86b) is ungrammatical or at least far less acceptable than its active counterpart under (86a):

- (86) a. *Oni rani-l-i drug druga-a.*
 they.NOM wound.PFV-PAST-PL each other-ACC
 ‘They wounded *each other*.’
- b. *?Oni by-l-i ran-en-y drug drug-om.*
 they be-PAST-PL wound.PFV-PASS-PL each other-INST
 lit. ‘They were wounded *by each other*.’

8. Russian constructions with *-n/-t* participles combine the functions of passive and resultative, the latter indicating states that result from a previous action (see Nedjalkov (ed.) 1988; Knjazev 1989a). The ambiguity of a participle does not affect its ability to collocate with the pronoun *drug druga* ‘each other’.

Nevertheless, the reciprocal pronoun is sometimes employed in this position when, for instance, the verb denotes an emotional attitude; cf.:

- (87) a. *Ona očarova-l-a mal'čik-a.*
 she.NOM charm.PFV-PAST-F.SG boy.M-SG.ACC
 'She charmed the boy.'
- b. *Oni očarova-l-i drug drug-a.*
 they.NOM charm.PFV-PAST-PL each other-ACC
 'They charmed *each other*.'
- c. *Oni by-l-i očarova-n-γ drug drug-om.*
 they be-PAST-PL charm.PFV-PASS-PL each other-INST
 lit. 'They were charmed *by each other*.'

7.1.3 Restrictions on usage

In addition to the above mentioned restrictions on the use in passive constructions, the reciprocal pronoun *drug druga* is subject to a number of other restrictions.

First, as is mentioned in 5.1 above, its occurrence is confined to predicates that can be used in discontinuous reciprocal constructions in which symmetric arguments differ in morphological coding. Predicates which lack this property and are thus only used in simple constructions, such as *razlišat'* (vt) 'to distinguish', *raz"edinjat'* (vt) 'to disconnect', *razdeljat'* (vt) 'to divide' do not occur with *drug druga*. Instead, they easily combine with another pronominal reciprocal collocation, viz. *među soboj*.

Besides, due to the lack of the nominative case form, *drug druga* cannot be employed either as a surface subject or as a predicative and, therefore, cannot serve as an equivalent of the English *each other* in sentences such as (88) from Lebeaux (1983:724) or (89) from Langendoen & Battistella (1982:172):

(88) *John and Bill were deciding what each other should do.*

(89) *The only people that the men recognized were each other.*

Finally, as it is shown in 3.2.3.1, the pronoun *drug druga* and the reflexive postfix *-sja* in the reciprocal meaning, are, as a rule, mutually exclusive in a sentence.

7.2 The pronoun *odin drugogo* 'one another'

In contrast to the pronoun *drug druga*, the pronominal collocation *odin drugogo* lit. 'one another', where the second component retains its full form (while in *drug druga* both components are 'short' forms of the same adjectival pronoun) has distinct plural and gender forms identical to those of the lexemes *odin* 'one' and *drugoj* 'another'; e.g. *odin drugogo* (M.SG.ACC), *odna druguju* (F.SG.ACC), *odni drugix* (PL.ACC), etc.

The pronouns *drug druga* and *odin drugogo* are regarded as synonymous (see Roslovec 1964:183). Nevertheless, the latter is most commonly used to describe non-prototypical reciprocal situations. The first to be mentioned are "chaining situations" (Lichtenberk 1985:24–28) or "linear configurations" (Fiengo & Lasnik 1973:453–5) de-

scribing situations that involve a kind of a chain of paired relations in an ordered series of participants (Kemmer 1988: 135); cf.:

- (90) *Po vs-em komnat-am čas-y odn-i za drug-imi*
 in all-PL.DAT room.F-PL.DAT clock-PL.NOM one-PL.NOM after another-PL.INST
prozvoni-l-i dvenadcat' i vs-jo umolk-l-o
 strike-PAST-PL twelve and all-N.SG.NOM be.silent.PFV-PAST-N.SG
opjat'. (A. Puškin)

again

'In all the room, the clocks struck twelve *one after another*, and everything lapsed into silence again.'

The interesting thing is that Mel'čuk (1995: 130) favours the rarely used *odin drugogo* over *drug druga* to designate a sequence of sounds; cf.:

- (91) *Poslyša-l-i-s' odin za drug-im tri krik-a.*
 hear.PFV-PAST-PL-REFL one.M.SG.NOM after another-SG.INST three shout.M-SG.GEN
 'Three shouts were heard *one after another*.'

Another frequently attested use of *odin drugogo* is for designating sets of situations emerging independently of each other, despite the fact that their participants are linked by inverse relations. This case may be exemplified by the following slightly adapted sentence from Roslovec (1964):

- (92) *Oni poklja-l-i-s' pogubi-t' odin drug-ogo.*
 they swear.PFV-PAST-PL-REFL ruin.PFV-INF one.M.SG.NOM another-M.SG.ACC
 'They swore to ruin *one another*.'

8. Sociative-comitative prefix *so-*

8.1 General characteristics

The sociative-comitative prefix *so-* has been inherited from Old Church Slavonic in which it was used to translate Greek words with the prefix *συν-* 'together, with', e.g. Russian *sočuvstvie* 'sympathy' – Greek *συμπαθεια*.

It differs from the overwhelming majority of Russian prefixes in some respects. Its most outstanding feature is that it does not affect verbal aspect: imperfective verbs are not perfectivized as is the case with the other prefixes (see Section 2.3); e.g. *upravljat'* (IPFV) 'to govern' – *so-upravljat'* (IPFV) 'to govern jointly'.⁹ It is noteworthy that the etymologically related prefix *s-* (see numerous examples in Section 6) does not share this peculiarity; e.g. *rezat'* (IPFV) 'to cut' – *s-rezat'* (PFV) 'to cut off'. In addition to this, the prefix *so-* freely combines not only with verbs, as is typical of Russian prefixes, but also with nouns

9. There is only one more prefix that shares this property, namely, *pred-* meaning 'in advance'; e.g.: *videt'* 'to see' – *pred-videt'* 'to foresee', *čuvstvoval'* 'to feel' – *pred-čuvstvoval'* 'to have a presentiment'.

and adjectives. In spite of being a loan translation, the prefix *so-* is still used to derive innovations and nonce words. A lot of old words with this prefix are current even now.

This prefix follows two main derivational patterns. First, it often combines, like an agglunative affix, with a word without affecting its grammatical properties. This is illustrated by the following examples:¹⁰

- | | | |
|---------------------------------------|---|---|
| (93) <i>razmyšlenie</i> ‘meditation’ | → | <i>so-razmyšlenie</i> ‘joint meditation’ |
| <i>pečalit’sja</i> ‘to be distressed’ | → | <i>so-pečalit’sja</i> ‘to be distressed together with sb’ |
| <i>avtor</i> ‘author’ | → | <i>so-avtor</i> ‘co-author.’ |

Words following this pattern sometimes have unpredictable restrictions on usage; thus the derivative from *graždanin* ‘citizen’ occurs, as E.Raxilina (p.c.) remarked, in plural form only, viz. *sograždane* ‘fellow citizens’, while its synonym *so-otečestvennik* (< *otečestvo* ‘fatherland’) is used freely in either number.

Further, the prefix *so-* together with a number of suffixes occurs as a part of certain complex formants; cf.:

- | | | |
|---|---|--|
| (94) <i>besed-ovat</i> ‘to have a talk’ | → | <i>so-besed-nik</i> ‘interlocutor’ |
| <i>služ-it</i> ‘to work’ | → | <i>so-služ-i-vec</i> ‘colleague’ |
| <i>kurs</i> ‘academic year’ | → | <i>so-kurs-nik</i> ‘fellow student’ |
| <i>butyl-ka</i> ‘bottle’ | → | <i>so-butyl’-nik</i> ‘drinking companion.’ |

These examples show that words in *so-* may be stylistically neutral or colloquial. Nevertheless, verbs denoting situations of everyday life such as *guljat* ‘to stroll’, *čitat* ‘to read’, *spat* ‘to sleep’, *igrat* ‘to play’ and the like do not take this prefix.

8.2 Semantic properties

Depending on the meaning of the base word, derivatives in *so-* designate either joint participation in an activity or the presence of a common feature in two or more participants.

Semantically, words in *so-* are as a rule subject-oriented, because the participants that carry out the same type of action or share the same property are the deep subjects in a situation. For example, the noun *soavtor* ‘co-author’ (← *avtor* ‘author’) implies that a book (or an article) has two or more authors but does not refer to an author of two or more books. There are, however, some exceptions. Thus, the syntactic term *sopodčinenie* ‘joint subordination’ (derived from *podčinenie* ‘subordination’) implies several items governed by one item and, thus, may be regarded as object-oriented.

Another semantic feature of a number words in *so-* is expression of the idea of disparity between the participants. The noun *součastnik* ‘accomplice’ (from *učastie* ‘participation’) is usually conceived as referring to a helper (in doing something illegal) and not to the main participant. An example of another variant of semantic shift is provided by verbs denoting emotional states; cf.:

10. The first two examples are borrowed from Uluxanov (1980:371).

- (95) *pereživat'* 'to take to one's heart' → *so-pereživat'* 'to take to one's heart someone else's troubles'
stradat' 'to suffer' → *so-stradat'* 'to have compassion'
čuvstvovat' 'to feel' → *so-čuvstvovat'* 'to sympathize.'

Besides, there is a lot of verbs with the prefix *so-* that could be treated as lexical reciprocals due to the fact that they are deponents or semi-deponents (see Ch. 2); cf. some of them:

- (96) *sovpadat'* 'to coincide with'
sootvetstvovat' 'to correspond/conform to, be in accordance'
soprikasat'sja 'to be contiguous, border on'
sosredotočivat' 'to concentrate'
sočetat', sovmeščat' 'to combine.'

9. Adjectives *vzaimnyj*, *obojudnyj* 'mutual, reciprocal' and their derivatives

This group of reciprocals comprises three types of items:

- the adjective *vzaimnyj* and its synonym *obojudnyj* both meaning 'mutual, reciprocal';
- their adverbial counterparts *vzaimno* and *obojudno* 'mutually, reciprocally';
- numerous compounds with the components *vzaimo-* and *obojudo-*; compare respectively:

- (97) a. *vzaimnoe uvaženie* 'mutual respect'
vzaimnye priglašenija 'mutual invitations'
 b. *vzaimno neperevodimyj* 'mutually untranslatable'
 c. *obojudovyygodnyj* 'mutually advantageous'
vzaimozamenjaemyj 'interchangeable'
vzaimosvjaz' 'interconnection, interrelation.'

Reciprocals of this group are often used in clusters of two or more, accompanied by reciprocals of other types; e.g.:

- (98) "Neposredstvenn-ye" *antonim-y* *vsegda vystupa-jut* *kak*
 immediate-PL.NOM antonym-PL.NOM always appear-3PL.PRES as
vzaimo-obuslovl-enn-ye *i* *vzaimo-zavisim-ye*

 love.IPFV-PAST-PL each other-ACC and cause.IPFV-PAST-PL mutual.F-SG.ACC
bol', iskrenne žela-ja drug drug-u dobr-a. (Ju. Lotman)
 pain.ACC sincerely wish.IPFV-CONV each other-DAT good.N-SG.GEN
 ‘Thus, what we become witnesses to, is not a conflict between kindness and malice but
mutual blindness of opposite cultures. The drama of the situation is intensified due to
 these two persons, who were speaking *mutually* untranslatable languages and were divided
 from *each other* by a wall of *mutual* misunderstanding, loved *each other* for some time and
 caused pain to *each other* although they sincerely wished *each other* well.’

All these words are far more likely to occur in formal than in informal style. Unlike in other Slavic languages, it seems impossible to say in Russian something like the following (Mrázek 1988: 128):

- (100) **Oni vzaimno ruga-jut-sja* (pere-gljad-yva-jut-sja).
 they mutually abuse.IPFV-3PL.PRES-REFL PREF-look-IPFV-3PL.PRES-REFL
 lit. *‘They are *mutually* scolding *each other* (exchanging glances).’

10. Russian reciprocals in comparison with other Slavic languages

As regards expression of reciprocity, the Slavic languages share two basic common properties. First, all of them use two kinds of means for this purpose, namely: (a) polysemous reflexive pronouns, clitics or affixes, and (b) a number of markers from *non-reflexive sources* such as the Polish adverbs *nawzajem* and *wzajemnie* ‘mutually’ or pronominal constructions of the type *jeden drugiego* ‘one another’; cf.:

- Polish (Macjusiović 1975: 143)
 (101) *Rozplącz-en-i lecz jedno o drug-im*
 separate.PFV-PASS-M.PL but one.N.SG.NOM about another-N.SG.LOC
pamięt-a.
 remember.IPFV-PRES.3PL
 ‘They are separated but remember *each other*.’

Secondly, in all the Slavic languages reflexive markers occur in two types of form that may be labelled “light” and “heavy” (Haiman 1983: 781–819), e.g. the Russian suffix *-sja* and the autonomous reflexive pronoun *sebjja* respectively, or the Polish reflexive clitic *się* (ACC-GEN) and its orthotonic variant *siebie*.

The main difference between Slavic languages lies in the “relative weight” of these three ways of expressing reciprocal semantics, viz. (a) reciprocal markers of non-reflexive origin, (b) “light” reflexive markers, and (c) “heavy” reflexive markers. From this viewpoint, we may distinguish between at least five different systems of marking the reciprocal meaning attested in the Slavic languages.

1. The first to be mentioned is the *Russian type* presented in this paper, whose peculiar feature is the absolute predominance of the non-reflexive means of rendering reciprocity. For the most part, this function is taken over by the pronominal collocation *drug druga* ‘each other’, whereas the set of reciprocals with the “light” reflexive marker is very limited in number (see 3.1.1). In its turn, the autonomous reflexive pronoun *sebja* cannot indicate reciprocity excepting its use in the fixed collocation *meždu soboj* lit. ‘between themselves’ (see Section 5).

This type is also characteristic of the other East Slavic languages, although they have retained a somewhat larger number of reflexive reciprocals in comparison with Russian; cf. Ukrainian *koxaty* ‘to love’ → *koxaty-sja* ‘to love each other’, Belorussian *vedati* ‘to know’ → *vedati-sja* ‘to know each other’, as in the following example:

- (102) *Pracava-l-i nu adn-ym zavodz-e, a ot že ne*
 work.IPFV-PAST-PL at one-M.SG.LOC factory.N-SG.LOC but not
veda-l-i-sja. (Kovaleva 1965:97)
 know.IPFV-PAST-PL-REFL
 ‘We worked at the same factory but did not know *each other*.’

In contrast to the East Slavic languages, the South and West Slavic languages seem to have no appreciable lexical restrictions on the reciprocal use of the “light” reflexive marker. This distinction is associated with a striking difference in the degree of structural separateness of these markers: while the East Slavic “light” reflexive markers have turned into verbal affixes occupying a fixed final position on a verb, in the other Slavic languages they have retained their original status of moveable clitics. Apart from this common feature, the latter group of Slavic languages is not uniform in respect of denoting reciprocal situations.

2. The exact opposite of the Russian type is the *Czech type* of correlation between reflexives and reciprocals which is characteristic of Czech and Slovak (see Mrázek 1988; Oravec 1982). Here the use of the reflexive markers for denoting reciprocity has been carried through almost completely. On the one hand, Czech (as well as most of the South and West Slavic languages) distinguishes between two case forms of the “light” reflexive/reciprocal marker, viz. between its direct (accusative) form *se* and its indirect (dative) form *si*. The choice between them depends on whether the subject is co-referential with a direct object, as in *praštit se* ‘to hit *oneself* / *each other*’ (Lichtenberk 1985:27), *milovat se* ‘to love *oneself* / *each other*’, *navštěvovat se* ‘to visit *each other*’, or with an indirect object, as in *říkat si* ‘to speak to *oneself* / *each other*’, *říkat si* ‘to hinder *oneself* / *each other*’. Compare two Russian sentences (a) and their translations into Czech (b):

- (103) a. *Nado poes-t’, – reši-l Zaxar.*
 necessary eat.PFV-INF decide.PFV-PAST.SG.M Z.NOM
 ‘I have to eat, Zaxar decided.’

- b. *Mě-l bych se najít-t, řek-l si*
 have-PAST.SG.M COND.1SG REFL.ACC eat.PFV-INF say.PFV-PAST.SG.M REFL.DAT
Zaxar.
 Z.NOM
 ‘I have to eat, Zaxar said to himself.’
- (104) a. *Vstřeti-l-i-s’ dva člověk-a i ne mog-ut ničeho drug*
 meet-PAST-PL-REFL two person.SG-GEN and not can-PRES.3PL nothing one
drug-u skaza-t’.
 one-DAT say.PFV-INF
 ‘Two persons (have) met and cannot say anything to each other.’
- b. *[...] a slov-o ne-můž-ou si řík-t.*
 ... but word.N-ACC not-can-PRES.3PL REFL.DAT say.PFV-INF
 ‘[...] but cannot say a word to each other.’

On the other hand, in Czech the autonomous (“heavy”) reflexive pronoun can render reciprocal semantics as well. It is used to mark co-reference with a prepositional object; cf.:

- (105) *Sěde-l-i jsme proti sobě.*
 sit.IPFV-PAST-PL be.1PL opposite self.DAT
 ‘We were sitting opposite each other.’
- (106) *Ne-moh-l-i by bez sebe žít-t.*
 not-can.IPFV-PAST-PL COND.3PL without self.GEN live.IPFV-INF
 ‘They could not live without each other.’

Other South and West Slavic languages may be treated as occupying various intermediate positions between Russian and Czech.

3. A different type to be distinguished is observed in *Polish* (see Wiemer, Ch. 11). Polish has a single accusative “light” reflexive/reciprocal marker *się* and lacks a dative marker. At the same time, the reciprocal cross-reference with both dative and prepositional objects is indicated by the “heavy” pronominal reflexive/reciprocal marker in the proper case form; cf.:

- (107) *X i Y daj-q sobie książk-i.*
 X and Y give.IPFV-PRES.3PL self.DAT book-ACC.PL
 ‘X and Y give books to each other.’
- (108) *X i Y pisz-q do siebie.*
 X and Y write.IPFV-PRES.3PL to self.GEN
 ‘X and Y write to each other.’

4. A different combination of features is characteristic of the *Bulgarian type*. This type shares some common features with the Czech type and differs from it in some respects. Like Czech, Bulgarian distinguishes between the accusative “light” marker *se* and the dative *si* both of them used reflexively and reciprocally, among a number of other functions (see Penchev, Ch. 13, §3); cf.:

- (109) *Nie se mie-m.*
 we.NOM REFL.ACC wash.IPFV-PRES.1PL
 ‘We wash ourselves/each other.’

- (110) a. *Kupava-m si edn-a knig-a.*
 buy.IPFV-PRES.1SG REFL.DAT one-F.SG book-F.SG
 'I buy a book for myself.'
- b. *Nie si kupava-me knig-i.*
 we.NOM REFL.DAT buy-1PL book-PL
 'We buy books for ourselves/each other.'

But in contrast to Czech, the Bulgarian "heavy" reflexive marker *sebe si* has not developed into a reciprocal marker. As a result, in combination with a prepositional object, the non-reflexive reciprocal pronominal collocation *edin drug* lit. 'one another' is used (an exception is the collocation *pomeždu si* 'between themselves'). In this respect Bulgarian is similar to Russian.

5. Finally, a separate type may be exemplified by literary Serbian, the nearest to the Russian type. In respect of the reflexive markers, Serbian has but one (accusative) "light" clitic form *se* and does not use its "heavy" form *sebe* as a reciprocal marker (with the exception of the collocation *među sobom* lit. 'between selves' common to all Slavic languages). At the same time, restrictions on derivation of reciprocals by means of *se* are not rigid, as can be seen from the list of this kind of verbs in the *Serbo-Croatian-Russian dictionary* (Tolstoy 1970); cf., among others:

- | | | |
|---|---|---|
| (111) <i>dariti</i> 'to give a present' | → | <i>dariti se</i> 'to give presents to each other' |
| <i>dozivati</i> 'to call' | → | <i>dozivati se</i> 'to call each other' |
| <i>vijati</i> 'to chase' | → | <i>vijati se</i> 'to chase each other' |
| <i>voleti</i> 'to love' | → | <i>voleti se</i> 'to love each other' |
| <i>vrehati</i> 'to offend' | → | <i>vrehati se</i> 'to offend each other' |
| <i>zagonetati</i> 'to ask riddles' | → | <i>zagonetati se</i> 'to ask each other riddles' |
| <i>z gledati</i> 'to see' | → | <i>z gledati se</i> 'to exchange glances.' |

To sum up, with regard to the correlation between reciprocals and reflexives in the Slavic languages, we may distinguish, first, between those languages where it seems possible to give an exhaustive or nearly exhaustive list of reflexive reciprocals (such as the East Slavic languages) and those where restrictions on formation of reflexive reciprocals are lax (if they exist at all). The latter languages can again be subdivided into (i) those which possess a distinct "light" dative form of the reflexive/reciprocal marker and those which lack this form (cf. Bulgarian and Czech vs. Polish and Serbian), and (ii) those in which the "heavy" reflexive pronoun is regularly used to express reciprocity and those in which this usage is

Table 1.

	Rigid lexical restrictions	Two case forms of light reflexive marker	Reflexive marking of prepositional object
Russian	+	–	–
Serbian	–	–	–
Bulgarian	–	+	–
Polish	–	–	+
Czech	–	+	+

limited to collocations of the type *meždu soboj* ‘between selves’ (cf. Czech and Polish vs. Bulgarian and Serbian).

For the reader’s convenience, the relevant features are summarized in Table 1.

1. Introduction

1.1 Vedic Sanskrit: Corpus of texts and chronological periods

Vedic Sanskrit (dating from the 2nd millennium BC onwards) is the earliest attested language of the Indo-Aryan group of the Indo-European language family and one of the most ancient attested Indo-European languages. Chronologically, Vedic can be divided into two main periods: early Vedic (also called ‘mantra language’, i.e. the language of the hymns addressed to the Vedic gods, mantras and magic spells), and middle / late Vedic (also called ‘the language of the Vedic prose’). The oldest layer of Vedic is attested in the language of the Ṛgveda (RV), which can approximately be dated to the second half of the second millennium BC. Within the RV, we can distinguish between the early RV (‘family books’, or maṇḍalas, which include books II–VII) and the late RV (encompassing, above all, maṇḍalas I and X, as well as a part of book VIII, Vāḷakhilya). The language of the second most ancient text, the Atharvaveda (AV), resembles in many respects – and is essentially synchronic with – the language of the late RV. Early Vedic is followed by middle and late Vedic (= the language attested in the Brāhmaṇas, Āraṇyakas, the oldest Upaniṣads and Sūtras). The post-Vedic period includes the younger Upaniṣads and Sūtras, as well as Epic and Classical Sanskrit.

The absolute chronology of these periods poses serious problems (see e.g. Witzel 1995: 97f.), thus only very rough approximation can be given for various periods: the early Vedic period cannot be dated earlier than to 1500 BC (and hardly begins much later than 1200 BC); the middle Vedic period probably starts after 800 BC; and the post-Vedic period must have started somewhere in the second half of the first millennium BC, hardly much earlier than 300 BC.

The most important evidence for Indo-European comparative studies and for typological observations is furnished by early Vedic. Already by the middle Vedic period, Sanskrit was no longer a spoken language, co-existing as a sacral language alongside the Middle Indo-Aryan vernaculars. The prose texts, however, may also retain a number of archaic forms and constructions unattested in earlier texts. Of still lesser linguistic rele-

vance, in general, are Epic and Classical Sanskrit, which, however, may attest a number of interesting diachronic developments.

The term ‘Sanskrit’ is sometimes used to refer to both forms of the language, i.e. Vedic Sanskrit proper and post-Vedic (Epic, Classical) Sanskrit.

1.2 Overview

As in many other ancient Indo-European languages, the reciprocal meaning is either expressed periphrastically (by means of constructions with *anyó (a)nyám* ‘each other’ and, in post-Vedic Sanskrit, with some other reciprocal pronouns, as well as with the adverb *mithás* ‘mutually’), or morphologically, by means of (1) the middle type of inflexion (middle diathesis; see below), a morpheme which expresses a number of other intransitive derivations, such as reflexive and passive; and (2) two preverbs/prefixes (see Section 2.3) which participate in the expression of the reciprocal and sociative meanings, *ví-* (with the sandhi variant *vy-*) ‘asunder’ and *sám-* (*/sám-*) ‘together’ (free or bound in early Vedic; mostly bound prefixes from middle Vedic onwards). Cf. *dviṣ* ‘hate’ – *ví-dviṣ-ate* ‘they hate each other’; *vac* ‘speak’ – *ví ... avoca-nta* ‘they argued with each other’; the preverb *sám-* is a productive morpheme deriving spatial reciprocals, cf. *i* ‘go’ – *sám-ayanta* (RV 6.21.1) ‘they come together’, *gam* ‘go’ – *sám-gam* ‘meet together, unite’.

There are also a number of symmetric predicates (mostly *media tantum*), where the reciprocal meaning is built into the verbal semantics, such as *spṛdh* ‘compete’.

2. Grammatical notes¹

2.1 The morphological structure of the verbal form

The verbal form can have the following maximal morphemic structure: (preverb(s) / prefix(es)) .../(augment *a-*)-(reduplication syllable)-root-(derivational stem suffix)-(thematic vowel *a*²)-(mood)-inflexion. Below, a few examples are given:

- (1) *vi-jí-gī-ṣā-mahai* (cf. (8))

PREV-RED-OVERCOME-DES-1 PL.SUBJ.MED

(preverb + reduplication syllable + root + thematic suffix of desiderative + ending of the 1st person plural middle subjunctive form = 1st person plural middle subjunctive form of the desiderative of the verb *ji* ‘overcome’)

‘we desire to overcome one another, we will try to overcome one another.’

1. The best surveys of the Vedic and/or Sanskrit grammar are: Whitney (1889); Macdonell (1910) and (1916) (a shorter and very convenient version of the former); and Elizarenkova (1982) (for Vedic); Renou (1930/1960) (for post-Vedic / Classical Sanskrit). The reader is also recommended to consult the short but well-organized sketch presented in Zaliznjak (1976).

2. In the case of thematic and thematicized suffixes such as *-ya-*, *-sa-*, *-nva-*, etc., the thematic vowel (*a*) is traditionally regarded as a part of the suffix; the suffixes “properly speaking” are *-y-*, *-s-*, *-nv-*.

(2) *vy-a-di-dviṣ-a-h* (cf. (24))

PREV-AUG-RED/CAUS-hate-THEM.VOWEL-2SG.AOR.ACT

(preverb + augment + reduplication syllable + root + thematic vowel + secondary

(= aorist/imperfect) ending of the 2nd person singular active form = 2nd person singular active form of the reduplicated (causative) aorist of the verb *dviṣ* 'hate')

'you have made [them] hate each other.'

There is a rich system of both vocalic and consonant alternations (ablaut, palatalization, etc.), as well as morphophonemic changes at morphemic and word boundaries (sandhi), which often make these boundaries opaque. In the text examples below the symbol \cup indicates that a sandhi has been undone.

2.2 Preverbs

The class of semi-autonomous morphemes, traditionally called preverbs, includes *ádhi* 'above, over, on', *ánu* 'along, after', *abhí* 'to(wards), over, against', *á* 'to(wards), at', *úpa* 'to, near', *pári* '(a)round, about', *ví* 'apart, asunder', *sám* 'together' and others. The majority of them can also be used as adpositions (prepositions or postpositions). Exceptions include, in particular, *úd* 'up', *ní* 'down', *párā* 'away' and *ví* 'apart, asunder'. In early Vedic, preverbs commonly behave as free morphemes; in middle and late Vedic the autonomy of preverbs constantly decreases and tmesis (i.e., the separation of preverbs from verbal forms) becomes rare.

2.3 The grammatical categories of the verb

The Vedic verbal paradigm includes three main classes of forms, called present, aorist and perfect systems (forms of the future system are rare in early Vedic). Within each of these sub-sets, forms are built on the same stem, i.e., on present, aorist and perfect stems respectively. There are several sets of personal endings: 'primary' (used foremost in the present tense), 'secondary' (endings used in the imperfect, aorist and some non-indicative moods), perfect, imperative, and subjunctive. Each tense system includes a number of finite forms and a pair of participles, active and middle.

The inventory of the grammatical categories of the verb includes person (1st, 2nd and 3rd) and number (singular, dual and plural); diathesis, or voice³ (active and middle); tense (present, imperfect, perfect, aorist, future, periphrastic future); and mood (indicative, imperative, injunctive, subjunctive, optative, conditional). The non-finite forms include two

3. These are traditional terms used in Sanskrit and Indo-European linguistics, referring to two types of inflexion (e.g., in the present: 2sg. *-sí*, 3sg. *-tí* in the active ~ 2sg. *-se*, 3sg. *-te* in the middle; in the perfect: 3sg. *-a*, 3du. *-átur*, 3pl. *-úr* in the active ~ 3sg. *-é*, 3du. *-átur*, 3pl. *-úr* in the middle; etc.). Both have certain shortcomings: the former is not to be confused with the 'diathesis' in the sense of the Leningrad Typological Group (referring to the type of syntactic construction, or valency pattern); the latter may also refer to the opposition between the passive and non-passive (transitive) construction.

participles (active and middle) for each tense, converbs (traditionally called ‘absolutives’ or ‘gerunds’), infinitives, gerundives, and some others categories.

2.4 Valence-changing derivations

2.4.1 *The middle and its functions*

The range of the functions rendered by the middle type of inflexion (= middle diathesis) is typical of the ancient Indo-European linguistic type as attested in “Classic” languages (Ancient Greek, Latin). Here belong the self-beneficent meaning with no valence change (‘to do sth for oneself’, as in the handbook example *yájati* ‘sacrifices’ ~ *yájate* ‘sacrifices for oneself’), as well as a number of intransitivizing derivations, such as passive, reflexive, and anticausative (decausative). The choice of the function(s) idiosyncratically depends on the base verb. However, already in the language of the earliest text, the RV, we observe the loss of several grammatical functions of the ancient Indo-European middle, and the intransitivizing functions are largely taken over by special productive markers, such as the passive suffix *-yá-* and the reflexive pronouns *tanú-* and *ātmán-* (for details, see Kulikov 2006, 2007).

2.4.2 *Causative oppositions*

The most regular and productive causative marker in the present system is the suffix *-(p)áya-*, cf. *vṛdh* ‘grow, increase’ – *vardháyati* ‘makes grow, increases’, *cit* ‘appear, perceive’ – *cetáyati* ‘shows (= makes appear), makes perceive’ (~ *citáyati* ‘appears’). In addition to *-(p)áya-*causatives, in early Vedic we find a few other (non-productive) formal types of present causative oppositions. In particular, the causative member is commonly expressed by a present with the nasal suffix *-nó-/ -nu-* (present V), *-nā-/ -nī-* (present IX) or nasal infix *-ná-/ -n-* (present VII), often opposed to an intransitive (anticausative) present with the suffix *-ya-* (present IV) or a root present with a thematic vowel (present I). Causative oppositions of other types are less common.⁴ The intransitive (anticausative) member of the opposition is typically inflected in the middle, whilst the transitive-causative is inflected in the active; cf.: *kṣi* ‘perish, destroy’: *kṣíyate* (present IV) ‘perishes’ ~ *kṣināti* (present IX) ‘destroys’; *jan* ‘be born, arise’: *jáyate* (present IV) ‘is born’ ~ *jānati* (present I), *janáyati* ‘begets’; *pū* ‘purify’: *pávate* (present I) ‘becomes clean, purifies oneself’ ~ *punāti* (present IX) ‘purifies’. With some presents, the causative opposition is only marked by the diathesis (middle/active), as in *námate* ‘bends’ (intr.) ~ *námati* ‘bends’ (tr.); *svádate* ‘is sweet’ ~ *svádati* ‘makes sweet’. In the aorist system, the causative meaning is typically expressed by the reduplicated aorist, cf. *vṛdh* ‘grow, increase’ – *ávīrvṛdhat* ‘made grow’. There are also labile forms that can be used both transitively and intransitively, cf. 3sg.pf.med. *vāvṛdhé*, 3sg.pf.act. *vavárdha* ‘he has grown (intr.)’ ~ 3sg.pf.act. *vavárdha* ‘has increased (tr.)’ (see Kulikov 2003).

4. See e.g. Joachim (1978:21ff.).

2.4.3 *Passive*

There are several verbal formations in Vedic which can be employed in passive constructions. Non-finite passives include passive perfect participles with the suffix *-tá-/-ná-* and gerundives, or future passive participles, with the suffixes *-ya-*, *-tavya-* and *-anīya-*. Finite passive formations include the following (for details, see Kulikov 2006):

(1) presents with the suffix *-yá-* (derived from the root by means of the suffix *-y(á)-*, which can only take middle endings; e.g. *han* ‘to kill’: 1sg. *han-yé*, 2sg. *han-yá-se*, 3sg. *han-yá-te*, etc.);

(2) medio-passive *i*-aorists (with a defective paradigm: only 3sg. in *-i*, 3pl. in *-ran/-ram* and participle; e.g. *yuj* ‘yoke, join’: 3sg. *áyoji*, 3pl. *áyujran*, part. *yujāná-*);

(3) middle perfect/statives (which supply passive perfects for some verbal roots; also with a defective paradigm: 3sg. in *-e*, 3pl. in *-re* and participle; e.g. *hi* ‘impel’: 3sg. *hinvé* ‘(it) is impelled’, 3pl. *hinviré* ‘(they) are impelled’; part. *hinvāná-*);

(4) some (isolated) middle forms.

2.5 Syntactic notes

As most other ancient Indo-European languages, Vedic is a nominative-accusative language. Normally, the subject surfaces in the nominative, the direct object in the accusative, and the second object in the accusative or dative. The instrumental case has its usual functions (comitative, instrument, passive agent). The word order is mostly free, but the neutral word order (which is prevalent, especially in prose texts) is SOV.

3. Morphological (synthetic) reciprocals

3.1 The reciprocal meaning is expressed by the middle inflexion only

3.1.1 *Middle reciprocals opposed to active non-reciprocals*

In early Vedic (particularly, in the RV), the middle inflexion (middle diathesis) still plays a rather important role as a marker of some intransitivizing derivations, thus inheriting the functions of the (Proto-)Indo-European middle. We find several verbs whose middle forms are employed in the reciprocal usage. However, there are not very many occurrences of middle forms which can be unambiguously interpreted as reciprocals (opposed to non-reciprocal active forms). A few clear instances of middle reciprocals without preverbs represent Ṛgvedic hapaxes (i.e., forms which are attested only once and only in the RV). These include, in particular:

mith ‘be inimical’ – *na methete* ‘(the day and night) are not inimical to one another’ (in RV 1.113.3; see Gotō 1987:244);

tṛ ‘surpass, overrun’ – *tarete* ‘overrun one another’ in (3):

- (3) (RV 1.140.3)
ubhá tarete abhí mātārā śśum
 both:NOM.DU overrun:PRES:3DU.MED towards mother:NOM.DU child:ACC.SG
 ‘Both parents overrun one another towards the child (sc. Agni, fire).’⁵

Quite often, a reciprocal interpretation is possible for some (but not all) middle forms, so that we are dealing with ‘weak’ morphological oppositions of the type ‘Active: non-reciprocal ~ Middle: non-reciprocal/reciprocal’, as is the case of the verb *yudh* ‘fight’. Active forms of *yudh* are employed either intransitively (‘X_{NOM} fights (for Z_{LOC})’) or, more rarely, transitively (‘X_{NOM} fights against Y_{ACC}, attacks Y_{ACC}’). Middle forms are only attested in intransitive constructions, some of which refer to reciprocal situations: ‘X^(non-SG)_{NOM} fight against each other’, as in (4):

- (4) (KSP 29.5:173.14-15 = KpSP 45.6:272.21)
yad vai putrau yudhyete pitā tābhyāṃ kalpayati
 when son:NOM.DU fight:PRES:3DU.MED father:NOM.SG them reconciles
 ‘When two sons fight against each other, the father reconciles them.’

In some cases the reciprocal interpretation is only one of possible analyses. For instance, we find examples which are ambiguous between reciprocal and anticausative and/or reflexive interpretations. This yields a ‘weak’ morphological opposition of another type: Act.: non-reciprocal ~ Med.: non-reciprocal / reciprocal / anticausative / reflexive. The choice between the different interpretations may require a special philological study. Examples of this type are attested, for instance, for some occurrences of middle forms of the verbs *bhr̥* ‘carry’ (cf. (5)) and *ukṣ̣* ‘(be)sprinkle’ (in (6)); note the difference between analyses suggested by several Sanskritists:

- (5) (RV 10.31.6)
samāná ā bhāraṇe bībhramāṇāḥ
 same:LOC in carrying:LOC carry:PRES:PART.MED:NOM.PL.M
 ‘[The gods] carrying each other (?) / being carried / moving in the same (act of) carrying.’

The passive translation of (5) suggested by most scholars⁶ is less likely for system-related reasons: passive usages are very rare for middle presents other than *-yá*-passives. More probable is a non-passive, anticausative (‘moving [repeatedly]’) or reciprocal (Gotō 1987:227: ‘sich gegenseitig tragend’) interpretation; see also Kulikov (2001:132).

5. See Gotō (1987:161); cf. also the compound *mīthas-tūr-* ‘surpassing each other’ derived from the same root (see Section 5).

6. Delbrück (1888:264); Wackernagel/Debrunner (1954:774, §619dβ); Geldner (1951:III, 178) (‘in gleicher Tragung getragen’); Renou (EVP XVI, 130).

(6) (RV 4.56.2)

devī... ukṣámāṇe

goddess:NOM.DU sprinkle:PRES:PART.MED:NOM.DU.F

‘The two goddesses sprinkling [ghee] / besprinkling each other.’⁷

We still await, among the desiderata for Vedic grammar, a comprehensive study of the Vedic middle, which would include an exhaustive catalogue of the attested functions of the middle forms.

3.1.2 Middle reciprocals without active counterparts: *Reciproca media tantum and symmetric predicates*

There is a group of reciprocals with the middle inflexion which are not opposed to non-reciprocal verbs with the active inflexion. This small class (mostly) consists of a few lexical reciprocals (symmetric predicates), where the reciprocal meaning is incorporated into the verbal semantics, such as *spr̥dh* ‘compete’ (cf. (7), (8), (15)) and *yād* ‘unite’ (attested only in the RV, in the present participle *yādamāna-* ‘uniting with sb.’) (see Gotō 1987:255f.):

(7) (RV 6.14.3)

spārdhante rāyaḥ

compete:PRES:3PL.MED rich:NOM.PL

‘The riches (of the Lord) compete (with each other).’

3.2 *vī*-reciprocals: The reciprocal meaning is expressed by the preverb *vī* and middle inflexion⁸

3.2.1 General remarks

More commonly (particularly in early Vedic), morphological reciprocals are derived by means of the preverb/prefix *vī* (with the sandhi variant *vy-*) added to forms with middle inflexion. This type seems to represent a new model, rather than the vestige of an old, formerly (in the proto-language?) productive, formation. *vī*-reciprocals are attested for some 20 verbs, mostly for the verbs of (i) hostile activities and (ii) communication/speech. Verbs which do not belong to these classes are listed under (iii):

- | | | |
|------------------------------|---|---|
| (i) <i>dviṣ</i> ‘hate’ | – | <i>vī-dviṣ</i> _{MED} ‘hate each other, be inimical’ (RV+) |
| <i>ji</i> ‘win, overcome’ | – | <i>vī-ji</i> _{MED} ‘overcome each other’ (ŚB) |
| <i>han</i> ‘kill, destroy’ | – | <i>vī-han</i> _{MED} ‘kill, destroy each other’ (AV+) |
| <i>tr̥h</i> ‘crush, destroy’ | – | <i>vī-tr̥h</i> _{MED} ‘crush, shatter, destroy each other’ (AV, TS) |
| <i>abhi-car</i> ‘bewitch’ | – | <i>vy-abhi-car</i> _{MED} ‘bewitch each other’ (YV) |
| <i>śap</i> ‘curse’ | – | <i>vī-śap</i> _{MED} ‘curse each other, quarrel’ (or ‘swear?’). |

7. As in the case of (5), the passive interpretation as suggested for this passage by Haudry (1977:395) (‘arrosé’) is unlikely. The sentence should rather be translated either as an absolute transitive (‘the two goddesses ... sprinkling [ghee]’; thus Grassmann (1873:244), Geldner (1951:I, 486); cf. also Geldner’s (1951:I, 474) note ad 4.42.4a) or as a reciprocal construction (‘besprinkling each other’; cf. Gotō 1993:122f.). See also Kulikov (2001:346).

8. See, in particular, Delbrück (1888: 243; 1897: 431f.); Gotō (1987:134, 294 et passim; 1989:283; 1996:7); Kulikov (2002).

- (ii) *vac* ‘speak’ – *vi-vac*_{MED} ‘discuss with each other, contest on sth, argue for sth (LOC)’
brū ‘speak’ – *vi-brū*_{MED} ‘discuss with each other, contest, argue’
vad ‘speak’ – (*vi-*)*vad*_{MED} ‘discuss with each other, contest, argue’
bhaj ‘make share, distribute, give sth (ACC) to sb (DAT) as a share’ –
*vi-bhaj*_{MED} ‘distribute sth (ACC) among each other, share with each other’.
- (iii) *añj* ‘anoint’ – *vy-añj*_{MED} ‘anoint each other’ (?) (RV)
dīv ‘play’ – *vi-dīv*_{MED} ‘play for sth with each other’ (YV+)
mi ‘(ex)change, alternate’ – *vi-mi*_{MED} ‘alternate with each other’ (?) (RV).

Next to these three small groups of reciprocals proper, *vi* is employed as a marker of spatial reciprocals of disjoining. This productive class will be briefly discussed in 3.3.

3.2.2 The main syntactic types of *vi*-reciprocals

3.2.2.1 “Canonical” (intransitive) reciprocals. These suggest a symmetric relation between the subject and direct object. Usually, this type is constructed with the non-singular (dual or plural) verbal form, as in (8)–(14):

- (8) (ŚB 1.5.4.6)
devās ca vā āsurās ca ... paspṛdhire. té
 god:NOM.PL and verily Asura:NOM.PL and compete:PERF:3PL.MED they:NOM.PL
daṇḍāir dhānubhir nā vy-ājayanta. té ha
 stave:INST.PL bow:INST.PL not *vi*-overcome:IMPF:3PL.MED they:NOM.PL PRTL
ā-vi-jaya-mānā ūcur. hānta vācy
 not-*vi*-overcome:PRES-PART.MED:NOM.PL.M say:PERF:3PL.ACT well speech:LOC.SG
ēvā brāhman vi-jigīṣāmahai
 PRTL sacred.formula:LOC.SG *vi*-overcome:DES:PRES:1PL.SUBJ.MED
 ‘The gods and the Asuras (demons) . . . were [once] competing. With staves and bows they did not overcome one another. [Neither of] them gaining victory over one another, they (the Asuras) said: “Well, we will try to overcome one another by means of speech, by means of sacred formula!”’
- (9) (TS 5.2.4.1)
vi vā etāu dviṣ-āte yās ca purā
vi PRTL this:NOM.DU.M hate:PRES-3DU.MED which:NOM.SG.M and earlier
agnir yās ca ukhāyām
 fire:NOM.SG which:NOM.SG.M and vessel:LOC.SG
 ‘The fire which [was] earlier and the one which is in the vessel are enemies (lit. hate each other).’
- (10) (TS 2.2.6.2)
 ... *yō vi-dviṣ-ānāyor ānam ātti*
 who *vi*-hate:PRES-PART.MED:GEN.DU.M food:ACC.SG eats
 ‘... who eats the food of two enemies.’⁹

9. Note that the lexicalized participle of the reciprocal *vi-dviṣ*_{MED} functions here as a substantive meaning ‘enemy’.

- (11) (KS 10.7:131.19)
abhicára-n *vā* *abhicar-yá-māṇo* *vā*
 bewitch:PRES-PART.ACT:NOM.SG.M or bewitch-PRES.PASS-PART.MED.NOM.SG.M or
devás ca vā ásurās ca vy-abhyácara-nta
 god:NOM.PL and ASURA:NOM.PL and vi-bewitch:IMPF-3PL.MED
 ‘Bewitching or being bewitched, the gods and the Asuras (demons) bewitched each other.’
- (12) (RV 9.86.43)
añj-áte vy añj-ate sám añj-ate
 anoint:PRES-3PL.MED vi anoint:PRES-3PL.MED together anoint:PRES-3PL.MED
krátum rih-anti mádhunā abhy añj-ate
 mental.power:ACC.SG lick:PRES-3PL.MED sweetness:INST.SG on anoint:PRES-3PL.MED
 ‘They (= waters) anoint themselves (with Soma), anoint each other (?), mix together with each other (?), lick (Soma’s) mental power, anoint themselves with (his) sweetness.’¹⁰

In some cases the reciprocal meaning is expressed both morphologically (with the preverb *ví* + middle inflexion) and periphrastically, by means of the adverb *mithás* ‘mutually’ (see Section 4.1):

- (13) (AV 3.30.4)
yéna devá ná vi-y-ánti ná u ca vi-dviṣ-áte
 which:INST.SG god:NOM.PL not vi-go:PRES-3PL.ACT not and vi-hate:PRES-3PL.MED
mitháh / tát kṛṇ-mo bráhma vo gṛhé
 mutually that make:PRES-1PL.ACT incantation:ACC.SG your house:LOC.SG
 ‘We perform in your house that incantation by virtue of which the gods do not go apart, do not hate one another (mutually).’
- (14) (AV 6.32.3 = 8.8.21)
mithó vi-ghn-āná úpa y-antu mṛtyúm
 mutually vi-kill:PRES-PART.MED:NOM.PL.M to go:PRES-3PL.IMP.ACT death:ACC.SG
 ‘Mutually crushing each other, let them (sc. our enemies) go to their death.’

Alongside ‘symmetric’ constructions with non-singular verbal forms we also find a ‘non-symmetric’ pattern with the verb in the singular constructed with the subject in the nominative and an oblique object in the instrumental referring to another participant of the reciprocal situation (cf. Russian *Ivan celuetsja s Annoj*, German *Hans küsst sich mit Anna*), as in (15):

- (15) (MS 1.5.11:80.7–8)
yéna spárdha-te yéna vā vy-abhicára-te ...
 who:INST.SG compete:PRES-3SG.MED who:INST.SG or vi-bewitch-PRES:3SG.MED

10. Example (12) is taken from a hymn describing the process of mixing Soma (sacral sap) with waters. Although most translators do not interpret *ví* as a reciprocal marker (Grassmann (1873: 24f.): ‘durchsalben’; Geldner (1951: III, 83–4): ‘sie salben sich, sie salben sich *bunt*, sie salben sich gleich ...’; explaining further: ‘*añj*, *vi-añj* und *sam-añj* wohl drei verschiedene Arten der Salbung’; Renou (EVP IX, 36): ‘(Les eaux) s’oignent, s’oignent *d’outré en outré* ...’; likewise Elizarenkova (1999: 81): ‘Oni umaščajutsja, umaščajutsja *naskvoz*’, umaščajutsja osnovatel’no ...’), the meaning ‘mutually, each other’ seems quite appropriate in the context.

‘With whom he competes or (lit.) with whom he bewitches [i.e. with whom he brings about the mutual bewitching], (that one ...).’

3.2.2.2 “Indirect” (transitive) reciprocals. These denote a symmetric relation between the subject and non-direct (typically, indirect) object, which surfaces either as a second accusative argument, or as a dative argument. Here belong a number of reciprocals derived from verbs of speech. Compare the non-reciprocal construction with the verb *vac* ‘speak’ constructed with the accusative of speech and the dative of the addressee (16) and the reciprocal construction (17):

(16) (RV 1.129.3)

indra⊃ *utá túbhyaṃ tád ... voc-a-m*

Indra:VOC and YOU:DAT that:ACC speak:AOR-SUBJ-1SG.ACT

‘And I will tell it to you, oh Indra ...’

(17) (RV 6.31.1)

ví toké apsú tánaye ca sūre⊃ *ávoc-anta*

vi seed:LOC.SG water:LOC.PL offspring:LOC.SG and sun.LOC.SG speak:AOR-3PL.MED

carṣaṇáyo vívāc-aḥ

tribe:NOM.PL contest-ACC.PL

‘The tribes contested (lit. contested contests) on seed, waters and offspring, on the sun.’¹¹

The middle forms with the preverb *ví* of two other verbs of speech, *brū* and *vad*, are employed in similar usages (the latter ousts *ví-vac*_{MED} in late Vedic texts, from the Brāhmaṇas onwards), cf.:

(18) (RV 6.25.4cd)

toké vā gōṣu tánaye yád apsú ví krā́ndas-ī

seed:LOC.SG OR COW:LOC.PL offspring:LOC.SG when water:LOC.PL *vi* army-NOM.DU

urvárāsu bráv-aite

field:LOC.PL speak:PRES-3DU.SUBJ.MED

‘... or when two armies contest on seed, on cows, on offspring, on waters, on fields.’

(19) (ŚĀ 4.14 = KauṣU 2.14)

etā ha vai devatā ahaṃ-śreyase ví-vada-mānā

this:NOM.PL.F deity:NOM.PL I-superior:LOC *vi*-speak:PRES-PART.MED:NOM.PL.M

asmāc charīrād uc-cakram-uḥ

this:ABL body:ABL out-go:PERF-3PL.ACT

‘Once these deities, each arguing for its own preeminence, departed from this body.’

Note that the middle forms without the preverb *ví* are attested in the same usage (see Delbrück 1888: 246), which must be due to the symmetric character of the verb, as in (20):

(20) (MS 4.4.1:41.19)

tásmín vā avadetām

that:LOC speak:IMPF:3DU.MED

‘They both discussed / argued for that.’

11. For the corresponding root noun *vívāc*- ‘(verbal) contest, competition’, see Section 5.

“Indirect” reciprocals can also be made from the verb *bhaj* ‘make share, distribute’. The base (non-reciprocal) construction of *bhaj* ‘make share, distribute, give sth (ACC) to sb (DAT) as a share’ is attested with the active forms (usually with the preverb *vi*), with the accusative or genitive of shared goods and with the dative of the recipient of distribution (see Jamison 1983: 129, Gotō 1987: 221f.): ‘X_{NOM} apportions Y^{goods}_{ACC/GEN} to Z^{recipient}_{DAT}’, as in (21). Accordingly, the corresponding reciprocal, *vi-bhaj*_{MED}, means ‘distribute sth (ACC) among each other, share with each other’, as in (22):

(21) (RV 10.48.1)

ahám dāśús-e ví bhajāmi bhójanam
 I:NOM worshipper-DAT.SG *vi* distribute:PRES:1SG.ACT food:ACC.SG
 ‘I (= Indra) apportion food to the one who worships [me].’

(22) (RV 10.108.8)

tá etám ūrvám ví bhajanta gónām
 they:NOM.PL this herd:ACC.SG *vi* distribute:PRES:3PL.MED.SUBJ cow:GEN.PL
 ‘They will share with each other this herd of cows.’

Another verb which forms non-direct object reciprocals is *dīv* ‘play’. Middle forms with the preverb *vi* are employed in constructions where the stake (i.e. that which is played/gambled for) is expressed by an accusative direct object, meaning ‘X^(non-SG)_{NOM} play for Y_{ACC} with each other’,¹² as in (23); some late texts also attest active forms with the preverb *vi* in the same usage:¹³

(23) (MS 4.4.6:57.10 ~ ĀpŚS 18.19.2 ~ VārŚS 3.3.3.24 ~ HirŚS 13.6.29)

tátra paṣṭhauhīm ví dīvya-nte [HirŚS *dīvya-nti*]
 there young.cow:ACC.SG *vi* play:PRES-3PL.MED play:PRES-3PL.ACT
 ‘There they play for a young cow.’

3.2.3 *vi*-reciprocals combined with other valence-changing categories

Unlike many Western Indo-European languages, Indo-Aryan has developed productive morphological causatives (present with the suffix *-āya-* and reduplicated aorist) and passives (present with the suffix *-yá-*); see Sections 2.4.2–3. All these derivatives can be made from *vi*-reciprocals.

3.2.3.1 Causatives derived from reciprocals. They are attested for the verb *dviṣ* ‘hate’. It is important to note that causatives are normally inflected in the active, and thus the causative derivation “absorbs” the middle diathesis, so that the preverb *vi* remains the only reciprocal marker:

12. The translation ‘verspielen’ (Böhtlingk & Roth, PW III, 617) is erroneous. For a comprehensive description of the play, see Falk (1986: 134ff. et passim).

13. The active inflexion attested in the HirŚS (23) must be secondary; see Schroeder (1883–84:7); Oertel (1934: 66f.) [= Kl. Schr. I, 697f.].

- (24) (AVP 2.58.1)
vi-dveṣ-anaṃ *kila*_U *āsitha* ⁺*yathā*_U *enau*
vi-hate-NR:NOM.SG verily be:PERF:2SG.ACT since he:ACC.DU
vy-adidviṣaḥ
vi-hate:CAUS.AOR:2SG.ACT
 ‘Verily, you are causing (mutual) hostility, for you have made them (both) inimical to each other (lit. made hate each other).’ (a verse addressed to a magic amulet)¹⁴

Note that the *nomen actionis vi-dveṣana-* is derived from the causative reciprocal (‘causing (mutual) hostility’), not from the reciprocal proper (‘(mutual) hostility’).

3.2.3.2 Passives derived from reciprocals

3.2.3.2.1 *Passives derived from “indirect” reciprocals* are attested for *vi-bhaj*_{MED} ‘share sth (ACC) with each other’ (cf. (21)–(22)). The main problem is distinguishing between reciprocal passives and passives of the non-reciprocal verbs, which are also quite common with the preverb *vi-*: since the *-yá-*passive is always inflected in the middle, the morphological opposition ‘Active ~ Middle’ is neutralized, so that the passive *vi-bhājyāte* may represent either a non-reciprocal passive (‘be shared, be distributed’) or a reciprocal passive (‘be distributed [by sb. among each other], be shared [by sb. with each other]’). By definition, the subject of a reciprocal construction can only be non-singular (plural or dual): ‘X’s / X and Y share sth. with each other’. Accordingly, the presence of a non-singular agent makes possible a reciprocal interpretation.

Thus, for instance, in the context of the plural subject *sátvāno* ‘the warriors’, a reciprocal interpretation is very likely:

- (25) (MS 2.2.13:25.13)
sátvāno *gā* *ichanti* *yád* *eté* *taṇḍulá*
 warrior:NOM.PL cow:ACC.PL seek:PRES:3PL.ACT when this:NOM.PL.M grain:NOM.PL
vi-bhāj-yá-nte
vi-distribute-PRES.PASS-3PL.MED
 ‘The warriors seek for cows, when these grains are distributed [by warriors among each other (?)] ...’

In (26), the reciprocal interpretation of *vi* is supported by the reciprocal adverb *mithas* ‘mutually’ (see Section 4.1) and by the commentator’s gloss *parasparam* ‘each other’:

- (26) (HirŚS 3.8.66)
adhīśrayaṇa-kāle *mitho* *vi-bhaj-yeran*
 putting.on.fire-time:LOC.SG mutually *vi-distribute-PRES.PASS:3PL.OPT.MED*
 ‘When one puts [the oblation] on [fire], [the rice grains] should be (mutually) distributed (among each other).’

14. Cf. Hoffmann’s (1976:567) translation: ‘weil du die beiden hast sich verfeinden lassen’.

3.2.3.2.2 *Passive derived from a “canonical” reciprocal* is attested for at least one Vedic verb, *tr̥h* ‘crush, destroy’. An example of the reciprocal of this verb occurs in the TS:

- (27) (TS 2.2.11.2)
vi-tr̥h-ānās *tiṣṭhanti*
vi-crush:PRES-PART.MED:NOM.SG.M stand:PRES:3PL.ACT
 ‘[They] keep crushing each other.’

The passive *tr̥hyá-^{te}* occurs 3 times, only in the AV. Two of these attestations instantiate a reciprocal construction, as in (28):

- (28) (AV 1.28.4)
ádhā mithó vikeśyò ví ghn-atām yātudhānyò
 then mutually hairless *vi* kill:PRES-3PL.IMP.MED sorceress:NOM.PL
vi tr̥h-ya-ntām arāyyàḥ
vi crush-PRES.PASS-3PL.IMP hag:NOM.PL
 ‘... then let the hairless sorceresses (mutually) kill each other; let the hags be crushed (killed) by each other.’

This translation seems more adequate than the non-reciprocal one suggested by Whitney & Lanman (1905:I, 29): ‘... then let the horrid-haired sorceresses mutually crush one another; let the hags *be shattered asunder*.’ The reciprocal interpretation (‘let the hags be shattered (killed) by each other’) is supported (i) by the reciprocal construction (*vi ghnatām* ‘let (them) kill each other’) in the preceding clause, and (ii) by another attestation of the passive *tr̥hyá-^{te}* (29), where the reciprocal meaning is expressed by the reciprocal adverb *mithás* ‘mutually’:

- (29) (AVŚ 5.17.7 ~ AVP 9.15.7)
vīrā yé tr̥h-yá-nte (AVŚ) / han-ya-nte (AVP) mithó
 hero:NOM.PL who:NOM.PL.M crush-PRES.PASS-3PL kill-PRES.PASS-3PL mutually
brahmajāyā hīnas-ti tān
 Brahman’s.wife:NOM.SG hurt:PRES-3SG.ACT they:ACC.PL.M
 ‘When heroes are mutually crushed it is the Brahman’s wife who hurts them.’

Passives of “canonical” reciprocals, albeit very rare, are worthy of special discussion. From the typological point of view, this syntactic type is extremely rare. While the indirect reciprocal derivation retains the initial direct object, so that passivization remains possible, a canonical reciprocal must be intransitive by definition, which, at first glance, rules out passivization. In the case of the periphrastic reciprocal construction (cf. English *each other*, German *einander*), at least a formal possibility of passivization exists due to the presence of a pronominal direct object (*each other*, *einander*) in the syntactic structure (*they crush each other* → *they are crushed by each other*). In the case of a morphological reciprocal (as in Vedic), the syntactic aspects of this derivation remain unclear. It may be the case that this peculiar construction was brought to life by some particular stylistic technique found in poetic texts.

3.2.4 *The polysemy and etymology of ví*

The range of meanings expressed by *ví* includes:

(i) splitting into parts, transformation of one single object into a group of objects or change of state resulting in certain autonomy of the parts of the object (cf. the case of the open gate¹⁵), cf. *bhid* ‘break, split’ – *ví-bhid* ‘break, split (asunder)’, *jñā* ‘know’ – *ví-jñā* ‘discern’, *śri* ‘adhere’ – *ví-śri* ‘open’;

(ii) spreading, expanding, cf. *bhr̥* ‘bring’ – *ví-bhr̥* ‘spread’, *sṛ̥* ‘run’ – *ví-sṛ̥* ‘run in several directions’;

(iii) distributive, cf. *dhā* ‘put, place’ – *ví-dhā* ‘distribute, arrange’;

(iv) reversive, cf. *vṛ̥* ‘close’ – *ví-vṛ̥* ‘open (doors)’, *sā* ‘tie’ – *ví-śā* ‘untie’;

(v) removing, leaving some space, cf. *nī* ‘carry’ – *ví-nī* ‘take away’, *tṛ̥* ‘(over)pass; bring, carry over’ – *ví-tṛ̥* ‘bring away, carry off’, *tap* ‘warm’ – *ví-tap* ‘give out heat’;

(vi) change, cf. *kr̥* ‘make’ – *ví-kr̥* ‘shape (up), change, disfigure’;¹⁶ cf. also *rūpā-* ‘form, appearance’ – *ví-rūpā-* ‘variegated, multiform’.

The set of functions attested for *ví* is quite unusual for the reciprocal morphemes in Indo-European languages, but is in line with its etymology. Already in the early Indo-European studies *ví* is traced back to the PIE adverb **dvis* ‘in two’ (**dvi-* in compounds) derived from the numeral ‘two’ (see, e.g., Pott 1859:705ff.), thus being genetically related to Ancient Greek *δια-*, Lat. *dis-*, Old High German *ze(r)-*, for which similar meanings are attested. Although Mayrhofer (EWAia II, 550) evaluates this etymology with skepticism, it is convincing both from the phonological¹⁷ and semantic point of view. The most remarkable parallel to the Vedic *ví* is the Ancient Greek prefix *δια-*, which also may render the reciprocal meaning; to mention just a few examples taken from Pott’s study (Pott 1859:733): *διά-λογος* ‘Unterredung’, *δια-ειπεῖν* ‘mit einander sprechen’ (the exact etymological cognate of Ved. *ví-vaC_{MED}*), *δια-κυνέω* ‘sich gegenseitig küssen’, *δια-κυρίττομαι* ‘sich unter einander stoßen’, *δια-πειλέω* ‘sich gegenseitig bedrohen’, *δια-μάχομαι* ‘fight against each other’. Note that, in some of these Greek examples, the reciprocal meaning is expressed by forms with the active inflexion.

3.3 Spatial reciprocals with the preverbs *ví* and *sám* and sociatives with *sám*

Spatial reciprocals with the preverbs *ví* ‘apart’ and *sám* ‘together’ denoting separating and joining, respectively, are much more productive than reciprocals proper with the middle inflexion and preverb *ví*. Unlike reciprocals proper, they can take both middle and active endings. Middle forms are typically employed as subject-oriented reciprocals (i.e. refer to separating/joining of the participants denoted by the subject: ‘come together’, etc.), while active forms can be employed either as subject-oriented reciprocals (cf. *ví-yánti* ‘(they)

15. For this meaning, see, in particular, Elizarenkova (2001:120ff.).

16. This semantics may result from the development of the following implicatures: ‘make in parts, asunder’ → ‘disintegrate’ → ‘disfigure’ → ‘change’.

17. See especially the convincing argumentation in Lubotsky (1994:202ff.).

Table 1.

	ACTIVE	MIDDLE
(Ø)	transitives (e.g. <i>bharati</i> 'X brings Y'); intransitives (e.g. <i>gacchati</i> 'X goes'); etc.	many symmetric predicates (including some lexical reciprocals), reflexives, ... (<i>bharate</i> 'Y brings oneself, moves' (ref.); 'X brings Y for oneself' (self-benef.))
<i>sám</i>	object-oriented spatial reciprocals of joining (e.g. <i>sám bharati</i> 'X brings Ys together'); (sociatives)	subject-oriented spatial reciprocals of joining (e.g. <i>sám gacchante</i> 'Xs come together'); sociatives (e.g. <i>sám pibante</i> 'Xs drink together')
<i>ví</i>	object-oriented spatial reciprocals of separating (e.g. <i>ví bharati</i> 'X spreads Ys asunder, distributes Ys'); (subject-oriented spatial reciprocals of separating [e.g. <i>ví-yánti</i> '(they) go apart'])	subject-oriented spatial reciprocals of separating (e.g. <i>ví gacchante</i> 'Xs go asunder, separate'); reciprocals proper (e.g. <i>ví jayante</i> 'Xs overcome each other')

go apart' in (13)), or, more commonly, as object-oriented reciprocals (i.e. referring to separating/joining of the participants denoted by the object: 'bring together', etc.). Some of the middle (and, more rarely, active) forms with *sám* should be qualified as sociatives, meaning 'perform the activity expressed by the base verb together', rather than spatial reciprocals (e.g. 'come together'). In some cases, the distinction between these two types cannot be drawn with accuracy.

The system of meanings expressed by the preverbs *ví* and *sám* is schematically represented in Table 1.

A detailed study of spatial reciprocals and sociatives remains a desideratum; below I confine myself to a few examples:

(i) (spatial) reciprocals:

- i* 'go' – *sám-i*_{MED} 'come together' – *ví-i* 'go apart', cf. (13)
- kram* 'step' – *sám-kram*_{MED} 'come together, meet' (AV, ŚB)
- gam* 'go' – *sám-gam*_{MED} 'meet together, unite; meet for fighting, fight with each other', cf. (30)
- car* 'move, walk' – *sám-car*_{MED} 'meet' (RV+)
- jñā* 'know' – *sám-jñā*_{MED} 'agree (with each other)' (cf. (49)) – *ví-jñā* 'distinguish (from each other)'
- dā* 'tie' – *sám-dā* 'tie together' – *ví-dā* 'untie', cf. (34)
- dhṛ* 'keep, hold' – *sám-dhṛ* 'keep together' – *ví-dhṛ* 'keep apart', cf. (31, 49)
- bhāṣ* 'talk, speak' – *sám-bhāṣ*_{MED} 'converse (with each other)', cf. (54).

(ii) sociatives:

- kamp* 'tremble' – *sám-kamp* 'tremble together', cf. (31)
- kruś* 'shout' – *sám-kruś* 'shout together'
- trp* 'rejoice' – *sám-trp* 'rejoice together', cf. (32).

Examples of constructions with spatial reciprocals and *sám* sociatives are:

- (30) (ŚBM 1.8.3.6 ~ ŚBK 2.8.1.5)
caturthé púruṣe tṛtīye sám gacchāmahe

 ‘Prajāpati created the gods. When they were born, they were tied together with evil. He untied them.’

18. Geldner (1889:281): ‘... im vierten, im dritten Gliede (der Verwandtschaft) dürfen wir uns geschlechtlich vereinigen.’ Explaining this passage, Weber-Brosamer (1988:86f., with fn. 195) rightly points out that *sám gacchāmahe* refers to fighting, not to sexual intercourse (as Geldner, and, subsequently, Rau (1957:40), understood it).

19. Gotō (1987:110) erroneously translates this form as a non-sociative, taking *sam*_(c) as the marker of completive actionality: ‘Sie waren in völlig (*sam*) erregter Bewegung.’

20. Some manuscripts attest variant readings with the active inflexion: *tṛpyanti*.

By the end of the Vedic period, (spatial) reciprocals/sociatives with *sám* and reciprocals of separating with *vi* reach an absolute productivity and cover the major part of the verbal dictionary (cf. the situation with the Latin prefixes *con-* and *dis-* of similar semantics).

4. Constructions with reciprocal pronouns and adverbs

Analytic markers of reciprocity show higher degree of productivity and regularity than morphological reciprocals with *vi* (which can only be made from a rather limited class of verbs) and *sám* (which cover only a part of the semantic domain of reciprocals). A more common reciprocal marker is the adverb *mithás* ‘mutually’; from middle Vedic onwards, it cedes to the polyptotic reciprocal pronoun *anyó* (*a*)*nyá-*.²¹

4.1 Reciprocals with the adverb *mithás*

The reciprocal adverb *mithás* (with the sandhi variants *mitháh*, *mithó*) ‘mutually’ is almost exclusively used with middle verbal forms. In the RV, *mithás*-reciprocals are attested with some 15 verbs and can form reciprocals of different syntactic types.

(i) “Canonical” reciprocals:

- | | | |
|------------------------------------|---|--|
| <i>vap</i> ‘scatter, (be)sprinkle’ | – | <i>mithó vapanta</i> ‘they (= the Maruts) besprinkle each other’ |
| <i>hi</i> ‘urge, impel’ | – | <i>mithó hinvāná</i> ‘impelling each other’ (cf. (35)) |
| <i>pū</i> ‘purify’ | – | <i>punāné mitháh</i> ‘purifying each other [of earth and heaven]’. |

(ii) “Possessive” reciprocals:

- | | | |
|-------------------|---|---|
| <i>rih</i> ‘lick’ | – | <i>rihaté kakúbho mitháh</i> ‘they lick each other’s backs’ (as bulls do) (cf. (36)). |
|-------------------|---|---|

(iii) It can also be (pleonastically) used with symmetric predicates and morphological middle reciprocals (including reciprocals with *sám*):

- | | | |
|--|---|---|
| <i>nas</i> ‘(happily) unite, approach’ | – | <i>sám ... mithó nasanta</i> ‘they mutually happily unite (with their relatives)’ (RV 8.72.14; see Gotō 1987:200) |
| <i>yat</i> ‘be in place, arranged’ | – | <i>ná yatante mithás</i> ‘they are not in competition with each other’ |
| <i>spṛdh</i> ‘compete’ | – | <i>sám ... mitháh pasṛdhānāsah</i> ‘competing with each other’. |

21. For a general survey of the reciprocal pronouns and constructions in Indo-European, see, in particular, Krisch (1999).

Note that *mithás* does not occur in constructions with “indirect” reciprocals.

Examples are:

- (35) (RV 10.65.2)
indrāgní... mithó hinv-āná tanvā
 Indra-Agni:NOM.DU mutually impel:PRES-PART.MED:NOM-ACC.DU.M REFL:NOM-ACC.DU
sámokasā
 having.same.abode:NOM-ACC.DU.M
 ‘Indra and Agni, ... mutually impelling each other themselves, having same abode ...’

Note that in (35) the reciprocal adverb *mithás* co-occurs with the emphatic reflexive pronoun *tanú-* ‘(one)self’ (on which see Kulikov 2007).

- (36) (RV 8.20.21)
rihaté kakúbho mitháh
 lick:PRES:3PL.MED back:ACC.PL mutually
 ‘They lick each other’s backs.’
- (37) (RV 10.68.10)
yát súryā-māsā mithá uccárātaḥ
 while sun-moon:NOM.DU mutually rise:PRES:2.DU.SUBJ.ACT
 ‘... while the sun and moon will rise one after another.’

mithás can also be employed with nominal forms, adjectives (as in (38)) and substantives:

- (38) (RV 7.38.5)
yé mithó vanúṣaḥ sápane
 who:NOM.PL.M mutually competing:NOM.PL take.care:PRES:3PL.MED
 ‘... who, competing with each other, take care ...’ (see Gotō 1987: 323, fn. 783)

Furthermore, *mithás-* appears as the first element of some compounds (see Section 5).

The adverb *mithás* becomes less frequent after the RV. It is interesting to note that all its attestations in the AV occur in pleonastic usages, in the compound *mitho-yodhá-* ‘battle, fight’ in AV 12.5.24 (see Section 5), i.e., with a verbal noun derived from a symmetric predicate, and in constructions with *ví-*reciprocals, cf. (13, 14, 28). Likewise, in later texts (in particular, in post-Vedic), it is often (mostly?), used pleonastically, as in (39), where it co-occurs with the reciprocal pronoun *anyonyam* ‘each other’:

- (39) (ManuSmṛ. 7.89)
āhaveṣu mitho anyonyam jighāmsanto mahikṣitaḥ
 battle:LOC.PL mutually each.other kill:DES:PART.ACT:NOM.PL.M king:NOM.PL
 ‘The kings who, seeking to kill each other in battles ...’

4.2 Reciprocal constructions with the pronoun *anyó (a)nyá-*

Reciprocal constructions with the reciprocal pronoun *anyó (a)nyá-* represent the most frequent type of the Sanskrit reciprocals. The polyptotic reciprocal marker (RM) *anyó ... anyá-* (*anyò’nyá-*, *anyonya-*) represents the iteration of the pronominal adjective *anyá-* ‘another, one of a number, the other’ (for its usages, see, in particular, Jamison 1997), thus literally meaning ‘another ... another’; cf. English reciprocal *one another*, Latvian *cits*

citū lit. ‘another (NOM) another (ACC)’. The first component (*anyó-*) is the sandhi form of the singular masculine nominative *anyás* (*anyáh*) before voiced consonants and *a*; the accent on *-ò-* and the loss of the following *a* also result from the sandhi. In contrast to the reciprocal adverb *mithás*, which occurs with middle verbal forms, *anyó (a)nyá-* typically combines with active forms.

4.2.1 *The main syntactic types of reciprocal constructions with anyó (a)nyá-*

The pronoun *anyó (a)nyá-* can express reciprocal relations between the subject and any other argument, including the direct object, indirect object, possessor noun, etc. Accordingly, the second part may appear in different case forms: accusative (= “canonical” reciprocals, cf. (40, 42, 44–5, 49)), dative (= “indirect” reciprocals, cf. (47)), genitive (= “possessive” reciprocals, cf. (50–51)), locative (cf. (53)), or instrumental (cf. (46)).

4.2.2 *The historical development of reciprocal constructions with anyó (a)nyá-*

From the early Vedic period onwards, we observe both an increase of productivity of *anyó (a)nyá-* and its morphological evolution from a free combination of words into a grammaticalized pronoun (see, in particular, Wackernagel 1905:322f.). This section offers a brief survey of the history of constructions with *anyó (a)nyá-*.

4.2.2.1 *Early Vedic (the early R̥gveda)*. In the earliest documented period, i.e. in the RV, reciprocal constructions with *anyó ... anyá-* are still rare. As mentioned above, reciprocity is more often expressed by other markers: middle endings, the preverbs *ví* and *sám*, and the adverb *mithás*. In the RV, we find as few as five attestations of the reciprocal proto-pronoun *anyó(-)(a)nyá-*. It is not yet grammaticalized as a single reciprocal marker, its constituent parts being essentially autonomous lexical units, which can be separated by other word(s). Both parts of the ‘quasi-pronoun’ agree in number and gender with the antecedent noun. The verbal form agrees with the first part of the reciprocal pronoun, and thus appears in the singular, as in (40):

- (40) (RV 7.103.3–4)
- | | | | |
|----------------|----------------|--------------------------------|-----------------|
| <i>anyó</i> | <i>anyám</i> | <i>úpa vādantam</i> | <i>eti</i> |
| other:NOM.SG.M | other:ACC.SG.M | to call:PRES:PART.ACT:ACC.SG.M | go:PRES:3SG.ACT |
| <i>anyó</i> | <i>anyám</i> | <i>ánu gr̥bhñāty</i> | <i>enor</i> |
| other:NOM.SG.M | other:ACC.SG.M | support:PRES:3SG.ACT | they:GEN.DU |
- ‘One (frog) goes to the call of another; one of the two supports another.’

The syntactic pattern attested with *anyá- ... anyá-* in early Vedic is schematically represented in (41):

- (41) RM1:NOM S:GEN.non-SG RM2:ACC V:SG
 (RM1 and RM2 stand for the first and second part of the reciprocal pronoun, S stands for the noun denoting the group of participants of the reciprocal situation, i.e. the antecedent of the reciprocal pronoun).

The only instance of the reciprocal proto-pronoun *anyá-* ... *anyá-* with a plural verbal form (in a construction where the second part of the reciprocal pronoun appears in a non-accusative (genitive) case) is attested in the late book 10 of the RV, cf. (42b):

- (42) (RV 10.97.14)
- a. *anyá* *vo* *anyám* *avatu*ᵛ
 other:NOM.SG.F you:GEN.PL other:ACC.SG.F help:PRES:3SG.IMP.ACT
- b. *anyá*ᵛ *anyásyā* *úpāvata*
 other:NOM.SG.F other:GEN.SG.F stand.by:PRES:2PL.IMP.ACT
 ‘Let one of you (medical plants) help another; stand one by another.’

4.2.2.2 Late early Vedic (late books of the R̥gveda, Atharvaveda). At the end of the early Vedic period, in the late R̥gveda and Atharvaveda, pattern (41) yields to the structure (43), with the verb in the non-singular (plural or dual) form, as illustrated in (44):

- (43) S:NOM.non-SG RM1:NOM (...) RM2:ACC V:non-SG
- (44) (AVŚ 12.3.50)
- sám* *agnáyo* *vid-ur* *anyó* ^a*nyám*
 together fire:NOM.PL know:PERF-3PL.ACT other:NOM.SG.M other:ACC.SG.M
 ‘The fires know *each other*.’

Reciprocal constructions with the singular verbal forms virtually disappear after the RV. The constituent parts of the reciprocal pronoun normally occur adjacent to each other, as in (44), but they can still be separated by other word(s), as in (45). The singular form of RM1 and RM2 is not yet completely generalized. Thus, in the Paippalāda recension of the Atharvaveda, we find a rare example (45), where both parts of the pronoun *anyó* ... *anyá-* appear in the plural:

- (45) (AVP 5.10.7)
- hatāso* *anye* *yodhayanty* ⁺*anyāms*
 hit:PART.PERF.PASS:NOM.PL.M other:NOM.PL.M fight:PRES.CAUS:3PL.ACT other:ACC.PL.M
 ‘Those which are hit incite one another to fighting.’ (lit. ‘make fight one another’; said of alcohol-drinkers)

4.2.2.3 Middle and late Vedic. The language of the Vedic prose (foremost, Brāhmaṇas) displays a number of features that testify to a further grammaticalization of *anyò’nyá-*:

(i) *Inseparability.*

The parts of the reciprocal pronoun *anyò’nyá-* cannot be separated by other words.

(ii) *Accentuation.*

Although in most accentuated texts (in particular, in Taittirīya-Saṃhitā, Maitrāyaṇī Saṃhitā, Śatapatha-Brāhmaṇa), both parts of the reciprocal pronoun bear accents (*anyò-^anyá-*; see Wackernagel 1905:322f.), as, for instance, in (46, 50, 51, 53), we also find an example of a single accent (in this case, on the first component of the pronoun), attested in the Taittirīya-Brāhmaṇa (cf. (47); see Debrunner 1957:89):

- (46) (ŚB 14.4.3.30 = BĀUK 1.5.23)
*tāni sṛṣṭāny anyò-nyéna*_U
 that:NOM.PL.N created:NOM.PL.N other:NOM.SG.M-other:INST.SG.M/N
asparḍhanta
 compete:IMPF:3PL.MED
 ‘Those created (active functions) competed with each other.’
- (47) (TB 1.3.2.1)
té anyò-nyasmai ná *atiṣṭhanta*
 they:NOM.PL.M other:NOM.SG.M-other:DAT.SG.M not stand:IMPF:3PL.MED
 ‘They (the gods) did not adhere to each other.’

Unfortunately, this is the only example of *anyò-nya-* found in the TB, so that we cannot be sure whether this was a feature of the dialect of the TB, or just a minor lapsus of the scribe.

(iii) *Number and gender agreement.*

The reciprocal pronoun generalizes the singular form for both of its parts, so that examples such as (45) become impossible. The gender agreement of the constituent parts of the reciprocal pronoun follows one of the following two patterns: (a) *anya*-[M/N/F]-*anya*-[M/N/F] or (b) *anyó*[M]-*anyá*-[M/N/F]. In constructions of type (a), both parts of the reciprocal pronoun agree in gender with the nominal antecedent. This pattern is attested only in very few texts, in particular, in the relatively late Jaiminiya-Brāhmaṇa. Cf. (48), where the feminine substantive *prajā*[ḥ] ‘creatures’ triggers the feminine gender on both RM1 (*anyā*) and RM2 (*anyām*):

- (48) (JB 1.117:1–2)
prajāpatiḥ prajā asṛjata. ... tā aśanānyantīr
 P. creature:ACC.PL created they:NOM.PL.F being.hungry:NOM.PL.F
anyā-nyām ādan
 other:NOM.SG.F-other:ACC.SG.F eat:IMPF:3PL.ACT
 ‘Prajāpati created the creatures. [...] Being hungry, they ate each other.’

Most texts have generalized the masculine form of the first part of the reciprocal pronoun (*anyo-*) and thus follow the agreement pattern (b). Consequently, we observe in (49) (a passage from the Pañcaviṃśa-Brāhmaṇa parallel to (48)) and in (50) that the feminine gender is only marked on the second element of the reciprocal pronoun, whereas the first component is in the masculine (*anyo-*, not ***anyā-*). In (51), the masculine (*anyo-*) is used instead of the neuter form (***anyad-*) according to the same pattern:

- (49) (PB 24.11.2)
prajāpatiḥ prajā asṛjata. tā a-vidhṛtā
 P.:NOM creature:ACC.PL created they:NOM.PL.F not-kept.apart:NOM.PL.F
a-sañjānānā anyo-nyām ādan
 not-agree:PRES:PART.MED:NOM.PL.F other:NOM.SG.M-other:ACC.SG.F eat:IMPF:3PL.ACT
 ‘Prajāpati created the creatures. They, not being kept apart, not agreeing (with each other), ate each other.’

- (50) (ŚB 5.3.4.21)
anyò-nyásyā (**anyānyásyā*) *evàitác chriyá-*
 other:NOM.SG.M-other:GEN.SG.F (other:NOM.SG.F-...) PRTL superiority
á-tiṣṭhamānā ... yanti
 not-standing:NOM.PL.F go:PRES:3PL.ACT
 ‘... (The waters [F.]) are flowing ..., not yielding to one another’s superiority.’
- (51) (TS 7.2.8.6)
chándāṃsy anyò-nyásya
 metre:NOM.PL [N.] other:NOM.SG.M-other:GEN.SG.M/N
 (**anyád-anyásya*) *lokám abhy ádhyāyan*
 other:NOM.SG.M-other:GEN.SG.M/N place:ACC.SG be.eager:IMPF:3PL.ACT
 ‘The (poetic) metres were eager for each other’s place.’

4.2.2.4 *Further grammaticalization of anyo’nya- in late Vedic and post-Vedic Sanskrit.* In late Vedic and post-Vedic Sanskrit *anyo’nya-* is further grammaticalized. The following phenomena clearly show that its constituent parts, RM1 and RM2, lose the last features of independent forms, and the reciprocal pronoun becomes completely fossilized as a single lexical unit:

(i) Neither part of the reciprocal pronoun agrees in gender or number with the antecedent; the masculine singular form (nominative *anyo-*, accusative *anyam*, etc.) becomes generalized, cf. (52):

- (52) (Rām. 2.53.10)
anyo-nyam (**anyānyām = anyā-anyām*) *abhivikṣante ...*
 other:NOM.SG.M-other:ACC.SG.M other:NOM.SG.F-other:ACC.SG.F look.at:PRES:3PL.MED
ārtatarāḥ striyaḥ
 confused:NOM.PL.F woman:NOM.PL
 ‘The confused women look at each other.’

(ii) *anyo’nya-* can be used with non-subject antecedents, in particular, in object-oriented reciprocal constructions. Thus, in (53), RM2 receives the locative case as the oblique argument of the verb *juhomi* ‘(I) pour into’, but RM1 does not agree in case with its accusative antecedent *gharmāu* ‘oblations’:

- (53) (ŚB 11.6.2.2)
gharmāv evá ... anyò-’nyásmín
 gharma:ACC.DU PRTL other:NOM.SG.M-other:LOC.SG.M
 (**anyām-anyásmín*) *juhomi*
 other:ACC.SG.M-other:LOC.SG.M pour:PRES:1SG.ACT
 ‘I pour both gharma-oblations, one into another.’

(iii) In the post-Vedic period (in particular, in Epic Sanskrit), we also find the fossilized (adverbial) form *anyonyam* employed in constructions where the grammatical case of the second constituent of the reciprocal pronoun (i.e. accusative) does not correspond to the case pattern of the verb. Cf. (54), where we might expect RM2 to appear in the instrumental case, in accordance with the case pattern of the verb *saṃ-bhāṣ* ‘converse’:

- (54) (Rām. 5.89.52)
teṣāṃ saṃbhāṣa-māñānām anyo-nyam ...
 they:GEN.PL.M converse:PRES-PART.MED:GEN.PL other:NOM.SG.M-other:ACC.SG.M
 (**anyasyānyena* = *anyasya-anyena*)
 other:GEN.SG.M-other:INST.SG.M
 ‘... of them, conversing with each other ...’

(iv) In post-Vedic Sanskrit, where nominal composition becomes very productive, the stem *anyonya-* can also appear as the first member of a compound (meaning ‘mutual, reciprocal’); see Section 5.

4.3 Other polyptotic reciprocal pronouns

Alongside *anyó (a)nyá-*, there exist two other reciprocal pronouns with a similar structure (and probably built on its model), namely *itaretara-* and *paras-para-*. They are first attested at the end of the Vedic period and, consequently, should be qualified as essentially post-Vedic forms.

4.3.1 The reciprocal pronoun *itaretara-*

The form *itaretara-* is derived from the pronominal adjective *itara-* ‘(an)other’. It appears at the very end of the Vedic period and remains less common than *anyonya-*. Its inner structure is less clear than that of *anyonya-*. It might be based either on the bare stem (*itara-itara-*), or on the nom.sg.f. form (*itarā-itara-*). The only example of the first component in the masculine form (and one of the earliest attestations of this reciprocal pronoun) is found in a late Vedic text, Bṛhad-Āraṇyaka-Upaniṣad:

- (55) (ŚB 14.5.4.15 = BĀU 2.4.15)
yātra hí dvaitām iva bhāvati, tād itara
 where since duality:NOM.SG as become:PRES:3SG.ACT then other:NOM.SG.M
itaram paśyati
 other:ACC.SG.M look:PRES:3SG.ACT
 ‘For where there is a duality, there one sees another ...’

4.3.2 The reciprocal pronoun *paras-para-*

Like *itaretara-*, the pronoun *paras-para-* is a post-Vedic form (one of its earliest occurrences being found in the Śrauta-Sūtras, VaikhŚS 8.7:84.12). It represents the iteration of the pronominal adjective *para-* ‘far, other, different, alien, foreign’. Cf. (56):

- (56) (KA 1.13.18)
paras-parād vā bhedayed enān
 other:NOM.SG.M-other:ABL.SG.M OR split:PRES.CAUS:3SG.OPT.ACT they:ACC.PL.M
 ‘Or, he should divide them from each other ...’

As in the case of *anyonyam*, the accusative form *paras-param* can be used adverbially, as in (57):

- (57) (MBh. 1.194.6)
paras-pareṇa *bhedaś ca na ādhātuṃ teṣu*
 other:NOM.SG.M-other:INST.SG.M split:NOM.SG and not establish:INF they:LOC.PL
śakyate ekasyāṃ ye ratāḥ patnyāṃ
 be.able:PASS:3SG one:LOC.SG.F who:NOM.PL.M being.in.love:NOM.PL.M wife:LOC.SG
na bhidyante paras-param
 not split:PRES:3PL.MED other:NOM.SG.M-other:ACC.SG.M
 ‘And they cannot be alienated from one another (lit. ‘for them, the split from one another cannot be established’). [Men] who are in love with the same wife are not split (mutually).’

Generally, no difference in meaning between reciprocals with *anyonya-* and *paraspara-* can be observed. Neither European nor Indian grammarians make a distinction between them.²² However, at least in one Classical Sanskrit text, Kauṭīliya’s “Arthaśāstra” [KA] (a treatise on governing the state, written between the 4th and 2nd centuries BC), *anyonya-* and *paraspara-* seem to be semantically distinguished. *paraspara-* is used in contexts dealing with reciprocal hostile activities, while *anyonya-* is employed in other contexts, dealing with friendly or neutral activities. Cf. a few contexts and compounds which clearly demonstrate this semantic opposition:

anyonya-:

- na ... anyonyam ... vidyuh* (KA 1.12.12) ‘they should not know each other’
vāsayeyuh ... anyonyam (KA 2.36.6) ‘they should lodge each other’ (lit. ‘make live, stay’)
adoṣas tyaktum anyonyam (KA 3.14.38) ‘[in these cases] there is no harm in abandoning each other’
anyonyārakṣa- (KA 2.1.2) ‘mutual protection’

paraspara-:

- parasparam abādhamānā vaseyuh* (KA 3.16.33) ‘may they live without troubling each other’
parasparam ... tyajataḥ (KA 3.20.18) ‘abandoning each other’
parasparād ... bhedayet (KA 1.13.18) ‘he should divide them from each other’ (see (56))
parasparasyāveśanikān (KA 5.1.47) ‘guests of each other’ (said of secret agents, spies)
parasparadveṣa- (KA 9.6.26) ‘mutual hatred’
parasparahiṃsā- (KA 3.9.28) ‘mutual damage’
parasparam ... vikramayet (KA 5.6.25) ‘(he) should make (them) fight against each other’; cf. (58):

- (58) (KA 5.6.25)
amātyaḥ kulya-kumāra-mukhyān
 minister:NOM.SG royal.family-prince-principal.officer:ACC.PL
paras-param mukhyeṣu vā
 other:NOM.SG.M-other:ACC.SG.M principal.officer:LOC.PL or
vikramayet
 fight:PRES.CAUS:3SG.OPT.ACT

22. According to Richter (1898: 49), *parasparam* is mostly used with two reciprocants. Textual evidence does not support his assumption, however.

‘The minister should make the members of the royal family, princes and principal officers fight against each other or against (other) principal officers.’

I have not come across this opposition elsewhere, although it cannot be ruled out that some other texts make a similar distinction. It may be an invention of Kauṭīliya, the author of the text, probably based on the above-mentioned semantic difference between *anya-* ‘(an)other’ and *para-* ‘other, foreign, alien’.

5. Nominal derivatives and compounds with the reciprocal meaning

All reciprocal markers discussed in Sections 3–4, including both the preverbs/prefixes *vi* and *sám* and free forms (the adverb *mithás* and the polyptotic reciprocal pronouns *anyonya-*, *itaretara-* and *paraspara-*), can be employed to form nominal derivatives with a reciprocal meaning.

Reciprocal nouns with the prefixes *vi-* and *sám-* and compounds with the first element *mithás-* are attested from early Vedic onwards; cf. the two nouns derived from the verb *dviṣ* ‘hate’: action nominals in *-ana-* *vi-dvéṣana-* (RV 8.1.2) and in *-as-* *vi-dveṣas-* (RV 8.22.2), both meaning ‘(mutual) hate, hostility’; and the root noun *vi-vāc-* ‘(verbal) contest, competition’ derived from the verbal root *vac* ‘speak’.²³

Compounds with *mithás-* as the first element are derived from the following verbal roots and nominal stems:

<i>tṛ</i> (<i>tūr</i>) ‘surpass’	– <i>mithas-túr-</i> (e.g. in RV 6.49.3 <i>mithas-tūrā</i> ‘(day and night), surpassing each other’)
<i>pā</i> ‘protect’	– <i>mithó-avadya-pa-</i> (in RV 10.67.8 <i>mithó-avadya-pebhiḥ</i>) ‘those who protect each other from blame’
<i>yudh</i> ‘fight’	– <i>mitho-yodhá-</i> (AV 12.5.24) ‘battle, fight’.

Compounds with *anyonya-* become productive in the post-Vedic period. These include, for instance:

<i>yoga-</i> ‘union’	– <i>anyonya-yoga</i> (ManuSmṛ. 3.32) ‘mutual union (of a girl and her lover)’
<i>śreṣṭhya-</i> ‘superiority’	– <i>anyonya-śreṣṭhyāya</i> (KpS 38.2:206.1) ²⁴ ‘for superiority to each other’
<i>sakta-</i> ‘connected’	– <i>anyonya-sakta-</i> (Prašna-Upaniṣad 5.6) ‘connected with each other’
<i>anna-bhojana-</i> ‘food-eating’	– <i>anyonyāna-bhojana-</i> (= <i>anyonya-anna-</i>) (Āgñiveśya-Gr̥hya-Sūtra 3.10.3:4) ‘eating each other’s food’
<i>tyāgin-</i> ‘abandoning’	– <i>anyonya-tyāgin-</i> (YājñSmṛ. 2.237) ‘abandoning each other’.

23. See Kuiper (1960: 268–273).

24. This is the earliest and the only Vedic example of a compound built with *anyonya-* (see Debrunner 1957: 89); the parallel passages of the other Saṃhitās of the Yajurveda (MS, KS, TS) have reciprocal constructions with the reciprocal pronoun used as a free form in the genitive (*anyònyāsya* in KS 24.9:100.3 and MS 3.7.10:90.1), or the dative (*anyònyāsmāi* in TS 6.2.2.1).

Examples of compounds made with the two other reciprocal pronouns, *itaretara-* and *paraspara-*, also first appear in post-Vedic texts:

- (i) *itaretara-*
yājaka- ‘sacrificer’ – *itaretara-yājaka-* (ĀpDhS 1.29.8) ‘officiating at each other’s sacrifices’
adhyāpaka- ‘teacher’ – *itaretarādhyāpaka-* (ĀpDhS 1.29.8) ‘teaching each other’
janman- ‘birth, origin’ – *itaretara-janman-* (Vārtt. on Pāṇ.) ‘originating from each other’
āśraya- ‘attachment’ – *itaretarāśraya-* (Vārtt. on Pāṇ.) ‘attachment to each other’.
- (ii) *paraspara-*
vyapekṣā- ‘relation’ – *paraspara-vyapekṣā-* (Vārtt. on Pāṇ. 2.1.1) ‘mutual relation’ (gramm. term)
adin- ‘consuming, eating’ – *parasparādin-* (= *paras-para-adin-*) (ManuSmṛ. 12.59) ‘consuming, eating one another’
jighāmsu- ‘desiring to kill’ (nominal derivative of the desiderative of the verb *han* ‘kill’) – *paraspara-jighāmsavaḥ* (Atharvaveda-Pariśiṣṭa 61.1.23) ‘desiring to kill each other’.

From the early Vedic period onwards, spatial reciprocals (and sociatives) can also be easily derived from nominal stems by means of the prefixes *sam-* (mostly in action nominals), *sa-*, which represents the zero grade allomorph of *sam-* (in adjectives), and *vi-*. The prefixes can be added to various nominal stems. Many of these formations show different degrees of lexicalization. Note the following examples, mostly from early Vedic (RV):

<i>sad</i> ‘sit’	<i>sam-sād-</i> ‘sitting together, assembly’
<i>dhā</i> ‘put’	<i>sam-dhā-</i> ‘union, agreement’
	<i>sam-dhī-</i> ‘junction, connection, combination, sandhi’
	<i>vi-dhā-</i> ‘division, part’
<i>dṛś-</i> ‘view, look’	<i>sa-dṛś-</i> ‘looking alike, of the same form’
<i>yuj</i> ‘yoke, join’	<i>sam-yúj-</i> ‘joining together’
	<i>sa-yúj-</i> ‘yoked together; companion’ (cf. (59))
	<i>vi-yoga-</i> (post-Vedic) ‘disjunction’
<i>ókas-</i> ‘abode’	<i>sám-okas-</i> ‘having same abode’ (cf. (35))
<i>rátha-</i> ‘chariot’	<i>sa-rátha-</i> ‘on the same chariot’ (cf. (59)).

Like their verbal counterparts, reciprocal/sociative nouns with *sam-* and *sa-* are commonly constructed with the instrumental of the second reciprocant, as in (59):

- (59) (RV 10.168.2)
tābhiḥ *sa-yúk* *sa-ráthaṃ* *devá*
 that:INST.PL.F SOC-join:NOM.SG.M SOC-chariot:ACC.SG.M god:NOM.SG
ṛyate
 drive:PRES:3SG.MED
 ‘United with those [young women], the god drives on the same chariot (with them).’

Acknowledgments

I am deeply grateful to Vladimir Nedjalkov and Emma Geniušienė for their patience, remarks, criticism and comments on earlier versions of this paper. I am much indebted to Robert Ryan and Carlotta Viti for valuable comments on my paper. I acknowledge grant 275-70-009 (VENI-project) received from the Netherlands Organization for Scientific Research (NWO), and financial support from the Alexander von Humboldt-Stiftung.

1. Introductory notes

1.1 Kabardian

Kabardian (Circassian) belongs to the Adyghe group of the Abkhaz-Adyghe family. Nearly 370,000 native speakers of Kabardian live in the Western part of the North Caucasus. Kabardian is rather closely related to Adyghean (about 100,000 speakers), another major language of the Adyghe group. Kabardian has the status of a literary language since 1920s, when the first Kabardian alphabet was devised. For a detailed account of Kabardian grammar see Jakovlev (1948), Abitov et al. (1957).

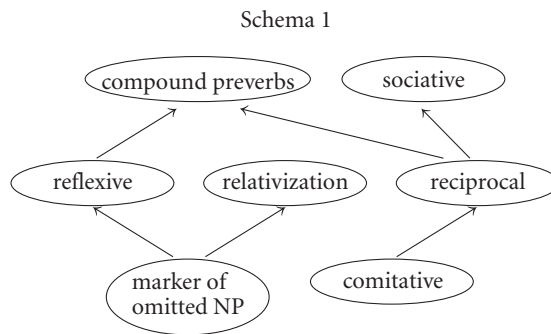

The specific feature of Kabardian and other Abkhaz-Adyghe languages is their high synthetism. A verb normally agrees with all the subordinated NPs. Most of the derivative categories also normally have synthetic expression. Therefore a Kabardian verb may contain 10 and even more grammatical markers. The verbal form in (1) (from Kumaxov 1971:319) is by far not the longest one:

- (1) *f-a: -x^o -ja-d-γa-s^α -a: -s:*
 2SG-3PL-BEN-3SG/PL-1PL-CAUS-lead-PAST-ASS
 ‘We caused them/him to lead you for them.’

1.2 Means of expression for reciprocity, reflexivity, comitativity and sociativity

Kabardian reciprocals are treated here together with comitatives, sociatives and reflexives because of the related derivation of these categories. *Reciprocal* and *reflexive* derivation is marked with the same affix *-z-*, with possible positional variants (*-za-*, *-zarə-*, *-zə-*). The same marker is used in *relativization*. Thus the prototypical function of *-z-* is to mark deletion of an NP dependent upon a verb, be that deletion of a coreferential NP in a reciprocal or reflexive construction or deletion of a relativized NP in a relative clause. It is interesting to note that there seems to be no way to discover which of the particular functions of *-z-* was primary. Although it seems doubtful that a morpheme could originate with the highly “generalized” function of marking an omitted NP, it is not clear what the lexical source of the grammaticalization could be. Still more interestingly, at the present stage some apparent examples of the inverse degrammaticalization of *-z-* are evident: in combination with many preverbs it loses its syntactic function and a combination of the two morphemes is reinterpreted as a single compound preverb.

The *comitative* is marked with a special valence-increasing prefix, and *sociative* is expressed as a reciprocal of a comitative verb. Schema 1 shows the relations between these categories:

The synthetic means used to express the categories in question are introduced in Table 1.

These markers of reciprocity and the related categories are highly productive. A reciprocal with *-za-/-zarə-* may be derived in a regular way from any Kabardian verb for which the meaning of reciprocity is ever possible. It also covers all the diathesis types of reciprocals. This regularity makes redundant any lexical ways of expressing reciprocity. A pronoun with the meaning ‘each other’, though present in Kabardian, is but a marginal substitute for the reciprocal marker. Another important consequence of this regularity is that the reciprocal marker may be combined with a great variety of verbal markers within

Table 1. Verbal markers of reciprocal, reflexive, sociative, and comitative

	Type of coreference (if any)	
	Coreference between subject and direct object in transitive verbs	Other types of coreference
Reciprocal	-zarə-	-za-
Reflexive	-zə-	-za-
Comitative		-da-
Sociative		-za-da-

(The final vowel of these markers is usually omitted if the next morpheme begins with a vowel.)

one verbal form. Naturally, in many of these combinations the meaning of the reciprocal marker can be modified in one way or another. However, a calculus of all transformations becomes tremendously difficult because of the extraordinary combinatorial possibilities of the reciprocal marker. Therefore the present paper lists only the most regular semantic transformations, without a claim for completeness.

The comitative marker *-da-* belongs to the numerous set of derivational morphemes termed “preverbs”. Preverbs modify the meaning of a verb, at the same time introducing a new indirect object, the semantic role of which is indicated by the preverb. Specifically *-da-* indicates that the indirect object which it adds has a comitative meaning. This meaning can also be expressed by the adverb *i-γ^osau* ‘A together with B’, in which the first element preceding the hyphen is an agreement marker cross-referencing the comitative NP. The sociative adverb *za-γ^osau* ‘A and B together’ is formed from *i-γ^osau* by means of the reciprocal marker *-za-*.

1.3 Additional characteristics and illustrations

A variant of the reciprocal/reflexive marker is inserted in the agreement slot of an NP which is deleted in a reciprocal or reflexive construction. Because of this interaction of reciprocal/reflexive marking with the agreement system, Kabardian may be said to employ *morphological-paradigmatic* means to express reciprocity/reflexivity. The essence of morphological-paradigmatic marking is that there is a special marker (or markers) for a category, but it is substituted for an agreement marker in the agreement slot. Thus morphological-paradigmatic marking differs both from *morphological-derivative* marking, when a derivative marker of the category is added to the verb but does not substitute for any other marker, and from *paradigmatic* marking, when a category is expressed by a change of agreement markers.

The *reciprocal* marker is *-zarə-* if a reciprocal entails coreferentiality between the subject and the direct object of a transitive verb, and *-za-* in other cases:

- (2) a. a:ħa-m ua u-a:[-o]-cəx-Ø.
 they-ERG you 2SG.ABS-3PL.ERG-DYN-KNOW-PRES
 ‘They know you.’

- b. *a:ħa-r Ø-zar-o-cax-Ø.* (reciprocal of vt)
 they-ABS 3PL.ABS-REC-DYN-know-PRES
 ‘They know each other.’
- (3) a. *fa !’əžə-m fə-Ø-psa:l-a:-s’.*
 you.PL old.man-OBL 2PL.ABS-3SG.OBL-speak-PAST-ASS
 ‘You spoke to the old man.’
- b. *fa-ra !’əžə-m-ra fə-za-psa:l-a:-s’.* (reciprocal of vi)
 you.PL-CONJ old.man-OBL-CONJ 2PL.ABS-REC-speak-PAST-ASS
 ‘You and the old man spoke to each other.’

The *reflexive* marker is *-zə-* when a reflexive entails coreferentiality with the subject of a transitive verb and it is *-za-* on two-place intransitive bases:

- (4) a. *sa a:-r Ø-s-o-tx’as’-Ø.*
 I he-ABS 3SG.ABS-1SG.ERG-DYN-wash-PRES
 ‘I am washing him.’
- b. *sa zə-z-o-tx’as’-Ø.* (reflexive of vt)
 I REFL-1SG.ERG-DYN-wash-PRES
 ‘I am washing myself.’
- (5) a. *da a:-bə d-Ø-o-ups’-Ø.*
 we he-OBL 1PL.ABS-3SG.OBL-DYN-ask-PRES
 ‘We are asking him.’
- b. *da də-z-o-ups’-ž^α.* (reflexive of vi)
 we 1PL.ABS-REFL-DYN-ask-SUFF
 ‘We are asking ourselves (each of us is asking himself).’

The *comitative* is marked with the preverb *-da-*. The collaborator is named by an indirect object NP, and the agreement marker cross-referencing the collaborator immediately precedes the preverb:

- (6) a. *!’əžə-m š^αayər Ø-je-f-a:-s’.*
 old.man-ERG wine 3SG.ABS-3SG.ERG-drink-PAST-ASS
 ‘The old man was drinking wine.’
- b. *!’əžə-m x’as’a-xa-m š^αayər Ø-Ø-d-e-f-a:-s’.* (comitative)
 old.man-ERG guest-PL-OBL wine 3SG.ABS-3PL.OBL-COM-3SG.ERG-drink-PAST-ASS
 ‘The old man was drinking wine *with the guests*.’

Finally, the *sociative* meaning is rendered by a reciprocal derived from a comitative:

- (7) a. *!’əžə-m x’as’a-ħa-m š^αayər Ø-Ø-d-e-f-a:-s’.* (comitative)
 old.man-ERG guest-PL-OBL wine 3SG.ABS-3PL.OBL-COM-3SG.ERG-drink-PAST-ASS
 ‘The old man was drinking wine with the guests.’
- b. *!’əžə-m-ra x’as’a-xa-m-ra š^αayər*
 old.man-ERG-CONJ guest-PL-ERG-CONJ wine
Ø-za-da-ra-f-a:-s’. (sociative)
 3SG.ABS-REC-COM-3PL.ERG-drink-PAST-ASS
 ‘The old man and the guests were drinking wine *together*.’

Table 2. Case endings

Instrumental	- <i>ča</i>
Adverbial	- <i>au/-u/-ua.</i>

2. A sketch of the Kabardian grammatical system

This section contains relevant information on the Kabardian grammatical system. For more details on Kabardian morphology see Abitov et al. (1957), Colarusso (1992). Much valuable information on some grammatical features of Kabardian and its close relative Adyghe is also contained in Gishev (1991), Jakovlev (1948), Kumaxov (1971; 1989), Rogava & Kerasheva (1966), Turchaninov & Cagov (1940).

2.1 Case system

Kabardian is a morphologically ergative language. The ergative case marker is *-m*, and the absolutive case marker is *-r*. The oblique (indirect object) case marker coincides with the ergative case marker (see Table 2). These case markers occur only with definite NPs, while indefinite NPs in the core syntactic positions normally bear no case marking. The 1st and 2nd person pronouns do not distinguish between the ergative, absolutive and oblique cases. (For the interpretation of some examples below it is important to know that NPs conjoined by the marker *-ra* in a coordinate construction always assume the ergative/oblique form, regardless of their syntactic role; cf. (3b))

Kabardian also possesses cases which are usually treated as “marginal” (cf. Kumaxov (1971:64)). These are the instrumental and the adverbial case. These cases are never cross-referenced on the verb.

2.2 Verb system

2.2.1 *Classes of verbs and verb agreement*

As I have already mentioned, Kabardian has a highly developed polysyntheticism of the verb. The subject, direct object and indirect object(s) in the oblique case are obligatorily cross-referenced by agreement prefixes on the verb. Cross-referenced NPs are usually deleted in the sentence, if they can be inferred from the context. The 1st and 2nd person pronouns are especially very rare if the corresponding agreement prefix is present on the verb (an overt pronoun in this case is used only with logical stress).

Because of obligatory agreement with all core NPs, syntactic classes of verbs correspond to verb agreement patterns:

1) One-place intransitives subcategorize for and agree with only one NP (subject), which is in the Absolutive case; cf. (9).

Table 3. First and second person agreement markers

	Singular	Plural
1st p.	-s-	-f-
2nd p.	-w-	-d-

(These consonants may undergo certain phonological changes: voiceless consonants become voiced before voiced consonants and vice versa, and *-w-* becomes *-b/p-* under certain conditions.)

2) Two- and three-place intransitives subcategorize for and agree with one NP in the Absolutive case (subject) and with one or as many as three NPs in the Oblique case (indirect object(s)); cf. (13).

3) Transitives (vt) subcategorize for and agree with one NP in the Ergative case (subject) and one NP in the Absolutive case (direct object); cf. (10).

4) Bitransitives (vb) subcategorize for and agree with one NP in the Ergative case (subject), one NP in the Absolutive case (direct object) and from one up to (potentially) three NPs in the Oblique case (indirect object(s)); cf. (11).

The order of agreement prefixes is fixed as follows:

- (8) ABS – OBL – ERG – [ROOT].

The agreement markers of the 1st and 2nd persons are as in Table 3.

The 1st and 2nd person agreement markers may also contain the vowels *-a-* or *-ə-* which follow the consonants given in Table 3. The choice between *-a-*, *-ə-* and *-∅-* depends upon the case of cross-referenced NP, tense and presence of a preverb in the verbal form:

- 1) *-ə-* when an absolutive NP is cross-referenced:

- (9) *sə-žag-a:-s'*
1SG.ABS-play-PAST-ASS
'I was playing.'
- (10) *sə-p-x'-a:-s'*
1SG.ABS-2SG.ERG-carry-PAST-ASS
'You carried me.'

- 2) *-a-* when an oblique NP is cross-referenced in the Past and in the Future:

- (11) *∅-fa-s-t-a:-s'*
3SG.ABS-2PL.OBL-1SG.ERG-give-PAST-ASS
'I gave this to you.'
- (12) *∅-qə-ua-da'ua-n-s'*
3SG.ABS-DIR-2PL.OBL-listen-FUT-ASS
'He will listen to you.'

3) No vowel if an oblique NP is cross-referenced in the Present or when the oblique NP agreement marker precedes a preverb (in any tense):

- (13) *sə-w-o-z'a-∅*
1SG.ABS-2PL.OBL-DYN-wait-PRES
'I am waiting for you.'

- (14) *sə-p-te-l'-a:-s'*
 1SG.ABS-2SG.OBL-PREV-jump-PAST-ASS
 'I jumped on you.'

4) No vowel if the ergative NP is cross-referenced:

- (15) *Ø-p-š'-a:-s'*
 3SG.ABS-2SG.ERG-do-PAST-ASS
 'You have done this.'

Note: any vowel of a personal agreement marker is deleted when followed by another vowel; the same holds true for vowels on markers of grammatical categories, including the reciprocal and reflexive, when they are inserted in the agreement slot instead of an agreement marker.

The markers of the 3rd person are *Ø*-, *ma:-*, *ma-*, *e-* and *i-*.

The 3rd person singular absolutive is always cross-referenced by zero suffix (cf. (16)) except in monovalent dynamic verbs, in which case it is cross-referenced by *ma:-* or *ma-* (cf. (17)):

- (16) *stača:n-ər Ø-sə-t-s'*
 glass-ABS 3SG.ABS-PREF-stand-ASS
 'The glass is standing.'
- (17) *š'a:la-r ma-la:ž-a.*
 young.man-ABS 3SG.ABS-WORK-PRES
 'The young man is working.'

The agreement marker for the 3rd person singular ergative of (bi)transitive verbs is *-e-* in the Present Indicative Affirmative and *-i-* in all the other tenses:

- (18) *a:-bə ža:na Ø-e-d-Ø.*
 he-ERG shirt 3SG.ABS-3SG.ERG-SEW-PRES
 'He is sewing a shirt.'
- (19) *a:-bə txəl' Ø-i-tx-a:-s'*
 he-ERG book 3SG.ABS-3SG.ERG-WRITE-PAST-ASS
 'He wrote a book.'

The same agreement markers with the same distribution cross-reference 3rd person singular indirect objects.

3rd person plural NPs in the ergative or oblique case are also cross-referenced with *-i-* and *-e-* with the same distribution of these markers, but, unlike 3rd p. singular, these markers are followed by the plural prefix *-a:-*. The agreement markers *-i-/e-* interact with *-a:-* resulting in *-a:-*, *-ja:-* and *-aj* (the latter for oblique NPs only) as contracted markers of 3rd p. singular:

- (20) *a-bə-ša-m a:-r Ø-ja:-x'-Ø.* (*ja:* < *-i-a:-*)
 he-ERG-PL-ERG he-ABS 3SG.ABS-3PL.ERG-CARRY-PRES 3PL.ERG < -3ERG-PL
 'They are carrying him.'

- (21) *a:-bə-ʃa-m s-a:-xʰ-Ø.* (a: < -i-a-)
 he-ERG-PL-ERG 1SG.ABS-3PL.ERG-CARRY-PRES 3PL.ERG < -3.ERG-PL
 ‘They are carrying me.’
- (22) *a:-bə-ʃa-m s-a:j-psalʰ-a:-sʰ.* (a:j < -i-a)
 he-OBL-PL-OBL 1SG.ABS-3PL.OBL-talk-PAST-ASS 3PL.OBL < -3.OBL-PL
 ‘I spoke to them.’

In the case of the 3rd person of the absolutive NP the suffix *-xa-* is optionally added to the verb. It is common with intransitives (cf. (23)), but marginal with transitives.

- (23) *a:-ʃa-r Ø-sʰə-s(-xa)-sʰ.*
 he-PL-ABS 3SG.ABS-PREF-sit-PL-ASS
 ‘They are sitting.’

2.2.2 Stative and dynamic verbs

All Kabardian verbs are divided into stative and dynamic. This semantic distinction is reflected in morphology: in the Present Tense, statives, but not dynamic verbs have the affirmative suffix *-sʰ*; conversely, dynamic verbs have the prefix *-o-* in the Present Tense (obligatorily in the 1st and 2nd person, with some verbs in the 3rd person as well), which is never attested on statives:

- (24) *s(ə)-o-bza:ʒa(*-sʰ).*
 1SG.ABS-DYN-evil(*-ASS)
 ‘I am getting evil.’ (dynamic verb)
- (25) *sə-bza:ʒa-sʰ.*
 1SG.ABS-evil-ASS
 ‘I am evil.’ (stative verb)

2.2.3 Tense

Kabardian has two series of tenses – I and II. In total, 8 tenses are distinguished: Present I and II, Past I and II, Aorist I and II, Future I and II. For the needs of understanding the present paper, however, the reader needs only to distinguish three main tenses of Kabardian – Present I, Past I and Future I. Present I is marked with the suffixes *-Ø* or *-r* (the latter appears optionally on dynamic verbs only); Past I is marked with the suffix *-a:*; Future I is marked with the suffix *-nu*. In Past I and Future I the affirmative suffix *-sʰ* obligatorily follows the tense suffixes.

2.2.4 Valence-increasing prefixes

There is a wide range of prefixes which signal increase of verbal valence, viz. addition of a direct or indirect object to the verb. The agreement marker of this (in)direct object immediately precedes a valence-increasing prefix. The following valence-increasing prefixes exist:

- 1) The causative marker *-ya-/ya:-*:

- (26) a. *u-o-kʰa-Ø.*
 2SG.ABS-DYN-go-PRES
 ‘You are going.’

- b. *uə-z-o-ya-k^oa-Ø*.
 2SG.ABS-1SG.ERG-DYN-CAUS-GO-PRES
 ‘I am sending you; I am making you go.’

2) The benefactive marker *-x^o(a)-* and malefactive marker *-f(a)-*: these markers signal addition of a Beneficiary NP or Maleficiary NP respectively in indirect object position:

- (27) a. *una Ø-z-o-š[’]-Ø*.
 house 3SG.ABS-1SG.ERG-DYN-build-PRES
 ‘I am building a house.’
 b. *una Ø-p-x^oa-z-o-š[’]-Ø*.
 house 3SG.ABS-2SG.OBL-BEN-1SG.ERG-DYN-build-PRES
 ‘I am building a house for you.’
 c. *una Ø-p-fə-z-o-š[’]-Ø*.
 house 3SG.ABS-2SG.OBL-MALEF-1SG.ERG-DYN-build-PRES
 ‘I am building a house in spite of your will.’

3) Valence-increasing preverbs: these preverbs signal addition of an indirect object with the meaning of location, direction, source of action, etc. There is a wide range of underived preverbs and a great many derived preverbs in Kabardian. The total number of preverbs seems to exceed 100. Smeets (1984: 251–87) lists 85 preverbs for Adyghe (for details on preverbs in Abkhaz-Adyghe languages see Tabulova & Temirova (1983)). Each preverb has its own meaning which can be modified in combination with different verbs. It should be emphasized that addition of a preverb to a verb is the basic way of expressing spatial characteristics of the action expressed by this verb: there is no system of locative cases in Kabardian, and expression of location or direction with the help of an indirect object NP in the Oblique case is possible only when this verb subcategorizes for this NP, and this, in turn, takes place only when this verb has an appropriate preverb. The examples in (28) show how different locative relations are expressed with the verb ‘sit’: this verb without a preverb cannot take an indirect object complement (28a), but when a preverb is added an indirect object becomes obligatory (28b–d). The exact interpretation of this indirect object depends upon the preverb:

- (28) a. *š[’]a:la-r Ø-š^oə-s-s[’]*.
 young.man-ABS 3SG.ABS-PREF-sit-ASS
 ‘The young man is sitting.’
 b. *š[’]a:la-r psə-m Ø-Ø-x^oa-s-s[’]*.
 young.man-ABS water-OBL 3SG.ABS-3SG.OBL-PREV-sit-ASS
 ‘The young man is sitting in the water.’
 c. *š[’]a:la-r stol-əm Ø-Ø-te-s-s[’]*.
 young.man-ABS table-OBL 3SG.ABS-3SG.OBL-PREV-sit-ASS
 ‘The young man is sitting on the table.’
 d. *š[’]a:la-r stol-əm Ø-Ø-g^oa-s-s[’]*.
 young.man-ABS table-OBL 3SG.ABS-3SG.OBL-PREV-sit-ASS
 ‘The young man is sitting near the table.’

As already mentioned, the comitative marker *-da-* patterns with the valence-increasing preverbs (see Section 6 for more details).

For the present study it is important to know that there cannot be more than one locative preverb in a verbal form. The causative and benefactive (or malefactive) markers however, are compatible with a locative preverb in a verbal form. Verbs containing both a locative preverb and a benefactive (or malefactive) marker have two indirect objects.

2.2.5 Valence-decreasing markers

Valence decrease is regularly marked only by the reciprocal and reflexive markers. There are no regular passive, antipassive, anticausative or other valence-decreasing mechanisms in Kabardian except reciprocal and reflexive.

2.3 Agreement in nominals

Kabardian nouns and adjectives agree with their possessors; when used predicatively, nouns also agree with the subject:

- (29) *murat Ø-si-a:da-s'.*
Murat 3SG-1SG-father-ASS
'Murat is my father.'
- (30) *u-i-a:da ma:-k^oa-Ø.*
2SG-i-father 3SG.ABS-go-PRES
'Your father is going.'

2.4 Agreement with conjoined NPs
