Chikezie Nwaoha: Co-Editor on First Edition
Peighton Hornung: Industrial Relations Editor

Forewords

The very basis of communicating depends on agreeing on a meaning. If we show a 6 month-old child an orange and consistently call it a banana for the next 18 years of his sheltered life, he will not believe the person who tells him that what he calls a banana is, in fact, an orange. The point of this analogy comes into full focus as we consider what could happen with miscommunications in virtually everything we hear, do, say, or perceive. Whether it is conduct or behavior, designing, making, using, selling, or buying—we must agree on definitions.

In this second edition of a successful book, the father–daughter authors Michael and Emma Holloway maintain the spirit of this theme but update the long list of terms and items that require adherence to definitions. In the process of doing so, they often ask us to challenge our preconceived notions and opinions. One person's preconceived opinions can be seriously at odds with somebody else's opinions, unless an agreed-upon definition becomes the central core of our understanding.

This is of great relevance in the expanding Universe of Industry. The relevance of definitions becomes clear in hundreds of different pursuits and endeavors, although space and time available force us to verbalize a motto that, hopefully, is accepted by those seeking safety and reliability in work processes and asset management: "Discover Reliability Facts; Rethink Old Assumptions." This book will prove helpful to those who seek to add value rather than engaging in dead-ended debates and flawed arguments.

Heinz P. Bloch, P.E.

There's a story about when Spanish explorers first arrived in the Gulf of Mexico, they wanted to know what the name of the land was. They asked the first local that they encountered, "What do you call this place?" The Maya, who resided on the peninsula said, "Yucatan" which has been the name of the peninsula ever since. Unfortunately, Yucatan in Mayan means, "I don't understand." Oops.

Misunderstandings in the industrial place can have less comical outcomes. The first step in avoiding miscommunication is by having shared lexicon. Mr. Holloway and Ms. Holloways' 2nd edition of the Dictionary of Industrial Terminology is the industry's benchmark to standardize lexicon used across maintenance, engineering, and reliability disciplines. This literary tome is a must-have anchor on the bookshelf of any technician, engineer or thought leader in the industrial space.

Congratulations on amassing such a valuable document, which will be a guiding resource for years to come as the first line of defense against miscommunications in the workplace.

Greg Livingstone
Chief Innovation Officer
Fluitec

This is an often-repeated story by communication experts about an old lady who hoped to rent a room in Switzerland. She voiced her concerns regarding the availability of a commode that she referred to as WC (Water Closet). The recipient, the landlord, presumed WC to be a Wayside Chapel. His response is naturally hilarious.

> "I take great pleasure in informing you that the WC is located 9 miles from the house. It is located in the middle of a grove of pine trees, surrounded by lovely grounds. It can hold 229 people and is open on Sundays and Thursdays. As there are many people expected in the summer months, I suggest you arrive early. There is, however, plenty of

> standing room. This is an unfortunate situation especially if you are in the habit of going regularly. It may be of some interest to you that my daughter was married in the WC, as it was there, that she met her husband. It was a wonderful event. There were 10 people in every seat. It was wonderful to see the expressions on their faces. We can take photos in different angle. My wife, sadly, has been ill and unable to go recently. It has been almost a year since she went last, which pains her greatly. You will be pleased to know that many people bring their lunch and make a day of it. Others prefer to wait till the last minute and arrive just in time. I would recommend your ladyship plan to go on a Thursday as there is an organ accompaniment. The acoustics are excellent and even the most delicate sounds can be heard everywhere. The newest addition is a bell which rings every time a person enters. We are holding a bazaar to provide plush seats for all, since many feel it is long needed. I look forward to escorting you there myself and seating you in a place where you can be seen by all."

Words are important! They provide a compass to our thoughts and endeavors. Almost 2,500 years ago, Socrates stated, "The beginning of wisdom is the definition of terms." In a world that is more than ever tied up in the exchange of information, knowledge, and ultimately wisdom, we need to heed Socrates. In this fast-paced world, where communication aspires to be super-luminal, we need to be precise, concise, accurate and succinct, because success hangs on the efficacy of this communication. Since we are all in the pursuit of excellence, it is a boon to have an agreed-upon definition of words that we use on a daily basis and even words that we rarely use, provided we all understand the definition going forward and work towards that goal of reducing failure and producing excellence. The team of Holloway and Holloway has undertaken a mammoth challenge. Collecting and defining in agreement with what we all must drive towards—a universal understanding of communication of the utterances we use daily as not to contribute to confusion. Terms have been classified under various categories to assist the reader as well as various industrial acronyms, abbreviations and commonly used phrases have been thoroughly explained. The father/daughter team has established themselves as an asset to our industry.

Dr. Raj Shah
Director
Koehler Instrument Company, NY

The 2nd edition of Dictionary of Industrial Terminology fills a much-needed role for stakeholders across numerous industries. By compiling a comprehensive lexicon of industrial terms—each contributed by a recognized subject matter expert—Michael and Emma Holloway have admirably updated and expanded the terms defined in this volume. Users will find expanded definitions and illustrations useful—particularly when translating terms from English to other languages. Where a given term is used in multiple ways, the Holloways have included all of the relevant definitions. The Dictionary uses clear concise language, making it a valuable desktop reference for engineers, operations personnel, and managers.

Dr. Fredrick Passman
President
BCA, Inc.

"You two need to stop skylarking and turn to!!! I want this overhead dusted and the deck swabbed!" If you've ever served in the US Navy, you might have an idea of what you just read. You may have even heard it or something similar. If you've never been in the military, specifically the US Navy; that phrase may just sound like a bunch of gibberish. What it means is for the two sailors to stop messing around and get busy, the ceiling, with the vents and piping all need to be dusted, and the floor needs to be mopped. While I was in boot camp I learned, what seemed at the time an entirely new language. After I retired and started working in maintenance, I had to relearn English. Much of the terminology I learned in the Navy is different for the same items, and concepts in the civilian world.

If there had only been a text, I could turn to that would have helped me to translate what I was thinking into the civilian terms, that would have been a huge help and radically reduced the learning curve! Some of the terms in this book may be different than what you call them. That is fine, honestly that is kind of the point, to help us all to learn

a common language so that we are literally on the same page when we are talking about things and comparing ideas and strategies.

For this to be most effective you may need to challenge your preconceived notions of what something is or is not. We all come from different backgrounds and learned much of this maintenance and reliability stuff through tribal knowledge. It has been passed down from generation to generation of technicians since the beginning of time, or most likely, we made it up as we went along.

In the few years I have been involved in maintenance and reliability, I have been blessed to have met and worked with many experts in our field. As an "expert" we get used to being asked all of the questions, so we begin to think that we are always right. I challenge you, to humble yourself, as this text may not contain the words that you would use as a particular term, but that doesn't mean it's wrong, it's just different. A good friend of mine says, "seek first to understand, then to be understood." I think that this applies here, as new technologies are developed, new terms will develop as well. As technologies advance so should our reliability language that may require us to take off the "expert" hat and become the student for a bit.

In closing I want to say "Thank You" to Michael. For both putting something like this together, I truly wish I had found something like this earlier in my civilian career! It would have helped me to at least sound like I knew what I was talking about. Also, to say thank you for honoring me, by asking me to write this.

Loren Green, MLTII, MLAIII, MLE, CLS

This book is like a relief valve for me, to relieve my frustrations associated with how people interpret words that are ill-defined in the marketplace. Under such circumstances, individuals will utilize this ambiguity in understanding, to hijack that word for their own purposes (i.e.—confirmation bias). Oftentimes such interpretations are made for commercial reasons. Sadly, I have been in the problem-solving business (Root Cause Analysis or RCA) for over 35 years, and I have been unable to solve this dilemma alone. Even in my field of RCA, the term is so ill-defined it is useless. No matter what approach anyone is using to solve problems, they will call it 'RCA'. This makes it impossible to compare effectiveness of any one approach. As this book will demonstrate, my experience is not unique by any means. Just look at commonly used terms like Reliability Centered Maintenance, Predictive Maintenance, Failure, Reliability, Safety and the list goes on. There will certainly be preconceived opinions about the terminology in this book and that will evoke a constructive debate. That is how we will define the success of this book!

This book seeks to unify these 21,000+ words, terms, and phrases, for the betterment of our respective fields. The gracious contributors to this book are the Who's Who of experts in their respective fields. They share a passion for ensuring that we, as practitioners, have unity in purpose when it comes to operating our facilities in a safe and responsible manner. We do so while being good stewards to our employees, our customers, and the communities in which we operate.

My gratitude goes out to Michael and Emma for taking on this enormous, but necessary challenge. This is a must read for those who constantly experience undesirable outcomes due to miscommunications, simply because the same words meant different things to different people. This book will literally help steer your career!

Robert J. Latino
CEO
Reliability Center, Inc.

My twenty-five years of experience in Asset Reliability Management, qualifies me to recommend the importance of this dictionary, as the language of technical keywords is extremely important for day-to-day tasks in the manufacturing industry. It has indeed been a remarkable feat by Dr. Holloway to have created and compiled a dictionary of the industrial lexicon and now with its updated second edition, the dictionary adds on new terminologies and any previously uncovered terms and their definitions. Practitioners and academics alike will appreciate the significance of this timely update which signifies the importance of building upon the literature of the manufacturing and industrial field(s). Skillsets are built with practice and with each Holloway's contribution, we must embrace this vision that

it is the combination of knowledge and skill sets that will create safer, efficient, and more productive manufacturing environments. The first edition was received with much enthusiastic praise and this new dictionary will undoubtedly continue to be an invaluable tool for all working with the manufacturing industry. It is a reference work which should be in the hands of all those in any way connected to the manufacturing industry, as my experience has taught me that learning the industrial language is of utmost importance. The dictionary encapsulating the language of technical keywords will be an invaluable source for the global manufacturing industry.

Syed Munawer Hasan
Founder & CEO
Plant Asset Efficiency (PAE) Solutions

It is my absolute honor to write this foreword for Michael and Emma. Michael is a pioneer in the industry and really embodies the true spirit of a multifaceted Industrial Expert as he has worked for over 35 years in all fields of this ever-evolving sector. It also gives me great pleasure to support Emma, a fellow female STEM colleague, as she paves her way into the Industrial sector. She brings with her a wealth of knowledge and an unparalleled vocabulary! Michael and Emma have accurately documented thousands of words that are used in the Industry and provided simple explanations to allow readers to comprehend the meanings and use the terminology in the correct context.

When I first started in the industry as a fresh engineering graduate over a decade ago, I realized that I did not speak the same language as the technicians, other engineers, and industry professionals. Every time I heard a new word, I would write it down in my little notepad and look it up later. That notepad got filled quickly! However, even after researching the meanings of the new words and trying to use them, I realized that I would use them in the wrong context! This can be very embarrassing when you are presenting to a room filled with Managers and other Industry Professionals!

As I continued working in the industry, I constantly picked up new terms, but I kept wondering, *"What if there was one place that I could find all of this information? It would be so much easier for me and other professionals in the industry!"* I was then introduced to Michael D. Holloway and I needed a larger notepad for all those terms! Michael is a walking encyclopedia of information and it is no surprise that his daughter, Emma also inherited this trait!

The *Dictionary of Industrial Terminology* is an absolute must for anyone working in the Industry or with colleagues in the Industry. It lays the foundation for the bridging of the communication gaps that exist among industry professionals and can even assist sales personnel to utterly understand the needs of their industrial customers. This Second Edition is a game changer for our graduates now entering the industrial sector and for those who have been in the sector but never really comprehended some of the terms used on a daily basis. I would recommend this installment for all personnel within the Industrial sector and urge Supervisors to make it part of their initiation package for all new members of the team to ensure that everyone can communicate effectively.

Ms. Sanya Mathura MLE
Managing Director
Strategic Reliability Solutions Ltd

The rapidly evolving world of technology has necessitated an update to this dictionary. In so many applications, the various meanings of words can be a useful way of communicating. However, the variety of word meanings can be especially confusing, and thereby potentially costly, in the industrial technology arena. Within the scope of the this second edition, the elder and younger Holloway have provided a thorough catalog of words, and their appropriate definitions, to assist students, as well as professionals, in their performance in this constantly changing environment.

Mark Holloway
Brother

My relationship with Mike for 56 years has been outstanding and based upon communication and understanding. The main factors in personal and business success and growth are one's ability to communicate effectively, understand subject matter, and understand how words are used. A good dictionary to reference, especially in business, is critical to these factors. This work satisfies those needs in a brilliant fashion. Collaboration is important, the fact that a parent and child can contribute in unison is unique and honorable.

Chris Holloway
Twin Brother

Preface

It is our intent that this work act as a small contribution to your efforts in developing products and providing service. Industry began when we first manipulated our environment to provide increased comfort, convenience, and control. It is our responsibility to offer what we can for everyone's benefit. Please make the best use of resources and energy for a better life. All the royalty money made from the sale of this work will go towards sustaining intellectual content at universities. We hope that you take on the responsibility to produce with environmental and social concerns in mind. Everything we do should be to make things better and in doing so we will take on the true spirit of industry.

Dictionary of Industrial Terminology 2nd Edition

Term	Definition	*Industry*
A Class Items	A general meaning of this term is the most important item. When a group of products is analyzed according to some criterion and the individual products in the group ranked—i.e., placed in order—according to the criterion used, it is common to subdivide the products in the ordered list into three categories. The "A" category, or A Class, products are those products at the top of the list; the "B" category products are next, and the "C" category products are those at the bottom of the list. A common criterion applied in the analysis of the original group of products is according to each product's "annual value." Annual value is often thought of as reflecting a product's importance, and is defined as the product's annual usage multiplied by its unit value. (For example, if 200 products are used per annum and one unit costs $7, the annual value is $1,400). It will typically be found that if the A Class items are defined as the top 20% of the items at the top, they account for 80% of the total value of all the items. See ABC Classification and the vital few.	*Quality*
A priori analyses	See Planned analyses	*Quality Engineering*
A Programmable Logic Controller (PLC, or Programmable Controller)	A ruggedized, microprocessor-based system, which provides factory or plant automation by monitoring sensors and controlling actuators in real time.	*Electrical Engineering*
A to D or A/D Converter	A to D means Analog to Digital. This electronic hardware converts an analog signal like voltage, electric current, temperature, or pressure into a digital number that a computer can process and interpret.	*Process Control*
A.B. Meco-Moore	The A.B. Meco-Moore was a joint development of Anderson Boyes and the Mining Engineering Companies, hence the name. The first genuine cutter-loader machine developed to perform two operations simultaneously on a long wall face and therefore did away with any need for blasting.	*Mining*
A.C. Electrical Variable Speed Ratio	0.417361111	*Manufacturing*
A.G.M.A.	Abbreviation for "American Gear Manufacturers Associations," an organization serving the gear industry.	*Oil Analysis*
A.S.T.M. = "American Society for Testing Materials"	A society for developing standards for materials and test methods.	*Oil Analysis*
A/D	Analog-to-digital.	*Electrical Engineering*
A/D Converter	A device that changes an analog signal such as voltage or current into a digital signal (consists of discrete data values).	*Electrical Engineering*
A/F	Air/fuel ratio	*Petro-Chemical Abbreviations*

Term	Definition	*Industry*
AAA	AAA—See: Actors and Artists of America; Associated (AFL-CIO), See: American Arbitration Association	*Industrial Relations*
AAM	Alliance of Automobile Manufacturers—comprised of 10 North American manufacturers of passenger cars and light trucks.	*Mechanical, Process, and Operations*
AAMA	American Automobile Manufacturers Association	*Petro-Chemical Abbreviations*
AAR	American Association of Railroads	*Petro-Chemical Abbreviations*
A-Arm	A suspension linkage formed in the shape of an "A" or "V" found commonly on the front suspension. The sides of the two legs of the A-arm are connected to the chassis by rubber bushings and the peak of the A-arm is attached to the wheel assembly. In this way, the wheel can freely move up and down. Sometimes there is an upper A-arm, a lower A-arm, or both upper and lower A-arms. The British call it a "wishbone."	*Mechanical Engineering*
A-arms	A component of suspension, these metals or carbon fiber rods connect the tires and wheels to the chassis. They are usually shaped like an "A," with the point of the A connected to the wheel and the bottom two points of the A connected to the chassis. There are usually two A-arms at each wheel, one top and bottom. Also called wishbones	*NASCAR*
Abalyn ($C_{19}H_{29}COOCH_3$)	Commercial name for methyl abietate (b.p. 360–365°C, 705.6–714.6°F), used as plasticizer in lacquers and plastics.	*Material Process*
Abandon	(1) The proper plugging and abandoning of a well in compliance with all applicable regulations, and the cleaning up of the wellsite to the satisfaction of any governmental body having jurisdiction with respect thereto and to the reasonable satisfaction of the operator. (2) To cease efforts to find or produce from a well or field. (3) To plug a well completion and salvage material and equipment.	*Petroleum Drilling*
Abandoned	A well that is permanently closed off when no viable hydrocarbons are discovered or it is depleted and no longer capable of producing profitably.	*Petroleum Engineering*
Abandoned well	A well that is no longer in use, whether dry, inoperable, or no longer productive.	*Petroleum Drilling*
Abandonment	Converting a drilled well to a condition that can be left indefinitely without further attention and will not damage freshwater supplies, potential petroleum reservoirs, or the environment.	*Petroleum Engineering*
Abandonment plans	Plans required by law to be deposited with the authorities upon the closure of a coalmine, or section of a mine. They must be durable, and show the workings in relation to surface features and record information with respect to orientation, contours, scales, boundaries, faults, etc. The plans must also show the last recorded workings for the safety of any future operations.	*Mining*
ABAP	Advanced Business Application Engineering.	*Quality*
Abatement	(1) The act or process of reducing the intensity of pollution. (2) The use of some method of abating pollution.	*Petroleum Drilling*
ABB	Activity Based Budgeting.	*Quality*
ABC	In costing, Activity Based Costing (qv).	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
ABC Classification	The division of products in a group into three sub-groups: Group A, Group B and Group C. Division is usually accomplished by the following three step process: (1) the calculation for each product of its annual value, this being its "annual usage x its unit value"; (2) the ranking, or ordering, of all the products into an order based on their annual values, as calculated in Step 1, thus forming a list of products in descending order of annual value; and (3) the sub-division of the list in Step 2 into three groups according to Pareto principles. (The Pareto principle is that the top 20% (approx) of the products in the ordered list will account for some 80% of the total annual value of all the products together.) Thus the products in the list are split into the top group, called "A" (20% of the products, but 80% of the total annual value), the next group "B" (say, 30% of the products, about 15% of the total annual value) and the bottom group "C" (50% of the products, 5% of the total value). In fact, the split is arbitrary and it may be preferable to subdivide the products in other ways (e.g., the top 10% A, the next 15% B and the bottom 75% C). It may also be desirable to create a fourth group D—say, the bottom 20%, perhaps representing a mere 1% of the total annual value. Note also that if A products are to be looked after closely, and C products not at all so, then it may be desirable to promote a few "line stoppers" from Class C to Class A. The notion of the vital few and the trivial many is widely used. For example, in quality, Dr. Joseph Juran maintained that 80% of trouble was caused by 20% of the problems, so, he recommended, fix the 20% as first priority!	*Quality*
ABCD Checklist	The late Oliver Wight, and, through him, the MRP training company that bears his name, have established an assessment and scoring system whereby companies that have installed MRPII can judge how well they have succeeded. Originally, there were 20 or so criteria, and the rating of a company (Class A, Class B, Class C, and Class D) was simply a bit of fun. In Wight's eyes, Class A companies are using the system and literally working to the numbers it produces; Class B are using the system but still retain "little black books", Class C are running the system but not using it, and in Class D companies only the computer department ever see the output! There are now over 300 criteria and the process is taken very seriously. Very few companies—perhaps 20 in the UK—have attained Class A. Instead of concluding from this that it is MRP which is the problem, the promoters of this methodology conclude that the problems lie with the staff of the Class B to D companies (who clearly did not spend enough money on training).	*Quality*
ABCW	ABCW—See: Bakery and Confectionary Workers' International Union; American (AFL-CIO)	*Industrial Relations*
ABDOMEN	The third or posterior major division of the insect body; consists normally of nine or ten apparent segments; bears no functional legs in the adult stage, but may bear prolegs or false legs in the larval stage.	*Forestry*
Abietic acid $((CH_3)_2CH(CH_3)_2C_{14}H_{16}$	The chief constituent of rosin, a yellow, amorphous powder. Rosin and abietic acid derivatives are used as modifiers, especially as plasticizers, in various synthetic resin compositions. Rosin is used as driers in certain cold molded bituminous preparations and in some alkyd resin compositions to be used for coatings.	*Material Process*
ABIL	Agriculture-based industrial lubricants	*Petro-Chemical Abbreviations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ability (in layoff and promotion)	Training, skill, aptitude, and other factors essential in the performance of a job. It is the factor considered most important employers in promotion and generally ranks with length of service in layoffs, rehires, and transfers. The relative importance of ability (in connection with such factors as length of service, training, etc.) will vary from contract. Where job performance is based on acquired skills with a minimum of discretion as on some mass production jobs, length of service plays a greater role. Where substantial discretion and careful judgment are important, the factor of ability looms greater. A contract clause which combines ability and length of service may read as follows: "Promotions to all vacancies and positions created during the term of this agreement will be made from the basis of ability and seniority. Among employees whose ability is relatively equal, seniority will determine the choice for promotion." Ability has been measured by performance on the job, by work records, and other ratings designed to measure an employee's day-to-day handling of his job.	*Industrial Relations*
Ability Tests	Tests to measure the capacity to perform work of to determine aptitudes to pursue certain vocations are in widespread use. General intelligence tests used in vocational education have been adapted and modified to meet industrial needs. Current batteries of tests are being utilized for perceptiveness, manipulative ability, verbal facility, and a wide variety of factors, which may be of particular interest to a company in the performance of a particular service or productive operation.	*Industrial Relations*
Ability to Pay	A factor generally considered in labor-management negotiations. It is almost always an "implied" item to be kept in mind. Occasionally, it becomes a major "overt" criterion in wage determination. It has received widespread public consideration where the employer has claimed that he is unable to bear the brunt of the wage increase requested by the union. The detailed consideration of the company's financial ability or inability leads to a maze of complexities. For example, would a company's cash or profit picture permit an increase if it had not "expanded" or developed or purchased new equipment the previous year? Has it invested for the purpose of showing a limited ability to absorb a large wage increase? Does the company's ability to pay depend on future developments which it is difficult to assess at the time negotiations are taking place? What constitutes a company's ability to pay may be a highly controversial issue. For example, does a company's other expansion, which results in a poor liquid showing and high interest payment, show that it is unable to pay? An examination of union briefs on this point indicates that many issues have been raised which touch on the methods of company accounting an go much beyond the mere existence of cash surplus out of which a wage increase may be met. The ability to pay argument has been used by both labor and management to support a specific position in specific negotiations. Invariably, the financial position of a company cannot help but be the background of any wage negotiation. During the Second World War the National War Labor Board in a series of cases following the passage of The Wage Stabilization Act indicated that because of the necessity to stabilize wages it could not consider the company's ability to pay as a factor in determining what would constitute a proper wage adjustment. The Board also took the position that a company's financial inability to pay, during the stabilization period, should not deny the employees wage adjustments otherwise appropriate.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Abiotic	Not biotic; not formed by biologic processes.	*Chemical*
Abiotic pathogen	A nonliving, disease-causing entity, e.g., drought, salt, air pollutants.	*Forestry*
Able and Willing to Work	Criterion generally applied in state laws providing unemployment benefits to those out of work in covered occupations who report to the employment offices as "able and willing" to take employment.	*Industrial Relations*
Able-Bodied Labor	A term generally applied to workers who possess the physical strength to perform a variety of manual tasks. The term excludes the very young and the very old in the population as well as those incapacitated through physical or mental disability. "Ability to work" under unemployment compensation statutes has been defined variously to determine the claim by the individual for benefit payments.	*Industrial Relations*
Abnormal Demand	See Non-Consuming Demand and Unreasonableness Checks.	*Quality*
ABOT	Aluminum beaker oxidation test	*Petro-Chemical Abbreviations*
Above ground level (AGL)	Distance of the aircraft above the ground. Synonyms: radar altitude	*Aeronautical Engineering*
Above sea level (ASL)	Distance of the aircraft above mean sea level	*Aeronautical Engineering*
Above-Market Cost	The cost of a service in excess of the price of comparable services in the market.	*Energy*
Above-Market Generation	Electricity produced at costs higher than prevailing market prices.	*Energy*
Abradable Coatings	Coatings which are designed to be abraded by a mating surface to form a tight gas or air seal, while retaining good erosion resistance.	*Paint and Coatings*
ABRASION	A wearing, grinding, or rubbing away of material. The products of abrasion will be introduced into the system as generated particulate contamination.	*Mechanical, Process, and Operations*
Abrasion	A general wearing away of a surface by constant scratching, usually due to the presence of foreign matter such as dirt, grit, or metallic particles in the lubricant. It may also cause a breakdown of the material (such as the tooth surfaces of gears). Lack of proper lubrication may result in abrasion.	*Lubrication*
Abrasion Resistance	Ability of material or cable to resist surface wear.	*Electrical*
Abrasion-Resistance	The ability of the galvanized coating to resist damage caused by contact with hard, rough, or coarse media or objects	*Materials Process*
Abrasive blasting	The process of using a forceful stream of particles, available in varying hardness, to remove residue and contaminants from steel surfaces to prepare for galvanizing and/or to profile steel surfaces for paint application	*Materials Process*
Abrasive Blasting	A process for cleaning and roughening a surface by means of an abrasive directed at high velocity against the work piece.	*Paint and Coatings*
Abrasive Wear	Wear between two surfaces in relative motion due to particles (three-body) or surface roughness (two-body).	*Lubrication*
Abrasive Wear	Wear due to hard particles or hard protuberances forced against and moving along a solid surface.	*Paint and Coatings*
Abrasive wear	Wear occurring when a rough, hard surface slides on a softer surface. Grooves and wear particles form on the softer surfaces.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Abrogation of Agreement	The cancellation or setting aside of a collective bargaining agreement or any portion of it. This may be implied in the signing of the preceding agreement or may be spelled out by including a specific clause which sets aside all previous agreements or understandings. Some contracts set forth conditions under which the agreement may be voided. For example: "Should either party of this agreement violate any of its provisions, same shall be deemed sufficient cause for cancellation of this agreement by the other party." Title III, section 301 of the Taft–Hartley Act provides specific remedies in the federal courts for contract violations. See also: Separability clause, Savings Clause.	*Industrial Relations*
Absence	A temporary unavailability for work lasting for one or more days or shifts. It is to be distinguished from lateness which is of lesser duration than one day or shift, even though the employee may be unavailable when needed for work assignment.	*Industrial Relations*
Absence Rate (A.R.)	A measure, usually, in the form of a statistical estimate, to determine the time lost (in terms of hours or man-days) by being away from the job as against the time worked, or the time employees could have worked had they been present. The Bureau of Labor Statistics maintains data on absence rates. BLS records a "man-day lost" when the employee is absent on a day he was scheduled to work. Comparability of company or industry data privately maintained will depend upon the definition of such factors as: man-days, time worked, normal work period, work schedule, workday available.	*Industrial Relations*
Absentee	A worker who is unavailable for work for one or more days or shifts, when he has been assigned to or scheduled for or expected to report to work.	*Industrial Relations*
Absenteeism	The practice of a worker of failing o report for work for a period of one or more days or shifts, when he has been assigned to or scheduled to work. During war periods government agencies have sought to reduce absenteeism in order to increase the productive potential of industry. Collective bargaining agreements sometimes provide disciplinary action and discharge for excessive absenteeism. Where no standard has been established, the interpretation of "excessive" may give rise to the difficulty and require occasional submission to arbitration.	*Industrial Relations*
Absenteeism	This phenomenon relates to employee absence from work which, so far as the employer is concerned, is unauthorized and therefore unanticipated. A company analyzing absenteeism among its employees may distinguish between absence due to illness, supported by medical evidence, and absence due to other reasons. For a company department, a percentage measure of absenteeism is: (total number of staff days lost)/(total number of staff working days) x 100%.	*Maintenance*
Absenteeism Rate	Absenteeism Rate—See: Absence Rate	*Industrial Relations*
Absolute	A standard, fixed reference, as opposed to moving reference; Compare: relative;	*Aeronautical Engineering*
Absolute Viscosity	Absolute Viscosity. Absolute viscosity or the coefficient of absolute viscosity is a measure of the internal resistance. In the centimeter, gram, second (cgs) or metric system, the unit of absolute viscosity is the poise (abbreviated P), which is equal to 100 centipoise (cP). The English units used to measure or express viscosity are slugs per foot-second or pound force seconds per square foot. Sometimes, the English units are also expressed as pound mass per foot-second or poundal seconds per square foot.	*Maintenance and Repair*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Absolute Accuracy	A measure of the uncertainty of an instrument reading compared to that of a primary standard traceable to NJST.	*Reliability Engineering*
ABSOLUTE FILTRATION RATING	The diameter of the largest hard spherical particle that will pass through a filter under specified test conditions. This is an indication of the largest opening in the filter element. It does not indicate the largest particle that will pass through the element, since particles of greater length than diameter may pass.	*Mechanical, Process, and Operations*
Absolute Filtration Rating	The diameter of the largest hard spherical particle that will pass through a filter under specified test conditions. This is an indication of the largest opening in the filter elements.	*Lubrication*
Absolute humidity	Actual density of water vapor in the atmospheric usually expressed per volume unit.	*Material Process*
Absolute Losses	Production deferred or lost due to the specified element or system, as a percentage of the total potential production.	*Maintenance*
Absolute Majority	A vote n which 51% of those eligible to cast their vote do so in favor of or in opposition to a specific proposition. See: Elections, majority Rule	*Industrial Relations*
Absolute Pressure	Gage pressure plus atmospheric pressure.	*Electronic Process*
Absolute Pressure Sensor	A sensor which measures pressure in relation to zero pressure (a vacuum on one side of the diaphragm).	*General*
Absolute Pressure Transducer	A transducer which measures pressure in relation to zero pressure (a vacuum on one side of the diaphragm).	*Electronic Process*
Absolute risk	The observed or calculated probability of an event in the population under study.	*Analysis*
Absolute risk difference	The difference in the risk for disease or death between an exposed population and an unexposed population.	*Analysis*
Absolute risk reduction (ARR)	The difference in the rates of adverse events between study and control populations (i.e.: the difference in risk between the control group and the treated group: ARR=CER-EER)	*Analysis*
Absolute vibration	Vibration of an object relative to a fixed point in space. Seismic sensors (accelerometers and velocity pickups) measure absolute vibration. Contrasts with relative vibration.	*Reliability Engineering*
Absolute Viscosity	A measure of a fluid's resistance to tangential or shear stress. Also referred to as dynamic viscosity; see also viscosity. Units are usually given in centipoise.	*Chemical*
Absolute Viscosity	A term used interchangeably with viscosity to distinguish it from either kinematic viscosity or commercial viscosity. Absolute viscosity is the ratio of shear stress to shear rate. It is a fluid's internal resistance to flow. The common unit of absolute viscosity is the poise. Absolute viscosity divided by fluid density equals kinematic viscosity. It is occasionally referred to as dynamic viscosity. Absolute viscosity and kinematic viscosity are expressed in fundamental units. Commercial viscosity such as Saybolt viscosity is expressed in arbitrary units of time, usually seconds.	*Lubrication*
Absolute Zero	Temperature at which thermal energy is at a minimum. Defined as 0 Kelvin, calculated to be -273.15°C or -459.67°F.	*Electronic Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Absorb	Ability to pick up.	*Material Process*
Absorbent filter	A filter medium that holds contaminant by mechanical means.	*Oil Analysis*
Absorbents	Absorbents are material that take up or absorb any liquids or vapors that come in contact with it.	*Chemical*
Absorber	A device capable of reducing, of attenuating, of "soaking up" vibration, usually converting it to heat.	*Reliability Engineering*
Absorber Capacity	The maximum volume of natural gas that can be processed through an absorber at a specified absorption oil rate, temperature, and pressure without exceeding pressure drop or any other operating limitation.	*Petroleum Drilling*
Absorbing Well	A well for draining off surface water and conducting it to absorbent earth underground. Also called "dry well, waste well."	*Civil Engineering*
Absorption	Uptake of a gas into the bulk of a liquid. Example: In the liquid of a scrubber tower where an up-streaming gas is washed by a down-going flow of a scrubber solution.	*Chemical*
Absorption Costing	See Costing (Absorption).	*Quality*
Absorption Oil	A hydrocarbon liquid used to absorb and recover components from natural gas before being processed.	*Petroleum Drilling*
Abstract	A brief summary of the study and its results. It should tell you what the study tried to show, how the researchers went about it, and what they found.	*Quality Engineering*
Abutment	In coal mining, (1) the weight of the rocks above a narrow roadway is transferred to the solid coal along the sides, which act as abutments of the arch of strata spanning the roadway; and (2) the weight of the rocks over a long wall face is transferred to the front abutment, that is, the solid coal ahead of the face and the back abutment, that is, the settled packs behind the face.	*Mining*
Abyssinian well	A perforated pipe driven into the ground for pumping out collected ground water; well point.	*Civil Engineering*
AC	Alternating Current	*Energy*
AC Fine Test Dust (ACFTD)	A test contaminant used to assess both filters and the contaminant sensitivity of all types of tribological mechanisms.	*Oil Analysis*
ACA	ACA - See: Communications Association; American (Ind)	*Industrial Relations*
Acaricide	A substance that kills mites or ticks.	*Agriculture*
ACAS	Advisory, Conciliation & Arbitration Service, a UK Government body with branches throughout the country, offering advice and assistance on matters to do with employer/employee law and relations. Visit http://www.acas.org.uk.	*Quality*
ACBM	Acronym for "asbestos-containing building material."	*Energy*
ACC	American Chemistry Council - a trade association representing North American chemical manufacturers	*Mechanical, Process, and Operations*
Accelerant	A substance, catalyst, which accelerates a chemical processes.	*Material Process*
Accelerated Life Testing	This is a kind of testing carried out during the development of a new product in which parts are tested above the usual stress levels they would undergo in normal use, thereby causing early failures so that the results of the failure can be analyzed to create a profile of the failure behavior of the system.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Accelerated Stress Testing	This is a kind of post production test on a sampling of units which is carried out to detect latent failures and prevent flawed units from reaching the next level of assembly. Intensity is determined from the levels achieved during accelerated life testing.	*Reliability Engineering*
Accelerating Premium Pay	A wage incentive system under which the bonus or premium is progressively higher as the production standard is exceeded. An employee who exceeds his standard production by 5% may receive a 5% bonus, while one who exceeds his standard by 10% may receive a 15% bonus, and one who exceeds his standard by 20% may receive a 30% bonus.	*Industrial Relations*
Acceleration	Rate of change of velocity, either scalar or vector, often with subscripts such as ENU or XYZ to denote the coordinate frame; time derivative of velocity; time integral of jerk; Symbols: a, A; Typical Units: ft/s-squared, g; Dimensions: Length/Time-squared;	*Aeronautical Engineering*
Acceleration east	Aircraft acceleration in true east direction; Symbols: A sub E; Typical Units: ft/s-squared; Dimensions: Length/Time-squared.	*Aeronautical Engineering*
Acceleration north	Aircraft acceleration in true north direction; Symbols: A sub N; Typical Units: ft/s-squared; Dimensions: Length/Time-squared.	*Aeronautical Engineering*
Acceleration Stress	The additional stress that is imposed on a wire rope as a result of an increase in the load velocity.	*Wire Rope & Cable*
Accelerator	Fuel pedal or throttle. A foot-operated pedal or hand-operated lever connected by linkage or electronics to control vehicle speed.	*Mechanical Engineering*
Accelerator	Energizer, activating agent, catalyst. A substance that hastens a reaction, especially one that reduces the curing or hardening time of thermosetting plastics.	*Material Process*
Accelerometer	An inertial device for measuring acceleration, usually in three orthogonal axes (lateral X, longitudinal Y, and vertical Z); accelerometers usually consist of a mass, spring, and damper; accelerometers are usually included in inertial sensors, such as AHRS and INS.	*Aeronautical Engineering*
Accept	To allow to proceed, for example with a position update, usually by an operator; Compare: reject.	*Aeronautical Engineering*
Acceptable Quality Level (AQL)	If a supplier sends parts to a buyer, then the two parties may agree that a sampling plan should be used by the buyer to validate their quality on receipt. Among other things, the sampling plan will be selected on the basis that the incoming parts are to be at an agreed quality level of "p%" or better. Naturally, the supplier of the items wishes to be assured that if the quality of parts he actually sends is indeed equal to or better than p%, then there will be a very high probability that they will be duly accepted under the plan (i.e., that the plan will not result in their rejection). On the other hand, the recipient wishes to be assured that if the quality of the goods he receives is worse than p%, then there is a very high chance that they will be rejected. In summary, the term acceptable quality level means the level of quality (p%) at which a sampling plan is liable to result in the parts' acceptance. In fact, the "Dodge-Romig/Military Plans" plans give the supplier 95% assurance that if quality is at p% or better, material will be accepted. Note therefore that the word "acceptable" means, literally, "liable to acceptance"—it does not have the alternative common English meanings of "welcome" or "satisfactory." See AQL sampling tables. See also ATI.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Acceptance (of Goods)	A formal acknowledgement by a recipient that goods which have been physically delivered are satisfactory with regard to their identity (i.e., type), quality, quantity and other matters of central concern in the contract. By the Sale of Goods Act 1979, goods which are merely delivered are not deemed to be accepted until the recipient has been given a chance to inspect them or until a reasonable time has elapsed (without the recipient saying he rejects them) or unless the recipient begins to use the goods. The significance of legal acceptance is that the buying company thereby acknowledges that the main points of the contract have been fulfilled, and so cannot terminate the contract for breach of conditions. See Section 2.3.3 of the free on-line purchasing course at this site and sub-section 3.4.2 of the on-line course on stores, also at this site.	*Quality*
Acceptance of Offer (by Post, Fax or E-mail)	The convention is adopted in law that a party is deemed to accept a contractual offer at the moment he posts a letter saying he has so accepted it, not when the letter is actually received. This convention applies only to an acceptance: it does not apply, for example, to other matters such as counteroffers, revocations or the making of offers themselves. When the party transmits his acceptance of an offer by fax or e-mail, acceptance is deemed to take place when the transmission is actually received by the other party, not when it was sent.	*Quality*
Acceptor level	Energy level near the valence band in a p-type semiconductor.	*Material Process*
Access Charge	A charge for a power supplier, or its customer, for access to a utility's transmission or distribution system. It is a charge for the right to send electricity over another's wires.	*Energy*
Access to Company Books and Records	This issue may come up on contract negotiations when there is a question of the company's ability to pay, or when the union claims that the company's profits are greater than those actually reported. There are few instances in which employers voluntarily give the union access to the company's financial books and records. There are some exceptions to this rule. In the men's clothing industry the contract provides that the arbitrator or his representative make examine those records necessary to make a proper determination of the issues in dispute, or whether the contract is being lived up to. In the public utility field, State Public Utility Commissions in most cases have access to the records and books of companies within their jurisdiction. Such provisions flow from the rate fixing powers of the commission. The problem comes up in collective bargaining and may come before the NLRB when negotiations break down and the unions file an unfair labor practice charge alleging "refusal to bargain" or failure to bargain "in good faith" because the company withheld basic financial data. Access to company records may also be involved in seniority problems. Although company books and records generally are not accessible to union representatives, companies generally will permit union representatives to examine the records in connection with the promotion, transfer, or discharge or employees. The collective bargaining agreement may specify the type of records available to the union.	*Industrial Relations*
Access to Company Property by Employees and Company Representatives	Rights, variously applied, protecting employees not on strike to enter company premises for the purpose of working. These rights may be safe guarded by limiting the number of pickets at the plant entrance or providing police protection for those desiring to work during a labor dispute. See also: Strike, Picketing	*Industrial Relations*

Term	Definition	*Industry*
Access to Plant by Union Representatives	Provision often is made to permit union officers or agents other than those working on the premises, access to the place of work of employees. The purpose of such permission may be to allow them to collect dues or to handle or investigate grievances. The details as t time, place of entrance, method of escort etc., will vary from plant to plant and the conditions, which are present in the particular industry. Frequently the agreement may require a specific pass for the union representatives, and assurances from them that there will be no interference with production.	*Industrial Relations*
Access tunnel	Opening in natural draft tower used for access to the cold water basin. It can be large enough for a man only, or large enough for mechanical equipment.	*Facility Engineering*
Accessibility	A measure of the related ease of access to various portions of an item for operation or maintenance.	*Reliability Engineering*
Accession	Addition to the work force of a new employee or the rehiring of a former employee. Information on accession is maintained by employers in order to measure turnover in the plant. The Bureau of Labor Statistics computes turnover rates by diving the number of separations and accessions by the total number working during a specified period. See also: Accession Rate, Separation, Labor Turnover	*Industrial Relations*
Accession Rate (A.R.)	The number of new or rehired employees added to the workforce per hundred of employees. It is generally computed on a monthly basis.	*Industrial Relations*
Accident	A sudden, unforeseen, or unexpected occurrence, which results in injury, disability, or death to the person employed.	*Industrial Relations*
Accident Frequency Rate	A statistical measure showing the rate of accidents. This is usually in the form of a ratio of the number of man-hours (employee hours) worked to the number of disabling accidents or injured per 1,000,000 man hours worked. The number of hours actually worked sometimes is referred to as the number of hours the employees are "exposed" to accidents. The formula used by the Bureau of Labor Statistics is the total number of disabling injuries per one million man hours actually worked.	*Industrial Relations*
Accident Insurance	Laws in effect in most states providing for payments to employees injured on the job.	*Industrial Relations*
Accident Prevention	Efforts on the part of government boards, employers, and labor-management committees to eliminate and reduce the causes of industrial injuries and accidents.	*Industrial Relations*
Accident Prone	Term applied to workers who are involved in an unusually large number of accidents.	*Industrial Relations*
Accident Rate	Accident Rate - see: Accident Frequency Rate	*Industrial Relations*
Accident Reporting Laws	Provisions in many state statutes which require employers to report all disabling accidents marking absence from the job for more than one day or shift.	*Industrial Relations*
Accident Severity Rate	A statistical measure of the total number of days lost because of industrial accident per 1,000 man-hours of exposure.	*Industrial Relations*
Account (An)	A logical grouping of either receipts, expenditures, stocks or transactions relating to some particular activity having financial consequences. Examples of accounts are: the VAT account; the wages account; the copper raw materials account; the fuel expenditure account etc. (The term "accounting" originally meant the management of these accounts.)	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Account classification	The way in which suppliers of electricity, natural gas, or fuel oil classify and bill their customers. Commonly used account classifications are "Residential," "Commercial," "Industrial," and "Other." Suppliers' definitions of these terms vary from supplier to supplier. In addition, the same customer may be classified differently by each of its energy suppliers.	*Energy*
Account of others (natural gas)	Natural gas deliveries for the account of others are deliveries to customers by transporters that do not own the natural gas but deliver it for others for a fee. Included are quantities covered by long-term contracts and quantities involved in short-term or spot market sales.	*Energy*
Accounting Equation	In financial accounting, the accounting equation relating to a company's finances is: (assets + expenses) = (capital + liability + revenue). The effect of the equation may be summarized thus: if there is an increase in the company's assets, or if there is an incurrence of an expense, the increase must be balanced by a corresponding increase in liabilities, or capital, or revenue. These principles are incorporated in "double entry bookkeeping."	*Quality*
Accounting system	A method of recording accounting data for a utility or company or a method of supplying accounting information for controlling, evaluating, planning and decision-making.	*Energy*
Accounts (Type of)	Asset accounts, expense accounts, liability accounts, capital accounts and revenue accounts.	*Quality*
Accredited herd	A herd of dairy cattle certified by two successive tests to be free of tuberculosis. The tests are conducted by the USDA. Sometimes the term is mistakenly applied to a brucellosis-free herd.	*Agriculture*
Accrual	Funds are accrued, (lined), to cover a purchase which has not yet been invoiced.	*Procurement*
Accumulating Conveyor	Any conveyor designed to allow collection (accumulation) of material. May be roller, live roller, belt and gravity conveyors.	*Manufacturing*
Accumulation Conveyor	Any conveyor designed to permit accumulation of packages, objects, or carriers. May be roller, live roller, roller slat, belt, vibrating, power-and-free, or tow conveyors. See Minimum pressure accumulation conveyor and Zero pressure	*Equipment*
Accumulator	A vessel in which a gas is trapped and compressed by the liquid in a hydraulic system, thus storing energy to supply liquid under pressure to the system when needed.	*Mechanical*
Accumulator hydropneumatic	An accumulation in which compressed gas applies pressure to the stored liquid.	*Mechanical, Process, and Operations*
Accuracy	Measure of exactness, possibly expressed in percent; Compare: precision.	*Aeronautical Engineering*
Accuracy	Conformity of an indicated value to an accepted standard value, or true value.	*Process Control*
Accuracy (of a measurement)	A measurement process that has a small variability is said to have high precision. This does not mean, however, that the measured value is the true value. If the measured value is M and the true value is T, then the total error = M - T. This expression can be split into Total Error = (M - dx) + (dx - T). The first expression (M - dx) is the random deviation inherent in making any measurement - random error that can be "averaged away" by taking many repeated measurements. The second expression (dx - T) is bias due to a systematic fault in the measuring process (perhaps due, say, to an uncalibrated instrument). Bias can	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	only be detected and removed by investigation. The term (dx - T) can be found by averaging many measurements, and is referred to as the accuracy of the measuring process. 'Accuracy' in the context of stock records accuracy is dealt with in Section 1.4 of the free on-line course on Stock Records Accuracy, at this site.	
Accuracy, Reference	A number or quantity which defines the limit that errors will not exceed when the device is used under reference operating conditions. Note: Reference accuracy includes the combined conformity, hysteresis and repeatability errors. The units being used are to be stated explicitly. It is preferred that a + and - sign precede the number or quantity. The absence of a sign infers a + and – sign. Reference accuracy can be expressed in a number of forms. The following examples are typical: 1. Reference accuracy expressed in terms of the measured variable. Typical expression: The reference accuracy is + 1. 2. Reference accuracy expressed in percent of span. Typical expression: The reference accuracy is + ½% of span. 3. Reference accuracy expressed in percent of actual output reading. Typical expression: The reference accuracy is + 1% of actual output reading.	*Process Control*
ACE	Automated Commercial Environment.	*Quality*
ACEA	Association des Constructeurs Européens de l'Automobile (Association of European Automotive Manufacturers)	*Mechanical, Process, and Operations*
ACERT	Advanced Combustion Emission Reduction Technology (Caterpillar)	*Petro-Chemical Abbreviations*
Acetal	Acetal is a thermoplastic that was introduced in 1956. It is widely recognized as a potential replacement for die-cast metals because it is very rigid, yet not brittle. Acetal has a high melting point, is resistant to fatigue, and very strong. Currently, acetal is used to create cams, bearings, gears, bushings, housings, and conveyors. In addition, acetal is used in automotive seat belt components and door handles, shaver cartridges, in the moving parts in appliances and business machines, in gas tank caps, in plumbing fixtures, and in zippers.	*Material Engineering*
Acetaldehyde (CH_3CHO)	A colorless, fuming, inflammable liquid. Acetaldehyde reacts with phenol or the cresols to form thermosetting resins similar to the phenolics and also reacts with polyvinyl alcohol to form polyvinyl acetal. Acetaldehyde itself polymerizes to form paraldehyde.	*Material Process*
Acetaldehyde resins	Plastics derived from acetaldehyde and phenolic materials.	*Material Process*
Acetamide (CH_3CONH_2)	A colorless hexagonal liquid or rhombohedral deliquescent needles crystallizing from chloroform.	*Material Process*
Acetanilide ($CH_3CONHC_6H_5$)	Rhombohedral white leaflets crystallizing from water. Acetanilide derivatives are used as plasticizers.	*Material Process*
Acetate (CH_3COO-)	A compound containing the acetate group (CH_3COO-), cellulose acetate, sodium acetate; common name for cellulose acetate plastics.	*Material Process*
Acetate butyrates	Common name for cellulose acetate butyrate plastics.	*Material Process*
Acetic acid (CH_3COOH)	Colorless liquid with a sharp odor. Acetic acid is used in the preparation of cellulose acetate and cellulose mixed esters, and in the preparation of polyvinyl acetate. It occurs in dilute form in vinegar.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Acetylene (CH CH)	A colorless inflammable gas used as raw material for the production of certain synthetic resins, notably vinyl resins and vinylidene chloride resins. It is also a raw material for the production of many solvents and other organic modifiers used in plastics.	*Material Process*
Acetone (CH_3COCH_3)	A highly useful solvent, especially in the manufacture of celluloid and cellulose nitrate lacquers and dopes, and an intermediate in the production of methyl methacrylate plastics. A colorless inflammable volatile liquid with an either like odor and burning taste.	*Material Process*
Acetone cyanohydrin	An intermediate in the manufacture of methyl methacrylate.	*Material Process*
Acetyl	Any chemical compound with an acetate group.	*Chemical*
Acetyl peroxide ($(CH_3CO)_2O_2$)	An oxidizing agent and polymerization catalyst for such synthetic resins as polystyrene, vinyl ester resins and acrylic resins.	*Material Process*
Acetyl triethyl citrate ($C_{14}H_{22}O_8$)	A crystalline compound, used as plasticizer for cellulose acetate.	*Material Process*
Acetylation	The process of introducing one or more acetyl groups into a compound.	*Material Process*
Acetylene C_2H_2 (ethyne)	Unsaturated aliphatic hydrocarbon gas. Used as a fuel gas in combustion thermal spray processes, welding and cutting. Acetylene has the highest flame temperature and requires the smallest amount of oxygen to form a neutral flame.	*Paint and Coatings*
Acetylene tetrachloride ($CHCl_2CHCl_2$)	A colorless poisonous liquid, an intermediate product in the manufacture of vinylidene chloride, formed by the reaction of chlorine and acetylene and again reacting with them to form vinylidene chloride.	*Material Process*
acfm	Actual cubic feet per minute	*Facility Engineering*
Achievement Test	Examinations designed to measure, through established norms or standards, the progress of an employee after specialized education or training programs.	*Industrial Relations*
Acid	It is a water soluble sour tasting chemical compound. An acid has pH less than 7. The molecule contains hydrogen and are sour tasting compounds and their generic formula is AH.	*Chemical*
Acid	A water substance with pH less than 7 that reacts with and neutralizes an alkali.	*Chemistry*
Acid deposition or acid rain	Refers loosely to a mixture of wet and dry "deposition" (deposited material) from the atmosphere containing higher than "normal" amount of nitric and sulfuric acids. The precursors or chemical forerunners of acid rain formation result from both natural sources, such as volcanoes and decaying vegetation, and man-made sources, primarily emissions of sulfur and nitrogen oxides resulting from fossil fuel combustion.	*Mining*
Acid mine drainage	This refers to water pollution that results when sulfur-bearing minerals associated with coal are exposed to air and water and form sulfuric acid and ferrous sulfate. The ferrous sulfate can further react to form ferric hydroxide, or yellow boy, a yellow-orange iron precipitate found in streams and rivers polluted by acid mine drainage.	*Energy*
Acid mine drainage (AMD)	Runoff caused by water flowing over and through sulfur-rich areas, such as coal or metal mines, is one of the main pollutants (pdf link) of surface water in this region, raising long-term ecological and economic concerns. This has had a huge environmental impact in Pennsylvania, especially in the western part of the state. There are proposals to use AMD as a source for frack water (see definition below) with the help of recycling facilities to reduce AMD's impact on waterways.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Acid mine drainage	Acidic run-off water from mine waste dumps and mill tailings ponds containing sulfide minerals. Also refers to ground water pumped to surface from mines.	*Mining*
Acid mine water	Mine water that contains free sulfuric acid, mainly due to the weathering of iron pyrites.	*Mining*
Acid Number	A measure of the amount of KOH needed to neutralize all or part of the acidity of a petroleum product.	*Lubrication*
Acid Number	The quantity of base, expressed in milligrams of potassium hydroxide, that is required to neutralize the acidic constituents in 1 g of sample.	*Lubrication*
Acid rain	Also called acid precipitation or acid deposition, acid rain is precipitation containing harmful amounts of nitric and sulfuric acids formed primarily by sulfur dioxide and nitrogen oxides released into the atmosphere when fossil fuels are burned. It can be wet precipitation (rain, snow, or fog) or dry precipitation (absorbed gaseous and particulate matter, aerosol particles or dust). Acid rain has a pH below 5.6. Normal rain has a pH of about 5.6, which is slightly acidic. The term pH is a measure of acidity or alkalinity and ranges from 0 to 14. A pH measurement of 7 is regarded as neutral. Measurements below 7 indicate increased acidity, while those above indicate increased alkalinity.	*Energy*
Acid Sludge	The residue left after treating petroleum oil with sulfuric acid for the removal of impurities. It is a black, viscous substance containing the spent acid and impurities.	*Lubrication*
Acid Treating	A refining process in which unfinished petroleum products, such as gasoline, kerosene, and lubricating oil stocks, are contacted with sulfuric acid to improve their color, odor, and other properties	*Lubrication*
Acid treatment	A process in which unfinished petroleum products such as gasoline, kerosene, and lubricating oil stocks are treated with sulfuric acid to improve color, odor, and other properties.	*Petroleum Engineering*
Acidic precipitation	Snow and rain that have a low pH, caused by sulfur dioxide and nitric oxide gases from industrial activity released into the atmosphere.	*Mining*
Acidic rocks	Igneous rock carrying a high (greater than 65%) proportion of silica.	*Mining*
Acidity	In lubricants, acidity denotes the presence of acid-type constituents whose concentration is usually defined in terms of total acid number. The constituents vary in nature and may or may not markedly influence the behavior of the lubricant.	*Oil Analysis*
Acidophilus milk	Milk to which Lactobacillus acidophilus bacteria have been added to aid in the digestion of lactose (milk sugar). Some humans have difficulty digesting lactose. When they drink regular milk they may suffer diarrhea, abdominal bloating and discomfort.	*Agriculture*
Acidosis	Acid poisoning in the blood	*Chemical*
Acknowledgment	A communication (written or electronic) used to inform the buyer that the supplier has accepted the purchase order. An acknowledgment may add additional terms. However, a bilateral agreement is consummated as a result of this acknowledgment, as long as the terms of the acknowledgment are not substantively different from those of the purchase order.	*Procurement*

Please see the Appendix for further illustration

Term	Definition	*Industry*
ACME thread	A flat topped screw thread for power transmission. This thread has a 29º included angle between adjacent thread faces compared with the 60º angle of the U.S. standard "V" thread.	*Mechanical*
Acorn Nut	A nut (so-called because of its shape) that has a domed top so that it prevents contact with the external thread.	*Maintenance*
Acoustic Emission	Acoustic emissions are sound or ultrasound pulses generated during crack initiation or propagation in materials and coatings as a result of being subjected to stress. Acoustic emissions can be detected by transducers.	*Paint and Coatings*
Acoustic Emission Analysis	Like vibration analysis, patterns of acoustic emission spectra are monitored and diagnosed. Acoustic emission analysis technology is applied to study bearing faults, detect flaws and cracks in welding and pipe-work, and to study de-lamination, de-bonding, and fracture in aerospace materials.	*Maintenance*
Acoustic emission testing	A type of nondestructive testing in which defects are monitored as a results of ultrasonic emission caused by stressing the flawed material.	*Material Process*
Acoustic Ultrasound	A predictive maintenance technology that is applied to thickness, density, flow and level sensing. It is associated with the measurement of sound above 15 kHz.	*Reliability Engineering*
Acoustics	The degree of sound. The nature, cause, and phenomena of the vibrations of elastic bodies; which vibrations create compressional waves or wave fronts which are transmitted through various media, such as air, water, wood, steel, etc.	*Electronic Process*
Acquire	To begin reception of useful data.	*Aeronautical Engineering*
Acquisition (crude oil)	The volume of crude oil acquired by the respondent for processing for his own account in accordance with accounting procedures generally accepted and consistently and historically applied by the refiner concerned, or in the case of processing agreement, delivered to another refinery for processing for the respondent's own account.	*Energy*
Acquisition (foreign crude oil)	All transfers of ownership of foreign crude oil to a firm, irrespective of the terms of that transfer. Acquisitions thus include all purchases and exchange receipts as well as any and all foreign crude acquired under reciprocal buy-sell agreements or acquired as a result of a buy-back or other preferential agreement with a host government.	*Energy*
Acquisition (minerals)	The procurement of the legal right to explore for and produce discovered minerals, if any, within a specific area; that legal right may be obtained by mineral lease, concession, or purchase of land and mineral rights or of mineral rights alone.	*Energy*
Acquisition costs, mineral rights	Direct and indirect costs incurred to acquire legal rights to extract natural resources. Direct costs include costs incurred to obtain options to lease or purchase mineral rights and costs incurred for the actual leasing (e.g., lease bonuses) or purchasing of the rights. Indirect costs include such costs as brokers' commissions and expenses; abstract and recording fees; filing and patenting fees; and costs for legal examination of title and documents.	*Energy*
acre	The unit most commonly used to measure farm and ranch land in the United States . An acre is 43,560 square feet, or 0.4048 hectares. To convert acres to hectares, multiply acres by .4048. (Example: 100 acres X .4048 = 40.48 hectares.)	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Acreage	An area, measured in acres, that is subject to ownership or control by those holding total or fractional shares of working interests. Acreage is considered developed when development has been completed. A distinction may be made between "gross" acreage and "net" acreage:	*Energy*
Acre-foot	The volume of water that will cover an area of 1 acre to a depth of 1 foot.	*Energy*
Acrolein or Acrylic aldehyde (CH2 CHCHO)	A colorless inflammable liquid, unstable. A substance with an acrid, irritating odor. Acrolein readily polymerizes to form a resin, especially in the presence of small amounts of peroxide formed by contact with air.	*Material Process*
Across-the-Board-Increase	a wage adjustment given at one time to all or a significant group of the workers in a plant, company, or industry.	*Industrial Relations*
Acrylates	A group of thermoplastics resins produced by polymerization of acrylic acid derivatives, particularly methyl metacrylate.	*Material Process*
Acrylic	Acrylics became a part of the plastics family in 1936 and were used in World War II as aircraft canopies. Acrylics are known for being rigid, hard, and transparent. It is particularly useful in products that will be exposed to sunlight or other weather elements for periods of time because it is very resistant to sunlight and weathering. Today, acrylics are used in outdoor signs, lighting diffusers, washbasins, automobile tail lights, sinks, tables, safety shields, and skylights. Acrylics are also used for large enclosures, such as swimming pools and room dividers.	*Material Engineering*
Acrylic	Type of polymer popular for floor finishes. Also, a manmade synthetic fiber used in spun yarn to resemble wool in carpet.	*Chemistry*
Acrylic acid (CH2CHCOOH)	Plastics derived from acrylic acid or its derivatives. Variants acrylates, methyl methacrylates.	*Material Process*
Acrylic acid ($CH_2CHCOOH$)	An unsaturated acid which polymerizes to form resins.	*Material Process*
Acrylonitrile (vinyl cyanide) (CH_2CHCN)	Colorless liquid (b.p. 170 °F, 76.66 °C). Derived from alcohol and hydrogen cyanide. One of the raw for oil resistant synthetic rubbers. Used as an ingredient in the production of Buna rubbers.	*Material Process*
Acrylonitrile-Butadiene-Styrene (ABS)	This thermoplastic, which was introduced in 1948, is made by combining acrylonitrile, butadiene, and styrene. As a result, it draws upon the strengths of each. ABS is very durable against impact and has a high mechanical strength. Therefore, it is commonly used in automotive parts, appliances, business machines, pipes, and telephone components.	*Material Engineering*
ACS	American Chemical Society	*Petro-Chemical Abbreviations*
ACSI	American Customer Satisfaction Index - a metric devised by the ASQ and others attempting to express and track customer satisfaction as delivered by a wide range of companies and government institutions.	*Quality*
Act	Frequently used interchangeably with the word "law."	*Industrial Relations*
Actual Hours Worked	the number of hours spent by an employee on the job during a fixed reporting period, weekly or monthly.	*Industrial Relations*
acting."	acting."	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Actinic	Capable of effecting chemical changes by radiant energy.	*Material Process*
Actinomycetes	any of numerous, generally filamentous, and often pathogenic, microorganisms resembling both bacteria and fungi.	*Chemical*
Action Date	The day that the next action on a part is scheduled to take place.	*Quality*
Activate	To begin performing a mission objective, such as flying along a radial of a radio station; usually refers to a mode of radio navigation, such flying along that radial after capturing that radial; See Also: capture criterion; Compare: arm, capture.	*Aeronautical Engineering*
Activated Alumina	A highly porous material produced from dehydroxylated aluminum hydroxide. Is used as a desiccant and as a filtering medium.	*Lubrication*
Activated Carbon	A granular material usually produced by the roasting of cellulose-based substances, such as wood or coconut shells, in the absence of air. It has an extremely porous structure and is used in water conditioning as an adsorbent for organic matter and certain dissolved gases. Sometimes called "activated charcoal."	*Petroleum Engineering*
Activation Energy	Energy barrier that must be overcome by atoms in a given reaction or process	*Material Process*
Active Model Capture	This technology involves the automated capture of process models from naturally-occurring process data. For example, when the operator makes a set point change, a process model can be developed. For more on active model capture, click here	*Process Control Engineering*
Active power	The component of electric power that performs work, typically measured in kilowatts (kW) or megawatts(MW). Also known as "real power." The terms "active" or "real" are used to modify the base term "power" to differentiate it from Reactive Power. See Power, Reactive Power, Apparent Power	*Energy*
Active Redundancy	Redundancy in which all redundant items operate simultaneously.	*Reliability Engineering*
Active solar	As an energy source, energy from the sun collected and stored using mechanical pumps or fans to circulate heat-laden fluids or air between solar collectors and a building.	*Energy*
Active workings	Any place in a mine where miners are normally required to work or travel and which are ventilated and inspected regularly.	*Mining*
Activity (ai)	A thermodynamic term for the apparent or active concentration of a free ion in solution. It is related to concentration by the activity coefficient.	*General Engineering*
Activity (ai)	A thermodynamic term for the apparent or active concentration of a free ion in solution. It is related to concentration by the activity coefficient.	*Electronic Process*
Activity Based Costing (ABC)	A costing procedure devised by Robert Kaplan (*) and Robin Cooper in 1988 whereby the costs incurred in manufacturing are not accumulated by geographic area, and then assigned to products based on a simple "cost driver", such as the number of employees in the area, but instead are accumulated by type of activity undertaken. Examples of activities are machine set ups; quality management; purchase order placement; etc.. The costs incurred in these activities are then allocated to products based on the demand the products make on the activities. The argument against the adoption of ABC is that action taken by staff to reduce the demand of a particular product on an activity, and so reduce its cost, are	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	likely to be disruptive. For example, a manager may reduce the demand of a product on purchase placement costs by ordering very large lots of material at infrequent intervals. (*Kaplan is also co-inventor of the balanced scorecard, qv.)	
Activity Coefficient (fi)	A ratio of the activity of species i (ai) to its molality (C). It is a correction factor which makes the thermodynamic calculations correct. This factor is dependent on ionic strength, temperature, and other parameters.	*General Engineering*
Activity-based costing system	A system that tracks costs based on the activities that are responsible for driving costs in the production of manufactured goods	*Quality*
Actors and Artistes of America; Associated (AFL-CIO)	a national union chartered by the American Federation of Labor in July 1919.	*Industrial Relations*
Actors and Artistes of America; Associated Actors' Equity Association (AFL-CIO)	originally launched in 1913. Affiliated with the American Federation of Labor in 1919.	*Industrial Relations*
Actual Peak Load Reductions	The actual reduction in annual peak load (measured in kilowatts) achieved by consumers that participate in a utility Demand Side Management (DSM) program. It reflects the real changes in the demand for electricity resulting from a utility DSM program that is in effect at the same time the utility experiences its annual peak load, as opposed to the installed peak load reduction capability (i.e., Potential Peak Load Reduction). It should account for the regular cycling of energy efficient units during the period of annual peak load.	*Energy*
Actual Peak Load Reductions	Reduction in annual peak load by consumers who participate in a DSM program that reflect changes in demand.	*Energy*
Actual peak reduction	The actual reduction in annual peak load (measured in kilowatts) achieved by customers that participate in a utility demand-side management (DSM) program. It reflects the changes in the demand for electricity resulting from a utility DSM program that is in effect at the same time the utility experiences its annual peak load, as opposed to the installed peak load reduction capability (i.e., potential peak reduction). It should account for the regular cycling of energy efficient units during the period of annual peak load.	*Energy*
Actual Wages	the term has been used as synonymous with "real" wages, or the actual purchasing power of the dollar-generally measured by changes in the consumer price index.	*Industrial Relations*
Actual well path	a best estimate of where a well bore exists in 3D space, as computed with directional survey data and the minimum curvature survey calculational method.	*Petroleum Drilling*
Actuarial Analysis	Statistical Analysis Of Failure Data To Determine The Age-Reliability Characteristics Of An Item.	*Plant Engineering*
Actuarial Equivalent	Equivalent pension rates established after equating such factors as interest, form of pension, and mortality.	*Industrial Relations*
Actuary	an individual trained or engaged in the practice of applying probability in the field of mortality to determine the financial risk involved.	*Industrial Relations*
Actuato	A device that carriers out a function in response to an input signal.	*Material Process*
Actuator	A mechanism of the switch or switch enclosure which operates the contacts.	*Electrical Engineering*

Term	Definition	*Industry*
Actuator	In electrical engineering, the term actuator refers to a mechanism that causes a device to be turned on or off, adjusted or moved, usually in response to an electrical signal. In some literature the terms actor or effector are also used. The term "effector" is preferred by programmers, whereas engineers tend to favor "actuator." An example of an actuator is a motor that closes blinds in response to a signal from a sunlight detector. Actuators enable computers to control complex manufacturing processes without human intervention or supervision.	*Electrical*
Acute Angle	An angle that is less than 90°.	*Math*
Acute injury	Injury, usually involving necrosis, which develops within several hours to a few days after a high dose exposure to a pollutant; expressed as fleck, scorch, bifacial necrosis, etc.	*Forestry*
ACV	All Commodity Volume.	*Quality*
ACWA	ACWA - See: Clothing Workers of America; Amalgamated	*Industrial Relations*
Ad Hoc Arbitration	Ad Hoc Arbitration - see : Arbitration, Ad Hoc	*Industrial Relations*
Ad Valorem	A customs duty levied according to the value of the goods.	*Quality*
Adair v. United States	a major labor case in which the Supreme Court, in 1908, held that section 10 of the Erdman Act of 1898 (30 Stat. 424, c. 370) was unconstitutional.	*Industrial Relations*
Adams v. Tanner	decision by the Supreme Court in 1917 holding unconstitutional a statute passed by the State of Washington which prohibited employment agencies in the state from collecting fees from the employees.	*Industrial Relations*
Adamson Act	act of Congress passed in 1916 at the request of President Woodrow Wilson. It provided the 8-hour day for interstate railroad employees.	*Industrial Relations*
Adapter	A mechanism or device for attaching non-mating parts.	*Electronic Process*
Adapter spool	An extension which is added to a short face-to-face valve, to conform to standard API 6D face-to-face dimensions.	*Mechanical*
Adapters or Reducer Couplings	reduces large drill motor thread to smaller thread for use with smaller bits (i.e. bots smaller than 1.25 inches).	*Petroleum Drilling*
Adaptive Automatic Transmission	Some transmissions can "learn" and adapt to the driver's style, altering shift points and other transmission functions to produce the most efficient operation.	*Mechanical Engineering*
Adaptive Control	Method of control whereby tuning (response) of the control system is varied with the process conditions, unlike other control where tuning is manual and remains constant.	*Electrical Engineering*
Adaptive Cruise Control	One step beyond cruise control, adaptive cruise control uses a radar sensor mounted in the front of the vehicle to maintain a safe cruising distance between your vehicle and the vehicle in front of you. Most systems allow you to set the interval (distance between vehicles) and will then accelerate and brake (within reason) to maintain that interval. In many cases, the systems can take into account hilly terrain and passing situations. All have the ability to act like regular cruise control, and they still require the driver to steer the vehicle normally. Some automakers refer to it as "intelligent" cruise control.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Adaptive Exponential Smoothing	Devised by Derek Trigg originally in connection with the tracking of the Nylon 8 process at ICI in Wilton, Co. Durham, Adaptive Smoothing is the only naive forecasting technique to incorporate a built-in ability to adapt its own behavior as circumstances change. The exponent alpha in single exponential smoothing is replaced by a variable "A," calculated from the past "n" forecast errors, where A = (sum of the errors where signs cancel)/(absolute sum of the errors). In short, as errors start to increase, A gets bigger and the forecasts start to catch up to the new level of demand. Adaptive smoothing is not a sound forecasting technique and is no longer used; it is regarded as a curiosity.	*Quality*
Adaptor Flange	An intermating flange that connects between two other flanges that are different connection types from each other. Two types are available:-	*Petroleum Engineering*
Adaptor Spool	A pressure control housing body with two different end connections to fit between two other pieces of equipment. Can often be used instead of a Double Studded Adaptor because at least one of the components to which it connects has a studded flange connection.	*Petroleum Engineering*
ADC	Analogue to Digital Convertor	*Control Engineering*
ADC	Analogue to Digital Converter, or Automated Data Collection.	*Quality*
Added Value	See Value Added.	*Quality*
Addendum	Height of tooth above pitch circle or the radial distance between the pitch circle and the top of the tooth.	*Mechanical Engineering*
Addition Polymerization	Chain growing by a chemical reaction in which molecules combine through interaction of unsaturated groups without splitting off any by products.	*Material Process*
Additional Requirements	complies with the requirements of the applicable code and standard and any additional requirements established by the owner.	*Maintenance and Repair*
Additive	Any material added to a base stock to change its properties, characteristics or performance.	*Lubrication*
Additive	A chemical substance added to a petroleum product to impart or improve certain properties. Common petroleum product additives are: antifoam agent, anti-wear additive, corrosion inhibitor, demulsifier, detergent, dispersant, emulsifier, EP additive, oiliness agent, oxidation inhibitor, pour point depressant, rust inhibitor, tackiness agent, viscosity index (VI.) improver.	*Lubrication*
Additive company	A specialty chemicals business which produces ingredients which enhance the performance of base oils for specific purposes, such as lubricating passenger car engines.	*Mechanical, Process, and Operations*
Additive Level	The total percentage of all additives in an oil. (Expressed in % of mass (weight) or % of volume)	*Lubrication*
Additive model	A statistical model in which the combined effect of several factors is the sum of the effects produced by each of the factors in the absence of the others. For example, if one factor increases risk by a% and a second factor by b%, the additive combined effect of the two factors is (a + b)%. See also: Multiplicative model	*Quality Engineering*
Additive stability	The ability of additives in the fluid to resist changes in their performance during storage or use.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Additives	In the manufacturing process of plastics, polymer is just one constituent. There are other chemicals like impact modifiers, colorants, reinforcements, plasticizers and stabilizers etc that give specific properties to the plastics. These are called additives.	*Chemical*
Address	The label or number identifying the memory location where a unit of information is stored.	*General*
ADE	Automated Data Entry.	*Quality*
Adequacy (electric)	The ability of the electric system to supply the aggregate electrical demand and energy requirements of the end-use customers at all times, taking into account scheduled and reasonably expected unscheduled outages of system elements. NERC definition	*Energy*
Adequate Remedy at Law	a solution or remedy which is practical, efficient, plain, and complete to achieve the ends of justice and its prompt administration as a remedy in equity.	*Industrial Relations*
Adherence	the act, action, or quality of zinc bonding to steel, measured in pounds per square inch (psi) or mega pascals (MPa)	*Materials Process*
Adhesion	The attraction or joining of two materials, such as a lubricating grease and a metal.	*Lubrication*
Adhesive Wear	Wear caused by metal-to-metal contact; characterized by local welding and tearing of the surface.	*Lubrication*
Adhesive Wear	Wear occurring when two smooth surfaces slide over each other. fragment are pulled off one surface and adhere to the other.	*Material Process*
Adiabatic	Without loss or gain of heat	*Chemical*
Adipic acid ($COOH(CH_2)_4COOH$)	A dibasic acid useful for the production of polyamides or Nylons, or for alkyl resins. A colorless monoclinic prisms substance.	*Material Process*
Adit	A nearly horizontal passage from the surface by which a mine is entered and dewatered. A blind horizontal opening into a mountain, with only one entrance.	*Mining*
ADIT	A passageway or opening driven horizontally into the side of a hill generally for the purpose of exploring or otherwise opening a mineral deposit. An adit is open to the atmosphere at one end, a tunnel at both ends.	*Mining*
Adit	An entrance to a mine, generally a horizontal tunnel.	*Mining*
Adjacent	Angles that have the same vertex and a common arm. They lie on opposite sides of the common arm.	*Math*
Adjunction	the resolution of a dispute by a tribunal or court.	*Industrial Relations*
Adjustable speed drives	Drives that save energy by ensuring the motor's speed is properly matched to the load placed on the motor. Terms used to describe this category include polyphase motors, motor oversizing, and motor rewinding.	*Energy*
Adjustable Suspension	Provides better ride or handling. A variety of systems are used to vary shock-absorber firmness. Some automatically sense road conditions and adjust shock-absorber settings accordingly. Others include a switch on the dashboard or console that allows the driver to adjust shock-absorber settings to provide a softer or firmer ride, or sharper handling.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Adjusted analysis	An analysis that controls (adjusts) for baseline imbalances in important patient characteristics. See also: Confounder	*Quality Engineering*
Adjusted electricity	A measurement of electricity that includes the approximate amount of energy used to generate electricity. To approximate the adjusted amount of electricity, the site-value of the electricity is multiplied by a factor of 3. This conversion factor of 3 is a rough approximation of the Btu value of raw fuels used to generate electricity in a steam-generation power plant.	*Energy*
Adjustment	A summarizing procedure for a statistical measure in which the effects of differences in composition of the populations being compared have been minimized by statistical methods.	*Analysis*
Adjustment bid	A bid auction conducted by the independent system operator or power exchange to redirect supply or demand of electricity when congestion is anticipated.	*Energy*
Adjustment Board	an agency designed to deal with a specific set of labor-management problems.	*Industrial Relations*
Adjustment of Disputes	Adjustment of Disputes - see: Dispute Adjustment	*Industrial Relations*
Adjustment of Grievances	Adjustment of Grievances - see: Grievance Adjustment	*Industrial Relations*
Adkins v. Children's Hospital	the Supreme Court decision in 1923 which held unconstitutional a law passed by Congress in 1918 providing for the fixing of minimum wages for women and children in the District of Columbia.	*Industrial Relations*
Administration	the process of carrying out or enforcing a statute.	*Industrial Relations*
Administration of the Agreement	Administration of the Agreement - see: Agreement, Administration of	*Industrial Relations*
Administrative and general expenses	Expenses of an electric utility relating to the overall directions of its corporate offices and administrative affairs, as contrasted with expenses incurred for specialized functions. Examples include office salaries, office supplies, advertising, and other general expenses.	*Energy*
Administrative Costs	All executive, organizational, and clerical costs associated with the general management of an organization rather than with manufacturing, marketing, or selling.	*Procurement*
Administrative Employee	a class of management employees exempt from the provisions of the Fair Labor Standards Act (Wage-Hour Law).	*Industrial Relations*
Administrative Law	a body of law established by rules, regulations and court interpretations of actions by an administrative agency established by the Federal Government or the state legislature.	*Industrial Relations*
Administrative Order (ruling or interpretation)	a regulation or order issued by an administrative agency or administrator setting forth detailed procedures and interpretations of the law.	*Industrial Relations*
Administrative Procedure Act	a law passed by Congress in June 1946 to establish uniform procedures for administrative and quasi-judicial agencies.	*Industrial Relations*
Administrator	a person who has the responsibility of carrying out the purposes and provisions of the law.	*Industrial Relations*
Administrator (of a Cochrane Review Group)	See Managing Editor (previously known as Review Group Co-ordinator (RGC))	*Quality Engineering*

Term	Definition	*Industry*
Adminors	The name of the e-mail discussion list for Managing Editors. See also: Managing Editor (previously known as Review Group Co-ordinator (RGC))	*Quality Engineering*
Admission to Union	Admission to Union - see: Union Membership Regulations	*Industrial Relations*
Admixture	Addition to cement to provide desirable features, for example, coloring agent.	*Material Process*
ADSL	Asymmetric Digital Subscriber Line, a methodology enabling a single copper wire carrying a telephone signal to transmit data at anything from 10x the normal rate to 40x the normal rate—i.e., it is a digital connection over a normal telephone line that is also capable of carrying high speed traffic. "Asymmetric" means that the user cannot send ("upload") data as fast as he can receive it. As well, what is important from the user's point of view, is that the connection is "always on." ADSL Max denotes new technology intended to improve performance, especially for users a long way from the telephone exchange.	*Quality*
Adsorbent Filter	A filter medium primarily intended to hold soluble and insoluble contaminants on its surface by molecular adhesion.	*Lubrication*
Adsorption	Attachment of a molecule or atom to a solid surface. Adsorption involves a chemical bond between the adsorbed species and the surface.	*Chemical*
Adsorption	Adhesion of the molecules of gases or liquids to the surface of solid materials.	*Petroleum Engineering*
Adsorptive Filtration	The attraction to, and retention of particles in, a filter medium by electrostatic forces, or by molecular attraction between the particles and the medium.	*Lubrication*
Adust	Dry or burnt, in the humoral system of medicine	*Breakroom*
Advance	Mining in the same direction, or order of sequence; first mining as distinguished from retreat.	*Mining*
Advance on Wages	payments of earnings prior to the regular pay day.	*Industrial Relations*
Advance royalty	A royalty required to be paid in advance of production from a mineral property that may or may not be recoverable from future production.	*Energy*
Advance Shipping Notice	See ASN.	*Quality*
Advanced composites	Synthetic fiber reinforced composites with relatively high modulus fibers. The fiber modulus is generally higher than that of E-glass.	*Material Process*
Advanced head or Advanced heading	a heading in advance of the coalface often known as a 'pilot heading' or 'advanced gate'.	*Mining*
Advanced Metering	Device for recording or communicating actual electric use during minutes, hours, days or weeks useful for time-of-day, on-peak/off peak or other billing rates.	*Energy*
Advanced Mobile Phone System	An analog only, 1G standard that operates in the 800MHz to 900MHz frequency band. It is still widely used in the United States.	*Electrical Engineering*
Advanced Planning and Scheduling	See APS.	*Quality*
Advanced planning and scheduling system	Planning and optimization tool that balances demand with plant capacity, thus allowing manufacturers to identify bottlenecks and divert workload to alternative production cells.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Advanced Power Management	Power management standard for computers that provides five power states: Ready, Stand-by, Suspended, Hibernation, Off.	*Electrical Engineering*
Advanced Power Management	Power management standard for computers that provides five power states—Ready, Stand-by, Suspended, Hibernation, Off.	*Electrical Engineering*
Advanced process control (APC)	In general terms, advanced process control refers to large-scale computer systems that are used to monitor and control processing plants such as cement factories or oil refineries. The systems extend traditional process control, which is used to monitor and control individual processes, by evaluating and controlling multiple processes across the plant. By monitoring multiple processes, APC systems can optimize operations for multiple parameters, evaluating the impact each adjustment will have on neighboring operations by referencing current and historical data. With a broad yet detailed view of an entire plant's operations, APC applications allow processes to operate closer to their maximum capacity, while maintaining the necessary standards of reliability and safety.	*Electrical*
Advanced Product Quality Planning	System developed by the AIAG automotive organization to communicate common product quality planning and control plan guidelines for suppliers to the automotive industry.	*Electrical Engineering*
Advances from municipality	The amount of loans and advances made by the municipality or its other departments to the utility department when such loans and advances are subject to repayment but not subject to current settlement.	*Energy*
Advances to municipality	The amount of loans and advances made by the utility department to the municipality or its other departments when such loans or advances are subject to current settlement.	*Energy*
Advancing Face	Advancing Face – see Face	*Mining*
Advection	the process of transfer of fluids (vapors or liquid) through a geologic formation in response to a pressure gradient that may be caused by changes in barometric pressure, water table levels, wind fluctuations, or infiltration.	*Chemical*
Adverse effect	An adverse event for which the causal relation between the drug/intervention and the event is at least a reasonable possibility. The term 'adverse effect' applies to all interventions, while 'adverse drug reaction' (ADR) is used only with drugs. In the case of drugs an adverse effect tends to be seen from the point of view of the drug and an adverse reaction is seen from the point of view of the patient. See also: Adverse event, Side effect Also called: Adverse reaction	*Quality Engineering*
Adverse event	An adverse outcome that occurs during or after the use of a drug or other intervention but is not necessarily caused by it. See also: Adverse effect	*Quality Engineering*
Adverse reaction	See Adverse effect	*Quality Engineering*
Adverse water conditions	Reduced stream flow, lack of rain in the drainage basin, or low water supply behind a pondage or reservoir dam resulting in a reduced gross head that limits the production of hydroelectric power or forces restrictions to be placed on multipurpose reservoirs or other water uses.	*Energy*
Adverse Weather Conditions	Reduced streamflow, lack of rain in the drainage basin, or low water supply behind a pondage or reservoir dam resulting in a reduced gross head that limits the production of hydroelectric power or forces restrictions to be placed on multipurpose reservoirs or other water uses.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Advice Note	A message from a supplier to a receiving company stating that goods ordered are in the process of being actually dispatched. The advice note may be paper or electronic, and will include the relevant Order Number. An advice note is equivalent to an ASN.	*Quality*
Advisory	A signal to indicate safe or normal configuration, condition of performance, operation of essential equipment, or to attract attention and impart information for routine action purposes (from MIL-STD-1472D); an annunciator that is the least critical (less than a caution or a warning).	*Aeronautical Engineering*
Advisory Council	an agency, generally tri-partite in structure, designed to assist in a consultative or advisory capacity on major policy issues.	*Industrial Relations*
Advisory Council on Employment Security	state employment service agencies operating under the Wagner-Peyser Act are required to establish tri-partite Advisory Councils on Employment Security.	*Industrial Relations*
AEA	AEA - See: Actors and Artistes of America; Associated-Actors' Equity Association (AFL-CIO)	*Industrial Relations*
AECC	Automobile Emissions Control by Catalyst	*Petro-Chemical Abbreviations*
Aecial stage (aecium)	A spore stage of the rust fungi; a cuplike structure bearing aeciospores.	*Forestry*
AEG	Allgemeine Elektricitäts—Gesellschaft.	*Quality*
AEI	Associated Electrical Industries.	*Quality*
AEN	Ambient electromagnetic noise. The electrical and magnetic waves measured in decibels that are generated in the air by electrical devices—sortation systems, conveyors, alarm systems, radio VDUs etc. A major problem with AEN lies in the installation of RFID - the radio waves generated and read by the RFID devices are interfered with by the AEN. Prior to setting up an RFID system, therefore, it is necessary to carry out a site assessment or site survey. In the site assessment, a Full Faraday Cycle Analysis is performed over a 24-hour working day of the proposed RFID interrogation zone to determine the AEN present. By doing so, RFID readers can be positioned so as to minimize AEN radio interference. The subjects of AEN, site surveys and Full Faraday Cycle Analyses remind us that in setting up an RFID system, in, say, a warehouse, problems are as much matters of physics and electronic engineering as they are of systems analysis.	*Quality*
AER	AER - See: Anticipated earned rate	*Industrial Relations*
Aeration	the process of bringing air into contact with a liquid (typically water), usually by bubbling air through the liquid, spraying the liquid into the air, allowing the liquid to cascade down a waterfall, or by mechanical agitation. Aeration serves to (1) strip dissolved gases from solution, and/or (2) oxygenate the liquid. The rate at which a gas transfers into solution can be described by Fick's First Law.	*Chemical*
Aerial magnetometer	An instrument used to measure magnetic field strength from an airplane.	*Mining*
Aerial tramway	A system for the transporting of ore or rock in buckets which are suspended from a cable.	*Mining*
Aerobe	An organism that grows only in the presence of free (molecular) oxygen.	*Chemical Engineering*
Aerobic	Requiring oxygen.	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Aerodynamic Noise	Noise produced by a gas accelerating to supersonic velocity at critical or higher pressure drops through the valve trim.	*Industrial Engineering*
Aerodynamics	The science of managing airflow plays a major role in racecar design and tuning because modern day open wheeled cars are highly sophisticated aerodynamic devices. Areas of high and low pressure are carefully managed to maximize downforce (to give a car grip) while minimizing drag (to maximize speed). You can see the wings on the nose and the large wing at the rear of the car. Underneath, two large grooves (like funnels cut in half) suck the car down on the track by creating a partial vacuum under the car. This is generally referred to as "ground effects." Wind tunnels play a key role in modern day open wheeled cars design and evolution.	*NASCAR*
Aeromagnetic survey	A geophysical survey using a magnetometer aboard, or towed behind, an aircraft.	*Mining*
Aerophor Breathing Apparatus	The Aerophor was introduced in 1910. The apparatus supplied oxygen from a liquid air source. The liquid air container and regenerator were carried on the back, and the breathing bag was worn on the chest. The overall weight of the apparatus was about 40 lbs.	*Mining*
Aerosol	An extremely fine mist or fog consisting of solid or liquid particles suspended in air. Also, term used for products that mechanically produce such a mist.	*Chemistry*
Aerotight Nut	A torque prevailing nut of all metal construction. The nut is slotted in two places which, after the nut has been tapped, are bent slightly inwards and downwards. When the nut is screwed onto the bolt thread the two slotted parts are forced back to their original position. Their stiffness causes the nut threads to bind onto the bolt threads and thus provides a prevailing torque. Aerotight is a registered trade mark of The Premier Screw and Repetition Co. Ltd of Woodgate, Leicester, United Kingdom, LE3 5GJ.	*Maintenance*
AEU	Amalgamated Engineering Union.	*Quality*
AFC	adaptive fuel control	*Petro-Chemical Abbreviations*
Affecting Commerce	Much of the federal legislation regulating labor-management relations is based on the authority on Congress to regulate commerce between the states.	*Industrial Relations*
Affidavit	a written statement given under oath and accepted as evidence when no better proof is available.	*Industrial Relations*
Affiliate	An entity that is directly or indirectly owned, operated, or controlled by another entity.	*Energy*
Affiliated Power Producer	A generating company that is affiliated with a utility.	*Energy*
Affiliated Retail Electric Provider	A Retail Electric Provider (REP) that is owned, but separately operated, by a former monopoly electric utility.	*Energy*
Affiliated Schools for Workers	a group of summer schools first organized during the 1920's such as Bryn Mawr and Oberlin to provide women wage earners with college guidance and training in economics, labor history, etc.	*Industrial Relations*
Affiliation	the joining or association of a group with a parent or national organization.	*Industrial Relations*

Term	Definition	*Industry*
Affirmative Action	A provision of the Equal Opportunity Act of 1972 that requires all firms to take affirmative action to move toward achieving a work force that accurately reflects the composition of the local labor pool. In recent years, this interpretation has been liberalized somewhat. The current definition is: "Any effort taken to expand opportunity for women or racial, ethnic, and national origin minorities by using membership in those groups that have been subject to discrimination as a consideration."	*Procurement*
Affirmative Order	an order issued by the National Labor Relations Board or State Labor Boards requiring an employer or union to take specific action to undo a wrong committed in violation of law.	*Industrial Relations*
Afforestation	Planting of new forests on lands that have not been recently forested.	*Energy*
AFGE	AFGE - See: Government Employees; American Federation of (AFL-CIO)	*Industrial Relations*
AFGM	AFGM - See: Grain Millers; American Federation of (AFL-CIO)	*Industrial Relations*
AFGW	AFGW—See: Glass Workers' Union of North America; Americana Flint (AFL-CIO)	*Industrial Relations*
AFHW	AFHW—See: Hosiery Workers; American Foundation of (AFL-CIO)	*Industrial Relations*
AFI	Average Fraction Inspected. A term used in quality and acceptance sampling to gauge the financial effectiveness, to a recipient of incoming goods, of a sampling inspection table or procedure. AFI is defined as ATI / N, where N is the number of the incoming items.	*Quality*
AFL-CIO	AFL-CIO - See: American Federation of Labor-Congress of Industrial Organizations	*Industrial Relations*
AFL-CIO Collective Bargaining Report	monthly report issued by the Research Department of the AFL-CIO.	*Industrial Relations*
AFL-CIO COPE	the Committee on Political Education was formed with the merger of the AFL-CIO in 1955.	*Industrial Relations*
AFM	AFM - See: Musicians; American Federation of (AFL-CIO)	*Industrial Relations*
AFNOR	Association Français de Normalisation	*Petro-Chemical Abbreviations*
A-Force	to hole a board into an adjoining board unintentionally, (N. East).	*Mining*
AFT	AFT - See: Teachers; American Federation of (AFL-CIO)	*Industrial Relations*
AFTE	AFTE - See: Engineers; American Federation of Technical (AFL-CIO)	*Industrial Relations*
After Sales Service	All services proposed by the vendor or manufacturer after the purchase.	*Maintenance*
After yellowing	The property of becoming yellow from age or exposure often exhibited by clear varnishes and lacquers containing synthetic resins.	*Material Process*
Afterburner	An off-gas posttreatment unit for control of organic compounds by thermal oxidation. A typical afterburner is a refractory-lined shell providing enough residence time at a sufficiently high temperature to destroy organic compounds in the off-gas stream.	*Chemical*
Aftercooler	A device which cools a gas usually after it has been compressed. AIR BLEEDER - A device for removal of air from a hydraulic fluid line.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Afterdamp	a mixture of non-inflammable gasses left after an explosion or fire in a coalmine. It usually has a high carbon monoxide (CO) content and is very low in oxygen. Afterdamp was responsible for more deaths among miners than were actually physically injured due to the explosions. Also known as "azote" (N. East).	*Mining*
Aftermarket	All products and services used in the repair and maintenance of vehicles that was not produced by the original vehicle manufacturer.	*Mechanical Engineering*
After-Market	Broad term that applies to any change after the original purchase, such as adding equipment not a part of the original purchase. As applied to alternative fueled vehicles, it refers to conversion devices or kits for conventional fuel vehicles.	*Energy*
Aftermarket converted vehicle	A standard conventionally fueled, factory-produced vehicle to which equipment has been added that enables the vehicle to operate on alternative fuel.	*Energy*
Aftermarket vehicle converter	An organization or individual that modifies OEM vehicles after first use or sale to operate on a different fuel (or fuels).	*Energy*
AFTRA	AFTRA - See: Actors and Artistes of America; Associated-American Federation of Television and Radio Artists (AFL-CIO)	*Industrial Relations*
AFUDC	Allowance for Funds Used During Construction	*Energy*
AFV	Alternative-Fuel Vehicle	*Energy*
AGA	American Gas Association	*Energy*
AGA	American Gas Association—A society comprising gas companies set up to achieve common goals.	*Mechanical*
Age Hardening	An increase in consistency (hardening) over time (also see Thixotropy).	*Lubrication*
Agent (legal)	An employee is the "agent" of an employer, whose function it is to assist the employer in the fulfillment of a contract. The limit of the agent's contractual involvement is that a contract of agency exists between him and his employer, and it is from this that he derives his authority to act. Such authority may be express, implied, apparent, ratified or of necessity. In general, the principal (i.e., employer) is bound by his agent's actions. This is not the case, however, if the agent acts contrary to the employer's specific instructions.	*Quality*
Agent	In pre-nationalization days the chief official of a large coalmine or group of mines under the same ownership was known as an Agent.	*Mining*
Agglomerate	Several particles adhering together.	*Paint and Coatings*
Agglomerate	A breccia composed largely or entirely of fragments of volcanic rocks.	*Mining*
Agglomerated Powder	A powder made up of agglomerates	*Paint and Coatings*
Agglomerating character	Agglomeration describes the caking properties of coal. Agglomerating character is determined by examination and testing of the residue when a small powdered sample is heated to 950 degrees Centigrade under specific conditions. If the sample is "agglomerating," the residue will be coherent, show swelling or cell structure, and be capable of supporting a 500-gram weight without pulverizing.	*Energy*
Agglomerating	refers to coal that softens when heated and forms a hard gray coke; this coal is called caking coal. Not all caking coals are coking coals. The agglomerating value is used to differentiate between coal ranks and also is a guide to determine how a particular coal reacts in a furnace.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Agglomeration	The potential of the system for particle attraction and adhesion.	*Oil Analysis*
Agglomeration	A method of concentrating valuable minerals based on their adhesion properties.	*Mining*
Agglutinating	refers to the binding qualities of a coal. The agglutinating value is an indication of how well a coke made from a particular coal will perform in a blast furnace. It is also called a caking index.	*Energy*
Aggravated Test	A test in which one or more conditions are set at a higher stress more level than the test item will encounter in the field, in order to reduce test time or assure a margin of safety.	*Reliability Engineering*
Aggregate	Inert solid bodies such as crushed rock, sand, gravel, crushed hydraulic cement concrete.	*Petroleum Drilling*
Aggregate	Coarse mineral material (e.g., sand, gravel) that is mixed with either cement to form concrete or tarry hydrocarbons to form asphalt.	*Chemical*
Aggregate Nonfibrous	Dispersed phase in a composite. Specifically refers to sand and gravel dispersed in concrete.	*Material Process*
Aggregate composite	Material reinforced with a dispersed particulate (rather than fibrous) phase.	*Material Process*
Aggregate data	Data summarized by groups, for example summary outcome data for treatment and control groups in a controlled trial. See also: Control group, Controlled trial, Treatment	*Quality Engineering*
Aggregate ratio	The ratio of two population aggregates (totals). For example, the aggregate expenditures per household is the ratio of the total expenditures in each category to the total number of households in the category.	*Energy*
Aggregate Strength	The strength derived by totaling the individual breaking strengths of the elements of the strand or rope. This strength does not recognize the reduction in strength resulting from the angularity of the elements in the rope, or other factors that may affect efficiency.	*Wire Rope & Cable*
Aggregation	Formation of aggregates. In drilling fluids, aggregation results in the stacking of the clay platelets face to face; as a result, viscosity and gel strength decrease.	*Petroleum Engineering*
Aggregation	The process of organizing small groups, businesses or residential customer into a larger, more effective bargaining unit that strengthens their purchasing power with utilities.	*Energy*
Aggregator	An entity that puts together customers into a guying group for the purchase of a commodity service. The vertically integrated investor owned utility, municipal utilities and rural electric cooperatives perform this function in today's power market. Other entities such as buyer cooperatives or brokers could perform this function in a restructured power market.	*Energy*
Aggressive environment	an environment that is particularly corrosive	*Materials Process*
Agile Manufacturing	Agile is an adjective from the Manufacturing Consultant's Golden Lexicon - a powerful word suggesting immediately that a company that is not agile is inferior to one that is (but we are not to enquire in what way the non-agile company is inferior). If agile manufacturing does have a meaning, it is that the company responds to a customer's requirement by the immediate commencement of fast manufacture, rather than through a reliance on forecasting and stock holding.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	Two examples of agile manufacture are: (1) in Just-in-Time, the instant response to market demand, through group technology, kanban and SMED; and (2) in quick response/assemble-to-order, the prior manufacture of machine options and their use in a final assembly stage.	
Aging	Allowing batches of synthetic resins, coatings, or various plastics materials to stand for some time to allow a natural change to take place, resulting in improved properties.	*Material Process*
Agitation	In metallurgy, the act or state of being stirred or shaken mechanically, sometimes accomplished by the introduction of compressed air.	*Mining*
AGM	AGM - See: Actors and Artistes of America; Associated-American Guild of Musical Artists, Inc. (AFL-CIO)	*Industrial Relations*
AGMA	An acronym for "American Gear Manufacturers Associations," an organization serving the gear industry.	*Lubrication*
AGMA Lubricant Numbers	AGMA specification covering gear lubricants. The viscosity ranges of the AGMA numbers (or grades) conform to the International Standards Organization (ISO) viscosity classification system (see ISO viscosity classification system).	*Lubrication*
AGR slant range	Straight-line distance from the aircraft to a point on the ground.	*Aeronautical Engineering*
Agribusiness	a way of farming that combines agriculture and business and usually involves large amounts of land, animals, and expensive technology be	*Agriculture*
Agricultural Land Commission (ALC)	The ALC is an independent Crown agency whose mission is to preserve agricultural land.	*Petroleum Engineering*
Agricultural Land Reserve (ALR)	The Agricultural Land Reserve (ALR) is a provincial zone in which agriculture is recognized as the priority use. Farming is encouraged and non-agricultural uses are controlled.	*Petroleum Engineering*
Agricultural Marketing Service, (AMS)	An agency of the USDA.	*Agriculture*
Agriculture	An energy-consuming subsector of the industrial sector that consists of all facilities and equipment engaged in growing crops and raising animals.	*Energy*
Agriculture, mining, and construction (consumer category)	Companies engaged in agriculture, mining (other than coal mining), or construction industries.	*Energy*
Agritourism	Agricultural tourism is a commercial enterprise at a farm, ranch or vineyard that provides enjoyment or education to visitors and generates supplemental income to growers. These enterprises also provide opportunities for urban populations to experience a farm. Agritourism can include farm stands, ag tours, wildlife viewing or bird watching, festivals, farm-animal petting zoos, wine tasting or u-picks. For more on Agritourism go here.	*Agriculture*
Agrochemical	Chemicals, like hormone, fungicide, or insecticide, that improve or protects the crop production.	*Chemical*
Agronomic	An adjective used to describe plants and plant products. Pertains to agronomy or agricultural plants and things affecting plants.	*Agriculture*

Term	Definition	*Industry*
Agronomy	Scientific discipline related to the production of agricultural crops. Universities aren't uniform in their organization of plant sciences into departments. For example, at some schools, scientists who work on corn would be found in the agronomy department. At other schools they would be found in the horticulture department.	*Agriculture*
AGV	AGV - See: Actors and Artistes of America; Associated American Guild of Variety Artists (AFL-CIO)	*Industrial Relations*
AGV (Automated Guided Vehicle)	A computer controlled device used in materials handling and factory internal transportation.	*Quality*
AH	Polycyclic aromatic hydrocarbons	*Petro-Chemical Abbreviations*
AHEM	Association of Hydraulic Equipment Manufacturers	*Petro-Chemical Abbreviations*
AI	Artificial Intelligence	*Control Engineering*
AIAG	Automotive Industry Action Group	*Gears*
AIAM	Association of International Automobile Manufacturers	*Petro-Chemical Abbreviations*
AIChE	American Institute of Chemical Engineers	*Petro-Chemical Abbreviations*
AID	Automatic Identification .... bar codes, RFID and contact memory buttons.	*Quality*
AIDAS	The tasks which the salesman must undertake in selling have been summarized by the mnemonic AIDAS, as follows: A = attention (making contact); I = interest; D = desire (showing the potential customer how the goods will benefit him); A = action (closing the sale); and S = satisfaction (making sure the business is retained).	*Quality*
Aiding	A process by which one or more sensors provide data to another sensor to produce results better than any single sensor; aiding occurs at the data source level or at the physical device level, depending upon specific implementation of the device and the data source (choice of implementation is transparent above the data source); aiding is automatically controlled by software without input from an operator; a basic control to a data source from navigation, radio navigation, or other devices Compare: update.	*Aeronautical Engineering*
Aileron	A control surface on fixed-wing aircraft, usually mounted on the aft edge of wings, that controls roll, and is controlled by the wheel; Symbols: delta sub A; Typical Units: rad, deg.	*Aeronautical Engineering*
AIM	(1) Application Integration Middleware; (2) Alternative Investment Market, a branch of the London Stock Exchange formerly known as the Unlisted Securities Market, launched in 1995 and having less stringent rules and regulations than the main stock exchange. The AIM was aimed at smaller, younger companies.	*Quality*
AIM	Automatic Identification Manufacturers ALPHANUMERIC-Description of a symbology's character set which consists of letters and numerals.	*Gears*
AIMS	Agile Infrastructure for Manufactured Systems (a program).	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Air Bag	The air bag, also known as a Supplemental Inflatable Restraint System, is a passive safety device, supplemental to safety belts, that inflates to provide a cushion to absorb impact forces during moderate to severe frontal collisions. This system can help to lessen the chance of contact with the steering wheel, instrument panel and windshield. The air bag is actuated automatically by sensors located in the front of the vehicle.	*Mechanical Engineering*
Air Bag	The air bag, also known as a Supplemental Inflatable Restraint System, is a passive safety	*Mechanical Engineering*
Air bagging	Air bagging, -see Bagging	*Mining*
Air Bleeder	A device for removal of air from a hydraulic fluid line.	*Lubrication*
Air box	a square wooden tube used to convey air into the face of a single drift, or shaft in sinking.	*Mining*
Air breather	A device permitting air movement between atmosphere and the component in which it is installed.	*Mechanical, Process, and Operations*
Air bridge	Air bridge, -see Air crossing.	*Mining*
Air classification	The separation of powder into particle size fractions by means of an air stream of controlled velocity.	*Paint and Coatings*
Air cleaner	A device using filters or electrostatic precipitators to remove indoor-air pollutants such as tobacco smoke, dust, and pollen. Most portable units are 40 watts when operated on low speed and 100 watts on high speed.	*Energy*
Air collector	A medium-temperature collector used predominantly in space heating, utilizing pumped air as the heat-transfer medium.	*Energy*
Air conditioning	Cooling and dehumidifying the air in an enclosed space by use of a refrigeration unit powered by electricity or natural gas. Note: Fans, blowers, and evaporative cooling systems ("swamp coolers") that are not connected to a refrigeration unit are excluded.	*Energy*
Air conditioning intensity	The ratio of air-conditioning consumption or expenditures to square footage of cooled floor space and cooling degree-days (base 65 degrees F). This intensity provides a way of comparing different types of housing units and households by controlling for differences in housing unit size and weather conditions. The square footage of cooled floor space is equal to the product of the total square footage times the ratio of the number of rooms that could be cooled to the total number of rooms. If the entire housing unit is cooled, the cooled floor space is the same as the total floor space. The ratio is calculated on a weighted, aggregate basis according to this formula: Air-Conditioning Intensity = Btu for Air Conditioning/(Cooled Square Feet * Cooling Degree-Days)	*Energy*
Air course	an underground tunnel or passage used solely or mainly for ventilation.	*Mining*
Air coursing	system of ventilation introduced in about 1760, in which the air current was directed through all the underground roadways of the mine before going to the upcast shaft. The system necessitated the building of stronger stoppings, brick was now being brought into use, and better fitting doors.	*Mining*

Term	Definition	*Industry*
Air crossing	a bridge constructed to allow the return airway to pass either under (undercast) or over (overcast) the intake airway. The air crossing must be made airtight to avoid the mixing or short-circuiting of either of the two air-currents. It should also be constructed in such a manner as to be able to withstand the results of an explosion. Also called an 'air bridge'.	*Mining*
Air Data Computer (ADC)	A primary navigation data source. A navigation sensor based on atmospheric data sensors; usually measures static pressure, dynamic pressure, and outside air temperature; sometimes computes other atmospheric data, such as indicated airspeed, Mach number, calibrated airspeed As a guidance mode, ADC is least accurate of the listed modes and is used only as a last resort.	*Aeronautical Engineering*
Air data dead reckoning (ADDR0)	Dead reckoning navigation based on simple instruments as source (barometric altimeter, magnetic compass, airspeed indicator, known wind conditions); sometimes called dead reckoning.	*Aeronautical Engineering*
Air doors	Air doors, -see Doors.	*Mining*
Air Entrainment	A device which converts compressed gas into mechanical force and motion. It usually provides rotary mechanical motion.	*Lubrication*
Air Filter	A particulate air filter is a device composed of fibrous materials which removes solid particulates such as dust, pollen, mold, and bacteria from the air.	*Mechanical Engineering*
Air fin coolers	A radiator-like device used to cool or condense hot hydrocarbons; also called fin fans.	*Petroleum Engineering*
Air flow	Total amount of dry air and associated water vapor flowing through the tower, measured in cubic feet per minute at the exhaust from the tower and converted to standard air which has a density of 0.075 lb. per cu. ft.	*Facility Engineering*
Air Gap	Space between the spark plug electrodes, also known as gap, often adjusted to gain maximum performance.	*Mechanical Engineering*
Air head	a drift of small dimensions used for ventilation. (S. Staffs.).	*Mining*
Air horsepower	The measure of useful power required to move a given air rate against a given resistance. The ratio of air horsepower to fan input horsepower is the measure of fan efficiency.	*Facility Engineering*
Air Injection	A system that injects air into the exhaust ports of the engine for combustion of unburned hydrocarbons in the exhaust gases, thus producing "cleaner" exhaust emissions.	*Mechanical Engineering*
Air inlet	Opening in cooling tower through which air enters a tower. On induced draft towers, the air inlet is commonly called the louvered face.	*Facility Engineering*
Air Lock Civil Engineering	An airtight chamber permitting passage to or from a space, as in a caisson, in which the air is kept under pressure.	*Civil Engineering*
Air locks	Surface depressions on a molded piece caused by trapped air between the plastics material and the mold surface.	*Material Process*
Air Motor	The incorporation of air in the form of bubbles as a dispersed phase in the bulk liquid. Air may be entrained in a liquid through mechanical means and/or by release of dissolved air due to a sudden change in environment. The presence of entrained air is usually readily apparent from the appearance of the liquid (i.e., bubbly, opaque, etc.) while dissolved air can only be determined by analysts.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Air pollution abatement equipment	Equipment used to reduce or eliminate airborne pollutants, including particulate matter (dust, smoke, fly, ash, dirt, etc.), sulfur oxides, nitrogen oxides (NOx), carbon monoxide, hydrocarbons, odors, and other pollutants. Examples of air pollution abatement structures and equipment include flue-gas particulate collectors, flue-gas desulfurization units and nitrogen oxide control devices.	*Energy*
Air pressure	Mechanics can adjust a car's handling by raising or lowering air pressure in the tires. Flex in the sidewall of a tire acts like another spring in the suspension. Increasing the air pressure makes the overall spring rate higher, while lowering the pressure will make it softer. This adjustment can be made much more quickly and easily than changing a spring on a shock.	*NASCAR*
Air sampling	the taking of air samples at predetermined points throughout the mine workings for later analysis in the laboratory.	*Mining*
Air Set	Also known as a filter regulator. A device used to reduce plant air supply to the actuator or positioner. Also filters the air to remove water or dirt from the pneumatic system.	*Industrial Engineering*
Air shaft or Air pit	a shaft used wholly, or mainly, to ventilate a mine. Old shafts were often used as an additional upcast or downcast air passage.	*Mining*
Air slit	Air slit—See Stenton	*Mining*
Air split	The division of a current of air into two or more parts.	*Mining*
Air splitting	refers to ventilation and the practice of splitting the intake air current into a number of individual air circuits, each one ventilating a certain district of the underground workings, and each one of the splits having a separate intake and return.	*Mining*
Air Stripping	A mass transfer process in which a substance in solution in water is transferred to solution in a gas, usually air.	*Petroleum Engineering*
Air Suspension	Instead of steel coil or leaf springs, some vehicles have a bellows-like unit at each corner that contains pressurized air. As a rule, air suspensions can produce a softer ride.	*Mechanical Engineering*
Air Suspension	Instead of steel coil or leaf springs, some vehicles have a bellows-like unit at each	*Mechanical Engineering*
Air Traffic Control (ATC)	Standard aviation term.	*Aeronautical Engineering*
Air Vent	Air vents are vital in steam systems, as they remove of air and non-condensable gases. After a shut down the steam system cools, and steam within the system condenses. This will create a vacuum which will cause air to be drawn into the system. When the system is brought back on-line, all of the contained air must be expelled before steam can refill and reheat the equipment. Air vents are designed with temperature sensitive devices and vent valves that open and close thermostatically. Air, being cool relative to steam, will open the valve and exit through the air vent, allowing steam to fill the system. Steam reaching the air vent will heat the device and cause the vent to close accordingly.	*Industrial*
Air	the current of air circulating through and ventilating a mine.	*Mining*
Air, Compressed	Air at any pressure greater than atmospheric pressure.	*Oil Analysis*
Air, Compressed (Pressure)	Air at any pressure greater than atmospheric pressure. AIR, FREE - Air at ambient temperature, pressure, relative humidity and density.	*Mechanical, Process, and Operations*

Term	Definition	*Industry*
Air, Standard	Air at a temperature of 68 degrees F, a pressure of 14.7 pounds per square inch absolute, and a relative humidity of 36% (0.075 pounds per cubic foot) In gas industries the temperature of "STANDARD AIR" is usually given at 60 degrees F.	*Mechanical, Process, and Operations*
Air/Oil Systems	A solenoid that is sealed to prevent leakage of the liquid into the plunger cavity	*Lubrication*
Airbag	device, supplemental to safety belts, that inflates to provide a cushion to absorb impact forces during moderate to severe frontal collisions. This system can help to lessen the chance of contact with the steering wheel, instrument panel and windshield. The air bag is actuated automatically by sensors located in the front of the vehicle. To maximize effectiveness, seat and shoulder belts must always be used in conjunction with this system	*Mechanical Engineering*
Airborne survey	A survey made from an aircraft to obtain photographs, or measure magnetic properties, radioactivity, etc.	*Mining*
Aircraft Cables	Strands, cords and wire ropes made of special-strength wire, designed primarily for use in various aircraft industry applications.	*Wire Rope & Cable*
Airdox	an appliance for breaking down coal by the release of high-pressure air at the back of a shot hole.	*Mining*
Airfoil	An aerodynamic device designed to improve traction by increasing the down-force on the vehicle. The use of airfoils (also called wings) increases the cornering capability and improves stability at speed, but often at the expense of additional aerodynamic drag.	*Mechanical Engineering*
Air-Gap Solenoid	A lubrication system in which small measured quantities of oil are introduced into an air/oil mixing device which is connected to a lube line that terminates at a bearing, or other lubrication point. The air velocity transports the oil along the interior walls of the lube line to the point of application. These systems provide positive air pressure within the bearing housing to prevent the ingress of contaminants, provide cooling air flow to the bearing, and perform the lubrication function with a continuous flow of minute amounts of oil.	*Lubrication*
Air-Hardened Steel	A steel that hardens during cooling in air from a temperature above its transformation range.	*Maintenance and Repair*
Air-insulated switchgear	Air-insulated switchgear—see Switchgear.	*Electrical*
Air-leg support	a compressed air appliance that consisted of a steel cylinder and an air-operated piston that enabled one man to support and advance a heavy drilling machine during drilling operations.	*Mining*
Air-lock	a casing at the top of an upcast shaft to minimize surface air leakage to the ventilation fan.	*Mining*
Air-mass flight path angle	Angle in vertical plane of earth speed vector and groundspeed vector; occasional definition for flight path angle; Compare: earth-referenced flight path angle; Symbols: gamma sub A; Typical Units: rad, deg.	*Aeronautical Engineering*
Airstream helmet	a type of helmet used in modern mining. The helmet has a small fan, which pulls air up the back of the helmet through a filter. The air is redirected down the front onto the face of the wearer.	*Mining*
Air-To-Close	An increase in air pressure to the actuator is required to cause the valve to close. This is another way of saying the valve is fail open or normally open.	*Industrial Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Air-To-Open	An increase in air pressure to the actuator is required to cause the valve to open. This is another way of saying the valve is fail closed or normally closed.	*Industrial Engineering*
Airway	Any passage through which air is carried. Also known as an air course.	*Mining*
AISI American Iron & Steel Institute	An association of steel makers which sets standards for the chemical and physical properties of steel and iron in various shapes and forms—pipe, tubing, sheet, strip, wire.	*Mechanical*
AIT	Automatic Identification Technology (Auto ID) ... bar codes, RFID and contact memory buttons.	*Quality*
AIW	AIW - See: Industrial Workers of America; International Union, Allied (AFL-CIO)	*Industrial Relations*
AK	antiknocks	*Petro-Chemical Abbreviations*
ALA	ALA - See: Lithographers of America; Amalgamated (Ind)	*Industrial Relations*
ALAPCO	Association of Local Air Pollution Control Officials	*Petro-Chemical Abbreviations*
Alaskan System Coordination Council (ASCC)	One of the ten regional reliability councils that make up the North American Electric Reliability Council (NERC).	*Energy*
Alcohol	The family name of a group of organic chemical compounds composed of carbon, hydrogen, and oxygen. The series of molecules vary in chain length and are composed of a hydrocarbon plus a hydroxyl group; CH(3)-(CH(2))n-OH (e.g., methanol, ethanol, and tertiary butyl alcohol).	*Energy*
Alcohols	Alcohol in chemistry means any organic compound in which a hydroxyl group (OH) is bound to a carbon atom, further bound to other hydrogen and or carbon atoms.	*Chemical*
ALDA	Air Line Dispatchers Association (AFL-CIO)	*Industrial Relations*
Aldehyde	An important starting material and intermediate in organic synthesis. Many aldehydes of industrial significance are used as solvents, perfumes, and flavoring agents or as intermediates in the manufacture of plastics, dyes, and pharmaceuticals.	*Chemical*
ALE	Application Level Events (Standard). A software standard connected with RFID which deals with the collection, management and routing of data. (For example, an RFID reader is capable of multiple readings of the same RFID tag in a fraction of a second ... this "dirty data" must be filtered.) See also GEN2.	*Quality*
Alfa-hederin	See helixin.	*Material Process*
alfa-iodoacetophenone (C6H5COCH2I)	alfa-iodoacetophenone (C6H5COCH2I)	*Material Process*
Algae	chiefly aquatic, eucaryotic one-celled or multicellular plants without true stems, roots and leaves, that are typically autotrophic, photosynthetic, and contain chlorophyll. Algae are not typically found in groundwater.	*Chemical*
Algaecide	A toxic material that will kill algae. Some of the more commonly used algaecides are chlorine, copper sulfate and phenolic compounds.	*Chemical Engineering*
Algeria	(1969-present)	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Algorithm	A set of (mathematical) instructions or procedures for carrying out a specific task such as defining the steps taken by an automation system.	*Electrical*
Algorithms	Algorithms are routines to deal with particular situations; for example, a controller formula to correct an element in a continuous process.	*Control Engineering*
ALI	AutoResearch Laboratories Incorporated	*Petro-Chemical Abbreviations*
Aliasing	If the sample rate of a function (fs) is less than two times the highest frequency value of the function, the frequency is ambiguously presented. The frequencies above (fs/2) will be folded back into the lower frequencies producing erroneous data.	*General Engineering*
Alicyclic hydrocarbons	Cyclic (ringed) hydrocarbons in which the rings are made up only of carbon atoms.	*Petroleum Engineering*
Alighting station	a platform where men leave a man-riding belt.	*Mining*
Alignment	Placing the emitter (light source) and receiver (photoreceiver or reflector) so as to direct the maximum amount of light on the photosensor. At long distances, when the light beam has widened, the receiver should be centered in the beam to lessen the chance of the emitter and receiver drifting out of alignment due to vibration or shock.	*Electrical Engineering*
Alignment (Precision)	Refers to bringing or placing machine(s) shaft(s) in line. Misaligned shafts often cause problems with machine components (i.e. bearings). Specialized tools and personnel for precision alignment exist. A number of tools are based on laser technologies.	*Maintenance*
Aliphatic	Any organic compound in which the main structure is a chain of carbon atoms joined to each other.	*Chemical*
Aliphatic hydrocarbons	Hydrocarbons characterized by open-chain structures: ethane, butane, butene, acetylene, etc.	*Petroleum Engineering*
Aliquot	Measured portion of a whole having the same composition. General term referring to part of a solution, sample, mixture, etc.	*Quality*
Alizarin dyes	Any of various mordant dyes derived from anthraquinone, important for fast colors for plastics.	*Material Process*
Alkali	A compound that has the ability to neutralize an acid to form a salt. A substance which is somewhat irritating or corrosive to the skin, eyes and mucous membranes. Turns red litmus paper to blue. Common strong alkalis are sodium and potassium hydroxide.	*Chemical*
Alkali	A chemical substance with pH greater than 7 that reacts with and neutralizes an acid. Also called alkaline or base.	*Chemistry*
Alkaline	Any of various soluble mineral salts found in natural water and arid soils having a pH greater than seven. In water analysis, it represents the carbonates, bicarbonates, hydroxides, and occasionally the borates, silicates, and phosphates in the water.	*Petroleum Engineering*
Alkalinity	An expression of the total basic anions (hydroxyl groups) that is present in a solution. It also represents, particularly in water analysis, the bicarbonate, carbonate, hydroxyl and occasionally the borate, silicate, and phosphate salts which will react with water to produce acid neutralizable anions.	*Chemical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Alkanes	The homologous group of linear saturated aliphatic hydrocarbons having the general formula C(n)H(2n+2). Alkanes can be straight chains, branched chains, or ring structures. Also referred to as paraffins.	*Chemical*
Alkenes	Unsaturated hydrocarbons that contain one or more carbon-carbon double bonds.	*Chemical*
Alkyd Resin	A type of polyester resin used in paints and other surface coatings. The original alkyd resins were made by co-polymerizing phthalic anhydride with glycerol, to give a brittle cross. Linked polymer.	*Paint and Coatings*
Alkyd resins	Synthetic resins prepared from polyhydric alcohol and polybasic acids or anhydrides, glycerol phthalic anhydride resins.	*Material Process*
Alkyds	Developed in 1926, alkyds were originally used in paints, enamels, lacquers, and other coatings used for refrigerators, automobiles, and stoves. Today, this is still the main purpose for alkyds, though alkyd compounds are now also used as a molding material. In this capacity, it is used for encapsulation of capacitors and resistors, in circuit breaker insulation, in housings, in coal forms, in cases, and in switchgear components. This is largely due to the fact that alkyds have excellent dielectric strength as well as heat resistance.	*Material Engineering*
Alkylate	The product of an alkylation reaction. It usually refers to the high-octane product from alkylation units. This alkylate is used in blending high octane gasoline.	*Energy*
Alkylation	A refining process for chemically combining isobutane with olefin hydrocarbons (e.g., propylene, butylene) through the control of temperature and pressure in the presence of an acid catalyst, usually sulfuric acid or hydrofluoric acid. The product alkylate, an isoparaffin, has high octane value and is blended with motor and aviation gasoline to improve the antiknock value of the fuel.	*Energy*
Alkylation	A process using sulfuric or hydrofluoric acid as a catalyst to combine olefins (usually butylene) and isobutane to produce a high-octane product known as alkylate.	*Petroleum Engineering*
Alkynes	the group of unsaturated hydrocarbons with a triple Carbon-Carbon bond having the general formula C(n)H(2n-2).	*Chemical*
All Purpose Cleaner	A powder or liquid detergent suitable for both general house cleaning duties and laundry. These products may not be as effective for specific cleaning jobs as products specially formulated for the task.	*Chemistry*
All Time Order	See All Time Supply.	*Quality*
All Time Supply	An expression coined by R. G. Brown to mean that quantity of stock that would just satisfy all remaining future demand for a product. Brown's use of the expression is in the calculation of the total potential remaining demand for a spare part related to a machine assembly, where the machine assembly itself has been discontinued by the manufacturer. For a few short years in this situation, the demand for spares for the main (discontinued) machine is normal and in accordance with normal service requirements. But as the discontinued machines remaining in the marketplace are withdrawn from service or are scrapped, it is found that the demand for spares for the surviving machines declines at an even rate, year on year. For example, the demand for spares in Year 2 may be 80% of the demand in Year 1, and the demand in Year 3 may be 80% of the demand in Year 2. The rate of decline is a geometric series, which	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	can therefore be summarized: if demand in one year is D and the rate of decline per year is L, the summation to infinity is D x L / (1 - L). For example, if the demand in one year is 100 units and the rate of decline of sales is 0.8 per year, the total remaining demand is 100 x 0.8 / (1 - 0.8), or 400 units. If the company guarantees providing spares for 5 years after withdrawal of the main machine, the demand over the 5 years can be readily calculated (100 x 0.8 + 64 x 0.8 + ... = 269 units). Consequently, in this case, by manufacturing a single lot of 400 units to cover the all time supply, and notwithstanding the cost of holding stock, the company is providing for the likely demand in its guarantee period, plus a "safety stock" of 131 units. An example in which the All Time Supply calculation might have been useful is the discontinuation in 2007 by the retailer PC World of sale of floppy disks due to ever-declining sales, to the detriment of a decreasing number of customers wanting them.	
All welded construction	Pertains to a valve construction in which the body is completely welded and cannot be disassembled and repaired in the field.	*Mechanical*
AllChemE	Alliance for Chemical Sciences and Technologies in Europe. The representative body for chemistry and chemical engineering in Europe.	*Chemical*
All-electric home	A residence in which electricity is used for the main source of energy for space heating, water heating, and cooking. Other fuels may be used for supplementary heating or other purposes.	*Energy*
Alliance	This is a contract between two or more parties which is usually long term in nature to carry out well defined business objectives by combining and maximizing each party's potentials.	*Reliability Engineering*
Alliance (Contract)	An alliance is a long term commitment between two or more entities for the purpose of achieving clearly stated business objectives by maximizing the effectiveness of each participant's skills and resources, leading to an "alliance contract."	*Maintenance*
Alligator Lacing	Lacing attached to the belt with a hammer for the purposes of joining the ends of the belt together to form a continuous loop.	*Manufacturing*
Alligator teeth	Rows of mounting pegs for each stand in the birdbath.	*Petroleum Drilling*
Alligatoring	A term describing the appearance of lacquer films that have cracked into large segments so as to resemble alligator hide. If the cracking is fine and incomplete it is called checking.	*Material Process*
Allocation	See Stock (Allocated).	*Quality*
Allocation Basis	See Cost Driver.	*Quality*
Allocation concealment	See Concealment of allocation	*Quality Engineering*
Allowable total error, Tea	An analytical quality requirement that sets a limit for both the imprecision (random error) and inaccuracy (systematic error) that are tolerable in a single measurement or single test result.	*Quality*
Allowance	An intentional clearance between internal or external thread and the design form of the thread when the thread form is on its maximum metal condition. Not all classes of fit have an allowance. For metric threads the allowance is called the fundamental deviation.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Allowance for Funds Used During Construction (AFUD)	Construction activities may be financed from internally generated funds (primarily earnings retained in the business), or from funds provided by other external sources (short- and long-term debt). The allowance for funds used during construction is intended to recognize the cost of these funds dedicated to construction activities during the construction period. To arrive at the "allowance," a common procedural method makes use of a formula that is based on the assumption that short-term debt is the first source of construction funds. The cost rate for short-term debt is based on current costs. Since a utility plant is subject to depreciation, the allowance for funds used during construction is recovered in the form of depreciation from ratepayers over the service life of the plant to which it applies.	*Energy*
Alloy	Metal composed of more than one element.	*Material Process*
Alloy 11	A compensating alloy used in conjunction with pure copper as the negative leg to form extension wire for platinum-platinum rhodium thermocouples Types R and S.	*General*
Alloy 200/226	The combination of compensating alloys used with tungsten vs. tungsten 26% rhenium thermocouples as extension cable for applications under 200°C.	*General Engineering*
Alloy 203/225	The combination of compensating alloys used with tungsten/3%-rhenium vs. tungsten/25%-rhenium thermocouples as extension cable for applications under 200°C.	*Electrical*
Alloy 405/426	The combination of compensating alloys used with tungsten 5% rhenium vs. tungsten 26% rhenium thermocouples as extension cable for applications under 870°C.	*General Engineering*
Alloy 405/426	The combination of compensating alloys used with tungsten 5% rhenium vs. tungsten 26% rhenium thermocouples as extension cable for applications under 870°C.	*Electronic Process*
Alloy layers	the interior layers of the galvanized coating comprised of iron/zinc intermetallics formed when molten zinc reacts with iron in the steel	*Materials Process*
Alloy steel	A steel consisting primarily of iron with some percentage of one or more other elements such as chromium, nickel, manganese, or vanadium deliberately added to enhance its properties.	*General Mechanical*
Alloy Wheels	A generic term used to describe any non-steel road wheel. The most common alloy wheels are cast aluminum. Technically, an alloy is a mixture of two or more metals. These wheels are known for their light weight and strength.	*Mechanical Engineering*
Alloy Wheels	A generic term used to describe any non-steel road wheel. The most common alloy	*Mechanical Engineering*
Alloy	A compound of two or more metals.	*Mining*
Alluvial	Pertaining to or composed of alluvium, or deposited by a stream or running water.	*Petroleum Engineering*
Alluvial or Bench Deposits	An ancient river-washed rock and gravel bar that may be thousands of feet from the nearest stream, creek, or river. Alluvial or bench deposits contain untapped potential for finding gold because such areas have never been worked before. The hydraulic giants generally worked alluvial deposits.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Alluvium	A general term for clay, silt, sand, gravel, or similar unconsolidated material deposited during comparatively-recent geologic time by a stream or other body of running water as a sorted or semisorted sediment in the bed of the stream or on its floodplain or delta, or as a cone or fan at the base of a mountain slope.	*Petroleum Engineering*
Alluvium	A deposit of loose gravel between the superficial covering of vegetable mold and subjacent rocks.	*Mining*
All-Wheel Drive	Often confused with Four-Wheel Drive (4WD), this drive system features four, full-time active drive wheels to reduce wheel slippage and provide greater driver control over the vehicle. All-Wheel Drive automatically splits engine torque between the front and rear wheels as needed, improving on-road traction in unfavorable road conditions. Unlike Four-Wheel Drive, All-Wheel Drive is an on-road system and is not designed for off-road use. AWD does not require the driver to actively engage the system. It is operational at all times, and requires no switches, lights or visor instructions for system operation.	*Mechanical Engineering*
Almen EP Lubricant Tester	A journal bearing machine used for determining the load-carrying capacity or Extreme Pressure properties (EP) of gear lubricants.	*Lubrication*
ALO	ALO - See: Lace Operatives of America; Amalgamated (Ind)	*Industrial Relations*
ALOMEGA®	An aluminum nickel alloy used in the negative leg of a type K thermocouple (registered trademark of OMEGA ENGINEERING, INC.).	*Electrical*
alongside	Goods deposited on the dock, or a barge, within reach of a ship's loading equipment.	*Agriculture*
ALPA	ALPA - See: Air Line Pilots' Association; International (AFL-CIO)	*Industrial Relations*
Alpha	See Type I error	*Quality Engineering*
Alpha cellulose	The most abundant of the three forms of cellulose, insoluble in a 17–18% caustic solution, unlike the other two forms, prepared in purified form for use as a filler, especially for ureas.	*Material Process*
Alpha meter	An instrument used to measure positively charged particles emitted by radioactive materials.	*Mining*
Alpha ray	A positively charged particle emitted by certain radioactive materials.	*Mining*
Alpha Risk	See Producer's Risk (in sampling).	*Quality*
Alphanumeric	A character set that contains both letters and digits.	*Electrical*
Alpha-Numeric	A load-based tire sizing system containing the load capacity, type of tire construction, aspect ratio, and the rim diameter in inches.	*Mechanical Engineering*
Alpha-Numeric	A load-based tire sizing system containing the load capacity, type of tire construction, aspect ratio, and the rim diameter in inches.	*Mechanical Engineering*
Alphanumeric Code	"Alpha" means allowing letters of the alphabet, and "numeric" means numbers 0 to 9. Thus an alphanumeric code is one potentially containing letters (A, B, C and/or a, b, c ...) and numbers (1, 2, 3 ...). The number on a UK car number plate is alphanumeric (e.g., R754ORX).	*Quality*
Alps	To bore an oil well 3000 feet deep.	*Civil Engineering*
alt	Altitude	*Civil Engineering*
Alteration	Any physical or chemical change in a rock or mineral subsequent to its formation. Milder and more localized than metamorphism.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Alternate Angle	They lie 'inside' the parallel lines and on opposite sides of the transversal.	*Math*
Alternate energy source for primary heater	The fuel that would be used in place of the usual main heating fuel if the building had to switch fuels. (See Fuel-Switching Capability.)	*Energy*
ALTERNATE HOST	One of two taxonomically different hosts required by a heteroecious rust fungus to complete its cycle; also applies to some insects.	*Forestry*
Alternate Lay	Lay of a wire rope in which the strands are alternately regular and Lang Lay.	*Wire Rope & Cable*
Alternating Current	An electric current that continually reverses its direction giving a definite plus and minus wave form at fixed intervals.	*Electrical*
Alternating current (AC)	Alternating current is a form of electricity in which the current alternates in direction (and the voltage alternates in polarity) at a frequency defined by the generator (usually between 50 and 60 times per second, i.e., 50–60 hertz). AC was adopted for power transmission in the early days of electricity supply because it had two major advantages over direct current (DC)—its voltage could be stepped up or down according to need using transformers (see Transformer), and it could be interrupted more easily than DC. Neither advantage is as relevant today as it once was because power electronics can solve both issues for DC. (See also Direct current and Transmission and distribution.)	*Electrical*
Alternating Current Resistance	The resistance offered by any circuit to the flow of alternating current.	*Electrical*
Alternative fuel	Alternative fuels, for transportation applications, include the following:	*Energy*
Alternative fuel vehicle converter	An organization (including companies, government agencies and utilities), or individual that performs conversions involving alternative fuel vehicles. An AFV converter can convert (1) conventionally fueled vehicles to AFVs, (2) AFVs to conventionally fueled vehicles, or (3) AFVs to use another alternative fuel.	*Energy*
Alternative Investment Market	See AIM meaning (2).	*Quality*
Alternative-fuel vehicle (AFV)	A vehicle designed to operate on an alternative fuel (e.g., compressed natural gas, methane blend, electricity). The vehicle could be either a dedicated vehicle designed to operate exclusively on alternative fuel or a nondedicated vehicle designed to operate on alternative fuel and/or a traditional fuel.	*Energy*
Alternative-rate DSM program assistance	A DSM (demand-side management) program assistance that offers special rate structures or discounts on the consumer's monthly electric bill in exchange for participation in DSM programs aimed at cutting peak demands or changing load shape. These rates are intended to reduce consumer bills and shift hours of operation of equipment from on-peak to off-peak periods through the application of time-differentiated rates. For example, utilities often pay consumers several dollars a month (refund on their monthly electric bill) for participation in a load control program. Large commercial and industrial customers sometimes obtain interruptible rates, which provide a discount in return for the consumer's agreement to cut electric loads upon request from the utility (usually during critical periods, such as summer afternoons when the system demand approaches the utility's generating capability).	*Energy*
Alternator	Alternator—see Generator.	*Electrical*

Term	Definition	*Industry*
Alternator	A component of the electrical system, it converts 12-volt DC (Direct Current) from the	*Mechanical Engineering*
Alternator Current	battery into AC (Alternating Current) at the rate of 13.8 to 14.2 volts. The alternator also provided	*Mechanical Engineering*
ALU	Arithmetic Logic Unit. The part of a CPU where binary data is acted upon with mathematical operations.	*General Engineering*
Alumel	An aluminum nickel alloy used in the negative leg of a Type K thermocouple (Trade name of Hoskins Manufacturing Company). Ambient Compensation: The design of an instrument such that changes in ambient temperature do not affect the readings of the instrument.	*Electrical*
Aluminizing (gas)	High temperature (approx. 900oC) pack or gaseous diffusion of aluminum into the surface of a component to enhance high temperature corrosion and oxidation resistance.	*Paint and Coatings*
Aluminizing (hot dip)	An aluminum coating process based on submersion in liquid metal, usually with a strip steel product being continuously fed through the bath. Provide galvanic corrosion protection.	*Paint and Coatings*
Aluminizing (Thermal Spray Method)	Thermal sprayed coatings of aluminum usually on substrates of steel or nickel chromium alloys which are subsequently heat treated to aluminize the surface.	*Paint and Coatings*
Aluminum chloride (AlCl3)	A white to colorless crystals, very deliquescent with an odor of HCL. A catalyst for the reaction of benzene and ethylene to form ethyl benzene, from which in turn styrene, the monomer of polystyrene, is obtained.	*Material Process*
Aluminum Ion Plating	The deposition of aluminum by a vacuum evaporative process. Provides galvanic corrosion resistance. Normally given a passivation treatment.	*Paint and Coatings*
Aluminum oxide (Al2O3)	A hexagonal, colorless crystals, catalyst for various syntheses, notably the preparation of ethylene from ethyl alcohol, and for various polymerization reactions, especially the of vinyl esters. Aluminum oxide occurring naturally is called bauxite.	*Material Process*
Aluminum sulfate (Al2SO4)	A white powder.	*Material Process*
Aluminum	Aluminum is the most abundant metal in the Earth's crust. For industrial steam purposes, aluminum is remarkable for the metal's low density and for its ability to resist corrosion due to the phenomenon of passivation.	*Industrial*
Aluminum	element found in the galvanizing bath (added to molten zinc through a product commonly called "brightener bar") that gives the hot-dip galvanized coating a shiny appearance	*Materials Process*
Aluminum alloy	Metal alloy composed of predominantly aluminum.	*Material Process*
Aluminum Alloy	White particles which indicate wear of aluminum component such as a casing wall.	*Lubrication*
Aluminum-killed steel	steel treated with aluminum as an oxidizing agent in order to reduce the oxygen content to such a level that no reaction occurs between carbon and oxygen during solidification	*Materials Process*
Always-on	A permanently open connection (a term usually used in relation to the Internet).	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
AM	Amplitude Modulation.	*Quality*
Amain	Waggons or tubs are said to run amain if they get by accident over an incline bank head without the rope being attached; or through the rope becoming detached or broken, (N. East).	*Mining*
Amalgam	Gold or silver combined with quicksilver.	*Mining*
Amalgamated Society of Engineers	A former craft trade union in engineering.	*Quality*
Amalgamation	A process by which gold and silver are extracted from an ore by dissolving them in mercury.	*Mining*
amb	Ambient	*Civil Engineering*
Amber	A yellowish clear to opaque fossil resin derived from an extinct conifer, formerly used in the manufacture of some fine varnishes, and for decorative purposes.	*Material Process*
ambient	surrounding; the surrounding environment and conditions.	*Chemical*
Ambient Temperature	The temperature of the surrounding medium, usually used to refer to the temperature of the air in which a structure is situated or a device operates.	*Maintenance and Repair*
Ambient Compensation	The design of an instrument such that changes in ambient temperature do not affect the readings of the instrument.	*General Engineering*
Ambient Conditions	The conditions around the transducer (pressure, temperature, etc.).	*Electrical*
Ambient dew point	The ambient temperature in °F when dew begins to be deposited.	*Facility Engineering*
Ambient environment	The conditions (e.g. temperature and humidity) characterizing the air or other medium that surrounds materiel.	*Reliability Engineering*
Ambient Pressure	Pressure of the air surrounding a transducer.	*Electronic Process*
Ambient Temperature	Temperature of the air surrounding a component.	*Electrical Engineering*
Ambient Temperature	Any all encompassing temperature within a given area.	*Electrical*
Ambient Temperature Sensor	Temperature sensor used to measure the temperature of the air that surrounds a component (the ambient temperature).	*Electrical Engineering*
Ambient wet-bulb temperature	The wet-bulb temperature that is measured in accordance with the definition of ambient. Readings are obtained by means of a mechanically aspirated psychrometer.	*Facility Engineering*
American Brahman	The first beef breed developed in the United States . The American Brahman plays an important role in crossbreeding programs throughout much of the world. The breed was developed from Bos indicus (cattle of India) types imported into the United States between 1854-1926. The breed is noted for its environmental adaptivity, longevity, mothering ability and efficient beef production. The American Brahman Breeders Association was organized in 1924. The breed has a hump on its shoulders and is commonly ridden in rodeo contests.	*Agriculture*
American Indian Coal Lease	A lease granted to a mining company to produce coal from land held in trust by the United States for Native Americans, Native American tribes, and Alaska Natives in exchange for royalties and other revenues.	*Energy*
American Landrace	American Yorkshire, Berkshire, Chester White, Duroc, Hampshire, Hereford, Poland China	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
American Petroleum Institute (API)	The American Petroleum Institute is the primary trade association representing the oil and natural gas industry in the United States.	*Petroleum Drilling*
American Quarter Horse	Adherents claim the American Quarter Horse was the first breed of horse native to the United States . It evolved by mixing bloodlines of horses brought to the New World . Its genetics include Arab, Turk and Barb breeds. Selected stallions and mares were crossed with horses brought to Colonial America from England and Ireland in the early 1600s. Colonists prized the breed for its short-distance racing abilities. It is the horse most associated with Western ranching and rodeo.	*Agriculture*
American Saddlebred	The American Saddle Horse was developed in Colonial America and gained fame as a breed during the Civil War, 1861-1865. General Lee's Traveller, Grant's Cincinnati , and Sherman 's Lexington were crosses between American Saddlebred and Thoroughbred. Stonewall Jackson's Little Sorrell was a cross between American Saddlebred and pacing stock. Most cavalrymen in the Confederate commands of Generals John Hunt Morgan and Nathan Bedford Forrest rode American Saddlebreds, which performed legendary feats of endurance.	*Agriculture*
American Wire Gage (AWG)	The standard system used for designating wire diameter. Also referred to as the Brown and Sharpe (B&S) wire gage.	*Electrical*
American Wire Gauge	A measure of wire thickness (which also dictates cross-sectional area, and for a given material, ampacity). Example: 24 AWG wire has a nominal diameter of 0.0201in or 0.511mm. Also called the Brown and Sharpe Wire Gauge. Note that steel wire is measured by a different gauge. AWG only applies to wire used to conduct electricity.	*Electrical Engineering*
AMH	Automated Materials Handling.	*Quality*
AMI	Advanced Metering Infrastructure is a term denoting electricity meters that measure and record usage data at a minimum, in hourly intervals, and provide usage data to both consumers and energy companies at least once daily.	*Energy*
Amides Compounds	derived from carboxylic acids by replacing the hydroxyls of the -COOH group by the amine group –NH2 .	*Material Process*
Amines	Amines are organic compounds containing nitrogen. Here one or more hydrogen atoms are replaced by alkyl groups or other groups where the nitrogen is bonded to a carbon atom in the group. Amine are used in rubber, dyes, pharmaceuticals, and synthetic resins and fibers and in a host of other applications.	*Chemical*
Amines	Derivatives of ammonia by substitution of one or more hydrogens by an alkyl or aryl group. The primary amines are important in the production of amino aldehyde plastics.	*Material Process*
Amino	Indicating presence of NH2.	*Material Process*
amino acid	Building blocks of proteins. Plants have 22 types of amino acids.	*Agriculture*
Aminoplasts	General term for synthetic resins from amino or amido compounds.	*Material Process*
Ammeter	An instrument used to measure current.	*Electrical*
Ammonia	A water-soluble, colorless, pungent gas with the formula NH3.	*Chemical Engineering*
Ammonia (NH3)	A colorless gas, a source material and a solvent, as the hydroxide, used with carbon dioxide in the production of urea, and with formaldehyde in the production of hexamethylenetetramine.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ammonium	Positive ion with the formula NH4+ that forms when ammonia dissolves in water. It adds non-natural alkalinity to the water.	*Chemical Engineering*
Ammonium cyanate (NH4CNO)	A white crystal, a compound whose solution on standing changes slowly to urea.	*Material Process*
Ammonium oleate (NH4C17H33 COONH4)	A yellowish soapy mass or yellow powder, an emulsifying agent used to allow polymerization of monomers while held in aqueous emulsion.	*Material Process*
Ammonium sulfide (NH 4)S	A colorless, yellow hygroscopic crystals. Substance which reacts with calcium cyanamide to form thiourea.	*Material Process*
Amorphous	Devoid of crystalline structure.	*Material Process*
Amorphous metal	Metal lacking long range crystalline structure.	*Material Process*
Amorphous semiconductor	Semiconductor lacking long range crystalline structure.	*Material Process*
Amorphous silicon	An alloy of silica and hydrogen, with a disordered, noncrystalline internal atomic arrangement, that can be deposited in thin-film layers (a few micrometers in thickness) by a number of deposition methods to produce thin-film photovoltaic cells on glass, metal, or plastic substrates.	*Energy*
Amorphous solid	A noncrystalline solid with no well-defined ordered structure.	*Chemical*
Amorphous	A term applied to rocks or minerals that possess no definite crystal structure or form, such as amorphous carbon.	*Mining*
Amortization	Synonymous with depreciation.	*Quality*
Amortization	The depreciation, depletion, or charge-off to expense of intangible and tangible assets over a period of time. In the extractive industries, the term is most frequently applied to mean either (1) the periodic charge-off to expense of the costs associated with non-producing mineral properties incurred prior to the time when they are developed and entered into production or (2) the systematic charge-off to expense of those costs of productive mineral properties (including tangible and intangible costs of prospecting, acquisition, exploration, and development) that had been initially capitalized (or deferred) prior to the time the properties entered into production, and thereafter are charged off as minerals are produced.	*Energy*
amp	Ampere	*Oil Analysis*
Ampacity	The amount of current a conductor can carry without exceeding its specified temperature, in amperes.	*Electrical Engineering*
Ampacity	(See current: carrying capacity).	*Electrical*
Ampere	The standard unit of electrical current.	*Electrical*
Ampere (amp)	A unit used to define the rate of flow of electricity (current) in a circuit; units are one coulomb (6.28 x 1018 electrons) per second.	*General Engineering*
Ampere (amp)	A unit used to define the rate of flow of electricity (current) in a circuit; units are one coulomb (6.28 x 1018 electronics) per second.	*Electronic Process*
Amphibolite	A gneiss or schist largely made up of amphibole and plagioclase minerals.	*Mining*
Amphoteric	having the characteristics of an acid and a base and capable of reacting chemically either as an acid or a base	*Materials Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Amplifier	A device which draws power from a source other than the input signal and which produces as an output an enlarged reproduction of the essential features of its input.	*Electrical*
Amplifier	A device for amplifying the error signal sufficiently to cause actuation of the stroke control. Several types of servo amplifiers are used at the present time: electronic (DC, AC, phase sensitive, and magnetic) and mechanical.	*Mechanical, Process, and Operations*
Amplifier Class	Amplifier circuit types are divided into "classes" which describe whether the amplifier operates in a linear or switching mode, and any techniques used to restore linearity of output.	*Electrical Engineering*
Amplifier Electronic	device for increasing current.	*Material Process*
Amplitude	A measurement of the distance from the highest to the lowest excursion of motion, as in the case of mechanical body in oscillation or the peak-to-peak swing of an electrical waveform.	*Electrical*
Amplitude Modulation	A modulation method in which the carrier amplitude changes with the input signal amplitude.	*Electrical Engineering*
Amplitude of sound	The loudness of a sound.	*Mechanical, Process, and Operations*
Amplitude Span	The Y-axis range of a graphic display of data in either the time or frequency domain. Usually a log display (dB) but can also be linear.	*General*
AMPM	AMPM stands for AMSAA maturity prediction model. This is an enhanced reliability growth model that allows the user to predict failure rates in future stages of development. This model allows the user to assess the effectiveness of proposed and implemented fixes in order to determine the future failure rate.	*Reliability Engineering*
AMR	Automated Meter Reading is a term denoting electricity meters that collect data for billing purposes only and transmit this data one way, usually from the customer to the distribution utility.	*Energy*
AMS	Agricultural Marketing Service, an agency of the USDA.	*Agriculture*
AMSAA model	AMSAA stands for Army Material Systems Analysis Activity. This is a reliability growth model that uses a relationship between cumulative test time and cumulative failures to develop a reliability growth model.	*Reliability Engineering*
Amyl benzoate	Plasticizer, ester.	*Material Process*
Amyl borate	Solvent, ester.	*Material Process*
Amyl ether	Solvent, ether.	*Material Process*
Amyl laurate	Solvent ester.	*Material Process*
Amyl oleate	Solvent, ester.	*Material Process*
Amyl phenyl m-amyl ether	Solvent ether.	*Material Process*
an electrical signal that is proportional to the acceleration value of the motion. A	an electrical signal that is proportional to the acceleration value of the motion. A	*Electronic Process*
Anaerobe (facultative)	An organism that can grow under either aerobic or anaerobic conditions.	*Chemical Engineering*

Please see the Appendix for further illustration

Term	Definition	Industry
Anaerobe (strict)	An organism that grows only in the absence of free oxygen (e.g., sulfate reducing bacteria).	*Chemical Engineering*
Anaerobic	anaerobic	*Chemical*
Anaerobic	Not requiring oxygen.	*Agriculture*
Anaerobic Adhesive	An adhesive which hardens in the absence of air, such adhesives are often used as a thread locking medium.	*Maintenance*
Anaerobic decomposition	Decomposition in the absence of oxygen, as in an anaerobic lagoon or digester, which produces CO2 and CH4.	*Energy*
Anaerobic lagoon	A liquid-based organic waste management installation characterized by waste residing in water at a depth of at least 6 feet for periods of 30 to 200 days.	*Energy*
Analog	in chemistry, a structural derivative of a parent compound.	*Chemical*
Analog Computer	A computing device comprised of functional modules such as amplifiers, multipliers, dividers, etc., interconnected in such a way as to facilitate the solution of a set of mathematical expressions or to implement some control strategy. The input to and the output from an analog computer are continuous signals as contrasted with a digital computer which updates an output every scan.	*Electrical Engineering*
Analog Output	A voltage or current signal that is a continuous function of the measured parameter.	*Electrical*
Analog Position Sensor	A type of position sensor whose voltage output varies over a range of values.	*Electrical Engineering*
Analog Position Sensor	A type of position sensor whose voltage output varies over a range of values.	*Mechanical*
Analog Switch	An analog switch (sometimes just called a "switch") is a switching device capable of switching or routing analog signals (meaning signals that can have any level within a specified legal range), based on the level of a digital control signal. Commonly implemented using a "transmission gate," an analog switch performs a function similar to that of a relay. Example:	*Electrical Engineering*
Analog switch	An analog switch can turn an audio signal on or off based on a MUTE signal; or analog switches could send one of two signals to a headphone amplifier. Most commonly implemented using CMOS technology integrated circuits. Maxim makes hundreds of examples. See the Analog Switch and Multiplexer Product Line page.	*Electrical Engineering*
Analog Temperature Sensor	Temperature sensor with a continuous analog voltage or current output that is related, usually linearly, to the measured temperature.	*Electrical Engineering*
Analog-to-Digital Converter (A/D or ADC)	A device or circuit that outputs a binary number corresponding to an analog signal level at the input.	*General Engineering*
Analogue	Analogue devices are those which communicate via a small electric current. For example, food industry flow meters send a current of between 4 mA to 20 mA. The lowest value would represent no flow at all; the largest would indicate maximum flow.	*Control Engineering*
Analogy	A comparison between the similarities of two things	*Management Discussion*
Analysis	(1) A step-by-step process of determining the solution to a problem. (2) The collection, viewing, and examination of data and information. (3) The process of determining the composition of a substance or material using chemical or physical methods.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Analysis of Features	In the design of a new product, "analysis of features" is a formal method, employing a matrix, for analyzing competitive products. See also parametric analysis.	*Quality*
Analysis Of Variance (ANOVA)	This is an acronym for analysis of variance which is a statistical method that is used to identify the source of potential problems in the production process. It is used to identify if variation in measured output values is due to variability between various manufacturing processes or within them.	*Reliability Engineering*
Analysis of variance, ANOVA	A statistical technique by which the observed variance can be divided into components, such as within-run and between-run variance which make up the total variance observed for an analytical method. Commonly used for analysis of the data from a replication study to make estimates of within-run and total imprecision when the data has been carefully collected over a series of runs and days.	*Quality*
Analyte	A substance or chemical constituent being analyzed.	*Petroleum Drilling*
Analytic process, system	Refers to the part of the total testing process that involves measurement and analysis, as opposed to the pre-analytic part that deals with all the steps prior to performing the test and the post-analytic part that deals with all the steps after the test result is once available.	*Quality*
Analytical error	Difference between the estimated value of a quantity and its true value. This difference (positive or negative) may be expressed either in the units in which the quantity is measured, or as a percentage of the true value. Used here to mean the difference between a patient's test result produced by the analytical process and the true or correct value for that sample.	*Quality*
Analytical Ferrography	The magnetic precipitation and subsequent analysis of wear debris from a fluid sample This approach involves passing a volume of fluid over a chemically treated microscope slide which is supported over a magnetic field. Permanent magnets are arranged in such a way as to create a varying field strength over the length of the substrate. This varying strength causes wear debris to precipitate in a distribution with respect to size and mass over the Ferrogram. Once rinsed and fixed to the substrate, this debris deposit serves as an excellent media for optical analysis of the composite wear particulates.	*Lubrication*
Analytical measurement range, AMR	Defined by CAP (College of American Pathologists) as the range of numeric results a method can produce without any special specimen pre-treatment, such as dilution, that is not part of the usual analytic process. Same as reportable range in CLIA terminology.	*Quality*
Analytical quality assurance (AQA)	Used with charts of operating specifications (OPSpecs charts) to indicate the level of assurance for detecting critical sized errors. For example, 90% AQA(SE) means there will be at least a 90% chance of detecting the critical systematic error when operating within the allowed limits for imprecision and inaccuracy for the given control rules and total number of control measurements (N).	*Quality*
Analytical quality requirement	Used here to refer to a quality requirement in the form of an allowable total error (TEa). Often defined on the basis of proficiency testing criteria for acceptable performance, such as the CLIA requirements for regulated analytes.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Analytical run	Generally defined by CLIA as an 8 hour to 24 hour interval during which control materials must be analyzed. According to CLSI C24, a run is "an interval (i.e., a period of time or series of measurements) within which the accuracy and precision of the measuring system is expected to be stable. In laboratory operations, control samples are analyzed during each analytical run to evaluate method performance, therefore the analytical run defines the interval (period of time or number of specimens) between evaluations of control results. Between quality control evaluations, events may occur causing the measurement process to be susceptible to variations that are important to detect."	*Quality*
Analytical sensitivity	The ability of an analytical method to detect small quantities of the measured component. Numerically characterized by determination of detection limit.	*Quality*
Analytical specificity	The ability of an analytical method to measure only the sought-for analyte or measurand. Numerically characterized by determination of interferences and non-specific responses to other analytes or materials.	*Quality*
Ancestor	A material anywhere within a product's bill of material at a lower level. Thus if A and B are used to make material C, A and B are C's ancestors. If D is used to make A, D is also C's ancestor.	*Quality*
Anchor	Any device for securing a suspension or cantilever bridge at either end.	*Civil Engineering*
Anchor	Any device for securing a suspension or cantilever bridge at either end.	*Civil Engineering*
Anchor bolt	A threaded bolt embedded in a concrete basin or fitted to supported members, to which an anchor casting is attached.	*Facility Engineering*
Anchor casting	A device for attaching the tower structure to the foundation; it does not include the anchor bolt. Also known as Column Anchor.	*Facility Engineering*
Anchor pin	A pin welded onto the body of ball valves. This pin aligns the adapter plate and restrains the plate and gear operator from moving while the valve is being operated.	*Mechanical*
Anchor prop	a prop, set at an angle between the roof and floor, on the coalface to act as an anchor for the main and tail ropes, when maneuvering short and longwall cutting machines.	*Mining*
Anchor span	On a suspension or cantilever bridge a span from an anchorage to the nearest pier or tower.	*Civil Engineering*
Anchor station	a device, usually hydraulic, which prevents uncontrolled movement of the delivery or return end units of a conveyor.	*Mining*
Anchorage	In a suspension bridge a massive masonry or concrete construction securing a cable at each end.	*Civil Engineering*
Ancient Riverbed Claims	Gold found in beds of rivers now extinct.	*Mining*
Ancillary services	Services that ensure reliability and support the transmission of electricity from generation sites to customer loads. Such services may include load regulation, spinning reserve, non-spinning reserve, replacement reserve, and voltage support.	*Energy*
Ancillary Services	Services necessary for the transmission of energy from resources to loads.	*Energy*
AND	Combining two signals so that the output is on if both signals are present. This can be accomplished by an AND logic gate (two inputs, one output which is high if both inputs are).	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
AND	Combining two signals so that the output is on if both signals are present. This can be accomplished by an AND logic gate (two inputs, one output which is high if both inputs are).	*Electrical Engineering*
AND 10050	A United States Air Force-Navy Aeronautical Design Standard in which a straight thread port is specified to attach tube fittings to various components. The fitting employs an "O" ring seal compressed in a special cavity in the port.	*Mechanical, Process, and Operations*
AND Logic	An output is produced only when all inputs are present.	*Electrical Engineering*
Anderton shearer-loader	an adaptation of the Anderton longwall cutter in which the jib of the cutter was replaced by a shearer drum which was capable of cutting a web of variable depth. The machine, introduced in 1952, rode on top of an armored conveyor and needed a prop-free-front for working. The first shearers cut coal in only one direction. The machine was then flitted back along the face, loading any loose coals by using a plough deflector. Later models were capable of cutting coal in both directions and became bi-directional, and were known as "bi-di's."	*Mining*
Andon	A visual management tool and component of the lean philosophy. These are lights placed on or adjacent to machines or production lines to indicate operation status.	*Reliability Engineering*
Andon Board	In Just-in-Time and lean manufacture, a large electronic board suspended from the ceiling in the workplace bearing constantly updated figures relating to achieved and target production. The andon is also used to communicate warnings on quality and production flow through a simple colored light system	*Quality*
Andra	A heading driven in a diagonal direction with respect to the cleat, neither "end" nor "bord" (Yorks).	*Mining*
Anecdote	See Case study	*Quality Engineering*
Anemometer	An instrument for measuring and/or indicating the velocity of air flow.	*Electronic Process*
ANFAVEA	Brazil Auto Manufacturer's Association	*Petro-Chemical Abbreviations*
ANFO	Acronym for ammonium nitrate and fuel oil, a mixture used as a blasting agent in many mines.	*Mining*
ANG	ANG - See: Newspaper Guild; American (AFL-CIO)	*Industrial Relations*
Angle	The amount of turning between two rays (half-lines) that start from the same point.	*Math*
Angle Controlled Tightening	A tightening procedure in which a fastener is first tightened by a pre-selected torque (called the snug torque) so that the clamped surfaces are pulled together, and then is further tightened by giving the nut an additional measured rotation. Frequently bolts are tightened beyond their yield point by this method in order to ensure that a precise preload is achieved. Bolts of short length can be elongated too much by this method and the bolt material must be sufficiently ductile to cater for the plastic deformation involved. Because of the bolt being tightened beyond yield, its re-use is limited.	*Maintenance*
Angle of dip	The angle at which strata or mineral deposits are inclined to the horizontal plane.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Angle of draw	In coal mine subsidence, this angle is assumed to bisect the angle between the vertical and the angle of repose of the material and is 20° for flat seams. For dipping seams, the angle of break increases, being 35.8° from the vertical for a 40° dip. The main break occurs over the seam at an angle from the vertical equal to half the dip.	*Mining*
Angle of repose	The maximum angle from horizontal at which a given material will rest on a given surface without sliding or rolling.	*Mining*
Angle Valve	A globe style valve where the inlet and outlet ports are at 90°.	*Industrial Engineering*
Angle valve	A variation of the globe valve, in which the end connections are at right angles to each other, rather than being inline.	*Mechanical*
Angstrom	Ten to the minus tenth (10–10) meters or one millimicron, a unit used to define the wavelength of light. Designated by the symbol Å.	*Electrical*
angular deviation	the components of Technical Hole Deviation that address differences between actual and planned angular well bore properties; includes msID, RCID, msAD, and RCAD.	*Petroleum Drilling*
Angular Frequency	The motion of a body or a point moving circularly, referred to as the circular frequency O which is the frequency in cycles per second (cps) multiplied by the term (2) and expressed in radians per second (2pf).	*General Engineering*
Angular rate sensor	A sensor that measures rotational velocity (degrees or radians per second) around its sensitive axis.	*Reliability Engineering*
Angus	An English breed of beef cattle introduced to the United States from its native Scotland in 1873. Sometimes called Aberdeen Angus. In the United States breed registries are separate for red and black Angus through the Red Angus Association of America and the American Angus Association. The breed is prized for its ease of calving and mothering ability, and for its lean meat. The American Angus Association records more cattle each year than any other beef breed association, making it the largest beef breed registry association in the world.	*Agriculture*
Anhydrous	Free from water, especially free from water of crystallization.	*Material Process*
Anhydride	Any chemical compound obtained, either in practice or in principle, by the elimination of water from another compound.	*Chemical*
Anhydrous	A lubricating grease without water (as determined by ASTM D 128).	*Lubrication*
Anhydrous	Devoid of water.	*Lubrication*
anhydrous ammonia	A common form of nitrogen fertilizer used by wheat growers and other farmers.	*Agriculture*
Aniline (C6H5NH2)	Colorless oily aromatic liquid. A raw material for the production of many dyestuffs and other organic compounds and synthetic resins such as aniline–formaldehyde resins. It is also a solvent and paint or other coating remover.	*Material Process*
Aniline Point	The lowest temperature at which equal volumes of aniline and hydrocarbon fuel or lubricant base stock are completely miscible. A measure of the aromatic content of a hydrocarbon blend, used to predict the solvency of a base stock or the cetane number of a distillate fuel.	*Lubrication*
Aniline Point	The minimum temperature for complete miscibility of equal volumes of aniline and the sample under test ASTM Method D611. A product of high aniline point will be low in aromatics and naphthenes and, therefore, high in paraffins.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	Aniline point is often specified for spray oils, cleaning solvents, and thinners, where effectiveness depends upon aromatic content. In conjunction with API gravity, the aniline point may be used to calculate the net heat of combustion for aviation fuels.	
Aniline resins	Amino aldehyde resins, derived from aniline and formaldehyde.	*Material Process*
Animal & Plant Health Inspection Service, (APHIS)	An agency of the USDA.	*Agriculture*
Animal Groups	Apes: a shrewdness Badgers: a cete Bats: a colony, cloud or camp Bears: a sloth or sleuth Bees: a swarm Buffalo: a gang or obstinacy Camels: a caravan Cats: a clowder or glaring; Kittens: a litter or kindle; Wild cats: a destruction Cobras: a quiver Crocodiles: a bask Crows: a murder Dogs: a pack; Puppies: a litter Donkeys: a drove Eagles: a convocation Elephants: a parade Elk: a gang or a herd Falcons: a cast Ferrets: a business Fish: a school Flamingos: a stand Foxes: a skulk or leash Frogs: an army Geese: a gaggle Giraffes: a tower Gorillas: a band Hippopotami: a bloat Hyenas: a cackle Jaguars: a shadow Jellyfish: a smack Kangaroos: a troop or mob Lemurs: a conspiracy Leopards: a leap Lions: a pride Moles: a labor Monkeys: a barrel or troop Mules: a pack Otters: a family Oxen: a team or yoke Owls: a parliament	*Breakroom*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	Parrots: a pandemonium Pigs: a drift or drove (younger pigs), or a sounder or team (older pigs) Porcupines: a prickle Rabbits: a herd Rats: a colony Ravens: an unkindness Rhinoceroses: a crash Shark: a shiver Skunk: a stench Snakes: a nest Squirrels: a dray or scurry Stingrays: a fever Swans: a bevy or game (if in flight: a wedge) Tigers: an ambush or streak Toads: a knot Turkeys: a gang or rafter Turtles: a bale or nest Weasels: a colony, gang or pack Whales: a pod, school, or gam Wolves: a pack Zebras: a zeal	
Animal resin	A resin of animal origin, shellac, a product of the lac insect.	*Material Process*
Anion	A negatively charged ion.	*Chemical Engineering*
Anion	A negatively charged ion (Cl–, NO3–, S2–, etc.)	*Electronic Process*
Anion Exchange	Ion exchange process in which anions in solution are exchanged for other anions from an ion exchanger.	*Petroleum Engineering*
ANIQ	Mexican equivalent to the CMA	*Petro-Chemical Abbreviations*
Anisotropic	the condition in which hydraulic properties of an aquifer are not equal when measured in all directions.	*Chemical*
Anisotropic	Having properties that very with direction.	*Material Process*
Anisotropy	Variation of a transport property in different directions in a material. Is often obtained from homogenization of regular structures. Example: Monolithic structures in tubular reactors.	*Chemical*
Anisotropy	Variation of a transport property in different directions in a material. Is often obtained from homogenization of regular structures. Example—Monolithic structures in tubular reactors.	*Chemical Engineering*
Ankerite	An iron magnesium carbonate mineral found in some coal cleats.	*Mining*
ANN	An abbreviation sometimes used for artificial neural networks.	*Control Engineering*
Anneal	To subject to heat with subsequent cooling. When annealing copper; the act of softening the metal by means of heat to render it less brittle.	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Annealing	Heating a metal to a temperature above a critical temperature and holding above that range for a proper period of time, followed by cooling at a suitable rate to below that range for such purposes as reducing hardness, improving machinability, facilitating cold working, producing a desired microstructure, or obtaining desired mechanical, physical, or other properties.3 (A softening treatment is often carried out just below the critical range which is referred to as a subcritical annealing.)	*Maintenance and Repair*
Annual	A plant that lives or grows for only one year or one growing season.	*Forestry*
Annual Effects	Effects in energy use and peak load resulting from participation in DSM programs in effect during a given period of time.	*Energy*
Annual efficiency	Key figure to assess the energy efficiency of a heating boiler. The annual efficiency shows the percentage relation between the utilizable thermal energy and the energy consumed for a full year. see Standard efficiency	*Thermal Management*
Annual Equivalent	An equal cash flow amount that occurs every year.	*Energy*
Annual Fuel Utilization Efficiency	A measure of heating efficiency, in consistent units, determined by applying the federal test method for furnaces. This value is intended to represent the ratio of heat transferred to the conditioned space by the fuel energy supplies over one year.	*Energy*
Annual Inventory Turns	A measure of asset management that is calculated by dividing the value of annual plant shipments at plant cost (for the most recent full year) by the average total inventory value at plant cost. Total inventory includes raw materials, work in process, and finished goods. Plant cost includes material, labor, and plant overhead.	*Maintenance*
Annual Maintenance Cost	A metric determined by taking the amount of money spent annually to maintain assets divided by the replacement asset value (RAV) of the assets being maintained. It is expressed as a percentage.	*Reliability Engineering*
Annual Maximum Demand	The greatest of all demands of the electrical load which occurred during a prescribed interval in a calendar year.	*Energy*
Annual operating factor	Annual operating factor: divided by the product of design firing rate and hours of operation per year.	*Energy*
Annual report	The formal financial statements and report on operations issued by a corporation to its shareholders after its fiscal year-end.	*Mining*
Annual requirement	The reporting company's best estimate of the annual requirement for natural gas to make direct sales or sales for resale under certificate authorizations and for company use and unaccounted-for gas during the year next following the current report year.	*Energy*
Annual seed mixture	A mixture of soybean, millet, cow pea, sorghum, lespedeza, buckwheat, and other seeds from which single-season plants are grown to serve primarily as food or protective cover for wildlife.	*Forestry*
Annual Stock Check	Stock which is manufactured by a company is regarded from the financial viewpoint as an investment waiting to be sold. Consequently, in order to strike the balance sheet at the end of its financial year, the company must report its stock, valued at cost price, as part of its current assets (*). If the stock records are not reliable and there is no program of cycle counting in place, a major counting	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	exercise must be embarked on to do so, usually over a short period such as a long weekend. The annual stock take is a significant cause of errors in stock records since the counting performed is often not accurately done and discrepancies between the counts recorded and the stock records are not verified or investigated as they should be, due to pressure of time. Other causes of error in annual stock counting are: (1) failure to prepare the stores or warehouse for the counting exercise (e.g., by tidying the environment and making sure everything is correctly labeled); (2) employing inexperienced staff to perform the counting; (3) rushing the counting exercise through the imposition of a completion deadline. If a company has reasonably good records accuracy and a cycle counting program in place, it should definitely not allow annual stock check figures to overwrite the records. For practical notes relating to the annual stock count, visit the free on-line course Stock Records Accuracy, at this site (Section 5.1 and possibly 5.2). (* Current assets are assets which are cash or will soon become cash, as opposed to fixed assets such as land and buildings.)	
Annual total inventory turns	A measure that is calculated by dividing the value of annual plant shipments at plant cost (for the most recent full year) by the total average daily inventory value at plant cost. Total average daily inventory includes raw materials, work in process, and finished goods. Plant cost includes material, labor, and plant overhead.	*Quality*
Annual Usage Value (AUV)	The quantity of a material used per annum, multiplied by its unit cost. The figure is widely used in ABC Classification, since it reflects both a material's commercial and manufacturing importance. See also DGR.	*Quality*
Annuity	A series of equal cash flows over a number of years.	*Energy*
Annular	Refers to the space between the inside diameter of a cased or drilled hole and a secondary string of casing suspended inside this space.	*Petroleum Engineering*
Annular area	A ring shaped area - often refers to the net effective area of the rod side of a cylinder piston, i.e., the piston area minus the cross sectional area of the rod.	*Mechanical, Process, and Operations*
Annular Down-hole Safety Valves (ADHSV)	These provide a subsurface barrier between a platform and the high pressure gas lift inventory in the annular space in a gas lifted well. Because these valves are typically positioned approximately 1000ft below the platform, the inventory of gas above the ADHSV is still significant and, for this reason, the benefits from the valves are minimal in some cases.	*Reliability Engineering*
Annular Space	The open space between the outside of the well casing and the side of a well (the wall of the borehole or outer casing).	*Petroleum Engineering*
Annulus	The space around a pipe in a well bore, also referred to as the annular space.	*Petroleum Drilling*
Annulus	The area between the casing and the tubing or between the wellbore and the casing, etc. Refers to a space between tubulars and other tubulars or the earth that must be calculated when figuring drilling fluid volume, cement jobs, etc.	*Petroleum Drilling*
Annulus	The space between: (1) The casing and the wall of the borehole. (2) Two strings of casing. (3) Tubing and casing.	*Petroleum Drilling*
Anode	A positively charged electrode that, during electrolysis, attracts anions.	*Chemical Engineering*
Anode	The switch contact connected to the positive terminal of the power supply.	*Electrical Engineering*
Anodic	exhibiting the properties of an anode; zinc is anodic to steel	*Materials Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Anodic area	Area on a metal surface where electrons are given up and metal dissolves (corrosion).	*Chemical Engineering*
Anodic Coating	A coating that becomes the anode in an electrochemical cell with the substrate (cathode). The only metals in common use for thermal spraying which are anodic to iron and steel are zinc and aluminum.	*Paint and Coatings*
Anodic reaction	The oxidation reaction occurring at the anode in an electrochemical cell.	*Material Process*
Anodizing	The production of an oxide layer on aluminum alloys. The process is electrolytic, a typical electrolyte being sulfuric acid. Treatment at room temperature produces thin, decorative layers with some corrosion protection. Treatment at 0oC produces hard, thicker layers (up to 100μ) with wear resistance. They can be post sealed to give improved corrosion resistance.	*Paint and Coatings*
Anodized aluminum	Aluminum alloy with a protective layer Al2O3 (aluminum oxide).	*Material Process*
Anomaly	Something irregular or inconsistent.	*Maintenance*
ANOVA	ANOVA stands for analysis of variance, a method by which the source of variability is identified. This method is widely used in industry to help identify the source of potential problems in the production process, and identify whether variation in measured output values is due to variability between various manufacturing processes, or within them. By varying the factors in a predetermined pattern and analyzing the output, one can use statistical techniques to make an accurate assessment as to the cause of variation in a manufacturing process.	*Reliability Engineering*
ANOVA (Single Factor, analysis of variances)	The conduct of a process or procedure may give rise to certain outputs which are recordable as quantitative data. For example, a job shop produces units of output in the course of a day, and the number of units produced may be recorded, say, as 100 pieces. However, the process can proceed under alternative factor levels (qv), or alternative conditions. The recorded output from the process may then be different depending on the particular, unique factor or condition prevailing. For example, the number of units of output produced by the job shop in the day may be different depending whether the day is Monday, or Tuesday, or Wednesday, or Thursday or Friday. Single factor ANOVA is used to determine whether the differences in output emanating from the alternative levels of a particular factor are statistically significant. For example, it may be used to determine whether the job shop's output is dependent on the day of the week. To begin, the analyst must first calculate the variance of the observed data at each factor level (e.g., the variance in the output figures as observed for each of the days of the week.) Next, two statistical measures are calculated. The first, SST, is known as the Between Treatments(*) Variation, or "sum of the squares for treatment." The SST is a measure of the closeness, or difference between, the variances calculated. The second statistical measure is known as the Within Treatment Variation, or "sum of the squares for error" (SSE). This is a measure of the variation within each set of observed data. Finally, both the SST and SSE are adjusted for statistical averaging purposes to take account of the number of degrees of freedom (qv) permitted, to give the MST (mean square for treatment) and the MSE (mean square error). The last step is to calculate MST/MSE, known as the test statistic F. If F is sufficiently large (greater than 1, but probably much greater), then there is statistical significance as a result of the alternative factor levels (e.g., that the job shop output on Monday is significantly different	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	from the output on Tuesday, from ... Friday). ANOVA is widely used in industry, including at the Analyse phase of Six Sigma. Naturally, the analyst so using it need not be concerned with the statistics ... all he need do is enter the numbers on, say, a MINITAB screen! Note that multifactor ANOVA allows significance to be explored when several factors themselves are present. For example, the output observed between the days of the week, but also qualified by which season of the four seasons of the year is involved - Mondays in Summer, v. Tuesdays in Winter .... (* The term "treatment" used in ANOVA and DOE harks back to the experiments of Sir Ronald Fisher in 1915, using ANOVA and DOE to investigate the yields from potato crops with different types of types of potato and different types of manure.) See also The Null Hypothesis.	
Anoxic	Total deprivation of oxygen.	*Chemical*
ANPRM	Advance notice of proposed rule making (US-EPA)	*Petro-Chemical Abbreviations*
ANS	Advanced Networks and Services.	*Quality*
ANSI	American National Standards Institute	*Electrical Engineering*
ANSI	American National Standards Institute—The principal standards writing organization in the U.S. who sets standards for a wide variety of items, including the design, fabrication, and testing of pressure piping, systems, and components for various pipeline services.	*Mechanical*
ANSI ASC X.121	also known as X.12, a technical standard for the transmission of EDI messages over telecommunications links. The dominant standard in North America, Australia and New Zealand.	*Quality*
ANSI assembly identifier	he serial numbering scheme adopted by the American National Standards Institute (ANSI) to ensure uniqueness of an assembly serial number.	*Energy*
ANSI Class	A strength designation for valves which show the maximum pressures at various temperatures at which a valve can be expected to work safely.	*Industrial Engineering*
ANSI/ISO/ASQC Q9000	The US terminology for ISO 9000 (qv).	*Quality*
Anterior	In front; before; opposite of posterior.	*Forestry*
anther	Male reproductive structure that produces pollen in plants.	*Agriculture*
Anthocyanosis	Presence of abnormal red-purple coloration in foliage.[1]	*Forestry*
Anthracene	A colorless monoclinic crystals. A coal tar crude important as a base material for the production of numerous dyes.	*Material Process*
Anthracite	The highest rank of coal; used primarily for residential and commercial space heating. It is a hard, brittle, and black lustrous coal, often referred to as hard coal, containing a high percentage of fixed carbon and a low percentage of volatile matter. The moisture content of fresh-mined anthracite generally is less than 15 percent. The heat content of anthracite ranges from 22 to 28 million Btu per ton on a moist, mineral-matter-free basis. The heat content of anthracite coal consumed in the United States averages 25 million Btu per ton, on the as-received basis (i.e., containing both inherent moisture and mineral matter). Note: Since the 1980's, anthracite refuse or mine waste has been used for steam electric power generation. This fuel typically has a heat content of 15 million Btu per ton or less.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Anthraquinone dyes	An important group	*Material Process*
Anthraquinone dyes	Anthraquinone dyes An important group of dyes derived from anthraquinone, insoluble in water but made soluble by reduction in the dye bath and, after becoming attached to the fiber to be dyed, regenerated in insoluble form there on by oxidation.	*Material Process*
Anthropogenic	Made or generated by a human or caused by human activity. The term is used in the context of global climate change to refer to gaseous emissions that are the result of human activities, as well as other potentially climate-altering activities, such as deforestation.	*Energy*
Anti Oxidant	A substance which prevents or slows down oxygen decomposition of a material.	*Electrical*
Anti Ozonant	A substance which prevents or slows down material degradation due to ozone reaction.	*Electrical*
Anti-Aliasing	An anti-aliasing filter is used before A/D conversion. It is a low-pass filter that removes signal components above the Nyquist frequency, thereby eliminating their sampled replicas (aliases) in the baseband.	*Electrical Engineering*
Anti-aliasing filter	A low pass filter designed to stop frequencies higher than some fraction of the sample rate, in order to minimize aliasing.	*Reliability Engineering*
Antibacterial	Counteracting bacteria.	*Chemistry*
Anti-Cavitation Trim	A special trim used in control valves to stage the pressure drop through the valve, which will either prevent cavitation from occurring or direct the bubbles that are formed to the centre of the flow stream, away from the valve body and trim. This is usually accomplished by causing the fluid to travel along a torturous path.	*Industrial Engineering*
Anticipated Delay Report	A printout or VDU display showing which works orders will be completed later than their planned due dates.	*Quality*
Anticipation Stock	Anticipation Stock: see Stock (Anticipation).	*Quality*
Anticline	An arch or fold in layers of rock shaped like the crest of a wave.	*Mining*
Antifoam	An agent that prevents foam from forming or reduces its presence.	*Chemical Engineering*
Anti-Foam Additive	Causes air bubbles to break on the surface, prevents build up of foam. Can also help prevent oxidation, they cannot prevent air entrainment, but function as an aid to quicker release of entrained air.	*Lubrication*
Antifoam Agent	An additive used to suppress the foaming tendency of petroleum products in service. May be a silicone oil to break up surface bubbles or a polymer to decrease the number of small entrained bubbles.	*Lubrication*
Anti-foam Agent	One of two types of additives used to reduce foaming in petroleum products: silicone oil to break up large surface bubbles, and various kinds of polymers that decrease the amount of small bubbles entrained in the oils.	*Lubrication*
Antifreeze	An additive that lowers the freezing point of a liquid	*Mechanical Engineering*
Anti-friction bearing	A rolling contact type bearing in which the rotating or moving member is supported or guided by means of ball or roller elements. Does not mean without friction.	*Oil Analysis*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Anti-Friction Coating	AF coatings are dry lubricants consisting of suspensions of solid lubricants, such as graphite, PTFE or molybdenum disulfide of small particle size in a binder. Such coatings can be applied to fastener threads to replace metallic coatings such as zinc and cadmium and offer maintenance free permanent lubrication. By careful selection of the lubricants, AF coatings can be designed to meet specific applications. The coatings are permanently bonded to the metal surface and provide a lubricating film preventing direct metal to metal contact.	*Maintenance*
Anti-Lock Brake System (ABS)	On a vehicle equipped with Anti-Lock Brakes, the wheels are equipped with speed sensors. When a sensor determines that a wheel is decelerating so rapidly that lockup may occur, the electro-Hydraulic Control Unit (EHCU) is activated. The EHCU then modulates the brake pressure in the appropriate brake lines by means of the solenoid-operated valves. This is intended to prevent wheel lockup and help the vehicle maintain directional stability during potentially hazardous braking situations.	*Mechanical Engineering*
Anti-Lock Brakes (ABS)	Helps maintain control in emergency stops. Particularly useful on slick, pavement. While the driver applies steady pressure to the brake pedal, the system automatically "pumps" the brakes many times per second to prevent wheel lock-up.	*Mechanical Engineering*
Anti-Lock Brakes (ABS)	Helps maintain control in emergency stops. Particularly useful on slick.	*Mechanical Engineering*
Antimicrobial	Agent that inhibits or destroys bacteria, fungi, protozoa or viruses that are pathogenic.	*Chemistry*
Anti-Oxidant (oxidation inhibitor)	An additive to retard oxidation. Anti-oxidants are critical to any application that is not sealed from the atmosphere. If you don't have a nitrogen blanket on your expansion tank or reservoir it is crucial that your fluid contain an anti-oxidant. Oxidation leads to sludge formation that left unchecked could cause blockages and lead to complete system failure.	*Lubrication*
Anti-oxidants	Prolong the induction period of a base oil in the presence of oxidizing conditions and catalyst metals at elevated temperatures. The additive is consumed and degradation products increase not only with increasing and sustained temperature, but also with increases in mechanical agitation or turbulence and contamination -- air, water, metallic particles, and dust.	*Oil Analysis*
Antiparallel spin paring	The alignment of atomic magnetic moments in opposite directions in ferrimagnetic materials.	*Material Process*
Anti-Reset Windup	This is a feature in a three-mode PID controller which prevents the integral (auto reset) circuit from functioning when the temperature is outside the proportional band.	*Electrical*
Anti-Roll Bar	A steel bar, linking the left and right side of a suspension. It comes into play during cornering. As the car leans in a turn, the anti-roll bar resists this leaning by transferring more weight to the outside tire. It provides a means to achieve good handling from stiff roll resistance while maintaining a comfortable ride through soft springs.	*Mechanical Engineering*
Anti-Seize Compound	An anti-seize compound is used on the threads of fasteners in some applications. The purpose of the compound depends upon the application. It can prevent galling of mating surfaces - such compounds are frequently used with stainless steel fasteners to prevent this effect from occurring. In some applications it is used to improve corrosion resistance to allow the parts to be subsequently dis-assembled Thirdly, it can provide a barrier to water penetration since the threads are sealed by use of the compound.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Antiseptic	A chemical agent that prevents or inhibits the growth of microorganism microbes, particularly on the skin.	*Chemistry*
Antiskid System	Helps maintain control in fast turns. Works whether or not the brakes are applied. Sensors automatically apply individual brakes to prevent a sideways skid. Some systems also cut back on the throttle, slowing the engine. It's also known as an electronic stability system or stabilization program.	*Mechanical Engineering*
Antistatic Additive	An additive that increases the conductivity of a hydrocarbon fuel to hasten the dissipation of electrostatic charges during high-speed dispensing, thereby reducing the fire/explosion hazard.	*Lubrication*
Antitpopal ventilation	ventilation by a current of air travelling in the opposite direction to that of the flow of the coal out of the mine.	*Mining*
Antiwear additives	Improve the service life of tribological elements operating in the boundary lubrication regime. Antiwear compounds (for example, ZDDP and TCP) start decomposing at 90° to 100°C and even at a lower temperature if water (25 to 50 ppm) is present.	*Oil Analysis*
Antiwear Agents	Additives or their reaction products, which form thin, tenacious films on highly loaded parts to prevent metal-to-metal contact.	*Lubrication*
Antonomasia	Substituting an epithet for a proper name or v.v. (e.g. your lordship or Judas)	*Breakroom*
ANX	Automotive Network Exchange.	*Quality*
AO	antioxidant	*Petro-Chemical Abbreviations*
AOC	Appelation d'origine controllee—"designation of original hallmark," being a status granted by the French government to more than 300 food and drink products, mainly wines and cheeses. An AOC designation is an assurance that the product has come from a specified geographical area.	*Quality*
AOCS	American Oil Chemists' Society	*Petro-Chemical Abbreviations*
AOG	Aircraft on (the) ground - the ultimate horror for stockists of aircraft spares, apparently justifying the abandonment of scientific inventory principles and the storage of gross and wildly excessive levels of stock.	*Quality*
AOI	Automated Optical Inspection.	*Quality*
AOQ	Average Outgoing Quality. The quality level of parts which have been subject to sampling. The level will be affected by the probability that certain lots will be rejected, and that, as a consequence, these lots will be 100% inspected. Since there has been 100% inspection of some of the parts, with rectification of any defects found, the overall outgoing quality will be improved. (If all lots are liable to be rejected by sampling, outgoing quality will be 100%.)	*Quality*
AOQL	The worst possible outgoing quality associated with items that have been subject to a particular sample plan (see AOQ).	*Quality*
APC	Advanced Process Control. This includes continuous applications such as cracking towers and advanced batch control involving activities like blend ratio control or bleaching.	*Control Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
APDF-DEC	Advanced Petroleum Based Fuels - Diesel Emission Control	*Petro-Chemical Abbreviations*
APE	Association of Petroleum Engineers	*Petro-Chemical Abbreviations*
Aperture	Most often an external cap (with a small opening) placed over the receiver lens to help detect small objects. It lets even a small object block enough light to be detected. Also, an internal aperture in most receivers reduces the effect of off: axis ambient light.	*Electrical Engineering*
APEX	The top or terminal edge of a vein on the surface or its nearest point to the surface.	*Mining*
APHIS	Animal & Plant Health Inspection Service, an agency of the USDA.	*Agriculture*
API	The American Petroleum Institute, a trade association.	*Energy*
API	An acronym for American Petroleum Institute. A trade association of petroleum producers, refiners, marketers, and transporters, organized for the advancement of the petroleum industry by conducting research, gathering and disseminating information, and maintaining cooperation between government and the industry on all matters of mutual interest.	*Lubrication*
API 16A	(Also ISO 13533) American Petroleum Institute publication specification used as the industry Specification for Drilling Equipment.	*Petroleum Engineering*
API 17D	The American Petroleum Institute specification used for Subsea Wellhead and Christmas Tree Equipment.	*Petroleum Engineering*
API 6A	(Also ISO 10423) The American Petroleum Institute publication specification utilized as the oil industry Specification for Wellheads and Christmas Tree Equipment.	*Petroleum Engineering*
Api County Code	An indicator developed by the American Petroleum Institute (API) to identify areas such as counties and other subdivision areas identified within state boundaries. Defined by API Bulletin D12A, as amended. This code becomes a part of the API Well Number.	*Petroleum Drilling*
Api County Code	An indicator developed by the American Petroleum Institute (API) to identify areas such as counties and other subdivision areas identified within state boundaries. Defined by API Bulletin D12A, as amended. This code becomes a part of the API Well Number.	*Petroleum Drilling*
API Engine Service Categories	Gasoline and diesel engine oil quality levels established jointly by API, SAE, and ASTM, and sometimes called SAE or API/SAE categories; formerly called API Engine Service Classifications.	*Lubrication*
API gravity	American Petroleum Institute measure of specific gravity of crude oil or condensate in degrees. An arbitrary scale expressing the gravity or density of liquid petroleum products. The measuring scale is calibrated in terms of degrees API; it is calculated as follows:	*Energy*
API Gravity	A gravity scale established by the American Petroleum Institute and in general use in the petroleum industry, the unit being called "the A.P.I. degree." This unit is defined in terms of specific gravity as follows:	*Lubrication*

Term	Definition	*Industry*
API LC	American Petroleum Institute Lubricants Committee. A group within API that is responsible for establishing Base Oil Interchange and Viscosity-Grade Read Across guidelines.	*Mechanical, Process, and Operations*
API Monogram	The registered trademark of the American Petroleum Institute (API). Qualified licensed manufacturers are authorized to use the API Monogram and their license number, on their documentation and on product labels to signify equipment meets the requirements of API specifications.	*Petroleum Engineering*
API SJ	API motor oil quality level for 2001 and older automotive engines	*Petro-Chemical Abbreviations*
API SL	API motor oil quality level for 2004 and older automotive engines	*Petro-Chemical Abbreviations*
API SM	API motor oil quality level for 2010 and older automotive engines	*Petro-Chemical Abbreviations*
API SN	API motor oil quality level first licensed October 1, 2010	*Petro-Chemical Abbreviations*
API Spec 6D	An API specification dealing with pipeline valves. Most pipeline valves are manufactured to this specification, and, if so, can be identified with the API 6D monogram.	*Mechanical*
API SPEC 6FA	The API specification dealing with the fire testing of pipeline valves. Once a particular size and pressure class valve is tested and passes the API-fire test, like valves can be identified with the above monogram. API-6FA supersedes API-RP-6F.	*Mechanical*
Api State Code	The indicator assigned to a state, as defined in API Bulletin D12A, as amended. This code is a part of the API Well Number	*Petroleum Drilling*
Api State Code	The indicator assigned to a state, as defined in API Bulletin D12A, as amended. This code is a part of the API Well Number (The Api State Code for Colorado is 05).	*Petroleum Drilling*
Api Well Number	A well identifier assigned as defined in API (American Petroleum Institute) Bulletin D12A, as amended. The API Well numbers are assigned by the appropriate state or federal regulatory agency.	*Petroleum Drilling*
Api Well Number	A well identifier assigned as defined in API (American Petroleum Institute) Bulletin D12A, as amended. The API Well Numbers are assigned by the appropriate state or federal regulatory agency.	*Petroleum Drilling*
API	American Petroleum Institute	*Petroleum Drilling*
APICS	The American Production and Inventory Control Society. Visit www.apics.org.	*Quality*
A-Pillar	In the side view, the foremost roof support of a vehicle, located in most instances between the outer edge of the windshield and the leading edge of the front door upper. Also known as an A-Post.	*Mechanical Engineering*
APL	See Applications Parts List	*Plant Engineering*
APO	Advanced Planning & Optimisation.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Appalachian basin	The subterranean geologic formations that roughly follow the Appalachian Mountain range. Drillers have started to use the term to refer to any exploitable formations in this area – shale gas, oil or coal, regardless of whether they are found in the mountains at all. Drillers have claimed the Appalachian basin stretches from New York to Tennessee; others say it extends well into Canada or that it's analogous to the entire eastern seaboard. The United States Department of Energy associates the Appalachian basin with the Marcellus Shale, the Devonian Shale, primarily of Ohio, and the Utica Shale in Virginia [Map (pdf link)].	*Petroleum Drilling*
Appalachian Region	Consists of Alabama, Eastern Kentucky, Maryland, Ohio, Pennsylvania, Tennessee, Virginia, and West Virginia.	*Energy*
Appaloosa	The famous spotted horse of the Nez Perce Indians. It wasn't until 1938 that the Appaloosa was recognized with a breed registry.	*Agriculture*
Apparent consumption, (coal)	Coal production plus imports of coal, coke, and briquets minus exports of coal, coke, and briquets plus or minus stock changes. Note: The sum of "Production" and "Imports" less "Exports" may not equal "Consumption" due to changes in stocks, losses, unaccounted-for coal, and special arrangements such as the United States shipments of anthracite to United States Armed Forces in Europe.	*Energy*
Apparent consumption, natural gas (international)	The total of an individual nation's dry natural gas production plus imports less exports.	*Energy*
Apparent consumption, petroleum (international)	Consumption that includes internal consumption, refinery fuel and loss, and bunkering. For countries in the Organization for Economic Cooperation and Development (OECD), apparent consumption is derived from refined product output plus refined product imports minus refined product exports plus refined product stock changes plus other oil consumption (such as direct use of crude oil). For countries outside the OECD, apparent consumption is either a reported figure or is derived from refined product output plus refined product imports minus refined product exports, with stock levels assumed to remain the same. Apparent consumption also includes, where available, liquefied petroleum gases sold directly from natural gas processing plants for fuel or chemical uses.	*Energy*
Apparent Density	The weight of a unit volume of powder or coating	*Paint and Coatings*
Apparent Hardness	The value obtained by testing a coating or sintered material with standard indentation hardness equipment. (See macrohardness) Since the reading reflects a composite of pores and solid material, (which may be particles relatively poorly bonded together) it is usually lower than that of an equivalent solid wrought or cast material. Not to be confused with particle hardness (See microhardness).	*Paint and Coatings*
Apparent power	The product of the voltage (in volts) and the current (in amperes). It comprises both active and reactive power. It is measured in "volt-amperes" and often expressed in "kilovolt-amperes" (kVA) or "megavolt-amperes" (MVA). See Power, Reactive Power, Real Power.	*Energy*
Apparent Viscosity	A measure of the viscosity of a non-Newtonian fluid under specified temperature and shear rate conditions.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Apparent Viscosity	The ratio of shear stress to rate of shear of a non-Newtonian fluid such as lubricating grease, or a multi-grade oil, calculated from Poiseuille's equation and measured in poises. The apparent viscosity changes with changing rates of shear and temperature and must, therefore, be reported as the value at a given shear rate and temperature (ASTM Method D 1092).	*Lubrication*
Appearance	A general term relating to characteristics which are observable only by visual inspection (see Bloom, Bulk Appearance, Color, Luster and Texture).	*Lubrication*
Appellation Controllee	See AOC.	*Quality*
apple knocker	Slang for farm laborers who pick apples.	*Agriculture*
Appliance	A piece of equipment, commonly powered by electricity, used to perform a particular energy-driven function. Examples of common appliances are refrigerators, clothes washers and dishwashers, conventional ranges/ovens and microwave ovens, humidifiers and dehumidifiers, toasters, radios, and televisions. Note: Appliances are ordinarily self-contained with respect to their function. Thus, equipment such as central heating and air conditioning systems and water heaters, which are connected to distribution systems inherent to their purposes, are not considered appliances.	*Energy*
Appliance efficiency index	A relative comparison of trends in new-model efficiencies for major appliances and energy-using equipment. The base year for relative comparisons was 1972(1972=100). Efficiencies for each year were efficiencies of different model types that were weighted by their market shares.	*Energy*
Appliance efficiency standards	The National Appliance Energy Conservation Act of 1987 established minimum efficiency standards for major home appliances, including furnaces, central and room air conditioners, refrigerators, freezers, water heaters, dishwashers, and heat pumps. Most of the standards took effect in 1990.The standards for clothes washers, dishwashers, and ranges took effect in 1988, because they required only minor changes in product design, such as eliminating pilot lights and requiring cold water rinse options. The standards for central air conditioners and furnaces took effect in1992, because it took longer to redesign these products. Appliance efficiency standards for refrigerators took effect in 1993.	*Energy*
Appliance Saturation	The percentage of households or buildings in a service area that have the type of equipment to which the demand-side technology applies. For example, if 50 percent of the residential customers have a central air conditioner, the appliance saturation is 50 percent.	*Energy*
Applicability	See External validity	*Quality Analysis*
Applicability Factor	The percentage of end-use energy and demand used by a technology to which the demand-side management (DSM) measure applies. For example, the high-efficiency fluorescent lighting DSM measure applies to fluorescent lighting but not all lighting. Applicability therefore represents the percent of the lighting end-use attributable to fluorescence for which there could be high-efficiency replacements installed.	*Energy*
Application	The work of applying steam to heat another medium for a specific purpose. Usually industrial, the main uses for steam are generally for heating, drying, humidification, and mechanical applications.	*Industrial*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Application	the act of putting to use; specifically, the use to which galvanized steel will be put	*Materials Process*
Application characteristics	Refer to those properties of a method which determine whether the method can be implemented in the particular laboratory of interest, assuming the method will perform acceptably. Characteristics such as cost, sample size, specimen type, etc.	*Quality*
Application Program	A computer program that accomplishes specific tasks, such as word processing.	*Electrical*
Application program interface	A software layer that allows a system to be programmed via a defined set of commands.	*Electrical Engineering*
Applications Parts List	A List Of All Parts Required To Perform A Specific Maintenance Activity. Typically Set Up As A Standard List Attached To A Standard Job For Routine Tasks. Not To Be Confused With A Bill Of Materials.	*Management*
applications.	applications.	*General Mechanical*
Applied force	See external force.	*Engineering Physics*
Appraisal Well	A well drilled as part of an appraisal drilling program which is carried out to determine the physical extent, reserves and likely production rate of a field.	*Petroleum Drilling*
Appraisal Well	A well drilled as part of an appraisal drilling program which is carried out to determine the physical extent, reserves and likely production rate of a field.	*Petroleum Drilling*
Apprentice	A Tradesperson (Or Craftsperson) In Training	*Management*
Approach	The difference between the cold water temperature in °F and the ambient or inlet wet-bulb temperature in °F.	*Facility Engineering*
Approach Ratio	The ratio of the arc of approach to the arc of action.	*Gears*
Appropriate Dispute Resolution (ADR)	A process for resolving conflicts between parties. It can include direct negotiations, facilitated sessions, mediations, or arbitration.	*Petroleum Engineering*
APQP	Advanced Product Quality Planning.	*Quality*
APRAC	Air Pollution Research Advisory Committee	*Petro-Chemical Abbreviations*
APS (UK - Advanced Planning & Scheduling System; US - Advanced Planning System)	A comprehensive planning and operational control system based on proprietary software and comprising a number of distinct modules, or sub-elements. The sub-systems include MPS, Forecasting, BOM and many others common to MRPII and ERP. However, a notable absentee among the modules is Closed-Loop MRP. The day to day plan control which is effected by Closed-Loop MRP in an MRPII/ERP system is replaced in an APS by a Finite Scheduling "Engine." That is, what is at the heart of an APS is the capability to produce a realistic schedule of work detailing the order of jobs, start and finish times and so on, taking account of practical scheduling and production rules and the desirability of optimizing throughput. Unlike the cumbersome manner of MRP, APS provides for interactive interrogation of the scheduling situation and interactive resolution of problems (e.g., planning difficulties due to plant breakdowns). See also Finite Capacity Scheduling.	*Quality*
AQL	See Acceptable Quality Level.	*Quality*
AQL Sampling Tables	See Sampling Tables (AQL or Military).	*Quality*
Aqueous	relating to, similar to, containing, or dissolved in water; watery	*Materials Process*

Term	Definition	*Industry*
Aqueous corrosion	Dissolution of a metal into a water based environment.	*Material Process*
Aqueous Decontamination	Removal of a chemical or biological hazard with a water-base solution	*Lubrication*
aqueous solubility	the extent to which a compound will dissolve in water. The log of solubility is generally inversely related to molecular weight.	*Chemical*
Aquiclude	An impermeable body of rock that may absorb water slowly, but does not transmit it.	*Petroleum Drilling*
aquifer	a geologic formation capable of transmitting significant quantities of groundwater under normal hydraulic gradients.	*Chemical*
Aquifer (Groundwater Aquifer)	A porous, water-bearing geological formation (e.g. sands, gravels, fractured rock) capable of transmitting water in sufficient quantities to serve as a source of water supply.	*Petroleum Engineering*
Aquifer Stimulation	A type of development done in semiconsolidated and completely consolidated formation to physically alter the formation to improve its hydraulic properties.	*Petroleum Engineering*
Aquifer Test	A test involving the withdrawal of measured quantities of water from, or addition of water to, a well and the measurement of resulting changes in head in the aquifer both during and after the period of discharge or addition.	*Petroleum Engineering*
Aquitard	A geologic formation that may contain groundwater but is not capable of transmitting significant quantities of groundwater under normal hydraulic gradients. In some situations aquitards may function as confining beds.	*Chemical*
AR	AR - See: Absence Rate, Accession Rate	*Industrial Relations*
ARA	Amsterdam-Rotterdam-Antwerp	*Energy*
Arabian	Horse of the Bedouin, developed anciently on the Arabian peninsula .	*Agriculture*
Arastra	A mill, consisting of one or more large stones dragged around on a circular bed, used to grind ore.	*Mining*
ARB	Air Resources Board (California)	*Petro-Chemical Abbreviations*
Arbiter, Funding	See Funding Arbiter	*Quality Engineering*
Arbiter, Publication	See Publication Arbiter	*Quality Engineering*
Arbitrage	The simultaneous purchase and sale of identical or similar assets across two or more markets in order to profit from a temporary price discrepancy.	*Energy*
Arc	One of several kinds of visible electrical discharge between separated contacts of a switch. It is primarily a stream of electrons and is accompanied by incandescent metal vapor.	*Electrical Engineering*
Arc Cutting	A group of cutting processes in which the severing or removing of metals is effected by melting with the heat of an arc between an electrode and the base metal (includes carbon, metal, gas metal, gas tungsten, plasma, and air carbon arc cutting). See also Oxygen Cutting.	*Maintenance and Repair*
Arc flash	An arc flash is caused by current flowing between two conducting surfaces and most commonly occurs in switchgear as a result of faulty equipment or poor work practices. Left unchecked, arc flashes release a tremendous amount of energy in a high-pressure blast of heat and debris, which can result in serious injuries to workers and damage to equipment.	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Arc of Action	Arc of the pitch circle through which a tooth travels from the first point of contact with the mating tooth to the point where contact ceases.	*Mechanical Engineering*
Arc of Approach	Arc of the pitch circle through which a tooth travels from the first point of contact with the mating tooth to the pitch point.	*Mechanical Engineering*
Arc of Recess	Arc of the pitch circle through which a tooth travels from its contact with the mating tooth at the pitch point to the point where its contact ceases.	*Mechanical Engineering*
Arc Shearer	a coal cutter that cuts at any required angle, but usually horizontally and/or vertically. (S. Staffs.).	*Mining*
Arc Welding	A group of welding processes in which coalescence is produced by heating with an electric arc or arcs, with or without the application of pressure and with or without the use of filler metal.3,4	*Maintenance and Repair*
Arc welding	A group of welding procedures that fuse metal pieces by melting them together, using heat from an electric arc between an electrode and the work piece. The arc is caused by electrical current flowing though plasma consisting of ionized air molecules and metal ions. Material from the electrode is transferred to the work piece, and the electrode is consumed over time. Arc-welding processes are attractive because of their low capital and running costs.	*Electrical*
Arc Wire Spraying	A thermal spray process where two electrically conducting wires are brought together to form an electric arc. Molten material formed in the arc is projected by a compressed gas stream towards the work piece to form a coating.	*Paint and Coatings*
Arch	A dam construction having the form of a barrel vault running vertically with its convex face toward the impounded water.	*Civil Engineering*
Arch dam	A dam resisting the pressure of impounded water by an arch principle, especially a dam having in plan the form of a single arch abutted by natural rock formations.	*Civil Engineering*
Arch girders or Arches	a length of 'H' rolled steel joist, bent to a semi-circular shape. Two or more sections would be fitted together by using bolts and fishplates to make up an arched shaped roof support for the roadways in a mine. - see also Rings.	*Mining*
Arched Truss	A truss having an archlike form but unlike a true arch in that it is free to move horizontally at its base, as in expanding or contracting because of temperature changes. A mixture of such substances with gravel, crushed rock, or the like, used for paving.	*Civil Engineering*
Arching	Fracture processes around a mine opening, leading to stabilization by an arching effect.	*Mining*
Arc-welding cell	The area of a factory set up to weld metals using electric arcs. ABB provides modular robotic arc-welding cells that are ready to install in a customer's plant.	*Electrical*
AREA	A surface enclosed by a specific boundary.	*Mechanical, Process, and Operations*
Area (of an airway)	Average width multiplied by average height of airway, expressed in square feet.	*Mining*
Area Load	The total amount of electricity being used at a given point in time by all consumers in a utility's service territory.	*Energy*
Area mining	practiced on relatively flat or gently rolling terrain and recovers coal by mining long strips successively; the material excavated from the strip being mined is deposited in the strip pit previously mined.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Area, Metallic	Sum of the cross-sectional areas of all the wires either in a wire rope or in a strand.	*Wire Rope & Cable*
Argentiferous	Bearing or producing silver.	*Mining*
Arginine NH2C(NH) NH(CH2)3CH(NH 2) COOH	Prisms crystallizing from water. A basic amino acid whose reaction with formaldehyde is being studied, especially by X-ray in the investigation of the formation of protein plastics such as casein plastics.	*Material Process*
Argon (Ar)	Monatomic noble gas, atomic number 18, one of the most inert elements. Commonly used as a plasma gas for plasma spraying and providing inert environments for many processes.	*Paint and Coatings*
Arhenius behavior	Having a property that follows the Arhenius equation.	*Material Process*
Arhenius equation	General expression for a thermally activated process.	*Material Process*
ARIMA	A refinement of ARMA, and better known as Box-Jenkins Technique (qv). (Autoregressive Integrated Moving Average)	*Quality*
Arithmetic mean	See Mean	*Quality Engineering*
Arles or Earles	a "golden handshake" or bounty paid to miners on joining to work in a mine in times of short supply of labor, binding the miner to that mine, pre 1844, (N. East).	*Mining*
Arm	A ray of an angle.	*Math*
ARMA (Autoregressive Moving Average)	A causal forecasting technique and the forerunner of ARIMA.	*Quality*
Armor	Mechanical protection usually accomplished by a metallic layer of tape, braid or served wires. Normally found only over the outer sheath.	*Electrical*
Armored Cable	A cable provided with a wrapping of metal, usually steel wires, flat tapes, or interlocked tapes, primarily for the purpose of mechanical protection.	*Electrical*
Armored Rope	Rope with individual strands spirally wrapped with flat steel wire.	*Wire Rope & Cable*
Armored Flexible Conveyor (AFC) or Snaking Conveyor	The A.F.C. was developed in Germany by the Gewerkschaft Eisenhutte Westfalia during W.W.2. A few units were tried out in Britain shortly after the war and by the sixties they were being installed on all the major longwall faces in Britain. Designed to carry a coal cutter, cutter-loader or to guide and hold a plough against the face. The A.F.C. is used on a prop free front and by using horizontal hydraulic rams, attached to powered supports, can be advanced (snaked over) behind the machine as it progresses along the face thereby preparing the face for the machine's immediate return run. The A.F.C. was also used on hand-filled faces. A heavy duty chain-type conveyor, the A.F.C. was nicknamed the 'Panzer' short for Panzerforderer by the miners.	*Mining*
Arms	upright props, also called 'uprights'.	*Mining*
Aroclor	Trade name for chlorinated diphenyls, ranging from oils to resins, and used as lacquer softeners and coating materials.	*Material Process*
aromatic	of or relating to organic compounds that resemble benzene in chemical behavior. These compounds are unsaturated and characterized by containing at least one 6-carbon benzene ring.	*Chemical*
Aromatic	Derived From, or characterized by, the presence of the benzene ring.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Aromatics	Aromatics, so called because of their distinctive perfumed smell, are a group of hydrocarbons including, mainly, benzene, toluene and the xylenes. These are basic chemicals used as starting materials for a wide range of consumer products. Almost all aromatics come from crude oil, although small quantities are made from coal.	*Chemical*
ARP	An acronym for Aeronautical Recommended Practice	*Lubrication*
Arrhenius Model	This is a model developed by the Swedish chemist Svante Arrhenius to show a relationship between absolute temperature and reliability in accelerated life testing.	*Reliability Engineering*
Arrhenius rate equation	Expression that relates the rate constant of a chemical reaction to the exponential of the temperature.	*Chemical*
Arse flap or Arse loop	a loop attached to the winding rope in which a man sat when carrying out repair work in the shaft. If it was fitted with a board to sit on it was known as an "arse flap" (Yorks), (N. East).	*Mining*
Artesian Well	A well deriving its water from a confined aquifer in which the water level stands above the ground surface; synonymous with flowing artesian well.	*Petroleum Engineering*
Articles of Association	Along with the Memorandum of Association (qv), one of the two key founding documents of a company, the Articles setting out internal company rules and regulations as they affect shareholders and directors.	*Quality*
Artifact	a historical object made by humans	*Agriculture*
artificial contaminant	must be added to the fluid to produce a given differential pressure across a filter at specified conditions. Used as an indication of relative service life.	*Mechanical, Process, and Operations*
Artificial Recharge	Recharge at a rate greater than natural, resulting from deliberate actions of man.	*Petroleum Engineering*
Artisan	signals that the product, whether cheese, bread, wine, etc., was hand crafted individually or in small batches. Artisan products frequently utilize traditional or indigenous methods.	*Agriculture*
AS	Ancillary Service	*Energy*
As is	A statement that the supplier of goods will not be responsible for the condition or quality thereof after the buyer receives them. Note importantly, that the statement has no legal effect unless it was agreed between the supplier and buyer beforehand at the time the contract was formed. In other words, "received as is" has no validity if it appears for the first time written on a delivery note.	*Quality*
As Low As Reasonably Practicable (ALARP)	Reasonably practicable involves weighing a risk against the trouble, time and money needed to control it. Thus, ALARP describes the level to which we expect to see workplace risks controlled.	*Reliability Engineering*
As received coal	Coal in the condition as received by the user.	*Energy*
AS/RS	Automated Storage & Retrieval System - a planned combination of materials handling devices and materials storage media forming a single integrated system. Depending on the vendor's specification, an AS/RS type might be a mini-load AS/RS; a unit load AS/RS; an order picking AS/RS; a human-aboard AS/RS; or an end-of-aisle AS/RS. The typical function of an AS/RS might be that a shuttle travels to the picking location to retrieve the items to be picked and delivers them to a station, a dispenser then dropping them into a container or onto a conveyor for eventual removal and dispatch.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
ASAE	American Society of Agricultural Engineers (sets standards for many hydraulic components for agricultural use).	*Mechanical, Process, and Operations*
ASAP	"as soon as possible" - office jargon.	*Quality*
Asbestine	An inert pigment consisting of a fibrous variety of talc, or magnesium silicate.	*Material Process*
Asbestos	A group of naturally occurring minerals that separate into long, thin fibers. Asbestos was used for many years to insulate and fireproof buildings. In the 1989 CBECS, information on asbestos in buildings was collected (Section R of the Buildings Questionnaire) for the U.S. Environmental Protection Agency (EPA). Asbestos treatment methods include removal, encapsulation or sealing, and enclosure behind a permanent barrier.	*Energy*
ASC	Accounting Standards Committee.	*Quality*
Ascensional ventilation or Antitropel ventilation	a system for ventilation in a mine in which the intake air is directed to the lowest point in the mine workings then ascends along the faces to the main return. The uphill flow of the air is assisted by it being heated as it travels along the faces and through the mine workings. This system is advantageous in gassy mines as firedamp also tends to flow upwards.	*Mining*
Ascertained Goods	Ascertained goods are a seller's stockholding of particular goods from which a buyer's order has already been picked or put to one side. That is, the goods have been identified and selected for sale. See also unascertained goods.	*Quality*
Ascertainment bias	See Detection bias	*Quality Engineering*
ASCII	American Standard Code for Information Interchange. A seven or eight bit code used to represent alphanumeric characters. It is the standard code used for communications between data processing systems and associated equipment.	*Electrical*
ASD	Auto spectral density. The measure of acceleration power per Hz of analysis bandwidth. Also known as Power spectral density, PSD. The square root of the area under the ASD curve is defined as the g RMS of acceleration.	*Reliability Engineering*
Aseptic, Aseptic Handling	Aseptic means "not liable to putrify, preventing putrefaction" (OED), hence aseptic handling in stores terminology means handling in a constant state of hygiene; when so handling, there must be a flawless level of air-tight, germ free sanitation. To achieve this, it is usually necessary to employ special plastic IBCs, which have been subject to stringent pre-treatment/cleaning. A popular aseptic vessel used in IBC aseptic handling is the 1000 liter 'Combo' from Schoeller Arca Systems.	*Quality*
Asexual reproduction	Reproduction or propagation that doesn't involve the union of gametes.	*Agriculture*
Asexual stage	Vegetative; without sexual organs or spores.	*Forestry*
Ash	Impurities consisting of silica, iron, alumina, and other noncombustible matter that are contained in coal. Ash increases the weight of coal, adds to the cost of handling, and can affect its burning characteristics Ash content is measured as a percent by weight of coal on an "as received" or a "dry" (moisture-free, usually part of a laboratory analysis) basis.	*Energy*
Ash	solid byproduct formed in the galvanizing process, consisting primarily of zinc oxides, that remains on the surface of the kettle; commonly referred to as "skimmings"	*Materials Process*
Ash (Sulfated)	The ash content of an oil, determined by charring the oil, treating the residue with sulfuric acid, and evaporating to dryness. Expressed as % by mass.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ash content	the percentage of incombustible material in coal. That portion of a laboratory sample remaining after heating under standard conditions to a constant weight, i.e. until all combustible matter as been burned away.	*Mining*
Ash inclusions	ash or skimmings carried out of the kettle on parts; ash inclusions remain solidified in the coating	*Materials Process*
Ashby-Style Charts	Heuristics used to provide a quick and simple means of looking at how different classes of materials tend to perform in terms of specific properties.	*Physics*
Ashing	The operation of cutting down a surface by means of a coarse abrasive, usually pumice, applied to a revolving cloth wheel.	*Material Process*
Asian-Pacific Americans	United States citizens whose origins are in Japan, China, the Philippines, Vietnam, Korea, Samoa, Guam, the U.S. Trust Territory of the Pacific Islands, (Republic of Palau), the Northern Mariana Islands, Laos, Kampuchea (Cambodia), Taiwan, Burma, Thailand, Malaysia, Indonesia, Singapore, Brunei, Republic of the Marshall Islands, the Federated States of Micronesia, Macao, Hong Kong, Fiji, Tonga, Kiribati, Tuvalu, or Nauru.	*Procurement*
ASLE	American Society of Lubrication Engineers. Changed now to Society of Tribologist and Lubrication Engineers (STLE).	*Oil Analysis*
ASME	American Society of Mechanical Engineers.	*General*
ASME Boiler and Pressure Vessel Code	which is referenced for many aspects of valve making, although not for the valves themselves.	*Mechanical*
ASN	Advance Shipping Notice, or Advance Shipping Notification. An Advice Note (qv)—a document sent either electronically or by some other means to a customer informing him that actual dispatch of an accepted order has commenced. The data on an ASN will typically include the customer order number and purchase order number, and, for the goods dispatched, SKU/product code numbers and quantities, lot numbers, pallet/container numbers, and carton numbers. A slightly risky means available to the customer for updating his records is to enter data direct from the ASN, and "backflush" the data automatically when the shipment is actually received.	*Quality*
Aspect Ratio	The dimensional relationship between tire section height and section width; section height divided by section width.	*Mechanical Engineering*
Aspect Ratio	The dimensional relationship between tire section height and section width; section	*Mechanical Engineering*
Asperities	Microscopic projections on metal surfaces resulting from normal surface-finishing processes. Interference between opposing asperities in sliding or rolling applications is a source of friction, and can lead to metal welding and scoring. Ideally, the lubricating film between two moving surfaces should be thicker than the combined height of the opposing asperities.	*Oil Analysis*
Asphalt	A dark brown-to-black cement-like material obtained by petroleum processing and containing bitumens as the predominant component; used primarily for road construction. It includes crude asphalt as well as the following finished products: cements, fluxes, the asphalt content of emulsions (exclusive of water), and petroleum distillates blended with asphalt to make cutback asphalts. Note: The conversion factor for asphalt is 5.5 barrels per short ton.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Asphalt (refined)	See Asphalt.	*Energy*
Asphaltenes	The asphalt compounds soluble in carbon disulfide but insoluble in paraffin naphthas.	*Petroleum Engineering*
ASR	See: Accident Severity Rate	*Industrial Relations*
As-received condition or as-received basis (coal)	Coal in the condition as received by the consumer or the laboratory analyzing the coal.	*Energy*
ass	Small, long-eared mammal and related to the horse; especially those of African origin that are ancestors of the donkey. Sometimes used as a synonym for donkey, but this is not technically accurate.	*Agriculture*
Assay	To test ores or minerals by chemical or other methods for the purpose of determining the amount of valuable metals contained.	*Mining*
Assay foot (meter, inch, centimeter)	The assay value multiplied by the number of feet, meters, inches, centimeters across which the sample is taken.	*Mining*
Assay map	Plan view of an area indicating assay values and locations of all samples taken on the property.	*Mining*
Assayed control material	A control solution or control material for which the manufacturer has measured the values expected for different tests and different methods. These "bottle values" are summarized on assay sheets and are useful for selecting control materials, however, they should not generally be used for setting the control limits because these values usually include a between-laboratory component of variation that makes the control limits too wide for use in an individual laboratory.	*Quality*
Assaying	Finding the percentage of a given metal in ore or bullion.	*Mining*
Assembler	A program that translates assembly language instructions into machine language instructions.	*Electrical*
Assembler	A program that translates assembly language instructions into machine language instructions.	*Electronic Process*
Assemble-to-Order	See two-level master scheduling.	*Quality*
Assemblies	the fitting together of manufactured parts into a complete structure, machine, or unit of a machine; assemblies sometimes require specific design features in order to be optimally galvanized	*Materials Process*
Assembly	The joining together of two or more piping components by bolting, welding, caulking, brazing, soldering, cementing, or threading into their installed location as specified by the engineering design.	*Maintenance and Repair*
Assembly	Building up layers of vencer and glue for plywood construction, especially for low pressure forming.	*Material Process*
Assembly identifier	A unique string of alphanumeric characters that identifies an assembly, bundle, or canister for a specific reactor in which it has been irradiated.	*Energy*
Assembly Language	A machine oriented language in which mnemonics are used to represent each machine language instruction. Each CPU has its own specific assembly language.	*General*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Assembly type	Each assembly is characterized by a fabricator, rod-array size, and model type. An eight-digit assembly type code is assigned to each assembly type based on certain distinguishing characteristics, such as the number of rods per assembly, fuel rod diameter, cladding type, materials used in fabrication, and other design features.	*Energy*
Assessment/Audit	A process that attempts to quantify the actual status of a customer's maintenance system to identify opportunities for improvement.	*Maintenance*
Assessment work	The annual or biennial work performed on a mining claim (or claims), after claim location and before patent, to benefit or develop the claim and to protect it from relocation by third parties.	*Energy*
Assessment	Amount levied on capital stock.	*Mining*
Asset	An entity with monetary value. In maintenance context, an asset is commonly considered to be any component of a plant or its equipment. For example, compressors, gearboxes, etc. A motor is also an asset as it is a component of a larger manufacturing unit.	*Maintenance*
Asset (Current)	Assets which are expected to be turned into cash in due course, or consumed in the course of operations. Current assets are entered in the balance sheet in increasing order of liquidity (i.e., stocks, then debtors, then cash itself).	*Quality*
Asset (Fixed)	Buildings, land and equipment acquired by the company and which have a continuing use in its business. Fixed assets are entered in the balance sheet in descending order of permanence (i.e., land first, then buildings ...). Small items such as typewriters are usually omitted.	*Quality*
Asset (Intangible)	An asset having no physical existence but which is nevertheless identifiable and controllable - four examples of many are the ownership of licenses, patent rights, trademarks and brand names.	*Quality*
Asset (Monetary)	An asset having a stated, unequivocal value (e.g., cash and debts).	*Quality*
Asset (Non Monetary)	An asset which must be sold in the market, and therefore has a value that is not definite (its value depends on what the market will pay!).	*Quality*
Asset (Wasting)	A wasting or sinking asset is a fixed asset that is steadily declining in value, with no hope of recovery in its value. An example is a mine which is being gradually depleted of minerals as mining takes place.	*Quality*
Asset Efficiency Optimization (AEO®)	A key aspect of any world-class asset management program is a proactive, efficient work management process, designed to ensure the effective performance of maintenance on critical assets. To achieve maximum return on investment and maintain the greatest degree of productivity, it is pivotal that organizations have a process that effectively translates asset information to knowledge, and ultimately releases value from that knowledge. To help organizations achieve these goals, SKF offers Asset Efficiency Optimization (AEO), a management process designed to achieve maximum efficiency and effectiveness from work management activities focused on business goals for the facility. The AEO process encompasses four key elements: Strategy, Identification, Control and Execution. Within each of these elements, the coordination and participation of three essential facets within the organization — process, culture, and technology — is paramount to the overall impact of AEO.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Asset Integrity	Asset integrity is the fitness of an asset to be operated as intended, and to perform as intended, with an acceptable risk of failure over its service life.	*Maintenance*
Asset Integrity Management	This is a written scheme outlining the ability of an asset to perform its required function effectively and efficiently while protecting the health, safety and environment and the means of ensuring that the people, systems, processes and resources that deliver this level of integrity are in place, in use and will perform when required throughout the lifecycle of an asset.	*Reliability Engineering*
Asset Knowledge Science (AKS)	This is an SKF process of documenting asset knowledge relevant to monitoring and diagnosing asset anomalies. The process encompasses generic literature, OEM and SKF information, and asset unique details. The goal is to provide a structure to justify which measurements are needed to detect and diagnose failures in an early stadium. The AKS is used to tune an SKF decision-support system called @ptitudeTM.	*Reliability Engineering*
Asset management	Also referred to as industrial and plant asset management. Asset management systems collect and manage data on the condition and availability of major plant equipment in discrete and process manufacturing plants. This enables plant operators to plan maintenance schedules more effectively (condition-based maintenance), avoiding both unnecessary equipment inspections and unexpected breakdowns, which can cause expensive interruptions in production time. Computerized asset management systems gather data in real-time to ensure maximum production uptime and throughput, with a minimum of human interaction.	*Electrical*
Asset Management	A process that oversees the cradle-to-grave status of key plant-floor machinery. It involves the acquisition of such equipment, along with their use, function and ultimate disposal, in order to maximize their potential performance and longevity.	*Reliability Engineering*
Asset Performance Assessment (APA)	The process may be applied at a strategic or detailed level and to various levels of sophistication. An initial 'desk top' assessment may provide a broad first cut summary of asset performance after which the level of analysis may be increased. This permits further investigation of 'hot spots' where significant gaps exist between actual and targeted performance. Similarly, the approach recognizes that the production of asset strategies should provide agencies opportunities to increase the level of analysis depending on their business requirements and current asset management capability. Development of asset strategies for a site or portfolio should therefore include scope for continuous improvement.	*Reliability Engineering*
Asset Register	In maintenance this term usually refers to a formal, structured listing of the plant and machinery at a given location.	*Maintenance*
Asset turnover	A measure of how efficiently assets are used to produce sales. The ratio shows how many dollars of sales were generated by each dollar of assets. Calculate by dividing net sales by average total assets.	*Quality*
Asset turns	A measure of company performance, defined as (sales revenue)/(total assets). Thus with sales of $25m and total assets of $5m, asset turns are 5.0. Also see stock turns. The reasonable contention that the forces which lead buyers in the marketplace to purchase goods are rationally based, although liable to change. The rational behavior of buyers, the assumption of the constancy, stands behind the validity of sales forecasting (and much else).	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Asset Utilization	Percentage of time a plant or equipment is operating at maximum demonstrated production rate, with perfect quality and defined yield.	*Maintenance*
Asset Utilization	A metric determined by multiplying Availability x Rate x Quality.	*Reliability Engineering*
Assignment Clause	A source of variation in a process that can be isolated, especially when its significantly larger magnitude or different origin readily distinguishes it from random cause of variation. Synonym - special cause.	*Maintenance*
Assistance for heating in winter	Assistance from the Low-Income Home Energy Assistance Program (LIHEAP). The purpose of LIHEAP is to assist eligible households to meet the costs of home energy, i.e., a source of heating or cooling residential buildings.	*Energy*
Assistance for weatherization of residence	The household received services free, or at a reduced cost, from the Federal, State, or local Government. Any of the following services could have been received: * Insulation in the attic, outside wall, or basement/crawlspace below the floor of the house * Insulation around the hot water heater * Repair of broken windows or doors to keep out the cold or hot weather * Weather stripping or caulking around any windows or doors to the outside * Storm doors or windows added * Repair of broken furnace * Furnace tune-up and/or modifications * Other home energy-saving devices.	*Energy*
Associated natural gas	**Associated natural gas:** See Associated-dissolved natural gas and Natural gas.	*Energy*
Associated-dissolved natural gas	Natural gas that occurs in crude oil reservoirs either as free gas (associated) or as gas in solution with crude oil (dissolved gas). Also see Natural gas.	*Energy*
Association	Statistical dependence between two or more events, characteristics, or other variables. An association may be fortuitous or may be produced by various other circumstances; the presence of an association does not necessarily imply a causal relationship.	*Analysis*
Assurance level	The minimum percentage of pressure containing devices of a verified design that will sustain 10 million applications of its Rated Fatigue Pressure.	*Mechanical, Process, and Operations*
A-stage resins	Uncured, thermosetting resins. They are soluble and fusible. Form of resin used for impregnation.	*Material Process*
Asthenosphere	The layer or shell of the earth below the lithosphere which is weak and in which isostatic adjustment takes place, magmas may be generated, and seismic waves are strongly attenuated.	*Petroleum Engineering*
ASTM	American Society for Testing and Materials.	*Electronic Process*
ASTM	American Society of Testing and Materials	*Materials Process*
ASTM D2670 Pin and V-Block Test	ASTM Test Method D2670 is for measuring the antiwear properties of liquid lubricants. The load is applied to the jaws and maintained by a toothed wheel. The wear is a function of the number of the tooth which needs to be engaged to keep the load constant for a fixed time.	*Lubrication*
ASTM D5302 Sequence VE	ASTM Test Method D 5302, the Sequence VE gasoline engine test, has been correlated with vehicles used in stop-and-go service prior to 1988, particularly with regard to sludge and valve train wear.	*Lubrication*
ASTM D5533 Sequence IIIF	ASTM Test Method D 5533, the Sequence IIIE gasoline engine test, has been correlated with vehicles used in high-temperature service prior to 1988, particularly with regard to oil thickening and valve train wear.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	Industry
Asymmetry Potential	The potential developed across the glass membrane with identical solutions on both sides. Also a term used when comparing glass electrode potential in pH 7 buffer.	*General Engineering*
Asymptote	a line that is considered to be the limit to a curve. As the curve approaches the asymptote, the distance separating the curve and the asymptote continues to decrease, but the curve never actually intersects the asymptote.	*Chemical*
Asynchronous	A communication method where data is sent when it is ready without being referenced to a timing clock, rather than waiting until the receiver signals that it is ready to receive.	*Electrical*
Asynchronous machines	**Asynchronous machines—**See Machines	*Electrical*
at wt	The abbreviation for atomic weight.	*Energy*
AT&T	American Telephone & Telegraph Co. Inc., with headquarters in New Jersey, affectionately known as Ma Bell.	*Quality*
ATA	American Trucking Association	*Petro-Chemical Abbreviations*
Atactic Irregular	Atactic Irregular alteration of side groups along a polymeric molecule.	*Material Process*
ATC	Automatic temperature compensation.	*Electrical*
ATD	Allison Transmission Division of GM	*Petro-Chemical Abbreviations*
ATF	automatic transmission fluid	*Petro-Chemical Abbreviations*
ATI	Average Total Inspection. A term used in quality and acceptance sampling to gauge the financial effectiveness, to the recipient of goods, of a sampling/acceptance procedure. The ATI is defined as the sum of two costs: (1) the cost of the required inspection of the sample taken of the incoming parts, and (2) the cost of the required inspection of incoming lots that have been rejected by the sample plan, even though their quality was at the level of quality agreed as being satisfactory. As far as cost (2) is concerned, the possibility of rejecting incoming lots which prove on later 100% inspection to be satisfactory is inherent in the very activity of sampling. Clearly, however, the lower this possibility, the better the sampling plan and methodology. Cost (2) cannot be completely eliminated except through 100% inspection of incoming parts. However, cost (2) can be reduced in some sampling methodologies if larger samples are taken—i.e., if cost (1) is increased. For superior, effective sampling, a balance should be found such that the total of cost (1) and cost (2) is minimized. Perhaps a more popular measure than ATI is AFI, Average Fraction Inspected. This is defined as ATI/N, where N is the number of the incoming items.	*Quality*
ATIEL	Association Technique de I'Industrie Européenne des Lubrifiants (European Oil Marketers Association)	*Petro-Chemical Abbreviations*
atm	Atmosphere	*Lubrication*
Atmosphere	a surrounding influence or environment that affects the rate of corrosion; frequency and amount of moisture, humidity, chlorides, sulfides, and wind are some of the atmospheric components affecting corrosion rates	*Materials Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Atmosphere (one)	A pressure measure equal to 14.7 psi.	*Mechanical, Process, and Operations*
Atmosphere, Technical	A unit of pressure used in Germany and equal to 1 Kp/cm2 (kilopound per square centimeter), approximately equal to 14.2 psig.	*Mechanical, Process, and Operations*
Atmospheric crude oil distillation	The refining process of separating crude oil components at atmospheric pressure by heating to temperatures of about 600 degrees to 750 degrees Fahrenheit (depending on the nature of the crude oil and desired products) and subsequent condensing of the fractions by cooling.	*Energy*
Atmospheric Pressure	The pressure exerted by the atmosphere.	*Industrial Engineering*
Atmospheric pressure	The external pressure exerted on a body by the atmosphere—14.7 psi (absolute) at sea level.	*Mechanical*
Atmospheric tower	One in which air movement through the tower is dependent upon atmospheric conditions, not induced by mechanical fans.	*Facility Engineering*
ATO	Assemble to Order.	*Quality*
Atom	Atom is the basic building block of chemistry. Atoms, also called chemical elements, can combine with one another to form compound. It is the smallest unit of matter that cannot be decomposed into simpler substances by ordinary chemical processes.	*Chemical*
Atomic absorption spectroscopy	Measures the radiation absorbed by chemically unbound atoms by analyzing the transmitted energy relative to the incident energy at each frequency. The procedure consists of diluting the fluid sample with methyl isobutyl ketone (MIBK) and directly aspirating the solution. The actual process of atomization involves reducing the solution to a fine spray, dissolving it, and finally vaporizing it with a flame. The vaporization of the metal particles depends upon their time in the flame, the flame temperature, and the composition of the flame gas. The spectrum occurs because atoms in the vapor state can absorb radiation at certain well-defined characteristic wave lengths. The wave length bands absorbed are very narrow and differ for each element. In addition, the absorption of radiant energy by electronic transitions from ground to excited state is essentially and absolute measure of the number of atoms in the flame and is, therefore, the concentration of the element in a sample.	*Oil Analysis*
Atomic force microscope (AFM)	A derivative of the scanning tunneling microscope in which a small force, rather than an electrical current, is used to trace out an image of the structure of the surface of the material.	*Material Process*
Atomic Mass	Mass of an individual atom expressed in atomic mass units.	*Material Process*
Atomic mass unit (AMU)	Equal to 1.66×10^{-24} g. Approximately equal to the mass of a proton or neutron.	*Material Process*
Atomic number	A number given to each element representing the number of protons in one atom of that element.	*Chemical Engineering*
Atomic packing factor (APF)	Fraction of unit cell volume occupied by atoms.	*Material Process*
Atomic radius	Distance from atomic nucleus to outermost electron orbital.	*Material Process*
Atomic resolution electron microscope	A refined version of the transmission electron microscope in which the packing arrangements of atoms in a thin sample can be imaged.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Atomic scale architecture	Structural arrangement of atoms in an engineering material.	*Material Process*
Atomic weight	Weight (in grams) of 6.02x1024 atoms of a particular element. The weight of an atom of any element compared with that of oxygen that is considered to be 16.	*Chemical Engineering*
Atomica	Atomica (formerly Guru.net) says, "The extent to which an experiment, test, or measuring procedure yields the same results on repeated trials." This definition is found in a number of dictionaries.	*Reliability Engineering*
Atomization	The dispersion of a molten material into particles by a rapidly moving gas or liquid stream or by mechanical dispersion.	*Paint and Coatings*
Atomized Powder	A powder produced by the dispersion of a molten material into particles by a rapidly moving gas or liquid stream or by mechanical dispersion.	*Paint and Coatings*
Atomization	The conversion of a liquid into a spray of very fine droplets.	*Lubrication*
ATP	See Available to Promise.	*Quality*
ATR	Automated Trouble Reporting.	*Quality*
Attapulgite Clay	A colloidal, viscosity-building clay consisting of hydrous magnesium aluminum silicates and used principally in saltwater drilling fluids.	*Petroleum Engineering*
Attenuate	Reduce	*Reliability Engineering*
Attenuation	The loss or reduction of beam intensity as a result of environmental factors, dust, humidity, steam etc.	*Electrical Engineering*
attenuation	the reduction or lessening in amount (e.g., a reduction in the amount of contaminants in a plume as it migrates away from the source).	*Chemical*
Atterberg limits	the moisture contents which define a soil's liquid limit, plastic limit, and sticky limit.	*Chemical*
Attribute Control Chart	In quality and SPC, an "attribute" is a particular undesirable quality characteristic such as a blemish, spot, hole or crack in a manufactured object. One method of monitoring a manufacturing process with regard to the production of manufactured objects is to take a sample every so-often, and inspect each part for the presence of any undesirable quality attribute. (A sample of 50 parts might be taken.) The number of parts having one or more attributes is then plotted on a graph (the horizontal axis representing time, the vertical axis the percentage of parts with one or more undesirable quality attributes). See also Count Chart.	*Quality*
Attributes	Attributes are the outcomes by which the relative "goodness" of a particular expansion plan is measured e.g. fuel usage. Some attributes, such as fuel usage, are measured in well-defined parameters. Other attributes (e.g. public perception of a technology) are more subjective. Attributes may be grouped in several ways. Categories include financial, economic, performance, fuel usage, environmental, and socio-economic. The attributes chosen must measure issues that directly concern the utility and have an impact on its planning objectives. Limiting the number of attributes reduces the complexity and cost of a study.	*Energy*
Attrition	The loss of participants during the course of a study. (Also called loss to follow up.) Participants that are lost during the study are often call dropouts. Also called: Dropouts, Loss to follow up	*Quality Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Attrition bias	Systematic differences between comparison groups in withdrawals or exclusions of participants from the results of a study. For example, participants may drop out of a study because of side effects of an intervention, and excluding these participants from the analysis could result in an overestimate of the effectiveness of the intervention, especially when the proportion dropping out varies by treatment group.	*Quality Engineering*
ATU	ATU - See: Telephone Unions; Alliance of Independent (Ind)	*Industrial Relations*
AUA	AUA- See: Associated Unions of America (Ind)	*Industrial Relations*
Auctioneering Device	A device which automatically selects either the highest or the lowest input signal from among two or more input signals.	*Process Control*
Audit	This is a systematic approach to ascertain the actual status of compliance to laid down maintenance strategies to identify areas where improvement is necessary.	*Reliability Engineering*
Audit Trail	See Transaction Trail.	*Quality*
auger	a tool for drilling/boring into unconsolidated earth materials (soil) consisting of a spiral blade wound around a central stem or shaft that is commonly hollow (hollow-stem auger). Augers commonly are available in flights (sections) that are connected together to advance the depth of the borehole.	*Chemical*
Auger electron	Secondary electron with a characteristic energy providing a basis for chemical identification.	*Material Process*
Auger mine	A surface mine in which the coal bed is removed by means of a large diameter drill. Usually operated only when the overburden becomes too thick for economical strip mining.	*Energy*
Auger mining	recovers coal through the use of a large-diameter drill driven into a coal bed in the side of a surface mine pit. It usually follows contour surface mining, particularly when the overburden is too costly to excavate.	*Energy*
Auger	A rotary drill that uses a screw device to penetrate, break, and then transport the drilled material (coal).	*Mining*
Austempering Heat treatment	Heat treatment of a steel involving holding just above the martensitic transformation range long enough to completely form bainite.	*Material Process*
Austenite	Face centered cubic (g) phase of iron or steel.	*Material Process*
Austenitic stainless steel	The common stainless steel, where the primary microstructure is austenite and the composition primarily iron but also includes both chromium and nickel. The steels are designated as 300 series such as 304, 316, CF8M, etc.	*General Mechanical*
Austenitic stainless steel	The common stainless steel, where the primary micro structure is austenite and the composition primarily iron but also includes both chromium and nickel. The steels are designated as 300 series such as 304, 316, CF8M, etc.	*Mechanical*
Autarky	Self sufficiency (see Industrial Autarky).	*Quality*
Author/Reviewer	See Reviewer/Author	*Quality Engineering*
Authorized capital	**Authorized capital** - see capital stock.	*Mining*
Authorized cash distribution to municipality	The authorized cash distributions to the municipality from the earned surplus of the utility department.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Auto Mode	In auto mode the controller calculates the output based its calculation using the error signal (difference between setpoint and PV). See Mode.	*Process Control*
Auto Shutdown	A feature in EIA-232 interface devices which puts the IC into a low-power shut-down mode when no signal is present on the EIA-232 bus.	*Electrical Engineering*
Auto spectrum (power spectrum)	A spectral display of the power (voltage squared) at each frequency. Phase is ignored.	*Reliability Engineering*
Auto Zeroing Technique	A method used to automatically set the null point on a pressure sensor. This is usually done by using a microprocessor to open a solenoid valve at a predeter-mined time interval. This references atmospheric pressure to both sides of the pressure sensor chip. The microprocessor reads the output voltage and makes that the new null point. This method is used to eliminate errors due to null offset and null temperature shift.	*Electrical Engineering*
Autoclave	An apparatus for heating materials under high pressure.	*Material Process*
Autoclaving	The production of a stable, protective oxide on steel parts by treatment in a pressurized, high temperature steam containing atmosphere.	*Paint and Coatings*
Autodiscriminate	Ability for one bar code reader to interpret several different codes.	*Gears*
Autoecious	Completing entire life cycle on one host; especially applied to the rust fungi.	*Forestry*
Autogenous grinding	The process of grinding in a rotating mill which uses as a grinding medium large pieces or pebbles of the ore being ground, instead of conventional steel balls or rods.	*Mining*
Autogenous grinding	The process of grinding ore in a rotating cylinder using large pieces of the ore instead of conventional steel balls or rods.	*Mining*
Auto-guided directional drilling	same as automated directional drilling.	*Petroleum Drilling*
AutoID	Automatic Identification Technology ... bar codes, RFID and contact memory buttons.	*Quality*
Autoignition	Minimum temperature which a substance must be heated without application of flame or spark to cause substance to ignite.	*Lubrication*
Autoignition temperature	the temperature at which a substance will spontaneously ignite. Autoignition temperature is an indicator of thermal stability for petroleum hydrocarbons.	*Chemical*
Autolok Nut	A torque prevailing nut of an all metal construction. Covered by UK patent 1180842 the nut is marketed by GKN Screws and Fasteners Limited.	*Maintenance*
Automated directional drilling	directional drilling with a system possessing a drilling mode whereby "tool settings" are automatically determined by system software, and frequently and automatically changed/controlled by system hardware, while drilling. The system controller software addresses angular deviation AND lineal deviation, and only requires specification of the actual and current planned well path trajectories. Thus, the system controller software temporarily assumes the role of a traditional directional driller. Current systems, like Baker Hughes Inteq's AutoTrak, can only attempt to automatically control angular deviation in "hold mode" and otherwise requires manual "steer mode" to attempt to control lineal deviation. In other words, their system automatically tries to be "on inclination" but not necessarily also "on depth."	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Automated Storage/ Retrieval Systems (AS/RS)	A combination of equipment and controls which handles, stores, and retrieves materials with precision, accuracy, and speed under a defined degree of automation.	*Equipment*
Automatic Climate Control	Heating and air conditioning system that adjusts itself as needed, to maintain a pre-set temperature.	*Mechanical Engineering*
Automatic count	A particle count obtained by an electromechanical or electronic device as opposed to visual microscopic counting technique.	*Mechanical, Process, and Operations*
Automatic Locking Front Hubs	Found in some four-wheel drive vehicles, this allows the driver to engage, or "lock," the front axle hubs without leaving the vehicle.	*Mechanical Engineering*
Automatic Locking Front Hubs	Found in some four-wheel drive vehicles, this allows the driver to engage, or "lock," the front axle hubs without leaving the vehicle.	*Mechanical Engineering*
Automatic Meter Reading	A system installed to read a utility meter remotely.	*Electrical Engineering*
Automatic Power Control	Feature in laser drivers (such as the MAX3669) that uses feedback from the laser to adjust the drive, to keep the laser's output constant.	*Electrical Engineering*
Automatic Reset	1. A feature on a limit controller that automatically resets the controller when the controlled temperature returns to within the limit bandwidth set. 2. The integral function on a PID controller which adjusts the proportional bandwidth with respect to the set point to compensate for droop in the circuit, i.e., adjusts the controlled temperature to a set point after the system stabilizes.	*Electrical*
Automatic set-back or clock thermostat	A thermostat that can be set to turn the heating/cooling system off and on at certain predetermined times.	*Energy*
Automatic Transmission Fluid (ATF)	Fluid for automatic, hydraulic transmissions in motor vehicles.	*Lubrication*
Automatic Transmission With Manual-Shift Capability	Allows manual gear changes, when desired, in an automatic transmission. Functions as a traditional automatic transmission when left in Drive, but includes a slot in which the shift lever can be moved to change gears manually. Sometimes, buttons for shifting manually through the gears are located on the steering wheel. This affords some of the advantages of a manual transmission, such as greater control of engine speed for better throttle response, but eliminates the need for a clutch pedal.	*Mechanical Engineering*
Automatic Welding	Welding with equipment which performs the entire welding operation without constant observation and adjustment of the controls by an operator. The equipment may or may not perform the loading and unloading of the work.	*Maintenance and Repair*
Automobile and truck classifications	Vehicle classifications for automobiles and light duty trucks were obtained from the EPA (Environmental Protection Agency) mileage guide book. Almost every year there are small changes in the classifications, therefore the categories will change accordingly. The EPA mileage guide can be found at any new car dealership.	*Energy*
Autonomous Maintenance	Operators in independent groups carry out routine maintenance and preventive maintenance. These groups, which may include maintenance workers, solve problems without management intervention. The maintenance department is only called on for bigger problems that require more resources, technology, or downtime.	*Maintenance*
Autonomous Maintenance	Maintenance that is performed by the machine operator/operations crew/production department rather than the maintenance staff. It generally includes tasks such as lubricating and tightening machine parts, and changing filters or belts.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Autoranging	The capability of an instrument to switch among ranges automatically. The ranges usually are in decade steps.	*Reliability Engineering*
Autoshutdown Plus	A feature in EIA-232 interface devices which puts the IC into a low-power shutdown mode when no signal is present on the bus or the transmitter inputs.	*Electrical Engineering*
Autotransformer	An autotransformer is a transformer that uses a common winding for both the primary and secondary windings. Essentially an inductor with a center-tap, an autotransformer is often used in power-supply boost-converter applications to achieve a higher output voltage, while limiting the peak flyback voltage seen by the power switch.	*Electrical Engineering*
Autotrophic	designating or typical of organisms that derive carbon for the manufacture of cell mass from inorganic carbon (carbon dioxide).	*Chemical*
Auto-Zero	An automatic internal correction for offsets and/or drift at zero voltage input.	*Electrical*
AUV	Annual usage value, qv. See also DGR.	*Quality*
Auxiliary Actuator	A mechanism, sold separately, to provide basic switches with easier means of operation and adjustment and adapt switches to different operating motions by supplying supplemental overtravel.	*Electrical Engineering*
Auxiliary generator	A generator at the electric plant site that provides power for the operation of the electrical generating equipment itself, including related demands such as plant lighting, during periods when the electric plant is not operating and power is unavailable from the grid. A black start generator used to start main central station generators is considered to be an auxiliary generator.	*Energy*
Auxiliary operations	All activities supportive of but not contributing directly to mining.	*Mining*
Auxiliary ventilation	Portion of main ventilating current directed to face of dead end entry by means of an auxiliary fan and tubing.	*Mining*
Auxiliary fan	A fan used in conjunction with air ducting to increase the ventilation to a section of the mine.	*Mining*
AV	Audio Visual.	*Quality*
AVA	AVA - See: American Vocational Association	*Industrial Relations*
Availability	Availability is the probability that a system or component is performing its required function at a given point in time, or over a stated period of time when operated and maintained in a prescribed manner. In other words, the proportion of total time that an item of equipment is capable of performing its specified functions. By taking different measures for uptime and downtime, different availability measures are obtained.	*Maintenance*
Availability	The ratio of the total time that a functional unit is capable of being used during a given interval.	*Reliability Engineering*
Availability (Achieved)	In the definition of achieved availability, the mean time between maintenance (MTBM) is used as measure of uptime. This mean time between maintenance includes both unplanned and planned maintenance. The mean (expected) system downtime includes unplanned and planned (preventive/predictive) maintenance, but does not include supply or maintenance resources delays. Achieved (equipment) availability fulfills the need to distinguish availability when planned maintenance shutdowns are included, whereby it assumes zero supply and maintenance resources delay times.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Availability (Inherent)	Inherent availability is defined as MTBF / (MTBF + MTTR). Availability increases by increasing reliability (MTBF) and maintainability (1/ MTTR). For example: MTBF = 1000 hours, MTTR = 48 hours. Then the availability is 1000/ 1048 = 95%. The inherent availability is solely based on the failure distribution and repair-time distribution, assuming no supply and maintenance delays, and no planned (preventive / corrective) maintenance. It is considered as an equipment design parameter. Inherent availability fulfills the need to distinguish expected performance between planned shutdowns.	*Reliability Engineering*
Availability (of a Machine)	Usually defined as (loading time - down time) / loading time. Synonymous with uptime.	*Quality*
Availability (Operational)	Similar to achieved availability, but in the operational availability also the supply and maintenance resource delays are included in the mean system downtime. Operational availability is required to isolate the total effectiveness and efficiency of maintenance operations. The mean time between maintenance and the mean system downtime can be measured in both "clock" or "calendar" time. Clock time is scheduled operating time, or "manned hours." When measuring in calendar time, the term generalized operational availability is sometimes used. By definition, inherent availability is higher or equal to achieved availability, and achieved availability is higher or equal to operational availability.	*Maintenance*
Available but not Needed Capability	Capability of generating units that are operable but not necessary to carry load.	*Energy*
Available Hours	The total number of hours that a piece of equipment is capable of performing its specified functions. It is equal to the total hours in any given period minus all the downtime hours.	*Maintenance*
Available-to-Promise	It is essential, if customer orders are to be delivered on the dates promised, that such orders do not exceed the company's commitment to future manufacture (i.e., do not exceed the company's declared master schedule. To ensure that this is so, a portion of the available master schedule effort is allocated to each customer order as it is accepted. That portion of the master schedule effort which has not been so allocated remains "available to promise (to future customers)". See also Capacity Available to Promise, and Capable to Promise.	*Quality*
Avalanche Photo Diode	A photodiode designed to take advantage of avalanche multiplication of photocurrent to provide gain. As the reverse-bias voltage approaches the break-down voltage, hole-electron pairs created by absorbed photons acquire sufficient energy to create additional hole-electron pairs when they collide with ions. Thus a multiplication or signal gain is achieved.	*Electrical Engineering*
Average	Refer to a textbook on electrical engineering. In the exclusive case of a pure sine wave, the average value is zero.	*Reliability Engineering*
Average Absolute msAD	average absolute value of azimuthal deviation associated with real survey stations over the length of drill hole for which a THD log is created. A smaller value usually indicates better directional control performance.	*Petroleum Drilling*
Average Absolute msHD	average absolute value of horizontal deviation associated with real survey stations over the length of drill hole for which a THD log is created. A smaller value usually indicates better directional control performance.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Average Absolute msID	average absolute value of inclinational deviation associated with real survey stations over the length of drill hole for which a THD log is created. A smaller value usually indicates better directional control performance.	*Petroleum Drilling*
Average Absolute msVD	average absolute value of vertical deviation associated with real survey stations over the length of drill hole for which a THD log is created. A smaller value usually indicates better directional control performance.	*Petroleum Drilling*
Average Annual Percent Change (Coal)	The average annual percent change over a period of several years that is calculated by taking the nth root [where n is the number of years in the period of interest] of the result of the current year's value divided by the value of the first year of the period; this result then has 1 (one) subtracted from it and that result is then multiplied by 100.	*Energy*
Average Cost	The revenue requirement of a utility divided by the utility's sales. Average cost typically includes the costs of existing power plants, transmission, and distribution lines, and other facilities used by a utility to serve its customers. It also includes operations and maintenance, tax, and fuel expenses.	*Energy*
Average daily production	The ratio of the total production at a mining operation to the total number of production days worked at the operation.	*Energy*
Average delivered price	The weighted average of all contract price commitments and market price settlements in a delivery year.	*Energy*
Average Demand	The energy demand in a given geographical area over a period of time. For example, the number of kilowatt-hours used in a 24-hour period, divided by 24, tells the average demand for that period.	*Energy*
Average household energy expenditures	A ratio estimate defined as the total household energy expenditures divided by the total number of households.	*Energy*
Average Life	How long, on average, a component lasts before it suffers a failure. Average life is commonly measured by Mean Time Between Failures (MTBF), and is usually expressed in hours.	*Maintenance*
Average mine price	The ratio of the total value of the coal produced at the mine to the total production tonnage.	*Energy*
Average Number of Employees (coal)	The average number of employees working in a specific year at coal mines and preparation plants. Includes maintenance, office, as well as production-related employees.	*Energy*
Average Open Market Sales Price (coal)	The ratio, for a specified time period, of the total value of the open market sales of coal produced at the mine to the value of the total open market sales tonnage.	*Energy*
Average production per miner per day	The product of the average production per miner per hour at a mining operation and the average length of a production shift at the operation.	*Energy*
Average production per miner per hour	The ratio of the total production at a mining operation to the total direct labor hours worked at the operation.	*Energy*
Average Recovery Percentage (coal)	The percentage of coal that can be recovered from known coal reserves at reporting mines, weight averaged for all mines in the reported geographic area.	*Energy*
Average Responding	A measurement proportional to the average of the absolute values of all input waveforms within a specified frequency range.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Average Revenue per Kilowatt hour	The average revenue per kilowatt-hour of electricity sold by sector (residential, commercial, industrial, or other) and geographic area (State, Census division, and national) is calculated by dividing the total monthly revenue by the corresponding total monthly sales for each sector and geographic area.	*Energy*
Average revenue per kilowatt hour	The average revenue per kilowatt hour of electricity sold by sector (residential, commercial, industrial, or other) and geographic area (State, Census division, and national) is calculated by dividing the total monthly revenue by the corresponding total monthly sales for each sector and geographic area.	*Energy*
Average Revenue per Kilowatt-hour	Revenue by sector and geographic area calculated by dividing the monthly revenue by monthly sales.	*Energy*
Average stream flow	feet per second, at which water passes a given point in a stream over a set period of time.	*Energy*
Average Total Inspected	See ATI.	*Quality*
Average vehicle fuel consumption	A ratio estimate defined as total gallons of fuel consumed by all vehicles divided by (1) the total number of vehicles (for average fuel consumption per vehicle) or (2) the total number of households (for average fuel consumption per household).	*Energy*
Average vehicle miles traveled	A ratio estimate defined as total miles traveled by all vehicles, divided by: (1) the total number of vehicles (for average miles traveled per vehicle) or (2) the total number of households (for average miles traveled per household).	*Energy*
Average water conditions	The amount and distribution of precipitation within a drainage basin and the run off conditions present as determined by reviewing the area water supply records over a long period of time.	*Energy*
Averaging	Summing and suitably dividing several like measurements to improve accuracy or to lessen the effect of any asynchronous components.	*Reliability Engineering*
Aviation gasoline (finished)	A complex mixture of relatively volatile hydrocarbons with or without small quantities of additives, blended to form a fuel suitable for use in aviation reciprocating engines. Fuel specifications are provided in ASTM Specification D 910 and Military Specification MIL-G-5572. Note: Data on blending components are not counted in data on finished aviation gasoline.	*Energy*
Aviation gasoline blending components	Naphthas that will be used for blending or compounding into finished aviation gasoline (e.g., straight run gasoline, alkylate, reformate, benzene, toluene, and xylene). Excludes oxygenates (alcohols, ethers), butane, and pentanes plus. Oxygenates are reported as other hydrocarbons, hydrogen, and oxygenates.	*Energy*
Avogadro's number	Equal to the number of atomic mass units per gram of material (= 0.6023 1024).	*Material Process*
Avoided Cost	The cost to the utility if it had generated or otherwise purchased the power. It is a benchmark price for energy services, used to compare resource alternatives. Avoided cost is the marginal long-term or short-term production cost that could be avoided by an alternative supply-side or demand-side resource. In many states, avoided cost rates have been used as the power purchase price offered to independent suppliers (co-generators).	*Energy*

Term	Definition	*Industry*
Avoided Costs	These are costs that a utility avoids by purchasing power from an independent producer rather than generating power themselves, purchasing power from another source or constructing new power plants. A Public Utility Commission calculates avoided costs for each utility, and these costs are the basis upon which independent power producers are paid for the electricity they produce. There are two parts to an avoided cost calculation: the avoided capacity cost of constructing new power plants and the avoided energy cost of fuel and operating and maintaining utility power plants.	*Energy*
AW	anti-wear	*Mechanical*
AWD	all-wheel drive	*Mechanical*
A-weighting	Emphasis given by filtering to sound measurements with the goal of compensating for the non-flat frequency response of human hearing, in order to get numbers approximating human response. See Equal Loudness Curves.	*Reliability Engineering*
AWG	American Wire Gage.	*Electronic Process*
AWG	Abbreviation for American Wire Gage, a standard system used for designating wire diameter. Also referred to as the Brown and Sharpe (B&S) wire gage.	*Electrical*
Awn	a cleavage or cleat in the coal at 45° to the main and butt cleats. The 'long awn' and 'short awn' are intermediate cleat directions, nearer respectively to the 'bord' and 'end' directions, i.e. < and > 45° to the main cleat.	*Mining*
AWS	American Welding Society—A society which sets guidelines and standards for all welds.	*Mechanical*
AWU	AWU - See: Aluminum Workers International Union (AFL-CIO)	*Industrial Relations*
AWWA Ratings	The American Water Works Association (AWWA) publishes standards and specifications, which are used to design and install water pipelines and distribution system piping. The ratings used may be in accordance with the flange ratings of AWWA C207, Steel Pipe Flanges; or the rating could be based upon the rating of the joints used in the piping.	*Maintenance and Repair*
AWWU	AWWU - See: Watch Workers Union; American (Ind)	*Industrial Relations*
Axial	Along the centerline of a shaft.	*Reliability Engineering*
Axial (thrust) position	Change in a rotor's position or displacement along its axis, relative to some nearby fixed point.	*Reliability Engineering*
Axial force	A system of internal forces whose resultant is a force acting along the longitudinal axis of a structural member or assembly.	*Engineering Physics*
Axial Plane	In a pair of gears it is the plane that contains the two axes. In a single gear, it may be any plane containing the axis and a given point.	*Gears*
Axial-load bearing	A bearing in which the load acts in the direction of the axis of rotation.	*Oil Analysis*
Axis of Rotation (Spin Axis)	The axis of rotation (spin axis) is that straight line about which a body rotates.	*General*
Axle	A non-rotating shaft on which wheels or rollers are mounted.	*Mechanical*
Axle Ratio	The ratio between the rotational speed (RPM) of the drive shaft and that of the driven wheel. Gear reduction in final drive is determined by dividing the number of teeth on the ring gear by the number of teeth on the pinion gear.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ayrshire	A breed of dairy cattle that originated in the County of Ayr in Scotland, prior to 1800. They may be any shade of red or white. The first Ayrshires arrived in America about 1822.	*Agriculture*
Ayshire	Brown Swiss, Guernsey , Holstein-Friesian, Jersey	*Agriculture*
az	Azimuth	*Civil Engineering*
AZA	American Zinc Association	*Materials Process*
Azeotrope	A specific mixture of components, which at a given pressure cannot be separated by distillation, i.e. the liquid and vapor phases have the same compositions.	*Chemical*
Azi*	planned well bore azimuth at MD*. (degrees)	*Petroleum Drilling*
Azimuth	A surveying term that references the angle measured clockwise from any meridian (the established line of reference). The bearing is used to designate direction. The bearing of a line is the acute horizontal angle between the meridian and the line.	*Mining*
Azimuthal deviation	the difference in azimuth between actual and planned well paths, typically at a specific measured depth. Same as msAD.	*Petroleum Drilling*
Azipod	The registered trademark of a family of modular electric propulsion systems for ships, the first of which was co-developed by ABB in the 1980s. The Azipod unit is fitted to the ship's hull externally in a pod, or casing, and combines the functions of a propulsion motor, main propeller, rudder and stern thruster. Since these functions are no longer installed as separate units inside the ship, space onboard can be used for other purposes. Azipod units also contribute to improved hydrodynamics, which result in fuel savings of around 15 percent compared to conventional propulsion systems.	*Electrical*
Azo group	Azo group The structural grouping –N=N-. Many compounds characteristic of this group are useful as dyes.	*Material Process*
Azote	Azote, -see Afterdamp.	*Mining*
--B--	--B--	*Petroleum Drilling*
B Bel	Measurement of a signal's power compared to a reference; also, measurement of sound pressure. Example: "decibel," or, "dB."	*Electrical Engineering*
B&S Gage	Brown and Sharpe wire gage used for copper conductor (same as American Wire Gage).	*Electrical*
B. and O. Plan	A well known plan of labor-management co-operation developed in the shops of Baltimore and Ohio Railroad. Otto S. Beyer has been given credit for developing the plan following the 1922 shopman's strike. Under the B. and O. Plan, committees of union representatives and supervisors handled employee grievances and discussed all questions relating to greater efficiency of railroad service. The joint committees operated on local, regional, and system bases. The Machinists Union was the first to agree to this program, the other crafts following.	*Industrial Relations*
B.F.S.L.	A method for defining linearity. A straight line placed on a sensor output curve such that half the data points lie above and half below that line. The method for determining B.F.S.L., is the sum of least squares.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
B.R.V.	Body Relief Valve—A relief valve (optional) installed on ball valves used in liquid service to provide for the relief of excess body pressure caused by thermal expansion.	*Mechanical*
B7, B7M	ASTM specification for bolting, A193 Grade B7, specified in API Spec 6A for standard service flange bolting. B7M is B7 Modified with controlled hardness (charpies tested) in the bolt (and 2HM nut) for sour service (NACE) exposed bolts.	*Petroleum Engineering*
Babbitt	A soft, white, non-ferrous alloy bearing material composed principally of copper, antimony, tin and lead.	*Lubrication*
Baby Wagner Acts	State and territorial labor laws based on the Wagner–Connery Act (National Labor Relations Act). These statutes deal primarily with representation procedures and unfair labor and management practices. See also: National Labor Relations Act	*Industrial Relations*
Back	The ceiling or roof of an underground opening.	*Mining*
Back cleat	Back cleat,-see Cleat.	*Mining*
Back connected	A condition where pipe connections are on normally unexposed surfaces of hydraulic equipment. (Gasket mounted units are back connected.)	*Mechanical, Process, and Operations*
Back dook	the return airway. (Scot).	*Mining*
Back end	In working a board, an excavation or kirving is made in the bottom part of the coal, half of the width of the board, and as far as the hewer was able to make it with his pick. This was followed by a vertical cutting of equal depth, next to the side of the place. A hole is then drilled near the roof, and fast side of the coal undermined, and in it gunpowder was placed, and the coal blown down. This was called the 'sump'. The remaining half of the place is called the 'back-end', and is similarly undermined and shot down, (N. East).	*Mining*
Back Flush	The reverse flow of water through a filtration system, used to dislodge trapped particles.	*Filtration*
Back Order	Items that have been ordered but cannot be shipped, (out of stock or some other reason). This is widely used as a measure of supplier performance and customer service (percent back orders, number of occurrences, number of back order days, etc.).	*Procurement*
Back Pay	Wages or earnings due to an employee because of (a) improper layoff or discharge under the collective bargaining agreement, (b) piece rate adjustments following a grievance under the contract, © violation of the legal minimum wage under federal, state, or territorial law, (d) violation of federal, state, or territorial laws prohibiting unfair labor practices. Back Pay under (a) and (b) general is pursuant to an arbitration award. Back pay under (c) and (d) results from action under the minimum wage or labor-relations laws and is enforced by the courts. Some authors distinguish between back pay and retroactive pay, holding the latter to apply to a delayed wage payment resulting from collective bargaining negotiations where wages are applied retroactively. See also: Fair Labor Standards Acts of 1983, Make Whole	*Industrial Relations*
Back Pay Award	Back Pay Award - See: Back Pay	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Back pressure	A pressure in series. Usually refers to pressure existing on the discharge side of a load. It adds to the pressure required to move the load.	*Mechanical, Process, and Operations*
Back pressure	The resistance which the material offers, owing to its viscosity, to continued flow when the mold is closing.	*Material Process*
Back pressure regulator	Regulator designed to control upstream pressure. See "REGULATOR."	*Mechanical*
Back ripping	ripping other than at the coalface to reopen air-roads closing up with the effects of strata pressure. It involves removing the existing deformed roof supports, excavating to the required dimensions and then re-setting with new supports.	*Mining*
Back road	the return air-road.	*Mining*
Back Room Boys	Employees hired by detective agencies who are assigned to shadowing, sleuthing, or general investigative work which does not require the use of a "cover." The LaFollette Committee investigation of detective agency activities in labor relations reported these and similar activities.	*Industrial Relations*
Back sample	Rock chips collected from the roof or back of an underground opening for the purpose of determining grade.	*Mining*
Back seat	A shoulder on the stem of a gate or globe valve which seals against a mating surface inside the bonnet to prevent leakage of media through the bonnet stuffing box when the valve is fully opened.	*General Mechanical*
Back shaft	the non-drawing shaft, i.e. the one used for other purposes other than drawing coal. This was usually the Upcast Shaft.	*Mining*
Back shear	a vertical cut made in the seam in advance of and parallel to the face line.	*Mining*
Back shift	the second shift of hewers in each day. They usually commenced work four hours after the pit began to draw coal. In later years back-shift became synonymous with the afternoon and night shifts.	*Mining*
Back skin	a large leather covering for the back and shoulders used in sinking and shaft work.	*Mining*
Back slum	tubway connecting the tubways on one side of the shaft to the other for returning the empties.	*Mining*
Backfill	Material used for refilling an excavation.	*Civil Engineering*
Backfill	Waste material used to fill the void created by mining an orebody.	*Mining*
Background	Minor amounts of radioactivity due not to abnormal amounts of radioactive minerals nearby, but to cosmic rays and minor residual radioactivity in the vicinity.	*Mining*
Background Contamination	The total of the extraneous particles which are introduced in the process of obtaining, storing, moving, transferring and analyzing a fluid sample.	*Lubrication*
Background Noise	The total noise floor from all sources of interference in a measurement system, independent of the presence of a data signal.	*General*
Backing Ring	Backing in the form of a ring that can be used in the welding of piping to prevent weld spatter from entering a pipe and to ensure full penetration of the weld to the inside of the pipe wall.	*Maintenance and Repair*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Backing or Backing deals	wooden planks, some 6 ft long, driven down close together behind the cribs if required, in bad ground.	*Mining*
Backing plate	Plate used as a support for the cavity blocks.	*Material Process*
Backlash	The amount by which the width of a tooth space exceeds the thickness of the engaging tooth on the pitch circles. As actually indicated by measuring devices, backlash may be determined variously in the transverse, normal, or axial planes, and wither in the direction of the pitch circles or on the line of action. Such measurements should be converted to corresponding values on transverse pitch circles for general comparison.	*Gears*
Backlog	Work that is not completed by the nominated "required by date." The period each work order is overdue is defined as the difference between the current date and the "required by date." All work that doesn't have a specified required by date is generally included on the backlog. Backlog is often measured in crew-weeks, the total number of labor hours represented by the work on the backlog, divided by the number of labor hours available in an average week. As such, backlog is one of the common key performance indicators in maintenance.	*Maintenance*
Backmarker	A car running near the back of the field.	*NASCAR*
Back-overman	The overman in charge of the backshift.	*Mining*
Backs	another word for "cleats"—see also Back.	*Mining*
Backseat	A Shoulder on the stem of a valve which seals against a mating surface inside the bonnet to permit replacement, under pressure, of stem seals or packing.	*Mechanical*
Backspacing	The measurement from the back of the bolt pad to the back edge of the rim; used to calculate offset and determine where the back of the bolt pad is located in relation to the rim width, sometimes referred to as rear spacing.	*Mechanical Engineering*
Backstay	a drag or trailer fixed to the back of a haulage train or set as a safety device when going uphill, to prevent runaways.	*Mining*
Back-Stay	Guy used to support a boom or mast; or that section of a main cable, as on a suspension bridge, cableway, etc., leading from the tower to the anchorage.	*Wire Rope & Cable*
Backstope	The initial lift or slice when commencing to stope or mine from a drift.	*Mining*
Back-to-back connection	In HVDC terms, links used to connect neighboring grids are often referred to as "back-to-back" connections, indicating that the distance between the two grids is minimal. Such connections are able to link independent power grids, including those operating at different frequencies, and enable power to flow from one grid to another. This means that generators on either grid can be used to secure the supply of electricity across the extended network. The connections can also improve voltage and frequency stability in the linked grids.	*Electrical*
Back-to-Work Movement	Any organized effort to get employees out on strike to return to work. Frequently the action is instituted by employers in order to have the workers abandon the strike. Unions generally regard such efforts as strikebreaking. See also: Rand Formula, Strikebreaker	*Industrial Relations*
Backtracking	Backtracking - See: Bumping	*Industrial Relations*
Backup	A system, device, file or facility that can be used as an alternative in case of a malfunction or loss of data.	*General Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Backup fuel	In a central heat pump system, the fuel used in the furnace that takes over the space heating when the outdoor temperature drops below that which is feasible to operate a heat pump.	*Energy*
Backup generator	A generator that is used only for test purposes, or in the event of an emergency, such as a shortage of power needed to meet customer load requirements.	*Energy*
Backup power	Electric energy supplied by a utility to replace power and energy lost during an unscheduled equipment outage.	*Energy*
Back-up ring (anti-extrusion ring) (junket ring) (bull ring)	A ring which	*Mechanical, Process, and Operations*
Backup Step-Up	Step-up, switching-regulator power supply with a backup battery switchover.	*Electrical Engineering*
Backwardation	A situation when the cash or spot price of a metal stands at a premium over the price of the metal for delivery at a forward date.	*Mining*
Backwash (Water Treatment)	The process in which filter beds are subjected to water flow opposite to the service flow direction to loosen the bed and flush solid materials accumulated on the resin bed to wastes.	*Petroleum Engineering*
Backwash (Well Development)	The surging effect or reversal of water flow in a well. Backwashing removes fine-grained material from the formation surrounding the borehole and, thus, can enhance well yield.	*Petroleum Engineering*
Backwork or Backbye work	Work done outbye of the working face. Also called "oncost work."	*Mining*
Bacteria	Microorganisms that live in the soil and convert nutrients into forms usable by plants	*Agriculture*
Bacteria	Single cell microorganisms not containing chlorophyll. Germs.	*Chemistry*
Bactericide	Additive to inhibit bacterial growth in the aqueous component of fluids, preventing foul odors.	*Lubrication*
Bactericide	A chemical agent that destroys bacteria.	*Chemistry*
Bacteriostat	A chemical agent that prevents bacteria from multiplying and growing (doesn't kill).	*Chemistry*
Baff week	At one time the colliers were paid on a two week basis. The baff week was the second week. (N. East).	*Mining*
Baff-ends	two outer wedges used in setting tubbing, used with a third central wedge called a 'spare'; or generally pieces of wood, 15 or 18 inches long, 5 or 6 inches broad, and from 1 to 2 inches thick, used for driving behind cribs or tubbing to bring them to their proper position in a shaft.	*Mining*
Baffle	The baffle is an integral part of a tubular heat exchanger. It provides support for the tubular bundles and helps guide the flow of heated product for maximum efficiency.	*Industrial*
Baffle	A device to prevent direct fluid flow or impingement on a surface.	*Lubrication*
Bag Flattener	A mounting assembly used to hold one conveyor upside down over another conveyor in order to squeeze or flatten the product.	*Manufacturing*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bag molding	Process of applying pressure by the use of a bag to transmit uniform pressure to all surfaces under molding.	*Material Process*
Bag of gas	a cavity found occasionally in gassey seams of coal containing gas under pressure, (N. East). –see Blower.	*Mining*
Baggasse	The residue left after the justice has been pressed from sugar cane, largely crushed fibers.	*Material Process*
Bagging	a flexible canvas tube used to conduct air from an auxiliary fan to where it was needed at the head of a drivage.	*Mining*
Baghouse	A dust-collection chamber containing numerous permeable fabric filters through which the exhaust gases pass. Finer particulates entrained in the exhaust gas stream are collected in the filters for subsequent treatment/disposal.	*Chemical*
Bag-muck	Dirt parting above the bags. –see Bags, (Yorks.).	*Mining*
Bags	Inferior coal associated with the upper part of the Barnsley Seam (Yorks).	*Mining*
Bagwork	A revetment, consisting of heavy material sewn into bags, for protecting embankments	*Civil Engineering*
Bail	a) U-shaped member of a bucket, or b) U-shaped portion of a socket or other fitting used on wire rope.	*Wire Rope & Cable*
Bailer	A long bucket with a valve on the bottom and a bail on top. It is lowered down into the hole, filled with water, and withdrawn.	*Petroleum Engineering*
Bailey bridge	A temporary bridge formed of prefabricated, interchangeable, steel truss panels bolted together.	*Civil Engineering*
Bailey v. Drexel Furniture Company	A decision of the Supreme Court which held invalid a federal statute which sought to tax the net profits of a company as a device to regulate child labor. The Supreme Court held invalid the right to of Congress to use its taxing power to regulate matters which were within the jurisdiction of the police powers of the state.	*Industrial Relations*
Bainite	Extremely fine needlelike microstructure of ferrite and cementite.	*Material Process*
Bait	food taken underground for the mid-shift meal break. OE "to bite or tear."—see also Snap.	*Mining*
Bait poke	The bag in which the bait is carried.	*Mining*
Baiting, Beating or Beating-up	Removing the floor dirt to improve the height of a roadway—see also Bate, Dint, Denting, Pocking and Pavement brushing.	*Mining*
Bakery and Confectionary Workers' International Union of America (Ind.)	Its monthly publication is the Bakers' and Confectioners' Journal. Its offices are located at 1000 16th Street., N.W., Washington, D.C. It was expelled from the AFL-CIO in December 1957.	*Industrial Relations*
Bakery and Confectionary Workers' International Union; American (AFL-CIO)	One of the national unions of the AFL-CIO. Its monthly publication is the ABC News. Its offices are located at 1120 Connecticut Avenue, N.W., Washington, D.C.	*Industrial Relations*
Balaclava	The fireproof hood drivers wear under their helmets to avoid burns to the face and neck.	*NASCAR*
Balance	A uniform mass distribution of a tire and wheel assembly about its axis of rotation.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Balance brow	a self acting inclined plane in steep seams. Driven on the full rise of the mine, down which full tubs of coal were lowered and the empties elevated up on a kind of carriage or platform on wheels actuated by a rope or chain haulage from above. (N. Staffs.).	*Mining*
Balance platforms	systems designed to load and unload automatically multiple decked winding cages at the shaft bottom. Also called 'hydraulic decking plant'.	*Mining*
Balance rope	a rope hung under the cage in the shaft as a counter-balance.	*Mining*
Balance sheet	A formal statement of the financial position of a company on a particular day, normally presented to shareholders once a year.	*Mining*
Balance weight	a replacement for one cage in a small shaft.	*Mining*
Balanced Scorecard	A "top–down" method of translating an organization's mission and strategy into tangible linkages, interrelationships, specific activities, and measures necessary for success. Reliability and maintenance issues are integrated into an overall business scorecard or identified in a stand-alone scorecard.	*Maintenance*
Balanced Trim	A trim arrangement that tends to equalize the pressure above and below the valve plug to minimize the net static and dynamic fluid flow forces.	*Industrial Engineering*
Balancing	(mechanical) Adjusting the distribution of mass in a rotating element, to reduce vibratory forces generated by rotation.	*Reliability Engineering*
Balancing authority (electric)	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time. NERC definition	*Energy*
Balancing item	Represents differences between the sum of the components of natural gas supply and the sum of the components of natural gas disposition. These differences may be due to quantities lost or to the effects of data reporting problems. Reporting problems include differences due to the net result of conversions off low data metered at varying temperature and pressure bases and converted to a standard temperature and pressure base; the effect of variations in company accounting and billing practices; differences between billing cycle and calendar period time frames; and imbalances resulting from the merger of data reporting systems that vary in scope, format, definitions, and type of respondents.	*Energy*
Balk	Balk, -see Baulk.	*Mining*
Ball	The spherical closure element of a ball valve.	*Mechanical*
Ball Joint	A component which permits universal rotational movement in a piping system.	*Maintenance and Repair*
Ball Bearing	An antifriction rolling type bearing containing rolling elements in the form of balls.	*Lubrication*
Ball check	A fitting with a small ball that seals against a seat preventing flow in one direction and allowing flow in the other direction.	*Mechanical*
Ball Joint	A ball-and-socket connection that lets a steering knuckle move in several directions at the same time.	*Mechanical Engineering*
Ball mill	A piece of milling equipment used to grind ore into small particles. It is a cylindrical shaped steel container filled with steel balls into which crushed ore is fed. The ball mill is rotated causing the balls themselves to cascade, which in turn grinds the ore.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ball mill	A cylindrical mill with steel malls within the revolving cylindrical supplying the grinding action and reducing the size of particles present.	*Material Process*
Ball Table	A group of ball transfers over which flat surface objects may be moved in any direction.	*Manufacturing*
Ball The	closure element of a ball valve.	*General Mechanical*
Ball Transfer	A device in which a larger ball is mounted and retained on a hemispherical face of small balls.	*Manufacturing*
Ball valve	a valve regulated by the position of a free-floating ball that moves in response to fluid or mechanical pressure.	*Chemical*
Ball valve	A valve using a spherical closure element which is rotated through 90° to open and close the valve.	*General Mechanical*
Ball-Burton-Hatch Bill	A bill designed to replace the National Labor Relations Act through the use of fact finding, mediation, and voluntary arbitration. It was opposed by labor as designed to remove many protections enjoyed by unions under the protection of the Wagner Act.	*Industrial Relations*
Balleisen Contracts	A form of individual contract, basically designed to eliminate the role of unions in collective bargaining. In its origin a variation of the yellow dog contract, the employee agrees as a condition of employment not to demand any form of union security, or a written collective bargaining agreement, but to handle his own grievances and to avoid the use of any labor organization while employed with the company.	*Industrial Relations*
Balls or Ball Ironstone	nodular concretions of clayband ironstone.	*Mining*
Ballstones	an early term for ironstone (N. Staffs.).	*Mining*
Bally seating	Underclay with nodular concretions (Lancs.).	*Mining*
Baln stone	The roof rock or roof stone, (N. East).	*Mining*
Balsams	Natural vegetable exudations consisting of resins mixed with volatile oil. The name is also applied to products having the physical characteristics of the natural balsams but produced by reactions that normally lead to resinous materials.	*Material Process*
Baltimore and Ohio Railroad Company v. Interstate Commerce Commission	a decision of the Supreme Court which upheld the right of Congress to regulate the hours of work as a safety measure within the scope of the commerce clause.	*Industrial Relations*
Banana oil	A solvent containing chiefly amyl acetate, with an odor of ripe bananas.	*Material Process*
Banburying	A mixing of material in plastic condition under pressure in a Banbury mixer.	*Material Process*
Band	Any widespread thin rock deposit; or a winding rope or chain; or a bed or seam of coal; or a thin layer of shale in the coal.	*Mining*
Band-Aid	A known temporary fix to a problem that may have to be performed one or more times until a permanent fix can be performed. (A permanent fix may consist of scheduled down time requirements, re-engineering, new procedural developments, etc.)	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Banded coal	coal seam made up of layers of various types of coal from hard bright coal to dull coal, or mineral charcoal.	*Mining*
Banded iron formation	A bedded deposit of iron minerals.	*Mining*
Banding	A foliar symptom characterized by a limited zone of necrotic or discolored tissue traversing the leaf, e.g., the band of tissue on a pine needle injured by SO2 or 03.[1]	*Forestry*
Bandsman	the man who loaded the cage at the pit bottom (S. Staffs.)—see also Onsetter.	*Mining*
Bandwidth	A symmetrical region around the set point in which proportional control occurs.	*Electrical*
Bandwidth	1. In computing, bandwidth is often a synonym for the rate of information transmitted by a network connection or interface. For example, a modem's bandwidth might be described as 56K, which means it is capable of transmitting 56,000 "bits" of information per second. A bit is the smallest unit of computerized data, comprising a single binary digit (i.e., 1 or 0). 2. Bandwidth in electronic communication is the difference between the highest- and the lowest-frequency signal in a given transmission medium. It is measured in hertz (Hz).	*Electrical*
Banicking	holing in the roof immediately above the coal seam and breaking down the coal off the face with crowbars. (Cannock).	*Mining*
Banjack	compressed air drill.	*Mining*
Banjo	A large type of collier's shovel, usually pear shaped, also known as a "pan shovel," "oscar" (S. Staffs.) or "pit pan," or an old type of miner's water bottle (S. Mids.).	*Mining*
Bank or Benk	the colliery surface near the shaft and at the level from which the cages are loaded and unloaded; or a general term for the surface; or to cover the fire in a boiler or domestic fire grate with slack or small coal to make the fire burn slowly through the night. Pronounced 'Bonk' in N. Staffs.	*Mining*
Bank plates	cast iron sheets with which the heapstead or pit bank was laid out or floored to help in the manipulation of tubs.	*Mining*
Bank to Bank	the time occupied by a collier between leaving the bank, i.e. pit top, and returning to the same, i.e., a shift.	*Mining*
Banker	Banker,—see Banksman.	*Mining*
Bank-head	The top of an incline.	*Mining*
Banking	On oval tracks, the corners are often tilted inward to provide faster speeds. On some road courses, certain turns may actually be banked outward, a very difficult type of corner known as "off-camber."	*NASCAR*
Banking wagon	a moveable security cover over the shaft top during sinking, also called a 'running bridge'. A moveable platform of wood, usually, mounted on a frame with wheels. Rails are laid on this platform on which the tip wagons run.	*Mining*
Banking-out	the operation of changing the tubs in the cage at the surface.	*Mining*

Term	Definition	*Industry*
Bankman or Banksman	The manager of a small mine employing less than a dozen colliers was known by many different names but the most common in the Midlands and Durham was Bankman or Banksman (16th Century). He usually stood at the head of the shaft to direct operations, and was responsible for the everyday running of the mine and for the sale of the coal; also the person in charge of the shaft and cage or skip at the surface of the colliery, i.e. the person at the surface who operates the signals from the cage or skip to the winding engineman and Onsetter, controls the loading of the cage and collects the checks or tallies from the men as they enter the cage. He may also search men for contraband. Sometimes called the "banker" or "lander."	*Mining*
Bankswoman	A female employed on the bank to pick dirt and stones from the coal, before the introduction of the screening plant. (S.& N. Wales, Scot., Lancs.)—see also Pit brow lassies.	*Mining*
Bannock	To overcut the coal by hand (S. Staffs.); or a brownish grey clay used for making firebricks. (Shrops.).	*Mining*
Bannocking	Dirt, soft, slippery shale or musdstone forming the roof of a coal seam.	*Mining*
Banquette	An embankment for buttressing the base of a levee and forming a berm.	*Civil Engineering*
Bant	An old Lancashire dialect word for string and could be from the earlier 'band', a rope or chain. Later it was used to refer to a certain number of men, usually three or four. Before the introduction of cages and conductors the men would ride up and down in the pit shaft sitting in short loose pieces of chain attached to the hemp rope in a cluster, with their knees facing inwards toward the centre of the shaft. There were usually two bants, the lower or bottom bant, composed of men, and the upper or foaley bant, made up of a cluster of lads fastened a few feet above the heads of the men. In later years the word was used in the sense of 'to catch the last bant' or the last journey into or out of the pit on the underground haulage.	*Mining*
Bar	A metric unit of pressure. One bar equals 14.5 psi.	*Mechanical*
Bar Claims	Gold found in low collections of sand, or gravel, in rivers, exposed at low water.	*Mining*
bar.	Barometer	*Civil Engineering*
Baraque	A boring tower erected on the surface over a shaft being bored, e.g., as in the Kind–Chaudron method.	*Mining*
Barbers and Beauty Culturists Union of America (AFL-CIO)	A union active in barber shops and beauty parlors. Its offices are located at 316 Flatbush Ave., Brooklyn, New York. Its official publication is The Beacon. It merged with the Journeymen Barbers, Hairdressers, Cosmetologist & Proprietors' International Union of America (AFL-CIO) during July 1956.	*Industrial Relations*
Barbers, Hairdressers, Cosmetologists, & Proprietors' International Union of America; Journeymen (AFL-CIO)	the organization publishes an official monthly journal. The offices are located at 1141 North Delware St, Indianapolis, Indiana.	*Industrial Relations*
Bare	to strip or cut by the side of a fault or boundary.	*Mining*
Bare (Minimum) Subsistence Level	A standard of living just sufficient to provide food, clothing, and shelter with no provision for insurance, medicine, recreation, and other incidental expenditures. It is sometimes referred to as the absolute minimum level sufficient to permit physical survival of the family.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bare Pulley	A pulley which does not have the surface of its face covered (or lagged).	*Manufacturing*
Bargaining	Bargaining—See: Collective Bargaining	*Industrial Relations*
Bargaining Agent	The union certified by national, state, or territorial labor agency to represent a majority of the employees in an appropriate bargaining unit and to be the exclusive bargaining agent for those employees.	*Industrial Relations*
Bargaining Agent , for Members Only	a form of union security in which the employer recognizes the union for its members only.	*Industrial Relations*
Bargaining Collective	Bargaining Collective - See: Collective Bargaining	*Industrial Relations*
Bargaining History	One of the criteria relied on by the National Labor Relations Board in determining the unit appropriate for collective bargaining purposes. It may also have a bearing on the charges of unfair labor practices where there is a claim of refusal to bargain.	*Industrial Relations*
Bargaining Rights	The legal authority of the union certified as the duly authorized bargaining agent to negotiate the terms and conditions of the employment and to act as the agent of the employees to protect those rights in the administration, enforcement, and renegotiation of the collective bargaining contract.	*Industrial Relations*
Bargaining Strength	The relative power positions of management and labor during the negotiating process.	*Industrial Relations*
Bargaining Theory of Wages	An attempt to explain wage payments on the basis of supply and demand for labor. Labor is considered as a commodity whose price fluctuates in the market place on the basis of the bargaining power of employers and workers.	*Industrial Relations*
Bargaining Unit	The group of employees held by, National, State, or Territorial Labor Boards to constitute the unit appropriate for bargaining purposes. Where no official designation or certification is made, it is the unit accepted by the employer for bargaining purposes.	*Industrial Relations*
Bargaining, Area-Wide	Bargaining, Area-Wide—See: Collective Bargaining	*Industrial Relations*
Bargaining, Industry-Wide	Bargaining, Industry-Wide - See: Collective Bargaining, Industry-wide	*Industrial Relations*
Barge	In the oil and gas industry, a barge is an unpowered multipurpose marine vessel. Barges are used as cargo tankers, equipment and supply carriers, crane platforms and support and accommodation bases in offshore drilling, and as submarine pipe-laying vessels.	*Electrical*
Bar-hook	a fork-like trailing bar attached to the back of the last tub on an incline to arrest the journey in the event of a detached or broken coupling, chain or rope. Also called a 'trigger' or a 'devil'.	*Mining*
Baring dirt	Baring dirt—see "Bannocking dirt."	*Mining*
Barite	Natural finely-ground barium sulfate used for increasing the density of drilling fluids.	*Petroleum Engineering*
Barium peroxide (BaO2)	White gray powder. An oxidizing catalyst for various syntheses and polymerization reactions.	*Material Process*
Bariumsulfate or Baryte (BaSO4)	Rhombic white crystals. It is naturally occurring form, used as an inorganic filler.	*Material Process*

Term	Definition	*Industry*
Barrage	Civil Engineering, an artificial obstruction in a watercourse to increase the depth of the water, facilitate irrigation, etc	*Civil Engineering*
Barrel	A unit of volume equal to 42 U.S. gallons.	*Energy*
Barrel	A unit of liquid volume of petroleum oils equal to 42 U.S. gallons or approximately 35 Imperial gallons.	*Lubrication*
Barrel	A unit of volume measurement used for petroleum and its products (7.3 barrels = 1 ton: 6.29 barrels = 1 cubic meter).	*Petroleum Drilling*
Barrels per calendar day	The amount of input that a distillation facility can process under usual operating conditions. The amount is expressed in terms of capacity during a 24-hour period and reduces the maximum processing capability of all units at the facility under continuous operation (see Barrels per Stream Day) to account for the following limitations that may delay, interrupt, or slow down production. 1. the capability of downstream processing units to absorb the output of crude oil processing facilities of a given refinery. No reduction is necessary for intermediate streams that are distributed to other than downstream facilities as part of a refinery's normal operation; 2. the types and grades of inputs to be processed; 3. the types and grades of products expected to be manufactured; 4. the environmental constraints associated with refinery operations; 5. the reduction of capacity for scheduled downtime due to such conditions as routine inspection, maintenance, repairs, and turnaround; and 6. the reduction of capacity for unscheduled downtime due to such conditions as mechanical problems, repairs, and slowdowns.	*Energy*
Barrels per stream day	The maximum number of barrels of input that a distillation facility can process within a 24-hour period when running at full capacity under optimal crude and product slate conditions with no allowance for downtime.	*Energy*
Barren	Said of rock or vein material containing no minerals of value, and of strata without coal, or containing coal in seams too thin to be workable.	*Mining*
Barren Contract	A contract vein, or a place in the contract vein, which has no mineral.	*Mining*
Barren ground	When a seam of coal becomes too thin to work it is said "to become barren ground." (Gloucs. and Bristol.). In other areas it was also known as 'dead ground', or an area that lacks coal or any other valuable mineral.	*Mining*
Barren measures	strata with unproductive seams of coal, e.g. of an unworkable thickness.	*Mining*
Barricading	Enclosing part of a mine to prevent inflow of noxious gasses from a mine fire or an explosion.	*Mining*
Barrier	Blocks airborne sound from entering passenger compartment via an aperture. Example, a piece of sticky elastomer that is pressed on so as to cover a hole.	*Reliability Engineering*
Barrier protection	the protection provided by inhibiting oxidation (rust) by an insoluble topcoating such as zinc, which isolates steel from any electrolytes that would assist the corrosion process	*Materials Process*
Barrier	Something that bars or keeps out. Barrier pillars are solid blocks of coal left between two mines or sections of a mine to prevent accidents due to inrushes of water, gas, or from explosions or a mine fire.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Barrier, Barrier coal, Barrier pillar or Pillar	An area or tract of coal left unworked to separate the workings of one colliery from those of another. The barrier was also left in place to protect a working colliery from the build-up of gas and water in old and abandoned workings. A barrier would often be left in between working districts in collieries for the same purpose.	*Mining*
Barring	a method of securing the sides of rectangular shafts in Scotland where the strata is very strong. Lining was inserted only where the sides of the shaft were not strong enough to stand without support.	*Mining*
Barrings	a set of timber bars and props supporting underground roadways or shafts.	*Mining*
Barrow	the next development in vehicles for transporting coal underground after the sledge. Gang planks were often laid on the floor where it was soft, forming a "barroway."	*Mining*
Barrow way	The underground road along which the barrowmen worked (Newcastle).	*Mining*
barrow	A male hog castrated before sexual maturity.	*Agriculture*
Barrowmen or Hurriers	men who transported coal from the workings to the shaft bottom or some intermediate transfer point underground. The name originates from the time when barrows were used for transporting coal. (Newcastle). –see also Putter.	*Mining*
Barry system	a system of coal face transport in which empty tubs enter by one gate, pass along the face where they are filled and return along the next gate, on a multi entry face. (Mids.).	*Mining*
Bars	these may be of wood or steel and are generally from 4 feet 6 inches to 7 feet in length. They are set as shown with two or more props to hold them to the roof. Compared with props and lids they are more stable, they support greater areas of roof and are in consequence more suitable for supporting broken roof. Wood bars are generally made by sawing props lengthwise so that the bars are half round, but bars of rectangular section are sometimes used. Their widths and thicknesses vary but the average wood bar is 5 inches wide and 2½ inches thick. Steel bars have a corrugated section, so that their resistance to bending is greater than that of flat bars. They are not as easily damaged as wood bars; if bent they can be straightened and reset several times. Steel bars of 'H' section or channel |¯| section may also be used, especially if the bars have to be long. Long bars such as this are frequently used at road heads and at other special places	*Mining*
Barth Premium Plan	A method of wage payment which averages both the piece-rate and time rate in order to arrive at the wages paid. It seeks to compensate both for the amount of production and the time spent on the job.	*Industrial Relations*
Barytes	A filler material prepared from naturally occurring barium sulfate.	*Material Process*
Basal area	The cross-sectional area in square feet of a tree trunk measured at 4.5 feet above the ground.	*Forestry*
Basal till	Unsorted glacial debris at the base of the soil column where it comes into contact with the bedrock below.	*Mining*
Basalt	An extrusive volcanic rock composed primarily of plagioclase, pyroxene and some olivine.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bascule	A device operating like a balance or see saw, esp. an arrangement of a movable bridge by which the rising floor or section is counterbalanced by a weight.	*Civil Engineering*
Base	A material which neutralizes acids. An oil additive containing colloidally dispersed metal carbonate, used to reduce corrosive wear.	*Lubrication*
Base Bill	The base bill is calculated by multiplying the rate from the electric rate by the level of consumption.	*Energy*
Base Bullion	Precious metals contained in lead.	*Mining*
Base camp	Centre of operations from which exploration activity is conducted.	*Mining*
Base Circle	The circle from which an involute tooth curve is generated or developed.	*Gears*
Base gas	The quantity of natural gas needed to maintain adequate reservoir pressures and deliverability rates throughout the withdrawal season. Base gas usually is not withdrawn and remains in the reservoir. All natural gas native to a depleted reservoir is included in the base gas volume.	*Energy*
Base Helix Angle	The angle, at the base cylinder of an involute gear, that the tooth makes with the gear axis.	*Mechanical Engineering*
Base Load	The minimum load experienced by an electric utility system over a given period of time.	*Energy*
Base load capacity	The generating equipment normally operated to serve loads on an around-the-clock basis.	*Energy*
Base load plant	A plant, usually housing high-efficiency steam-electric units, which is normally operated to take all or part of the minimum load of a system, and which consequently produces electricity at an essentially constant rate and runs continuously. These units are operated to maximize system mechanical and thermal efficiency and minimize system operating costs.	*Energy*
Base Load Unit	A generating unit that normally operates at a constant output to take all or part of the base load of a system.	*Energy*
Base Metal	The metal to be welded, brazed, soldered, or cut. It is also referred to as parent metal.	*Maintenance and Repair*
Base Number	The amount of acid (perchloric or hydrochloric) needed to neutralize all or part of a lubricant's basicity, expressed as KOH equivalents.	*Lubrication*
Base Number	The amount of acid, expressed in terms of the equivalent number of milligrams of potassium hydroxide, required to neutralize all basic constituents present in 1 g of sample	*Lubrication*
Base Oil	A base oil is a base stock or blend of base stocks used in an API-licensed engine oil.	*Lubrication*
Base Oil Credit	In lubricant cost calculations, the value of the base fluid displaced by the additive package.	*Lubrication*
Base oil interchange	Practice of testing in one base oil and extending the performance level achieved to additional base oils. Guidelines are established by API LC.	*Mechanical, Process, and Operations*
Base Pay	Base Pay - See: Base Rate	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Base period	The period of time for which data used as the base of an index number, or other ratio, have been collected. This period is frequently one of a year but it may be as short as one day or as long as the average of a group of years. The length of the base period is governed by the nature of the material under review, the purpose for which the index number (or ratio) is being compiled, and the desire to use a period as free as possible from abnormal influences in order to avoid bias.	*Energy*
Base Period	the period during which an employee fulfills the employment requirement in order to receive the benefits of the system. This is designed to limit the benefits of those in the labor force.	*Industrial Relations*
Base Pitch	In an involute gear it is the pitch on the base circle or along the line of action. Corresponding sides of involute teeth are parallel curves, and the base pitch is the constant and fundamental distance between them along a common normal in a plane of rotation. The Normal Base Pitch is the base pitch in the normal plane, and the Axial Base Pitch is the base pitch in the axial plane.	*Gears*
Base Rate	The portion of the total electric or gas rate covering the general costs of doing business unrelated to fuel expenses.	*Energy*
Base Rate of Pay	Same as the basic hourly rate. The "regular rate" of pay on which overtime (time one and a half) is computed under the Fair Labor Standards Act and the Walsh-Healey Public Contracts Act.	*Industrial Relations*
Base Station	A base station (or base station) is a wireless transceiver at a fixed location (e.g., atop a telephone pole) which is part of a wireless communications network, e.g., the cell phone network. Typically, the base station connects to any cell phones in its area and relays the calls to the wired network.	*Electrical Engineering*
Base Stock	The base fluid, usually a refined petroleum fraction or a selected synthetic material, into which additives are blended to produce finished lubricants.	*Lubrication*
Base Transceiver Station	The stationary component of a cellphone system includes transmit-receive units and one or more antennae. The combined systems (often including multiple co-located systems and ganged directional antennae) is called a cell-site, a base station, or a base transceiver station (BTS).	*Electrical Engineering*
Base valve mounting	The valve is mounted to plate which has top and/or side ports.	*Mechanical, Process, and Operations*
Base Year	The first year of the period of analysis. The base year does not have to be the current year.	*Energy*
Baseboard heater	As a type of heating equipment, a system in which either electric resistance coils or finned tubes carrying steam or hot water are mounted behind shallow panels along baseboards. Baseboards rely on passive convection to distribute heated air in the space. Electric baseboards are an example of an "Individual Space Heater."	*Energy*
BASEEFA	British Approvals Service for Electrical Equipment in Flammable Atmospheres. A certification body for electrical and electronic equipment for use in hazardous areas. In 1987 it was brought together with the Mining Equipment Certification Service to form the Electrical Equipment Certification Service (EECS).	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Baseflow	When groundwater flows to surface water.	*Petroleum Engineering*
Baseline	The electrical signal from a sensor when no measured variable is present. Often referred to the output at no-load condition.	*Electrical Engineering*
Baseline characteristics	Values of demographic, clinical and other variables collected for each participant at the beginning of a trial, before the intervention is administered.	*Quality Engineering*
Baseline Forecast	A prediction of future energy needs which does not take into account the likely effects of new conservation programs that have not yet been started.	*Energy*
Baseline Measurements	A set of measurements (or metrics) that seeks to establish the current or starting level of performance of a process, function, product, firm, etc. Baseline measurements are usually established before implementing improvement activities and programs.	*Maintenance*
Baseline spectrum	A vibration spectrum taken when a machine is in good working condition (new or just overhauled), used as reference for future monitoring or analysis.	*Reliability Engineering*
Baseload Capacity	Generating equipment operated to serve loads 24-hours per day.	*Energy*
Base-load power plant	To maintain power supplies as efficiently as possible, some power stations run near to full capacity all the time, while others are brought online or increase production temporarily to meet transient peaks in demand for electricity. The plants that maintain constant levels of production tend to be those that rely on lower-cost fuels and are known as "base-load" power plants.	*Electrical*
Basement rocks	The underlying or older rock mass. Often refers to rocks of Precambrian age which may be covered by younger rocks.	*Mining*
Bases	Compounds that react with acids to form salts plus water. Alkalis are water-soluble bases, used in petroleum refining to remove acidic impurities. Oil soluble bases are included in lubricating oil additives to neutralize acids formed during the combustion of fuel or oxidation of the lubricant.	*Lubrication*
Bashing	to build airtight stoppings using colliery waste. - see Stoppings, or the complete stowing of roadways or old workings.	*Mining*
Basic	A high-level programming language designed at Dartmouth College as a learning tool. Acronym for Beginner's All-purpose Symbolic Instruction Code.	*Electrical*
Basic rocks	Igneous rocks that are relatively low in silica and composed mostly of dark-colored minerals.|	*Mining*
Basic Service	The four charges for generation, transmission, distribution and transition that all customers must pay in order to retail their electric service.	*Energy*
Basic Services	Services that are necessary for the physical delivery of service, including generation, transmission and distribution.	*Energy*
Basic Spacing between Centers	Is a term that appears on IC package drawings in reference to dimensions between pins.	*Electrical Engineering*
Basic Switch	A self contained switching unit. It can be used alone, gang: mounted, built into assemblies or enclosed in metal housings.	*Electrical Engineering*
Basic Thread Profile	This is the theoretical profile of external and internal threads with no manufacturing tolerance applied.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Basic Transportation Reference	The basic transportation section of the U.S. Government Test Specification MIL-STD-810D, Method 514.3, Paragraph I-3.2.1, Page 514.3-5. Basic transportation defines the test profiles that have been defined for equipment that is shipped as secured cargo; by land, by sea or by air. The test levels are based upon land transport stress levels because these are higher than stresses imposed by air or sea transportation environments.	*General Engineering*
Basic Workday	the number of hours set out in the collective bargaining agreements or statutory overtime provisions, in excess of which premium payments are made. The 8-hour day is widely accepted as the standard or basic work-day.	*Industrial Relations*
Basic Workweek	most collective bargaining agreements specify eight hours as the basic workday and 40 hours as the basic workweek. Overtime or premium pay is provided for hours worked in excess of those specified.	*Industrial Relations*
Basidial stage (basidium)	A spore stage of the rust fungi; a specialized structure in the Basidiomycetes bearing basidiospores.	*Forestry*
Basidiocarps	Sexual fruiting structure in the Basidiomycetes; conks, sporophore, mushrooms, etc.	*Forestry*
Basin	(See Cold Water Basin and Distribution Basin).	*Facility Engineering*
Basin curb	The top level of the retaining wall of the cold water basin; usually the datum point from which tower elevation points are measured.	*Facility Engineering*
Basin sump	(See Sump).	*Facility Engineering*
Basket	A shallow pan into which smalls were raked by the fillers for loading into the tubs (S. Staffs.), or before the introduction of the cage, baskets were used for winding—see Corfe and Corve.	*Mining*
Basket (measure)	A common measure in Lancashire in the 17th and the 18th centuries. Similar to a "corf" or "corve." It contained approximately 1.1 cwt of coal. There were eight baskets to the load and ten loads equaled one rook, i.e., 88 cwt or 4.4 tons.	*Mining*
Basket Of Socket	The conical portion of a socket into which a broomed-rope-end is inserted and then secured.	*Wire Rope & Cable*
Basket ventilation	a system of ventilating a mine using the principle of hot air rising. This was achieved by hanging an iron basket containing burning coals in one of the two shafts or in a section of a bratticed shaft. The hot air rising in the shaft caused an updraft which drew the foul air out of the mine which was replaced by clean air descending the other shaft or section. The first recorded use of this system was in a colliery at Cheadle, North Staffs in about the 1650's.	*Mining*
Bass Boost	Circuitry that boosts the bass response of the amplifier, improving audio reproduction, especially when using inexpensive headphones.	*Electrical Engineering*
Bass or Bast	Black carbonaceous shale. (Yorks., Lancs. and Staffs.); or a thin band of cannel in a seam. (S. Wales.).	*Mining*
Basset or Basset edge	the point where a coal seam comes to the surface or 'outcrops'.	*Mining*
Bast	Bast—see Bass.	*Mining*
Bastard	Inferior coal, which burns to a white powdery slate (Yorks., Lancs., and Staffs.); or dirt in coal. (Yorks., Lancs., and Staffs.); or meaning 'impure'.	*Mining*

Term	Definition	*Industry*
Bastard fireclay	Underclay or seatearth of a coal seam which is unsuitable for manufacturing firebricks.	*Mining*
Bastard Whin	Very hard sandstone, but not so flinty as to be called "whin," (N. East).	*Mining*
Bat, or Bats, Batt or Battice	Carbonaceous shale or stone in coal. (Mids); or alternative term for 'Bass'.	*Mining*
Batch	Any quantity of material handled or considered as a "unit" in processing. i.e., any sample taken from the same 'batch' will have the same properties and/or qualities.	*Lubrication*
Batch reactor	Reactor characterized by its operation, which means that the reactor does reaches steady state.	*Chemical*
Bate	to excavate the floor material of a roadway to re-grade it after floor lift (S. Staffs.)—see Dint.	*Mining*
Batholith	A large mass of igneous rock extending to great depth with its upper portion dome-like in shape. Similar, smaller masses of igneous rocks are known as bosses or plugs.	*Mining*
Battery Backup	A feature of microprocessor supervisory circuits and some power supplies to switch between a main power source and a battery.	*Electrical Engineering*
Battery Freshness Seal	A feature in microprocessor supervisory circuits which disconnects a backup battery from any down-stream circuitry until VCC is applied the first time. This keeps a backup battery from discharging until the first time a board is plugged in and used, and thus preserves the battery life.	*Electrical Engineering*
Battery Fuel Gauge	A feature or device that measures the accumulated energy added to and removed from a battery, allowing accurate estimates of battery charge level.	*Electrical Engineering*
Battery Monitor	A feature that monitors the voltage on a battery and indicates when the battery is low. It is usually implemented using a comparator to compare the battery voltage to a specified level. May also include functions such as charging, remaining capacity estimation, safety monitoring, unique ID, temperature measurement, and nonvolatile (NV) parametric storage.	*Electrical Engineering*
Battery Switchover	A circuit that switches between the higher of a main supply and a backup battery.	*Electrical Engineering*
Battery Tests	A series or combination of examinations to measure a person's ability in a particular in a particular area or his potential to perform certain work.	*Industrial Relations*
Batt-picking	an old term for picking out stone by hand in the screening process. -see also Crow-picking.	*Mining*
Baud	A unit of data transmission speed equal to the number of bits (or signal events) per second; 300 baud = 300 bits per second.	*Electrical*
Baud Rate	The number of bits or discrete pieces of information transmitted per second.	*Electrical Engineering*
Baulk	a partial washout in the top part of a coal seam, often filled with sandstone; also a strong timber beam; or an interruption of the coal seam. (N. East).	*Mining*
Baum pots	calcareous concretions in the coal or in the roof. (Lancs.).	*Mining*
Baum washer or Baum jig	a system for cleaning run of mine coal invented by Baum in 1892. A well known type of coal jig washer in which the water pulsation is obtained by admitting compressed air above the water level at one side of the washer box instead of the operation of plungers as in other jig washers.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bauxite	A rock made up of hydrous aluminum oxides; the most common aluminum ore.	*Mining*
Bay	The volume between adjacent columns.	*Facility Engineering*
Bay Ridge Case	Supreme Court Case involving overtime payments under the Fair Labor Standards Act. The court held that premium payments under the collective bargaining agreements were to be considered in computing the basic rate of pay ("regular rate") for over-time computation.	*Industrial Relations*
Bayes' theorem	A probability theorem used to update the probability of an event in the light of a piece of new evidence. A common application is in diagnosis, where the prior probability of disease, obtained from population data, is updated to a posterior probability in the light of a positive or negative result from a diagnostic test.	*Quality Engineering*
Bayesian statistics	An approach to statistics based on application of Bayes' theorem that can be used in single studies or meta-analysis. A Bayesian analysis uses Bayes' theorem to transform a prior distribution for an unknown quantity (e.g. an odds ratio) into a posterior distribution for the same quantity, in light of the results of a study or studies. The prior distribution may be based on external evidence, common sense or subjective opinion. Statistical inferences are made by extracting information from the posterior distribution, and may be presented as point estimates, and credible intervals (the Bayesian equivalent of confidence intervals).	*Quality Engineering*
BBF	BBF - See: Boilermakers, Iron Shipbuilders, Blacksmiths, Forgers and Helpers; International Brotherhood of (AFL-CIO)	*Industrial Relations*
bbl	The abbreviation for barrel(s).	*Energy*
bbl	Abbreviation used for barrel of oil, which is equal to 42 US gallons or 159 Liters of liquid.	*Petroleum Drilling*
bbl	One barrel of oil; 1 barrel = 35 Imperial gallons (approx.), or 159 liters (approx.); 7.5 barrels = 1 ton (approx.); 6.29 barrels = 1 cubic meter.	*Petroleum Drilling*
bbl/d	The abbreviation for barrel(s) per day.	*Energy*
bbl/sd	The abbreviation for barrel(s) per stream day.	*Energy*
BCD, Buffered	Binary-coded decimal output with output drivers, to increase line-drive capability.	*Electrical*
BCD, Parallel	A digital data output format where every decimal digit is represented by binary signals on four lines and all digits are presented in parallel. The total number of lines is 4 times the number of decimal digits.	*Electrical*
BCD, Serial	A digital data output format where every decimal digit is represented by binary signals on four lines and up to five decimal digits are presented sequentially. The total number of lines is four data lines plus one strobe line per digit.	*Electrical*
BCD, Three-State	An implementation of parallel BCD, which has 0, 1 and high-impedance output states. The high-impedance state is used when the BCD output is not addressed in parallel connect applications.	*Electrical*
bcf	The abbreviation for billion cubic feet.	*Energy*
bcf	Billion cubic feet; 1 bcf = 0.83 million tons of oil equivalent.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
bcm	Billion cubic meters (1 cubic meter = 35.31 cubic feet).	*Petroleum Drilling*
BCW	BCW—See: Bakery and Confectionary Workers' international Union of America (Ind)	*Industrial Relations*
BDM	See Breakdown Maintenance.	*Maintenance*
BDV	Blow Down Valve—A small ball valve that is installed on the aboveground end of an extended drain line. This valve also serves to vent body cavity pressure in the "block and bleed" mode. See "Block and Bleed;" "Extended BDV."	*Mechanical*
Beach Mark	When studying the surface of a fracture, many times there are a series of concentric half-moon shaped lines; they can also be nearly straight and parallel. These lines indicate where the crack front actually stopped in its progress. The crack does not start again until the load, which initiated the crack in the first place, is applied again. If the load is removed then the crack stops and a new mark is made. The term came from the observation one can see on an ocean beach as the tide goes out and the level of the ocean lowers, any debris is left at the last previous high level. All of this debris being placed at the same ocean level creates a line of debris, or to coin the phrase "beach mark." The beach mark is always oriented perpendicular to the direction of the stress, so a failure analyst can tell exactly how the failed part was loaded and where the crack started. Another way to look at how crack growth works versus the beach marks left, is to imagine the circular ripple formed in a calm bucket of water when a small pebble is dropped into it. The pebble creates a circular wave which emanates outward from the epicenter. All of this information is very useful in failure analysis.	*Reliability Engineering*
Beachleaf marl	finely laminated brown marls, possibly of glacial origin. (Lancs.).	*Mining*
Bead	The area of the mounted tire which seats against the wheel.	*Mechanical Engineering*
Bead Seat	The position where the tire rests and seals on the inside of the rim.	*Mechanical Engineering*
Beam	(See Joist).	*Facility Engineering*
Beam building	Beam building - The creation of a strong, inflexible beam by bolting or otherwise fastening together several weaker layers. In coal mining this is the intended basis for roof bolting.	*Mining*
Beans	descriptive name for very small coals, the size of a bean.	*Mining*
Bear market	Term used to describe market conditions when share prices are declining.	*Mining*
Bearers	in early coal mining, these were boys, girls or women who transported coal underground in baskets on their backs, i.e. the 'bearing system'.	*Mining*
Bearing	A machine part in or on which a journal, shaft, axle, pin, or other part rotates, oscillates, or slides.	*Equipment*
Bearing	A support or guide by means of which a moving part such as a shaft or axle is positioned with respect to the other parts of a mechanism.	*Lubrication*
Bearing copper-based alloys	Often called "yellow brasses", when in contact with sea water or fresh water that is high in oxygen and carbon dioxide. (ASTM B61 and B62 are "red brasses" and not susceptible to dezincification.)	*Mechanical*
Bearing plate	A plate used to distribute a given load. In roof bolting, the plate used between the bolt head and the roof.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bearing Stress	The surface pressure acting on a joint face directly as a result of the force applied by a fastener.	*Maintenance*
Bearing System	Bearing System, -see Bearers.	*Mining*
Beat Frequency	Beat frequencies are periodic vibrations that result from the addition and subtraction of two or more sinusoids. For example, in the case of two turbine aircraft engines that are rotating at nearly the same frequency but not precisely at the same frequency; Four frequencies are generated - (f1) the rotational frequency of turbine one, (f2) the rotational frequency of turbine two, (f1 + f2) the sum of turbine rotational frequencies one and two, and (f1 - f2) which is the difference or "beat" frequency of turbines one and two. The difference of the two frequencies is the lower frequency and is the one that is "felt" as a beat or "wow" in this case.	*Electronic Process*
Beater	an iron rod used for stemming or tamping a shot hole prior to blasting.	*Mining*
Beating or beating up	Beating or beating up, - see baiting.	*Mining*
Beche	an instrument having some resemblance to the extinguisher of a candle, it was used for the purpose of extracting the bottom portion of a broken set of rods from a borehole or shothole.	*Mining*
Becket	An end attachment to facilitate wire rope installation.	*Wire Rope & Cable*
Becket Loop	A loop of small rope or strand fastened to the end of a larger wire rope. Its function is to facilitate wire rope installation.	*Wire Rope & Cable*
Bed	A foundation surface of earth or rock supporting a track, pavement, or the like. Example: a gravel bed for the roadway.	*Civil Engineering*
Bed Length	Length of bed sections only required to make up conveyor excluding pulleys, etc., that may be assembled at ends.	*Manufacturing*
Bed Width	Refers to the overall width of the bed section.	*Manufacturing*
Bedding	The arrangement of sedimentary rocks in layers.	*Mining*
Bedding Plane	In sedimentary or stratified rocks, the division planes that separate the individual layers, beds, or strata.	*Petroleum Engineering*
Bedeaux Wage Plan	a wage incentive plan popular in the 1920's, named after its sponsor, Charles Bedeaux, French engineer and industrialist. The plan gave emphasis to the movement to increase production through use of standards and techniques of measurement.	*Industrial Relations*
Bedford Cut Stone Co. v. Journeymen Stone Cutters' Association	A decision of the Supreme Court in 1927 holding the Journeymen Stone Cutters union in violation of the Sherman Antitrust Act. In issue was a union which provided that no member should work on stone cut by non-union labor.	*Industrial Relations*
Bedload	The part of the total stream load that is moved on, or immediately above, the stream bed, such as the larger or heavier particles (boulders, pebbles, gravel) transported by traction or saltation along the bottom; the part of the load not continuously in suspension or solution.	*Petroleum Engineering*
Bedrock	Solid rock forming the earth's crust, frequently covered by overburden or water.	*Mining*
Beef cattle	breeds commonly raised in the United States -	*Agriculture*

Term	Definition	*Industry*
Beefmaster	A breed developed by systematic crossing of Hereford, Shorthorn and Brahman cattle with traits especially valuable in the harsh environment of South Texas. Genetically, Beefmasters are half English (25% each of Hereford and Shorthorn) and half Brahman. Beefmasters were recognized by the U.S. Department of Agriculture as a pure breed in 1954. The registry is maintained by Beefmaster Breeders United.	*Agriculture*
Beehive pit	Beehive pit, -see Bell pit.	*Mining*
Beeswax	An important natural wax obtained from bees honey combs, m.p. near 140°C (284°F).	*Material Process*
Beethoven	a dynamo-condenser type of shot firing device.	*Mining*
Beetle	a small locomotive engine driven by compressed air, the invention of Messrs. Lishman and Young, (N. East).	*Mining*
Beetle Trade	name for urea-formaldehyde molding plastics.	*Material Process*
Beginner's Rate	the scheduled pay for an inexperienced employee. More generally set up as a trainee rate. The regular rate for the job is received as soon as the minimum training period is completed.	*Industrial Relations*
Belgian Draft Horse	By far the most common draft horse in America . There are more Belgians than all other draft breeds combined. They are the direct descendants of the "Great Horse" of medieval times, which carried armored knights into battle. They were known in Europe in the time of Caesar. According to the Guinness Book of World Records, the largest horse in the world was a Belgian stallion. It stood 19.2 hands (6'6") at his withers and weighed over 3,200 pounds.	*Agriculture*
Bell mould	Bell mould, -see Caldron bottom.	*Mining*
Bell nipple	An enlarged pipe at the top of a casing string that serves as a funnel to guide drilling tools into the top of the well.	*Petroleum Drilling*
Bell pit	One of the earliest methods for working coal that was lying very near to the surface. It consisted of short shafts from the surface to the coal seam, belled out at the bottom as far as possible until it became unsafe. When it became too dangerous to work the miners would abandon it and sink another nearby. The refuse from the new shaft would often be thrown into the old one. Also called a 'beehive pit'.	*Mining*
Bell wires	two bare wires that covered the length of a haulage system, which, when held together made a bell ring as a signal to the haulage driver.	*Mining*
Belleville spring	A spring resembling a dished washer, used in some ball valves to push the seats against the ball.	*Mechanical*
Bell-Horses	Bell-Horses - See: Pacers	*Industrial Relations*
Bellite	a 'third class' explosive which could only be exploded by a special detonator composed of fulminate of mercury. This explosive comprised 80% ammonium nitrate and 20% dinitrobenzol and obviated the risks from explosion by heat or sparks or by any ordinary shock. The invention of Carl Lamm, said to act like the best slow powders and was very useful for coal-mining.	*Mining*
Bellmen	men who worked on the conveyor belts or rope haulage signaling system.	*Mining*
Bellows Seal	A type of mechanical seal which utilizes bellows for providing secondary sealing and spring-type loading.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bellows Seal Bonnet	A bonnet which uses a bellows for sealing against leakage around the valve plug stem.	*Industrial Engineering*
Bell-Welded Pipe	Furnace-welded pipe produced in individual lengths from cut-length skelp, having its longitudinal butt joint forge-welded by the mechanical pressure developed in drawing the furnace-heating skelp through a cone-shaped die (commonly known as a welding bell), which serves as a combined forming and welding die.	*Maintenance and Repair*
Belo Wage Plan	a wage plan held by the Supreme Court to meet the overtime provisions of the Fair Labor Standards Act. The individual or collective bargaining contract provides a constant guaranteed weekly wage for fluctuation work weeks.	*Industrial Relations*
Belt	A broad, flexible strip of rubber, canvas, wood, etc., moved along the surface of a fresh concrete pavement to put a finish on it after it has been floated.	*Civil Engineering*
Belt clamp	a device constructed from lengths of timber which were clamped to the conveyor belt either side of a damaged joint. The clamps were then drawn together by using two "Sylvesters" thereby taking the tension out of the conveyor belt between the clamps. The belt-man would then cut out the damaged joint and remake a new one.	*Mining*
Belt Conveyor	An endless fabric, rubber, plastic, leather, or metal belt operating over suitable drive, tail end and bend terminals and over belt idlers or slider bed for handling bulk materials, packages, or objects placed directly upon the belt.	*Equipment*
Belt extension	adding lengths of structure to a conveyor belt to make it longer as the coal face or roadway advances.	*Mining*
Belt fastener	A conveyor belt consists of a number of lengths of belting joined together so that it is endless. The joints must be as strong as they can be made, and several types of commercial coupling or belt fastener were used, such as Bristol, Hayden Nilos and Comet.	*Mining*
Belt idler	A roller, usually of cylindrical shape, which is supported on a frame and which, in turn, supports or guides a conveyor belt. Idlers are not powered but turn by contact with the moving belt.	*Mining*
Belt or Belt conveyor	a conveyor belt, a moving endless belt. A series of conveyors, in tandem, would be used to carry coal from the face to the shaft or in some cases up a drift to the surface. It was driven by a drum to which it returns after passing around a tail pulley. Belt conveyors could vary in length from a few yards to over a mile. –see Cable Belt Conveyor. Conveyor belting was made of layers, or plies, of woven cotton (called cotton duck) which had been impregnated with rubber. These layers are enclosed in a rubber cover. It is the cotton duck that enables the belt to withstand tension. The rubber protects the cotton from damage.	*Mining*
Belt Scraper	A blade or brush caused to bear against the moving conveyor belt for the purpose of removing material sticking to the conveyor belt.	*Manufacturing*
Belt Speed	The length of belt, which passes a fixed point within a given time. It is usually expressed in terms of "feet per minute".	*Manufacturing*
Belt take-up	A belt pulley, generally under a conveyor belt and in by the drive pulley, kept under strong tension parallel to the belt line. Its purpose is to automatically compensate for any slack in the belting created by start-up, etc.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Belt-cleaner	a man employed to clear up the spillage alongside and below the conveyor system. A necessary job to prevent fires caused by friction, or a device fixed to a conveyor belt to scrape dirt from the surface of the belt as it passes.	*Mining*
Belted Bias Tire	A bias tire with additional reinforcing belt(s) between the casing plies and the tread	*Mechanical Engineering*
Belted Galloway	A beef breed notable for its unique appearance of a broad white belt, or sheet, around the middle. The rest of the animal may be black, red or dun color. Breeders often refer to the breed as "Belties." These polled (hornless) cattle developed during the 16th Century in the former Galloway district of Scotland. The breed is known for its exceptionally lean and flavorful meat and a double coat of hair that allows it to survive in very harsh climates.	*Agriculture*
Belt-men	the maintenance team responsible for the underground conveyor system.	*Mining*
Belts	an underground conveyor system.	*Mining*
Ben or Benn	a queue of men waiting to ride the cage. (Scot.).	*Mining*
Bench	One of two or more divisions of a coal seam separated by slate or formed by the process of cutting the coal.	*Mining*
Bench Claims	Minerals found in narrow tableland on hill-side, above a river.	*Mining*
Bench sample	a face or channel sample taken of just that contiguous portion of a coalbed that is considered practical to mine, also known as a "bench;" For example, bench samples may be taken of minable coal where impure coal that makes up part of the geologic coalbed is likely to be left in the mine, or where thick partings split the coal into two or more distinct minable seams, or where extremely thick coalbeds cannot be recovered by normal mining equipment, so that the coal is mined in multiple passes, or benches, usually defined along natural bedding planes.	*Energy*
Bench Set	The proper definition for bench set is the inherent diaphragm pressure range, which defines the high and low values for pressure applied to the diaphragm to produce rated valve plug travel with atmospheric pressure in the valve body. This test is often performed on a work bench in the instrument shop prior to placing the valve into service and is thus known as Bench Set.	*Industrial Engineering*
Benching	Breaking up the bottom coals using wedges when the holing has been made in the middle of the seam.	*Mining*
Benchmarking	The Process Of Comparing Performance With Other Organizations, Identifying Comparatively High Performance Organizations, And Learning What It Is They Do That Allows Them To Achieve That High Level Of Performance.	*Plant Engineering*
Benchmarking	A continuous process where a company measures and compares its functions, systems and practices against those of another entity. In doing so, it can identify gaps in its performance, quality, throughput, etc., and develop game plans to close the gaps.	*Reliability Engineering*
Benchmarking (Competitive)	The process of consistently researching new ideas, methods, practices, and processes, and adapting, adopting, and implementing their best features. It is the continuous procedure of measuring one's products, services, and practices against competitive "best in class" companies or organizations for the purpose of seeking improvement.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Benchmarking (External)	The process of consistently researching new ideas, methods, practices, and processes, and adapting, adopting, and implementing their best features. It is the continuous procedure of measuring one's products, services, and practices against external companies or organizations for the purpose of seeking improvement. See Key Performance Indicators.	*Maintenance*
Benchmarking (Generic)	The process of consistently researching new ideas, methods, practices, and processes, and adapting, adopting, and implementing their best features. It is the continuous procedure of measuring one's products, services, and practices against companies or organizations that carry out the same or similar functions (e.g. warehousing) for the purpose of seeking improvement. See Key Performance Indicators.	*Maintenance*
Benchmarking (Internal)	The process of consistently researching new ideas, methods, practices, and processes, and adapting, adopting, and implementing their best features. It is the continuous procedure of measuring one's products, services, and practices within the company for the purpose of seeking improvement. See Key Performance Indicators.	*Maintenance*
Bend	A bend is a pipe fitting much like an elbow, but with a longer radius.	*Industrial*
Bend-away	the order given by the person in charge for the cage to be drawn to bank, (N. East).	*Mining*
Bending moment	A system of internal forces whose resultant is a moment. This term is most commonly used to refer to internal forces in beams.	*Engineering Physics*
Bending Stress	Stress that is imposed on the wires of a strand or rope by a bending or curving action.	*Wire Rope & Cable*
Bend-up	an order given by the person in charge to raise the cage slowly, so that it may be instantly stopped on the order "Hold!" being given, (N. East).	*Mining*
Beneficiate	To concentrate or enrich; often applied to the preparation of iron ore for smelting.	*Mining*
Beneficiation	The treatment of mined material, making it more concentrated or richer.	*Mining*
Benefit Plans	Programs developed by many unions to protect their members from special hardships, due to unemployment, sickness, accidents, disability, and other risks of workers in modern society.	*Industrial Relations*
Benefit Year	the period of time set in unemployment compensation laws to permit a person covered by the law to meet one of the qualifications for benefit payments.	*Industrial Relations*
Bent	Civil Engineering, a transverse frame as of a bridge or an aqueduct designed to support either vertical or horizontal loads.	*Civil Engineering*
Bentonite	a colloidal clay, largely made up of the mineral sodium montmorillonite, a hydrated aluminum silicate. Because of its expansive property, bentonite is commonly used to provide a tight seal around a well casing.	*Chemical*
Benzanilide (C6H5CONHC6H5)	Colorless leaflets from alcohol.	*Material Process*
Benzene	An unsaturated, six-carbon ring, basic aromatic compound.	*Petroleum Engineering*
Benzene (C_6H_6)	A inflammable liquid. A solvent especially for varnishes and lacquers and starting point in the synthesis of many materials used in plastics, notably aniline, chlorobenzene for phenol, and benzene disulfonic acid for resorcinol.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Benzene (C_6H_6)	An aromatic hydrocarbon present in small proportion in some crude oils and made commercially from petroleum by the catalytic reforming of naphthenes in petroleum naphtha. Also made from coal in the manufacture of coke. Used as a solvent in the manufacture of detergents, synthetic fibers, petrochemicals, and as a component of high-octane gasoline.	*Energy*
Benzine	A solvent mixture of paraffin hydrocarbons less volatile than gasoline but more so than kerosene. Obtained by the fractional distillation of petroleum, to be distinguished from benzene, an aromatic hydrocarbon.	*Material Process*
Benzophenone (C6H5)2CO	A. Stable, colorless monoclinic prisms. A useful plasticizer.	*Material Process*
Benzoyl peroxide (C6H5CO)2O2	Colorless rhombic crystals from ether. An oxidant and catalyst for polymerization reactions of several important synthetic resins, notably acrylic and vinyl resins.	*Material Process*
Benzoyl acetone (C6H5COCH2COCH3)	A colorless liquid, plasticizer.	*Material Process*
Benzyl cellulose	The benzyl ester of cellulose, adaptable for use as a plastic and in coatings.	*Material Process*
Bergoff Technique	technique ascribed or credited to Pearl L. Bergoff, one of the most notorious strike-breakers in American history. He provided professional services to assist employers in preventing unionism and where it had obtained a foothold to dispose of it.	*Industrial Relations*
Berkshire	A breed of hogs that originated in Berks, England . It was introduced to the United States in 1823. The American Berkshire Association registers the breed.	*Agriculture*
Berm	a sloped wall or embankment (typically constructed of earth, hay bales, or timber framing) used to prevent inflow or outflow of material into/from an area.	*Chemical*
Bernal model	Representation of the atomic structure of an amorphous metal as a connected set of polyhedra.	*Material Process*
Bernouilli's Theory	If no work is done on or by a flowing, frictionless liquid, its energy, due to pressure and velocity, remains constant at all points along the streamline.	*Lubrication*
Beryllia	BeO (Beryllium Oxide), a high-temperature mineral insulation material; toxic when in powder form.	*Electrical*
Beryllia—BeO (Beryllium Oxide)	A high-temperature mineral insulation material; toxic when in powder form.	*Electronic Process*
Bessemer	An iron ore with a very low phosphorus content.	*Mining*
Best	A line midway between two parallel straight lines enclosing all output vs. pressure values.	*General Engineering*
Best Bu	A term used to imply that a purchase represents an overall combination of quality, price, and various elements of required service that in total are optimal relative to the firm's needs.	*Procurement*
Best Practice	A process, technique or innovative use of resources that has a proven record of success in providing significant improvement in cost, schedule, quality, performance, safety, environment or other measurable factors that impact the health of an organization.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Best practices	Management practices or techniques recognized to be the most effective and practical means to develop the resource, while minimizing adverse environmental and other effects.	*Petroleum Engineering*
Beta	The ratio of the diameter of a pipeline constriction to the unconstricted pipe diameter.	*General Engineering*
Beta Rating	The method of comparing filter performance based on efficiency. This is done using the Multi-Pass Test which counts the number of particles of a given size before and after fluid passes through a filter.	*Lubrication*
Beta-Ratio	The ratio of the number of particles greater than a given size in the influent fluid to the number of particles greater than the same size in the effluent fluid, under specified test conditions (see "Multi-Pass Test").	*Lubrication*
Between Rail Width	(BR) referred to as the distance between the conveyor frame rails on a roller bed, live roller or gravity type conveyor. Also referred to as (BF) Between Frame.	*Manufacturing*
Bevel	A type of edge or end preparation.	*Maintenance and Repair*
Bevel Angle	The angle formed between the prepared edge of a member and a plane perpendicular to the surface of the member.	*Maintenance and Repair*
Bevel Cutting	cutting at an angle other than a right angle between two lines or surfaces	*Petroleum Drilling*
Bevel Gear	A straight-toothed gear with the teeth cut on sloping faces and the gear shafts at an angle (normally a right angle)	*Lubrication*
Bevel gear operator	Device facilitating operation of a gate or globe valve by means of a set of bevel gears having the axis of the pinion gear at right angles to that of the larger ring gear. The reduction ratio of this gear set determines the multiplication of torque achieved.	*General Mechanical*
Bevel washer	A metal fitting used to accommodate through-bolts to angular position of a diagonal member, usually connecting to columns or other framework members.	*Facility Engineering*
Bevin Boys	During WW2, the shortage of manpower in the mines resulted in the Ministry of Labour, (Minister: Ernest Bevin), inaugurating a policy of drafting men of military age into the mines. From July 1943, the draftees for the mines were chosen by ballot and a number of men already serving with the forces were given, and took the option of working in the mines.	*Mining*
Bevin Shift	a colloquialism for idle shifts which, with the help of too easily obtained medical certificates, qualified the miner for the guaranteed weekly wage.	*Mining*
Beyond-the-Rails	A feature of amplifiers that allows input or output voltages to exceed the supply rails.	*Electrical Engineering*
BFCSD	BFCSD - See: Brewery, Flour, Cereal, Soft drink and Distillery Workers of America; International Union of United (AFL-CIO)	*Industrial Relations*
BHC	BHC - See: Barbers, Hairdressers, Cosmetologists and Proprietors' International Union of America; Journeymen (AFL-CIO)	*Industrial Relations*
BHN	Abbreviation for Brinell Hardness Number. (New abbreviation is now:- HBW).	*Petroleum Engineering*
BHP	(Abbr) (See Brake Horsepower).	*Facility Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
bhp-hr	brake horsepower hour	*Petro-Chemical Abbreviations*
BIA	Boating Industry Association (now NMMA)	*Petro-Chemical Abbreviations*
BIAS	A very low-level DC current generated by the panel meter and superimposed on the signal. This current may introduce a measurable offset across a very high source impedance.	*General*
Bias (Syn systematic error)	Deviation of results or inferences from the truth, or processes leading to such deviation. See also Referral Bias, Selection Bias.	*Analysis*
BIAS Current	A very low-level DC current generated by a panel meter and superimposed on a signal. This current may introduce a measurable offset across a very high source impedance.	*Electrical*
Bias prevention	Aspects of the design or conduct of a study designed to prevent bias. For controlled trials, such aspects include randomization, blinding and concealment of allocation. See also: Concealment of allocation, Internal validity, Quality score Also called: Methodological quality	*Quality Engineering*
Bias Tire	A tire built with two or more casing plies, which cross each other in the crown at an angle of 30 to 45 degrees to the tread centerline.	*Mechanical Engineering*
Biasmeas	Used here to represent the bias of a measurement procedure relative to a comparative method or a comparative group in proficiency testing.	*Quality*
Bibbley Rock	a conglomerate (N. Staffs.).	*Mining*
Bicarbonate alkalinity	In a water solution, the presence of ions resulting from the hydrolysis of carbonates when these salts react with water. A strong base and a weak acid are produced and the solution is alkaline. Its formula is HCO3-, but its concentration is usually denoted as ppm as CaCO3.	*Chemical Engineering*
Bid	In purchasing, a bid can be an offer to sell or an offer to buy. "Submittal response", "bid response", "proposal" are used interchangeably and refer to seller's documents and attachments in response to a bid request (i.e., Request for Proposal or Request for Quote).	*Procurement*
Bidding	a procedure for permitting employees of a company to make known their interest in a vacant position.	*Industrial Relations*
Bi-Di's	bi-directional shearers, capable of cutting the coal in both directions along the coal face.	*Mining*
Bidirectional	The device accommodates signals traveling either direction though a single channel.	*Electrical Engineering*
Bidirectional Differential Pressure Sensor	A differential pressure sensor allowing the greater input pressure to be applied to either pressure port.	*Electrical Engineering*
Biennial	Plants that require two growing seasons to complete their life cycle.	*Agriculture*
BIFACIAL NECROSIS	Death of plant tissues, extending from the upper to the lower leaf surface.[1]	*Forestry*
Bi-fuel vehicle	A motor vehicle that operates on two different fuels, but not on a mixture of the fuels. Each fuel is stored in a separate tank.	*Energy*
Bifunctional Polymer	with two reaction sites for each mer, resulting in a linear molecular structure.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bifurcated Contact	A movable or stationary contact which is forked or divided to provide two pairs of mating contact surfaces connected in parallel, instead of a single pair of mating surfaces.	*Electrical Engineering*
Big bear	A big bear is a hitch (see hitch) that lasts a minimum of 50 straight days.	*Petroleum Drilling*
Big Four	the major non-affiliated railroad brotherhoods which dominate the railroad industry. The big four include: The Brotherhood of Locomotive Engineers, The Brotherhood of Locomotive Firemen and Enginemen, The Brotherhood of Railway Trainmen, and The order of the Railway Conductors and Brakemen.	*Industrial Relations*
Big Steel	U.S. Steel Cooperation- the major steel producer in the United States.	*Industrial Relations*
Biggin	a pack built to support the roof.	*Mining*
Bihexagon Head	A bolt or screw whose cross section of its head is in the shape of a 12 pointed star.	*Maintenance*
Bilateral Action	distinguished from "unilateral" action, where the employer (usually) take action without discussion or agreement with the bargaining agent. Bilateral action involves the joint action of the parties to collective bargaining before the final action is taken.	*Industrial Relations*
Bilateral agreement	A written statement signed by two parties that specifies the terms for exchanging energy.	*Energy*
Bilateral Contract	A contract agreement between two willing parties. In a competitive electric market, bilateral contracts would be agreements between suppliers and customers that specify the terms and conditions for pricing and delivery of electric service. A contractual system between a buyer and a seller to obtain generation and/or ancillary services of a given type, duration, timing and reliability over a contractual term.	*Energy*
Bilateral Contract	A direct contract between the power producer and user or broker outside of a centralized power pool.	*Energy*
Bilateral energy transaction	A transaction between two willing parties who enter into a physical or financial agreement to trade energy commodities. Bilateral transactions entail reciprocal obligations and can involve direct negotiations or deals made through brokers.	*Energy*
Bill Of Lading (B/L)	A carrier's contract and receipt for goods it agrees to transport from one place to another and to deliver to a designated person.	*Procurement*
Bill of Materials	A List Of All The Parts And Components That Make Up A Particular Asset. Not To Be Confused With An Applications Parts List.	*Plant Engineering*
Bill Posters	Billers and Distributors of the United States and Canada; International Alliance of (AFL-CIO) - one of the national former AFL unions.	*Industrial Relations*
Billet	A plastic cake, usually cylindrical, placed in pressing chamber of hydraulic extrusion press.	*Material Process*
Billing period	The time between meter readings. It does not refer to the time when the bill was sent or when the payment was to have been received. In some cases, the billing period is the same as the billing cycle that corresponds closely (within several days) to meter-reading dates. For fuel oil and LPG, the billing period is the number of days between fuel deliveries.	*Energy*
Billy	a box for holding ironstone when ironstone was mined along with the coal (Forest of Dean).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Billy Coal	a thin unworkable coal seam, occurring above or below a workable seam. (N. Staffs.).	*Mining*
Bin	A container for storing material.	*Equipment*
Bin or Binn	the parting of black bass in the Bin Mine. (Lancs.).	*Mining*
Binary	The representation of a decimal number (base 10, 0 through 9) by means of a 4 bit binary nibble.	*General Engineering*
Binary Coded Decimal (BCD)	The representation of a decimal number (base 10, 0 through 9) by means of a 4-bit binary nibble.	*Electrical*
Binary data	See Dichotomous data	*Quality Engineering*
Binary diagram	Two component phase diagram.	*Material Process*
Binary-coded decimal	Representation of a number in which each decimal digit (0-9) is encoded in binary, with four bits per decimal digit.	*Electrical Engineering*
Binching	The stone 'seatearth', or 'fireclay' on which the coal seam rests. (Som.).	*Mining*
Bind or binds	Indurated shale or mudstone; or clay frequently containing clay ironstone; or sandstone or hard shale. (N. East). A term often applied by miners to any fine grained rock.	*Mining*
Binder	The resin of cementing constituent of a plastics compound. All plastics have a binder and some consist of filler components in addition.	*Material Process*
Binder	A helically applied tape or thread used for holding assembled cable components in place until additional manufacturing operations are performed.	*Electrical*
Binding coal	another term for bituminous coal, (N. East).	*Mining*
Bindle Stiffs	Bindle Stiffs - See: Bundle Stiffs	*Industrial Relations*
Bing	a colliery waste heap. (Scot.).	*Mining*
Binomial distribution	A statistical distribution with known properties describing the number of occurrences of an event in a series of observations. Thus, the number of deaths in the control arm of a controlled trial follows a binomial distribution. The distribution forms the basis for analyses of dichotomous data.	*Quality Engineering*
Bio fuel	A fuel made from plant materials or refuse as opposed to petroleum.	*Mechanical, Process, and Operations*
Bioassay	a method used to determine the toxicity of specific chemical contaminants. A number of individuals of a sensitive species are placed in water containing specific concentrations of the contaminant for a specified period of time.	*Chemical*
Bioaugmentation	the introduction of cultured microorganisms into the subsurface environment for the purpose of enhancing bioremediation of organic contaminants. Generally the microorganisms are selected for their ability to degrade the organic compounds present at the remediation site. The culture can be either an isolated genus or a mix of more than one genera. Nutrients are usually also blended with the aqueous solution containing the microbes to serve as a carrier and dispersant. The liquid is introduced into the subsurface under natural conditions (gravity fed) or injected under pressure.	*Chemical*
Bioavailability	the availability of a compound for biodegradation, influenced by the compound's location relative to microorganisms and its ability to dissolve in water.	*Chemical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Biocide	Biocides are formulations of one or more active substances which can kill or control viruses, bacteria, algae, moulds or yeasts.	*Chemical*
Biocides	Additive designed to inhibit the growth of microorganisms in liquids	*Lubrication*
Biodegradability (or biodegradation potential)	the relative ease with which petroleum hydrocarbons will degrade as the result of biological metabolism. Although virtually all petroleum hydrocarbons are biodegradable, biodegradability is highly variable and dependent somewhat on the type of hydrocarbon. In general, biodegradability increases with increasing solubility; solubility is inversely proportional to molecular weight.	*Chemical*
Biodegradable	Capability of organic matter to be decomposed by biological processes.	*Chemistry*
Biodegradation	a process by which microbial organisms transform or alter (through metabolic or enzymatic action) the structure of chemicals introduced into the environment.	*Chemical*
Biodegradation	The chemical breakdown of materials by living organisms in the environment. The process depends on certain microorganisms, such as bacteria, yeast, and fungi, which break down molecules for sustenance. Certain chemical structures are more susceptible to microbial breakdown than others; vegetable oils, for example, will biodegrade more rapidly than petroleum oils. Most petroleum products typically will completely biodegrade in the environment within two months to two years.	*Lubrication*
Biodiesel	A fuel typically made from soybean, canola, or other vegetable oils; animal fats; and recycled grease. It can serve as a substitute for petroleum-derived diesel or distillate fuel. For EIA reporting, it is a fuel composed of mono-alkyl esters of long chain fatty acids derived from vegetable oils or animal fats, designated B100, and meeting the requirements of ASTM (American Society for Testing materials) D 6751.	*Energy*
Biodiversity	a measure of the variety of living organisms on a farm, in an ecosystem, or making up a community.	*Agriculture*
Biodynamic	a method of farming developed by Rudolf Steiner, an Austrian scientist and philosopher. This approach regards a farm as a self-contained, living organism and emphasizes the vitality of soil maintenance and composting. Biodynamic growers work to balance and consider both the physical and non-physical aspects and cycles of a farm in their production.	*Agriculture*
Biofuel	Fuel derived from biomass, i.e., (recently) living organisms. This does not include fossil fuels such as coal and oil, which are derived from ancient organisms. Bioethanol, a fuel derived from sugar cane, corn and similar materials is an example of a biofuel. (See also Carbon cycle.)	*Electrical*
Biofuels	Liquid fuels and blending components produced from biomass feedstocks, used primarily for transportation.	*Energy*
Biogenic	Produced by biological processes of living organisms. Note: EIA uses the term "biogenic" to refer only to organic nonfossil material of biological origin.	*Energy*
Biogenic emissions	Emissions that are naturally occurring and are not significantly affected by human actions or activity.	*Energy*
Bioindicator species	Species, varieties, or cultivars sufficiently sensitive to a specific pollutant to be useful as indicators for the presence of that pollutant.	*Forestry*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bio-leaching	A process for recovering metals from low-grade ores by dissolving them in solution, the dissolution being aided by bacterial action.	*Mining*
Biological deposit	Water-formed deposits of organisms or their waste products (example: slimes, barnacles, etc.).	*Chemical Engineering*
Biological limit of detection, BLD	An older term that was commonly used to refer to an estimate of detection limit calculated from replicate measurements of a blank sample and replicate measurements of a low concentration sample. Typically the estimate is given as the mean of the blank sample plus 2 SD of the variation observed for the blank sample plus 2 SD of the variation observed for a low concentration sample. In effect, BLD equals LLD (the lower limit of detection) plus 2 SD of the variation observed for the low concentration sample.	*Quality*
Biological material	A naturally occurring structural material such as bone.	*Material Process*
Biomass	the amount of living matter in a given area or volume.	*Chemical*
Biomass gas	A medium Btu gas containing methane and carbon dioxide, resulting from the action of microorganisms on organic materials such as a landfill.	*Energy*
Biomass waste	Organic non-fossil material of biological origin that is a byproduct or a discarded product. Biomass waste includes municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural crop byproducts, straw, and other biomass solids, liquids, and gases; but excludes wood and wood-derived fuels (including black liquor), biofuels feedstock, biodiesel, and fuel ethanol. **Note:** EIA biomass waste data also include energy crops grown specifically for energy production, which would not normally constitute waste.	*Energy*
Biomass-based diesel fuel	Biodiesel and other renewable diesel fuel or diesel fuel blending components derived from biomass, but excluding renewable diesel fuel coprocessed with petroleum feedstocks.	*Energy*
Biomaterial	An engineered material created for a biological or medical application.	*Material Process*
Biomaterials	materials designed specifically for use in biological applications, such as artificial limbs and membranes for dialysis, as well as aiding in the repair of bones and muscle	*Physics*
Biomimetic processing	A ceramic fabrication technique which imitates natural processes, such as sea shell formation.	*Material Process*
BIOS	Acronym for basic input/output system. The commands used to tell a CPU how it will communicate with the rest of the computer.	*General Engineering*
Biostat	A chemical that is designed to control the population of troublesome microbes by inhibiting their reproduction and subsequent increase in population.	*Chemical Engineering*
Biotechnology	Generally, the use of recombinant DNA to take genes from one organism and insert them into the DNA of another organism. Although the term, first coined in 1917, originally described large-scale production of pigs fed on sugar beets, the term has evolved to describe genetic engineering. Usage isn't uniform, but scientists commonly use the terms genetic engineering, bioengineering, genetic modification, genetic engineering and biotechnology interchangeably. The technology is used in plants, animals, viruses, and bacteria.	*Agriculture*
Biotic pathogen	A living organism capable of inciting disease, e.g., fungi, bacteria, viruses, etc.	*Forestry*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Biotite	A platy magnesium-iron mica, common in igneous rocks.	*Mining*
Bi-Partite Board	sometimes referred to as a joint board where it is used as a step in the grievance machinery, at the step prior to arbitration.	*Industrial Relations*
Bipolar	The ability of a panel meter to display both positive and negative readings.	*Electrical*
Bipolar Inputs	An input which accommodates signals both above and below ground.	*Electrical Engineering*
Bipolar Junction Transistor	A Bipolar Junction Transistor, or BJT, is a solid-state device in which the current flow between two terminals (the collector and the emitter) is controlled by the amount of current that flows through a third terminal (the base).	*Electrical Engineering*
Bipolar junction transistor (BJT)	A sandwich configuration such as p-n-p transistor.	*Material Process*
Bipolar plate	Electrically conducting plate connected to the anode on one side and to the cathode on the other side in an electrochemical cell.	*Chemical*
Birdbath	The storage area for the bottom end of a stand of tubulars when they are stored vertically in the derrick. The birdbath also captures the drilling fluid that drains out of the stand of tubulars.	*Petroleum Drilling*
Birdcage	A colloquialism descriptive of the appearance of a wire rope forced into compression. The outer strands form a cage and, at times, displace the core.	*Wire Rope & Cable*
Biscuit	a piece of wood about 1½ inches thick and 4 inches square, placed between the top of a prop and the roof bar. Used with a wooden prop the biscuit would absorb the roof pressure and in most cases save the prop for further use. When used with steel supports it helped to stop the slip of steel on steel when erecting a prop and bar. - see also Bonnet, Cap, Lids and Wedges.	*Mining*
Bistable	Of or pertaining to the general class of fluidic devices which maintain either of two position operating states in the presence or absence of the setting input.	*Mechanical, Process, and Operations*
Bit	Acronym for binary digit. The smallest unit of computer information, it is either 0 or 1.	*Electrical*
Bit Adaptor	the threaded driving head of the bit.	*Petroleum Drilling*
Bit Banging	A technique which uses the general-purpose ports of a microcontroller to emulate a serial interface standard (I2C, SPI, etc).	*Electrical Engineering*
Bit Error Rate	A measure of the number of erroneous bits which can be expected in a specified number of bits in a serial stream.	*Electrical Engineering*
Bit Error Rate (BER) Tester	A piece of test equipment which determines the bit error rate for a device under test (DUT).	*Electrical Engineering*
Bit Error Ratio	The number of erroneous bits divided by the total number of bits transmitted, received, or processed over some stipulated period.	*Electrical Engineering*
Bit Extensions	used for drilling deeper holes. Extensions are threaded together and attached between the bit and the motor output shaft.	*Petroleum Drilling*
Bitting	the name of, and the action of, small pieces of stone falling from the roof.	*Mining*
Bitumen	A naturally occurring viscous mixture, mainly of hydrocarbons heavier than pentane, that may contain sulfur compounds and that, in its natural occurring viscous state, is not recoverable at a commercial rate through a well.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bitumen	Also called asphalt or tar, bitumen is the brown or black viscous residue from the vacuum distillation of crude petroleum. It also occurs in nature as asphalt "lakes" and "tar sands." It consists of high molecular weight hydrocarbons and minor amounts of sulfur and nitrogen compounds.	*Lubrication*
Bituminous coal	A dense coal, usually black, sometimes dark brown, often with well-defined bands of bright and dull material, used primarily as fuel in steam-electric power generation, with substantial quantities also used for heat and power applications in manufacturing and to make coke. Bituminous coal is the most abundant coal in active U.S. mining regions. Its moisture content usually is less than 20 percent. The heat content of bituminous coal ranges from 21 to 30 million Btu per ton on a moist, mineral-matter-free basis. The heat content of bituminous coal consumed in the United States averages 24 million Btu per ton, on the as-received basis (i.e., containing both inherent moisture and mineral matter).	*Energy*
Bituminous Coal Act of 1937	a federal law to regulate the sale and distribution of bituminous coal in interstate commerce, to protect the coal resources of the country, to regulate prices, and to eliminate unfair methods of competition.	*Industrial Relations*
Black air	Black air, -see Blackdamp.	*Mining*
Black Angus	Black Angus - See Angus.	*Agriculture*
Black Bolts and Nuts	The word black refers to the comparatively wider tolerances employed and not necessarily to the color of the surface finish of the fastener.	*Maintenance*
Black damp	A term generally applied to carbon dioxide. Strictly speaking, it is a mixture of carbon dioxide and nitrogen. It is also applied to an atmosphere depleted of oxygen, rather than having an excess of carbon dioxide.	*Mining*
Black Death	a pestilence which reached Europe in the middle of the 14th century (1348) and killed more than one third of the population. Wage and price regulations which began with the emergency carried through during the next two centuries and did much to change the manorial system and also limit the rights of individuals to determine their wages, hours, and conditions of employment. The conspiracy doctrine which was applied against individuals and combinations which sought to organize remained an effective weapon unit the middle of the 19th century.	*Industrial Relations*
Black flag	This flag is waved by the starter to signal a driver that he or she must immediately report to the pits for consultation related to a dangerous mechanical condition or a driving infraction. Failure to heed the flag can result in exclusion from the final results of the event. This flag may also be displayed in a "furled" (rolled-up) manner as a warning. Corner workers may also display a black flag if the session has been halted by the display of a red flag by the starter.	*NASCAR*
Black leg	The British equivalent for the term scab.	*Industrial Relations*
Black liquor	A by product of the paper production process, alkaline spent liquor, that can be used as a source of energy. Alkaline spent liquor is removed from the digesters in the process of chemically pulping wood. After evaporation, the residual "black" liquor is burned as a fuel in a recovery furnace that permits the recovery of certain basic chemicals.	*Energy*
Black list	A band composed of thin layers of bright coal and fusain in the hards of the Barnsley Seam (Yorks.).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Black lung benefits	In the content of the coal operation statement of income, this term refers to all payments, including taxes, made by the company attributable to Black Lung.	*Energy*
Black Oils	Lubricants containing asphaltic materials, which impart extra adhesiveness, that are used for open gears and steel cables.	*Lubrication*
Black smoker	Volcanic vent found in areas of active ocean floor spreading, through which sulfide-laden fluids escape.	*Mining*
Black spit	pneumoconiosis, a disease of the lungs, caused by the inhaling of coal dust, causing the spitting of black phlegm.	*Mining*
Black white face	A crossbred beef animal that is mostly black, but has white on its face. It is most commonly obtained by breeding Black Angus and Hereford cattle.	*Agriculture*
Blackband ironstone	a carbonaceous sideritic ironstone occurring in beds, usually associated with coal seams and containing sufficient included carbonaceous matter to enable it to be calcined without the addition of further fuel, also known as 'hard binds' in Scotland. Exploited commercially during the latter half of the 1800s in the Ayrshire and North Staffordshire coalfields.	*Mining*
Black-batt	black, carbonaceous shale.	*Mining*
Blackberry dirt	a crumbly carbonaceous shale forming a band 2 or 3 inches thick in the Bullhurst Seam. (N. Staffs.).	*Mining*
Blackbody	A theoretical object that radiates the maximum amount of energy at a given temperature, and absorbs all the energy incident upon it. A blackbody is not necessarily black. (The name blackbody was chosen because the color black is defined as the total absorption of light energy.)	*General Engineering*
Black-Connery Bill	Black-Connery Bill - See: Fair Labor Standards Act of 1938	*Industrial Relations*
Blackdamp or Chokedamp	a mixture of nitrogen and carbon dioxide present in mines. The gas will not support a flame or life. Usually found in old mine workings where ventilation is poor. Also known in Yorkshire as 'Black air'.	*Mining*
Blackjack	A miner's term for sphalerite (zinc sulfide).	*Mining*
Blacklist	a procedure whereby employers or employers' associations circulated the name or names of "undesirable" employees, mostly those who were active union men.	*Industrial Relations*
Blacklisting	the practice and procedure of using the Blacklist.	*Industrial Relations*
Blackout	A complete loss of power resulting from damage or equipment failure in a power station, power lines or other parts of the power system. A blackout may also be referred to as a power outage or power failure. (See High-current transients, Reactive power, Wide-Area Monitoring Systems.)	*Electrical*
Blacks	coaly blaes. (Scot.), or black shale (Yorks.).	*Mining*
Black-start capability	The ability of a power system (a generator or grid subsection) to restart after a blackout, independently of the larger grid, by using local generators. For example, HVDC Light transmission systems can be fitted with small diesel generators to provide auxiliary power that can be operational almost immediately in the event of a blackout. This power enables voltage control to be established and normal operations to be resumed quickly.	*Electrical*
Blacktop	Pertaining to or surfaced with blacktop. Example: a blacktop driveway.	*Civil Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Blade Server	A blade server is a computer system on a motherboard, which includes processor(s), memory, a network connection, and sometimes storage. The blade idea is intended to address the needs of large-scale computing centers to reduce space requirements for application servers and lower costs.	*Electrical Engineering*
Blade-passing frequency	A potential vibration frequency on any bladed machine (turbine, fan, etc.), the number of blades x shaft speed.	*Reliability Engineering*
Blaes	shale or mudstone, laminated, but typically soft and fissile. (Scot.).	*Mining*
Bland-Altman plot	The display of paired-data from a comparison of methods experiment by plotting the differences between the test and comparative results on the y-axis versus the average of the test and comparative results on the x-axis. Similar to a traditional "difference plot", except that the average of the test and comparative results provides the x-value rather than the value of the comparative result alone.	*Quality*
Blank Flange	A flange that is not drilled but is otherwise complete.	*Maintenance and Repair*
Blanket Agreement	a collective bargaining agreement whose terms cover an entire industry or large geographic area within an industry.	*Industrial Relations*
Blanket Injunction	a court order issued during a strike or to prevent a strike which is so broad in its sweep of restraints that it encompasses activities which have little relation to the dispute within the blanket.	*Industrial Relations*
Blanket Order	A term commitment (usually one year or more) to a supplier for certain goods or services over a predetermined period of time at predetermined prices, most-favored customer prices, or prices to be revised due to market or other conditions. This practice is aimed at reducing the number of small orders by utilizing short-term releases to satisfy demand requirements.	*Procurement*
Blast coal	Blast coal, -see Lignite.	*Mining*
Blast furnace	A furnace in which solid fuel (coke) is burned with an air blast to smelt ore.	*Energy*
Blast hole	A hole drilled for purposes of blasting rather than for exploration or geological information.	*Mining*
Blast packing	Blast packing, -see Pneumatic packing.	*Mining*
Blast piece	part of an old reciprocating pump.	*Mining*
Blaster	A mine employee responsible for loading, priming and detonating blastholes.	*Mining*
Blast-furnace gas	The waste combustible gas generated in a blast furnace when iron ore is being reduced with coke to metallic iron. It is commonly used as a fuel within steel works.	*Energy*
Blasthole	A drill hole in a mine that is filled with explosives in order to blast loose a quantity of rock.	*Mining*
Blasting	A pressurized stream of particulates (ceramic, plastic, metal, , etc.) applied on a surface to clean, peen or abrade.	*Paint and Coatings*
Blasting agent	Any material consisting of a mixture of a fuel and an oxidizer.	*Mining*
Blasting cap	A detonator containing a charge of detonating compound, which is ignited by electric current or the spark of a fuse. Used for detonating explosives.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Blasting circuit	Electric circuits used to fire electric detonators or to ignite an igniter cord by means of an electric starter.	*Mining*
BLE	BLE - See: Locomotive Engineers; Brotherhood of (Ind)	*Industrial Relations*
Bleach	A product that cleans, whitens, removes stains and brightens fabrics.	*Chemistry*
Bleaching	Loss of normal color, tending toward white, cream, or tan coloration.[1] Fin. Swe.	*Forestry*
Bleed	The process by which air is removed from a hydraulic system.	*Mechanical, Process, and Operations*
Bleeder or bleeder entries	Special air courses developed and maintained as part of the mine ventilation system and designed to continuously move air-methane mixtures emitted by the gob or at the active face away from the active workings and into mine-return air courses. Alt: Exhaust ventilation lateral.	*Mining*
Bleeder valve	A small-flow valve connected to a fluid process vessel or line for the purpose of bleeding off small quantities of contained fluid. It is installed with a block valve to determine if the block valve is closed tightly.	*Petroleum Engineering*
Bleeding	Separation of liquid lubricant from a grease.	*Lubrication*
Bleeding	The separation of some of the liquid phase from a grease	*Lubrication*
Bleed-off	To divert a specific controllable portion of pump delivery directly to reservoir.	*Mechanical, Process, and Operations*
Blemish Tire	A tire with a cosmetic or minor uniformity imperfection but whose safety and performance are unaffected.	*Mechanical Engineering*
Blend Molecular	scale polymeric mixture.	*Material Process*
Blende	An ore of zinc, consisting of zinc and sulfur.	*Mining*
Blended Powder	A powder consisting of two or more different powder materials thoroughly mixed.	*Paint and Coatings*
Blender	The equipment used to prepare the slurries and gels commonly used in stimulation treatments. Modern blenders are computer controlled, enabling the flow of chemicals and ingredients to be efficiently metered and requiring a relatively small residence volume to achieve good control over the blend quality and delivery rate.	*Petroleum Drilling*
Blending	Mixing of ingredients of a molding composition of molding powders. Usually several batches of one type are blended to ensure uniformity of molding conditions.	*Material Process*
Blending	The process of mixing lubricants or components for the purpose of obtaining the desired physical and/or chemical properties (see compounding)	*Lubrication*
Blending (see Compounding)	Blending is the process of mixing fluid lubricant components for the purpose of obtaining desired physical properties.	*Lubrication*
Blending components	See Motor gasoline blending components.	*Energy*
Blending plant	A facility that has no refining capability but is either capable of producing finished motor gasoline through mechanical blending or blends oxygenates with motor gasoline.	*Energy*

Term	Definition	*Industry*
BLF	British Lubricants Federation	*Petro-Chemical Abbreviations*
Blight	A common term for several different diseases; usually applied to those where leaf damage is sudden and severe.	*Forestry*
Blind Flange	A flange used to close the end of a pipe. It produces a blind end which is also known as a dead end.	*Maintenance and Repair*
Blind Alley Jobs	jobs accepted by workers which offer little if any opportunity for advancement. Such jobs lead nowhere either in terms of wages, prestige, or satisfaction.	*Industrial Relations*
Blind Coal	a coal that has lost part of its volatile constituents, and so burns with little or no smoke. (Scot.).	*Mining*
Blind drift	a pilot heading that has been driven in search of coal and then abandoned. Often used for storing equipment.	*Mining*
Blind heading	a heading or roadway with only one way in or out.	*Mining*
Blind Lode	A lode having no outcrop.	*Mining*
Blind pit or Blind shaft	Blind pit or Blind shaft, -see Staple pit.	*Mining*
Blind(ed) study (Syn masked study)	A study in which observer(s) and/or subjects are kept ignorant of the group to which the subjects are assigned, as in an experimental study, or of the population from which the subjects come, as in a nonexperimental or observational study. Where both observer and subjects are kept ignorant, the study is termed a double-blind study. If the statistical analysis is also done in ignorance of the group to which subjects belong, the study is sometimes described as triple blind. The purpose of "blinding" is to eliminate sources of bias.	*Analysis*
Blinding	A layer of sand or fine gravel for filling the gaps in the surfaces of a road or pavement, as one of crushed and compacted stone.	*Civil Engineering*
Blink Control	Controls the display segment blink rate.	*Electrical Engineering*
Blister	Undesired, rounded elevation of the surface of a plastic, whose boundaries may be either more or less sharply defined, somewhat resembling in shape a blister on the human skin. A blister may become flattened.	*Material Process*
Blister copper	A crude form of copper (assaying about 99%) produced in a smelter, which requires further refining before being used for industrial purposes.	*Mining*
Bloch wall	Narrow region of magnetic moment orientation change separating adjacent domains.	*Material Process*
Block	A term applied to a wire rope sheave (pulley) enclosed in side plates and fitted with some attachment such as a hook or shackle.	*Wire Rope & Cable*
Block and bleed	The capability of obtaining a seal across the upstream and downstream seat rings of a valve when the body pressure is bled off to atmosphere thru blow down valves or vent plugs. Useful in testing for integrity of seat seals and in accomplishing minor repairs under pressure. See "Double Block and Bleed."	*Mechanical*
Block caving	An inexpensive method of mining in which large blocks of ore are undercut, causing the ore to break or cave under its own weight.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Block caving	A cheap method of mining in which large blocks of ore are under cut, the ore breaking and caving under its own weight.	*Mining*
Block copolymer	Combination of polymeric component in blocks along a single molecular chain.	*Material Process*
Block diagram	A diagram that represents how the components, represented by "blocks," are arranged and related reliability-wise in a larger system. This is often but not necessarily the same as the way that the components are physically related. This is also called a Reliability Block Diagram or RBD.	*Reliability Engineering*
Block Heater	An accessory which uses electric power to keep an engine that's been turned off from becoming too cold, which makes it hard to start in extremely cold climates.	*Mechanical Engineering*
Block randomisation	See Random permuted blocks	*Quality Engineering*
Block valve	A valve used to isolate equipment.	*Petroleum Engineering*
Block	An acreage sub-division measuring approximately 10 x 20 km, forming part of a quadrant. e.g. Block 9/13 is the 13th block in Quadrant 9.	*Petroleum Drilling*
Block-Diagram	This is a diagram that represents how components which are usually represented by 'blocks' are arranged and related reliability-wise in a larger system. This is often but not necessarily the same as the way that the components are physically related. This is also called a Reliability Block Diagram or RBD.	*Reliability Engineering*
Blocking out	driving roadways all the way around a piece of coal it is proposed to work to ensure that it is free from faults or other features that may hinder its exploitation.	*Mining*
Blocking-up	Blocking-up, -see Dinting.	*Mining*
Block-rate structure	An electric rates schedule with a provision for charging a different unit cost for various increasing blocks of demand for energy. A reduced rate may be charged on succeeding blocks.	*Energy*
Blocks or Stops	small wooden blocks, mounted between the rails, to stop loaded tubs running away down an incline.	*Mining*
Blood albumin	A natural albuminous product obtained from blood, used in dye preparations and in the manufacture of some adhesives and protein plastics.	*Material Process*
Bloom	The typical blue or green surface color of a grease when viewed by reflected daylight.	*Lubrication*
Blossom Rock	Float ore, found upon the surface or near where lodes or ledges outcrop, and from which they have become detached.	*Mining*
Blow	floor lift due to gas or strata pressure.	*Mining*
Blow molding	Processing technique for	*Material Process*
Blow out	Water that is blown or pulled out of the air inlet by wind.	*Facility Engineering*
Blow-by	Passage of unburned fuel and combustion gases past the piston rings of internal combustion engines, resulting in fuel dilution and contamination of the crankcase oil.	*Lubrication*
Blowdown	Water discharged from the system to control concentration of salts or other impurities in the circulating water.	*Chemical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Blow-down	Condensate and gas is produced simultaneously from the outset of production.	*Petroleum Drilling*
Blowdown	The removal of hydrocarbons from a process unit, vessel, or line on a scheduled or emergency basis by the use of pressure through special piping and drums provided for this purpose.	*Petroleum Engineering*
Blow-down	Condensate and gas is produced simultaneously from the outset of production.	*Petroleum Drilling*
Blower	A squirrel-cage type of air moving device usually applied for operation at higher than normal static pressures or for sound control reasons.	*Facility Engineering*
Blower	Equipment for moving large volumes of gas against low-pressure heads.	*Petroleum Engineering*
Blowing mold	A mold in which a hallow article is blown (as from celluloid), made in two metal parts often hinged.	*Material Process*
Blowout	A sudden, uncontrolled release of underground pressure from the well.	*Petroleum Drilling*
Blow-out	When well pressure exceeds the ability of the wellhead valves to control it. Oil and gas "blow wild" at the surface.	*Petroleum Drilling*
Blow-Out Preventer	A heavy casing head control, filled with special gates or rams, which can be closed around the drill pipe, or which completely closes the top of the casing.	*Petroleum Drilling*
Blowout preventer (BOP)	Equipment installed on the wellhead to prevent the escape of fluids under pressure from the wellbore during drilling, completion, or workover operations. The BOP stack incorporates different sets of hydraulic rams enabling the well to be sealed with or without pipe in the hole, pumping of fluids into the well under pressure, and controlled release of fluids from the well.	*Petroleum Engineering*
Blow-out Preventers (BOP's)	High pressure wellhead valves that are designed to shut off the uncontrolled flow of hydrocarbons.	*Petroleum Drilling*
Blow-out preventers (BOPs)	Are high pressure wellhead valves, designed to shut off the uncontrolled flow of hydrocarbons.	*Petroleum Drilling*
Blow-out	When well pressure exceeds the ability of the wellhead valves to control it. Oil and gas "blow wild" at the surface.	*Petroleum Drilling*
BLS	Bureau of Labor Statistics within the U.S. Department of Labor	*Energy*
BLS Index	BLS Index - See: Bureau of Labor Statistics Index.	*Industrial Relations*
Blue Eagle	The insignia of the N.I.R.A.	*Industrial Relations*
Blue flag	This flag is displayed by corner workers around the track to signal to a driver that a faster car is either approaching (steady flag) or attempting a pass (waved flag). The driver being flagged has no obligation to do anything other than be alert, maintain the racing line and avoid intentionally obstructing the faster car.	*NASCAR*
Blue metal	Blue metal, – see shale.	*Mining*
Blue Sky Bargaining	unrealistic and unreasonable demands in negotiations by either or both labor and management, where neither concedes anything and demands the impossible, is sometimes referred to as blue-sky bargaining.	*Industrial Relations*
Blue-cap	the characteristic blue haze over the flame of a safety lamp when firedamp or methane, is present in the atmosphere.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bluetooth	A technology that allows voice and data connections between a wide range of mobile and stationary devices through short-range digital two-way radio. For instance, it specifies how mobile phones, Wireless Information Devices (WIDs), computers and PDAs interconnect with each other, with computers, and with office or home phones.	*Electrical Engineering*
Bluetooth Capability	The ability of a radio system to work with Bluetooth wireless connectivity, to function in concert with a cellular phone.	*Mechanical Engineering*
Blush	The clouding or whitening of a plastics wet with solvent or containing solvent, or of a lacquer film because of too rapid drying or high humidity. Also applied to the whitening or certain plastics, e.g., pyroxylin, by hot water or steam, or to whitening from any cause. Term not recommended for use.	*Material Process*
BMP	BMP—See: Bricklayers, Masons and Plasterers' International Union of America (AFL-CIO)	*Industrial Relations*
BMS	Building Management System	*Control Engineering*
BMWE	BMWE—See: Maintenance of Way Employees; Brotherhood of (AFL-CIO)	*Industrial Relations*
BNA	BNA - See: Bureau of National Affairs, Inc.	*Industrial Relations*
BNC	A quick disconnect electrical connector used to inter-connect and/or terminate coaxial cables.	*General Engineering*
BNP	Bureau de Normalisation des Pétroles (France)	*Petro-Chemical Abbreviations*
Boar	Mature male swine.	*Agriculture*
Board foot	A unit of wood measuring 1-inch in thickness by 12-inch in width by 12 inches in length.	*Forestry*
Board lot	One hundred shares.	*Mining*
Board of Inquiry	a board generally set up to investigate the facts involved in a labor dispute.	*Industrial Relations*
Board of Jurisdictional Awards, National	an agency created in 1919 for the purpose of resolving jurisdictional disputes between A.F. of L. craft unions.	*Industrial Relations*
Boardway's course	the direction at right angles to the line of cleavage or cleat of the coal.	*Mining*
Boardways	headings driven across the cleat, or 'on the bord'.	*Mining*
Bob-a locker	the man who stood by the side of the road pushing lockers between the spokes of the tubs to slow down their progress (N. Staffs.).	*Mining*
Bobbin	Formed core upon which the coil of a magnet is wound.	*Material Process*
BOCLE	ball on cylinder lubricity evaluator	*Petro-Chemical Abbreviations*
Bode Diagram	A plot of log amplitude ratio and phase angle values on a log frequency base for a transfer function.	*Process Control*
Bode plot	The magnitude of vibration at 1x shaft speed, also its phase relative to shaft position, both plotted against running speed.	*Reliability Engineering*
Body	The principle pressure containing part of a valve in which the closure element and seats are located.	*General Mechanical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Body centered cubic	Common atomic arrangement for metals.	*Material Process*
Body force	An external force acting throughout the mass of a body. Gravity is a body force. An inertial force is a body force.	*Engineering Physics*
Bodywork	The exterior of the car. The bodywork is generally made from carbon fiber. The panels lift off in sections so mechanics can get to mechanical components easily and quickly. Bodywork is carefully sculpted to maximize aerodynamic efficiency.	*NASCAR*
BOE	Barrels of Oil Equivalent (used internationally)	*Energy*
Bogey	efforts by employees to restrict output by setting up an informal standard (bogey) beyond which the employees do not go.	*Industrial Relations*
Bogey or Bogie	a flat-bottomed truck for manriding or transporting materials—see Flat Danny or Horned Danny.	*Mining*
Boghead coal or Torbanite	closely allied to some varieties of oil shale and consists essentially of oil-bearing algae mixed with small quantities of sediment.	*Mining*
Bogus (Type) Work	Refers to the "make work" practice in composing rooms by typesetters, who reset type which is not necessarily in order to print the article or advertisement.	*Industrial Relations*
Bohr magneton	Unit of magnetic moment	*Material Process*
Bohr magneton Unit	Unit of magnetic moment (= 9.27 10-24 Ampere m2)	*Material Process*
Bohr Model	Classical representation of atomic structure in which electrons orbit the positively charged nucleus in distinct energy levels	*Physics*
BOI	Business Operation Income (after taxes).	*Maintenance*
BOI	Base Oil Interchange	*Mechanical, Process, and Operations*
Boil	An unwanted flow of water and solid matter into an excavation, due to excessive outside water pressure.	*Civil Engineering*
Boiler	A device for generating steam for power, processing, or heating purposes; or hot water for heating purposes or hot water supply. Heat from an external combustion source is transmitted to a fluid contained within the tubes found in the boiler shell. This fluid is delivered to an end-use at a desired pressure, temperature, and quality.	*Energy*
Boiler fuel	An energy source to produce heat that is transferred to the boiler vessel in order to generate steam or hot water. Fossil fuel is the primary energy source used to produce heat for boilers.	*Energy*
Boiling point	the temperature at which a component's vapor pressure equals atmospheric pressure. Boiling point is a relative indicator of volatility and generally increases with increasing molecular weight.	*Chemical*
Boiling Point	The temperature at which a substance boils, or is converted into vapor by bubbles forming within the liquid; it varies with pressure	*Lubrication*
Boiling Range	For a mixture of substances, such as a petroleum fraction, the temperature interval between the initial and final boiling points.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Boiling-water reactor (BWR)	A light-water reactor in which water, used as both coolant and moderator, is allowed to boil in the core. The resulting steam can be used directly to drive a turbine.	*Energy*
Boilum	hard calcareous or siliceous nodules of irregular shape found in the shales and under-clays of the Coal Measures. (N. Staffs.)	*Mining*
Boll or Bowl (measure)	a measure of capacity used in the North of England and Scotland for grain, coal and other dry goods. The coal boll was probably derived from the corn boll, i.e. the amount a man could carry. The boll or bowl was a wooden tub or wheelbarrow used to load coals into the keels on the Tyne. At Gateshead in the mid 16th century the boll contained eight gallons. In the first part of the 17th century, in a lease of mines from the Prior of Tynemouth, the "chaldron" was defined as six bolls. The size of the boll was fixed by statute in 1678 and contained 22 gallons and a "pottle." By 1704 at Town Moor Colliery (N. East.) the boll had risen to 36 gallons. In evidence before a Select Committee of the House of Lords, in 1829 the boll contained 9676•8 cubic inches, or 34•899 imperial gallons. It would appear that the boll never attained a uniform measure.	*Mining*
Bolster	A structural member on which one end of a bridge truss rests.	*Civil Engineering*
Bolt	A bolt is the term used for a threaded fastener, with a head, designed to be used in conjunction with a nut.	*Maintenance*
Bolt	A fastener having a square or hex head and threaded on the opposite end to receive a nut sometimes used to make up a flanged connection.	*Mechanical*
Bolt Circle	Often referred to as the wheel bolt pattern; the diameter of an imaginary circle drawn through the center of each lug hole.	*Mechanical Engineering*
Bolt torque	The turning force in foot-pounds applied to a roof bolt to achieve an installed tension.	*Mining*
Bolted bonnet	A bonnet which is connected to a valve body with bolts or studs and nuts.	*General Mechanical*
Bolted construction	Describes a valve construction in which the pressure shell elements (such as body and closures of a trunnion ball valve) are bolted together and so can be taken apart and repaired in the field.	*General Mechanical*
Bolting sets	Bolts, or studs, and nuts sometimes supplied with flanged valves to install the valve between line flanges.	*Mechanical*
Bolting Tension	The energy resulting from applying Torque to nuts onto bolts/studs providing the required compressive force to hold connections in contact under pressure or load.	*Petroleum Engineering*
Bolting Torque	The rotational force applied to nuts onto stud bolts required to tighten and apply tension to the bolts in order to hold flanges or other connections.	*Petroleum Engineering*
BOM	See Bill Of Materials.	*Plant Engineering*
Bomb Oxidation	A test for the oxidation stability of a product obtained by sealing it in a closed container with oxygen under pressure. The drop in pressure of the oxygen is a measure of the amount of oxidation that has occurred.	*Lubrication*
Bonanza	Very rich ore, or situation.	*Mining*

Term	Definition	*Industry*
Bonanza	Fair weather; a mine said to en bonanza when it is yielding a profit. It is a Spanish term meaning good-luck.	*Mining*
Bond	The junction of the weld metal and the base metal, or the junction of the base metal parts when weld metal is not present.	*Maintenance and Repair*
Bond	The state of adhesion between the coating and the substrate. It's strength will depend on the details of the spraying process and the materials used. Bonding mechanisms may be mechanical, physical, chemical or metallurgical or a combination of these.	*Paint and Coatings*
Bond angle	Angle formed by three adjacent, directionally bonded atoms.	*Material Process*
Bond Coat	A coating applied as an intermediary between the main or top coating and the substrate in order to improve the bond strength and/or to provide a corrosion or oxidation barrier.	*Paint and Coatings*
Bond energy	Net energy of attraction (or repulsion) as a function of separation distance between two atoms or ions.	*Material Process*
Bond force	Net force attraction (or repulsion) as a function of separation distance between two atoms or ions.	*Material Process*
Bond length	Center- to- center separation distance between two adjacent, bonded atoms or ions.	*Material Process*
Bond strength	the strength with which two or more items are joined; the resistance that must be overcome in order to separate the joined materials, e.g. steel and zinc-iron alloy layers of the galvanized coating, or galvanized reinforcing steel and concrete	*Materials Process*
Bond Strength	The strength of the adhesion between the coating and the substrate. A number of test methods are in use to measure the bond strength of coatings.	*Paint and Coatings*
Bonded petroleum imports	Petroleum imported and entered into Customs bonded storage. These imports are not included in the import statistics until they are (1) withdrawn from storage free of duty for use as fuel for vessels and aircraft engaged in international trade; or (2) withdrawn from storage with duty paid for domestic use.	*Energy*
Bonding strength	A measure of the force required to separate the layers of a laminated product or particles of filler, usually fibrous, in a plastics compound.	*Material Process*
Bone	a hard cannel coal. (Lancs.).	*Mining*
Bone coal	Coal with a high ash content; it is dull in appearance, hard, and compact.	*Energy*
Bonnet	The bonnet is that portion of the valve pressure retaining boundary that may guide the stem and contains the packing box and stem seal. The bonnet may be integral to the valve body or bolted or screwed. The bonnet, if it is detachable, will generally provide the opening to the valve body cavity for removal and replacement of the internal trim. The bonnet is generally the means by which the actuator is connected to the valve body.	*Industrial Engineering*
Boobey	A type of box which held 6 to 8 cwt. of coal in which dirt or rubbish was sent to the bank or surface. (Som.).	*Mining*
Book	The portion of the carrying value (other than the portion associated with tangible assets) prorated in each accounting period, for financial reporting purposes, to the extracted portion of an economic interest in wasting natural resource.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Book value	The portion of the carrying value (other than the portion associated with tangible assets) prorated in each accounting period, for financial reporting purposes, to the extracted portion of an economic interest in a wasting natural resource.	*Energy*
Booked costs	Costs allocated or assigned to inter-departmental or intra company transactions, such as on-system or synthetic natural gas (SNG) production and company-owned gas used in gas operations and recorded in company books or records for accounting and/or regulatory purposes.	*Energy*
Boolean set	a mathematical concept whereby the degree to which an element belongs to a particular notion about some domain of definition is classified as completely true OR completely false. For example, consider the domain of all room temperatures; 76.2 degrees Fahrenheit either is or is not a member of the set of "comfortable room temperatures", depending on where the Boolean set boundary is defined.	*Petroleum Drilling*
Boom Hoist Line	Wire rope that operates the boom hoist system of derricks, cranes, draglines, shovels, etc.	*Wire Rope & Cable*
Boom Pendants	A non-operating rope or strand with end termination to support the boom.	*Wire Rope & Cable*
Boom ripper	a machine for cutting down a ripping by means of a rotating cutting head on a fixed or telescopic hydraulic boom.	*Mining*
Boom	A telescoping, hydraulically powered steel arm on which drifters, manbaskets and hydraulic hammers are mounted.	*Mining*
Boost Converter	A power supply that steps an input voltage up (boosts it) to a higher, regulated voltage.	*Electrical Engineering*
Booster	A pneumatic relay that is used to reduce the time lag in pneumatic circuits by reproducing pneumatic signals with high-volume and/or high-pressure output. These units may act as volume boosters or as amplifiers. A 1:2 booster will take a 3-15 psig input signal and output a 6-30 psig signal.	*Industrial Engineering*
Booster	A device that amplifies the amount of air (gas) going to a pneumatic actuator, producing a faster response. Having a separate air supply than the positioner, a booster typically is used with larger actuators that have larger volumes to fill.	*Mechanical*
Booster Conveyor	Any type of powered conveyor used to regain elevation lost in gravity roller or wheel conveyor lines.	*Manufacturing*
Booster or Booster fan	an underground ventilation fan used to increase the ventilation of a district or seam.	*Mining*
Boot	A protective covering over any portion of a cable or conductor in addition to its jacket or insulation.	*Electrical*
Boother	A boulder in the "Glacial Drift"; blue "Boothers" were much prized for road-making on farms. (N. Staffs.).	*Mining*
Bootstrap	Often refers to using the output of a step-up converter to drive the main power FET switch, providing more gate drive than the input can supply alone. Also refers to using a switched capacitor to boost the voltage of a node.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
BOP	The Blowout Preventer is a series of heavy valves and rams which can be engaged to prevent a blowout from occurring. There are typically several different rams and shears utilized in a BOP stack. These can either squeeze off the annulus, or space between the drill pipe and casing, or even shear off the drill pipe itself to close the hole. Drilling companies frequently conduct BOP drills which familiarize the crew with how to quickly close BOP valves to prevent a blowout.	*Petroleum Drilling*
BOP	See blow-out preventers	*Petroleum Drilling*
Bord and pillar	Bord and pillar, -see Pillar and stall.	*Mining*
Bord cleat	Bord cleat, -see Cleat.	*Mining*
Bord face	a coal face advancing in a direction at right angles to the line of main cleat.	*Mining*
Bord or Board and Pillar	a system of working coal by partial extraction which is similar to 'pillar and stall' in which between 30 and 60 per cent of the coal would be removed depending on the condition and the weight of the roof. Sometimes the pillars would be worked out at a later date by using the retreat system. Also known as 'board and wall', 'post and stall' 'square work' and 'stoop and room'. The bord is a roadway driven in the seam, usually at right angles to the cleat; or the principal working place with one or two hewers (N. East).	*Mining*
Bord, or Board	the main cleavage or cleat in coal seams. The direction of the cleat; or a roadway at right angles to the main cleat, or a roadway with solid coal sides. 'Board' or 'board' was also the principal working place some four to five yards wide, where one or two miners worked, hewing the coal.	*Mining*
Borderline customer	A customer located in the service area of one utility, but supplied by a neighboring utility through an arrangement between the utilities.	*Energy*
Bore	To form, make, or construct (a tunnel, mine, well, passage, etc.) by hollowing out, cutting through, or removing a core of material: Example: to bore a tunnel through the Alps; to bore an oil well 3000 feet deep.	*Civil Engineering*
Bore (or port)	The inside diameter of the smallest opening through a valve, e.g., inside diameter of a seat ring, diameter of hole through ball in a ball valve.	*General Mechanical*
Bore (or port)	The inside diameter of the smallest opening through a valve, e. g., inside diameter of a seat ring, diameter of hole through ball in a ball valve.	*Mechanical*
Borehole	Any deep or long drill-hole, usually associated with a diamond drill.	*Mining*
Borehole	The hole drilled by the drill bit	*Petroleum Drilling*
Borehole	The hole as drilled by the drill bit.	*Petroleum Drilling*
Borer	a long iron bar with a hardened chisel shaped tip used to bore shot holes in coal. Also known as a 'puncher' it was used without the aid of a hammer. The miner used a jab and twist action to bore the hole. - see Boring bar, Driller and Jumper; or a person whose business it was to search for minerals by boring	*Mining*
Boring	to pierce or gouge out with an auger or drill.	*Petroleum Drilling*
Boronizing	The diffusion of boron into the surface of a component (usually steel) by a high temperature (approx. 900oC) gas or pack process. Produces hard phases within the surface (Typically 100μm deep).	*Paint and Coatings*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Borosilicate glass	High durability, commercial glassware composed of primarily silica, with a significant component of B2O3.	*Material Process*
Borrow pit	A pit from which construction material, as sand or gravel, is taken for use as fill at another location.	*Civil Engineering*
Borrow pit	A pit from which construction material, as sand or gravel, is taken for use as fill at	*Civil Engineering*
Bosh or water bosh	a tank or tub out of which the horses drank underground (S. Wales.).	*Mining*
Boss	Any member of the managerial ranks who is directly in charge of miners (e.g., "shift-boss," "face-boss," "fire-boss," etc.).	*Mining*
Bossing	the holing or undercutting of a coal seam. (Scot.).	*Mining*
BOTD	ball on three disks	*Petro-Chemical Abbreviations*
BOTS	ball on three seats	*Petro-Chemical Abbreviations*
Bottle-coal	coal containing a high percentage of volatile hydrocarbons, suitable for gas making. (Scot.).	*Mining*
Bottled gas	Bottled gas: See Liquefied petroleum gases.	*Energy*
Bottled gas, LPG, or propane	Any fuel gas supplied to a building in liquid form, such as liquefied petroleum gas, propane, or butane. It is usually delivered by tank truck and stored near the building in a tank or cylinder until used.	*Energy*
Bottleneck	Any point at which production is slowed because demand placed on a resource is equal to or more than capacity. Bottlenecks identify machines that are critical to large sections of the production cycle.	*Maintenance*
Bottom	Floor or underlying surface of an underground excavation.	*Mining*
Bottom ash	Residue mainly from the coal burning process that falls to the bottom of the boiler for removal and disposal.	*Energy*
Bottom gate	on an inclined face the lower of the two or more gate roads serving the face.	*Mining*
Bottom hole pressure	The pressure in a well at the bottom of the hole, usually measured in pounds per square inch (psi).	*Petroleum Engineering*
Bottomhole	The lowest or deepest part of a well.	*Petroleum Drilling*
Bottom-hole contribution	A payment (either in cash or in acreage) that is required by agreement when a test well is drilled to a specified depth regardless of the outcome of the well and that is made in exchange for well and evaluation data.	*Energy*
Bottoming cycle	A waste-heat recovery boiler recaptures the unused energy and uses it to produce steam to drive a steam turbine generator to produce electricity.	*Energy*
Bottoms	Tower bottoms are residue remaining in a distillation unit after the highest boiling-point material to be distilled has been removed. Tank bottoms are the heavy materials that accumulate in the bottom of storage tanks, usually comprised of oil, water, and foreign matter.	*Petroleum Engineering*
Bottoms or Bottom coal	the lowest section of a coal seam that may or may not be extracted.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bouldering	Pavement made with small boulders.	*Civil Engineering*
Bounce Test	A shaking of unrestrained (loose) cargo. The cargo is repeatedly thrown a short distance into the air and then falls onto the vibrating platform.	*Reliability Engineering*
Boundary fault	a large fault usually forming the boundary to the mine or a section of the mine.	*Mining*
Boundary layer	Region in a fluid close to a solid surface. This region is characterized by large gradients in velocity and is often treated with approximative methods, because it is difficult to geometrically resolve the large gradients found there.	*Chemical*
Boundary Lubrication	Lubrication between two rubbing surfaces without the development of a full fluid lubricating film. It occurs under high loads and requires the use of anti-wear or extreme-pressure (EP) additives to prevent metal-to-metal contact.	*Lubrication*
Bovine	cattle	*Agriculture*
Bovine spongiform encephalopathy, (BSE)	mad-cow disease.	*Agriculture*
Bow	An undesirable shaft condition (rotating machinery) in which the shaft centerline is not straight.	*Reliability Engineering*
Bowk	originally a small wooden box used for lifting refuse out of a sinking pit. Later it was one of the many names given to a large barrel or bucket-shaped tub used when sinking shafts. - see also Kibble and Hoppit. Also the term used to describe in the North East for a report made by the cracking of the strata owing to the extraction of the coal beneath, or the noise made by the escape of gas under pressure.	*Mining*
Box bottoms	the small coal or slack that fell to the bottom of the tubs or boxes. It was produced by breakage in transit. (Leics.).	*Mining*
Box hole	A short raise or opening driven above a drift for the purpose of drawing ore from a stope, or to permit access.	*Mining*
Box scraper	a method of loading coal on a longwall face adapted from the main-and-tail haulage system and a forerunner of the coal plough. The simplest type consisted of a double-drum haulage engine that pulled a bottomless scraper box, skip or scoop backwards and forwards along the face by means of a main-and-tail rope. The system was first introduced in 1929—see also Slusher.	*Mining*
Box-end	The tension end of a conveyor belt.	*Mining*
Box-type magazine	A small, portable magazine used to store limited quantities of explosives or detonators for short periods of time at locations in the mine which are convenient to the blasting sites at which they will be used.	*Mining*
Boyle's Law	The absolute pressure of a fixed mass of gas varies inversely as the volume, provided the temperature remains constant.	*Mechanical, Process, and Operations*
Boyle's Law	A law stating that the pressure of a given mass of an ideal gas is inversely proportional to its volume at a constant temperature.	*Chemistry*
Boyle's Law	A law of physics stating that when gas is subject to compression and kept at a constant temperature, the product of the pressure and volume is a constant quantity, i.e., the volume is inversely proportional to the pressure.	*Petroleum Drilling*
bp	The abbreviation for boiling point.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
BPBD	BPBD—See: Bill Posters, Billers and Distributors of the United States and Canada; International Alliance of (AFL-CIO)	*Industrial Relations*
BPDP	BPDP - See: Painters, Decorators and Paperhangers of America; Brotherhood of (AFL-CIO)	*Industrial Relations*
B-Pillar	The roof support between a vehicle's front door window and rear side window, if there is one.	*Mechanical Engineering*
BPS	Bits per second.	*General Engineering*
Brace	(See Diagonal).	*Facility Engineering*
Braced arch	An arch of steel, timber, etc., having a trusslike framework maintaining rigidity under a variety of eccentric loads: a true arch because it is fixed or tied at both sides of the base.	*Civil Engineering*
Braced arch	An arch of steel, timber, etc., having a trusslike framework maintaining rigidity under a variety of eccentric loads—a true arch because it is fixed or tied at both sides of the base.	*Civil Engineering*
Bracehead	a piece of tough ash or oak, about 3ft long, passed through an eye in a short piece of iron, at the other end of which is a male screw to connect with boring rods. Using this men could manually turn the boring rods to form the borehole.	*Mining*
Bracing	metal that is attached to a fabrication prior to galvanizing in order to provide support so that the steel does not change shape during heating and cooling; can be temporary or permanent	*Materials Process*
Brackish	A level of salinity between fresh water and seawater – generally 0.5 to 30 grams of salt per liter.	*Filtration*
Braddish	Braddish, - see Brattice.	*Mining*
Braden Head	See Casing head	*Petroleum Engineering*
Bradenhead	A casinghead.	*Petroleum Drilling*
Bradenhead Test		*Petroleum Drilling*
Bradenhead	A casinghead.	*Petroleum Drilling*
Bradford Breaker	a screening and coal crushing machine which uses gravity impact to break the coal. It passes the run-of-mine coal through a cylindrical screen 8–14 ft in dia. and 15–22 ft long. It could deal with 500–600 t.p.h. reducing the coal to size according to the screen plates fitted.	*Mining*
Brady Brown	A type of frac sand (see Proppant) used in Eagle Ford Shale wells. Obtained from mines near the Texas towns of Brady and Voca.	*Petroleum Drilling*
Brae	an inclined roadway. (Scot.).	*Mining*
Bragg angle	Angle relative to a crystal plane from which x-ray diffraction occurs.	*Material Process*
Bragg's low	The relationship defining the condition for x-ray diffraction by a given crystal. plane.	*Material Process*
Brahman	See American Brahman.	*Agriculture*
Braid	A fibrous or metallic group of filaments interwoven in cylindrical form to form a covering over one or more wires.	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Braided Stream	A stream that divides into or follows an interlacing or tangled network of several small branching and reuniting shallow channels separated from each other by branch islands or channel bars, resembling in plan the strands of a complex braid.	*Petroleum Engineering*
Brake	to lower trams down a dip using a wheel and rope (N. Staffs.)—see also Jig.	*Mining*
Brake Assist	Designed to shorten stopping distance in a "panic" stop. Applies full braking power even if the brake pedal is not fully depressed. Sensors gauge the speed at which the driver initially depresses the brake pedal and determine whether full emergency stopping power is warranted.	*Mechanical Engineering*
Brake bias	In most cars, including street cars, pressing on the brake pedal applies a little more force to the front brakes than the rear. This is designed to take advantage of the fact that under braking, weight transfers to the front of the car. With lots of weight on the front tires, the brakes can be applied very hard without completely stopping the wheels from rotating ("locking the wheels"). At the same time, the rear of the car tends to get lighter, so the rear brakes must be engaged less than the fronts to avoid locking the rear wheels and possibly losing control. In a racecar, brake bias is adjustable by the driver to compensate for changing conditions, such as on a wet track where there is less weight transfer to the front of the car under braking, or to adjust for a changing center of gravity as fuel is burned off.	*NASCAR*
Brake Drum	A drum brake is a brake in which the friction is caused by a set of shoes or pads that press against a rotating drum-shaped part called a brake drum.	*Mechanical Engineering*
Brake Fade	A condition brought about by repeated brake applications, resulting in build-up of heat that causes a temporary reduction or fading of braking effectiveness.	*Mechanical Engineering*
Brake fade	Brakes transform motion into heat. The heat in the rotors of a car can reach 5,000 degrees F. When the fluid in the brake system exceeds its boiling point due to hard use, bubbles can form in the brake lines and calipers. Since these bubbles can be squeezed smaller by pressure from the brake pedal, the pedal tends to "go soft" and may even go to the floorboard without the brakes working properly.	*NASCAR*
Brake horsepower (bhp)	The actual power output of an engine or a motor.	*Facility Engineering*
Brake incline	a self-acting haulage system that used a hand-operated brake to control the speed of descent. - see also Gravity haulage.	*Mining*
Brake Linings	The replaceable friction material which contacts the brake drum in a drum brake system to slow or stop the vehicle.	*Mechanical Engineering*
Brake Master Cylinder	A cylinder containing a movable piston activated by pressure on the brake pedal. The piston produces hydraulic pressure that pushes fluid through the lines and wheel cylinders. This forces the brake lining or pad against the drum or disc to slow or stop the vehicle.	*Mechanical Engineering*
Brake Motor	A device usually mounted on a motor shaft between motor and reducer with means to engage automatically when the electric current is cut off or fails.	*Manufacturing*
Brake Pads	In a disc system, they are the replaceable flat segments consisting of a rigid backing plate plus frictional lining that takes the place of the shoe and lining in a drum brake.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Brake Roller	Air or mechanically operated brakes used underneath roller conveyor to slow down or stop packages being conveyed.	*Equipment*
Brake Shoe	The arc-shaped carrier to which the brake linings are mounted in a drum brake. They also force the lining against the rotating drum during braking.	*Mechanical Engineering*
Brakes Disc	A type of braking system in which brake shoes, in a vise-like caliper, grip a revolving disk mounted on a wheel to slow or stop disc and wheel rotation for braking.	*Mechanical Engineering*
Brakes Drum	A type of braking system that utilizes a metal drum mounted on a wheel to form the outer shell of a brake. The brake shoes press against the drum to slow or stop drum and wheel rotation for braking.	*Mechanical Engineering*
Brakesman	the man managing the winding engine.	*Mining*
Braking Torque	Torque applied by a brake to a tire/wheel assembly, which slows or stops the vehicle.	*Mechanical Engineering*
Bran	The broken coat of the seed of cereal grain, separated from the flour or metal by sifting or bolting.	*Material Process*
Branch	dull hard coal forming the top part of the Silkstone Seam, (Yorks.); or sometimes inferior cannel coal.	*Mining*
Branch Connection	The attachment of a branch pipe to the run of a main pipe with or without the use of fittings.	*Maintenance and Repair*
Branches	cross-measure drifts. (Som.).	*Mining*
Branching	The addition of a polymeric molecule to the side of a main molecular chain.	*Material Process*
Branded product	A refined petroleum product sold by a refiner with the understanding that the purchaser has the right to resell the product under a trademark, trade name, service mark, or other identifying symbol or names owned by such refiner.	*Energy*
Brangus	A distinct breed of beef cattle developed by crossing registered Brahman and Angus cattle. The earliest crosses were made in 1912. Breed development was assisted by the USDA Experiment Station at Jeanerette , Louisiana . Genetically Brangus are 3/8 Brahman and 5/8 Angus. The breed registry is maintained by the International Brangus Breeders Association, Inc.	*Agriculture*
Brashing	the action of coal falling away from the face. - see also Ratching.	*Mining*
Brashy	Rotten old timbers in the mine that had been attacked by fungus and could look sound, but were in fact brashy. (Yorks).	*Mining*
Brass, Brasses or Brassy	Iron pyrites, fool's gold, iron sulfide, a brass-like mineral occurring in coal. Thought to be possibly one of the causes of heating or spontaneous combustion in wastes or gobs.	*Mining*
Brassey coal	Coal containing golden specks of iron pyrites, also a well-known coal seam in the Lancs. Coalfield.	*Mining*
Brat	A thin stratum of a coarse mixture of coal and carbonate of lime or pyrites, frequently found lying at the roof of a seam of coal, (N. East).	*Mining*

Term	Definition	*Industry*
Brattice and Brattice cloth	a division or partition in a shaft, heading or other underground working place to direct air to a specific point, often to dilute flammable or noxious gases. It could also be used to divide the place or a shaft into two parts, one for the ingress of fresh air and the other for the egress of the used air. A brattice could be constructed of wood, brick or stonework, or heavy-duty tightly woven (sometimes tarred) cloth nailed to a timber frame or timber boarding.	*Mining*
Brattice or brattice cloth	Fire-resistant fabric or plastic partition used in a mine passage to confine the air and force it into the working place. Also termed "line brattice," "line canvas," or "line curtain."	*Mining*
Bratticed shafts	before the Act of 1862 made it compulsory for every mine to have a second shaft it was common practice to divide the shaft into two or more sections by means of brattices. This enabled the one shaft to be used for several functions simultaneously e.g. winding, pumping and ventilation. These partitions were a source of great danger. Being constructed from timber, if the brattices caught fire or were wrecked the men would be trapped below ground.	*Mining*
Braze Welding	A method of welding whereby a groove, fillet, plug, or slot weld is made using a nonferrous filler metal having a melting point below that of the base metals, but above 800°F. The filler metal is not distributed in the joint by capillary action.5 (Bronze welding, the term formerly used, is a misnomer.)	*Maintenance and Repair*
Brazing	Brazing. A metal joining process in which coalescence is produced by use of a nonferrous filler metal having a melting point above 800°F but lower than that of the base metals joined. The filler metal is distributed between the closely fitted surfaces of the joint by capillary action.	*Maintenance and Repair*
Brazzle, Brazils or brazzles	Another name for iron pyrites; also ? the term 'brazils' was used for small round nut-shaped nodules found in some blackband ironstones.	*Mining*
BRC	BRC—See: Railway Carmen of America; Brotherhood (AFL-CIO)	*Industrial Relations*
Breadth	A series of coal pillars formed by rearer working. (N. Staffs).	*Mining*
Break	Loosely used to describe a large-scale regional shear zone or structural fault.	*Mining*
Break Distance	The minimum distance between separated mating contacts in their fully open position.	*Electrical Engineering*
Break Down Maintenance (BDM)	"Unplanned" corrective maintenance performed on equipment after the equipment has suffered a failure and has to be corrected during a break down of the equipment. Break down maintenance indicates a lack of planning. See also RunTo Failure	*Maintenance*
Break line	The line that roughly follows the rear edges of coal pillars that are being mined. The line along which the roof of a coal mine is expected to break.	*Mining*
Break lines	Break lines, -see Breaks.	*Mining*
Breakaway	The point at which tire cornering traction is lost.	*Mechanical Engineering*
Breakaway Torque	The torque necessary to put into reverse rotation a bolt that has not been tightened.	*Maintenance*
Break-Before-Make	A switch that is configured to break (open) the first set of contacts before engaging (closing) the new contacts. This prevents the momentary connection of the old and new signal paths.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Breakdown (Puncture)	A disruptive discharge through insulation due to failure under electrostatic stress.	*Electrical*
Breakdown maintenance	Maintenance performed after a machine has failed to return it to an operating state.	*Oil Analysis*
Breakdown Voltage	The voltage at which the insulation between two conductors, or a conductor and ground will break down.	*Electrical*
Breakdown Voltage Rating	The dc or ac voltage which can be applied across insulation portions of a transducer without arcing or conduction above a specific current value.	*Electrical*
Breaker props	props set at the waste edge.	*Mining*
Break-even cutoff grade	The lowest grade of material that can be mined and processed considering all applicable costs, without incurring a loss or gaining a profit.	*Energy*
Breaking Strength	Breaking Strength is the ultimate load at which a tensile failure occurs in the sample of wire rope being tested. (Note: The term breaking strength is synonymous with actual strength.) Minimum Acceptance Strength is that strength which is 2-1/2% lower than the catalog or nominal strength. This tolerance is used to offset variables that occur during a sample preparation and actual physical test of a wire rope. Nominal Strength is the published (catalog) strength calculated by a standard procedure that is accepted by the wire rope industry. The wire rope manufacturer designs wire rope to this strength, and the user should consider this strength when making design calculations.	*Wire Rope & Cable*
Breakloose Torque	The torque required to effect reverse rotation when a pre-stressed threaded assembly is loosened.	*Maintenance*
Breakout	Drilling a well.	*Civil Engineering*
Break-out	To Break apart; to disconnect flanged or screwed Connectors.	*Petroleum Engineering*
Breakout Pressure	The minimum pressure which starts moving an actuator.	*Mechanical, Process, and Operations*
Breaks	cracks and fissures found in the strata and coal seams due to the working of coal in the near vicinity or subsidence. This can also occur when a seam is being worked above a previously worked area. (S. Staffs.). Subsidence cracks at the surface are called 'Break lines'.	*Mining*
Breakthrough	A passage for ventilation that is cut through the pillars between rooms.	*Mining*
Break-up	Time in the spring, usually during April and May, when the frost comes out of the ground causing softening and heaving of roadbeds or muskeg. During break-up, drilling and service rig contractors can't move equipment.	*Petroleum Drilling*
Breast	A working face, usually restricted to a stope.	*Mining*
Breast	A working face in a mine, usually restricted to a stope.	*Mining*
Breasting	a short heading stall, worked at right angles to, and forming the face of the main level or a short face advancing along the strike in 'rearer working. (N. Staffs.); or a wide heading or level; or pushing tubs etc. as opposed to pulling them. (N. East).	*Mining*
Breasting Ore	Taking ore from the face, breast or end of a tunnel. Bullion. - Precious metals, gold and silver, etc., not coined.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Breather	A device which permits air to move in and out of a container or component to maintain atmospheric pressure.	*Mechanical, Process, and Operations*
Breccia	A coarse-grained clastic rock, composed of angular broken rock fragments held together by a mineral cement or in a fine-grained matrix.	*Energy*
Breccia	A rock in which angular fragments are surrounded by a mass of fine-grained minerals.	*Mining*
Breed	to produce offspring by giving birth or by hatching	*Agriculture*
Breeder reactor	A reactor that both produces and consumes fissionable fuel, especially one that creates more fuel than it consumes. The new fissionable material is created by a process known as breeding, in which neutrons from fission are captured in fertile materials.	*Energy*
Breeding fire	spontaneous combustion, usually caused by ventilation air mixing with fine coal and made worse by the presence of pyrites (S. Staffs)—see also Heatings.	*Mining*
Breese or Breeze	fine slack. (Scot.); or small coal; or poor coke, used to manufacture breeze blocks.	*Mining*
Breeze	The fine screenings from crushed coke. Usually breeze will pass through a 1/2-inch or 3/4-inch screen opening. It is most often used as a fuel source in the process of agglomerating iron ore.	*Energy*
Brew or Brow	section of rock above the seam that is removed to extend the gate road (S. Staffs)—see also Rip.	*Mining*
Brick casing	Brick casing—see Back-casing.	*Mining*
Bride cake or Bright cake	Black highly carbonaceous slickensided shale with mussels, (Yorks.).	*Mining*
Bridge	A structure spanning and providing passage over a river, chasm, road, or the like.	*Civil Engineering*
Bridge Battery	A battery intended to provide power to system memory while the main battery is replaced.	*Electrical Engineering*
Bridge Cable	(Structural Rope or Strand) The all-metallic wire rope or strand used as the catenary and suspenders on a suspension bridge.	*Wire Rope & Cable*
Bridge carrier	A rubber-tire-mounted mobile conveyor, about 10 meters long, used as an intermediate unit to create a system of articulated conveyors between a mining machine and a room or entry conveyor.	*Mining*
Bridge conveyor	A short conveyor hung from the boom of mining or lading machine or haulage system with the other end attached to a receiving bin that dollies along a frame supported by the room or entry conveyor, tailpiece. Thus, as the machine boom moves, the bridge conveyor keeps it in constant connection with the tailpiece.	*Mining*
Bridge rails	iron rails, the upper part of which was hollow, weighing about 5½ lbs. per foot, used in barrow-ways instead of tram-plates; the tubs being fitted with flanged wheels, (N. East).	*Mining*
Bridge Resistance	See Input impedance and Output impedance.	*Electronic Process*
Bridge Socket	A wire rope or strand end termination made of forged or cast steel that is designed with baskets-having adjustable bolts-for securing rope ends. There are two styles: 1) the closed type has a U-bolt with or without a bearing block in the U of the bolt, and 2) the open type has two eye-bolts and a pin.	*Wire Rope & Cable*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bridges	a clearance to minimize seal extrusion.	*Mechanical, Process, and Operations*
Bridge-Tied Load	Used in audio applications, the load (a speaker in this case) is connected between two audio amplifier outputs (it "bridges" the two output terminals). This can double the voltage swing at the speaker, compared to a speaker that is connected to ground. The ground-tied speaker can have a swing from zero to the amplifier's supply voltage. A BTL-driven speaker can see twice this swing because the amplifier can drive either the + terminal of the speaker or the — terminal, effectively doubling the voltage swing. Example: Automotive or hand-held applications.	*Electrical Engineering*
Bridge-Tied Load	Used in audio applications, the load (a speaker in this case) is connected between two audio amplifier outputs (it "bridges" the two output terminals). This can double the voltage swing at the speaker, compared to a speaker that is connected to ground. The ground-tied speaker can have a swing from zero to the amplifier's supply voltage. A BTL-driven speaker can see twice this swing because the amplifier can drive either the + terminal of the speaker or the — terminal, effectively doubling the voltage swing. Example—Automotive or handheld applications.	*Electrical Engineering*
Bridgework	Civil Engineering, the art or process of bridge building.	*Civil Engineering*
Bridging	A condition of filter element loading in which contaminant spans the space between adjacent sections of a filter element thus blocking a portion of the useful filtration area.	*Mechanical, Process, and Operations*
Bridle or bridal chains	short chains by which the cage is attached to the winding rope; or a chain for preventing tubs overturning when travelling on a steep incline. (Scot.). Also called 'Bull chains'.	*Mining*
Bridle Sling	A two-part wire rope sling attached to a single-part line. The legs of the sling are spread to divide and equalize the load.	*Wire Rope & Cable*
Bright films	The opposite of bloomed films. A designation of film clarity.	*Material Process*
Bright Rope	Wire rope fabricated from wires that are not coated.	*Wire Rope & Cable*
Bright stock	A heavy residual lubricant stock with low pour point, used in finished blends to provide good bearing film strength, prevent scuffing, and reduce oil consumption. Usually identified by its viscosity, SUS at 210°F or cSt at 100°C.	*Oil Analysis*
Brighteners	Optical or fluorescent enhancers found in carpet cleaning products and fabric cleaners.	*Chemistry*
Brightness	Although the terms "brightness" and "luminance" are often used interchangeably, they are different. Luminance is the light intensity; brightness is how it is perceived by the human eye.	*Electrical Engineering*
Brights	bright coal, mainly vitrain.	*Mining*
Brine	A salt water and chemical mix that is produced after fracking a well. This liquid comes out of the ground with very high Total Dissolved Solids (TDS) levels and often toxic substances such as barium and strontium. After use in fracking, brine must be treated as contaminated waste water	*Petroleum Drilling*
Brine	Water that contains quantities of salt dissolved in it, particularly sodium chloride; salt water.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Brinell hardness	A value obtained by the use of the Brinell testing machine, in which a steel sphere of standard size is pressed with a standard pressure into the specimen under test for a standard length of time. The resistance to penetration being stated numerically as the Brinell hardness, the ratio of the pressure on the standardized sphere to the area of the indentation produced.	*Material Process*
BRINELL HARDNESS NO	BRINELL HARDNESS NO.—A number indicating metal hardness using the Brinell Scale. Can be converted to Rockwell B & C hardness by reference to conversion tables. See "Rockwell Hardness No."	*Mechanical*
Brinell hardness number	Parameter obtained from indentation test.	*Material Process*
Brinelling	Denting caused by impact of one bearing component against another while stationary.	*Lubrication*
Brinelling	Permanent deformation of the bearing surfaces where the rollers (or balls) contact the races. Brinelling results from excessive load or impact on stationary bearings. It is a form of mechanical damage in which metal is displaced or upset without attrition.	*Lubrication*
Brinkman equations	Extension of Darcy's law in order to include the transport of momentum through shear in porous media flow.	*Chemical*
Brinkman equations	Extension of Darcy's law in order to include the transport of momentum through shear in porous media flow.	*Chemical Engineering*
Briquettes	made from compressed coal dust, with or without a binding agent such as asphalt.	*Energy*
British Standard Brass	A specialist thread form based upon the Whitworth thread and consisting of 26 threads per inch whatever the thread diameter.	*Maintenance*
British thermal unit	The quantity of heat required to raise the temperature of 1 pound of liquid water by 1 degree Fahrenheit at the temperature at which water has its greatest density (approximately 39 degrees Fahrenheit).	*Energy*
British Thermal Unit (BTU)	The standard unit for measuring quantity of heat energy. It is the amount of heat energy necessary to raise the temperature of one pound of water one degree Fahrenheit.	*Energy*
Britisher	A strong corner pack formed of chocks built of broken wood and filled with stone.	*Mining*
Brittle	A brittle structure or material exhibits low ductility, meaning that it exhibits very little inelastic deformation before complete failure.	*Engineering Physics*
Brittle	Lacking in deformability.	*Material Process*
Brittle fracture	Failure of a material following mechanical deformation with the absence of significant ductility.	*Material Process*
Broad Spectrum	Killing a wide variety of Gram — (Negative) and Gram + (Positive) organisms.	*Chemistry*
Broadband	A transmission medium with enough bandwidth to carry multiple voice, video, or data channels simultaneously. Example: To provide fifty CATV channels on one coaxial cable; or to provide Internet access over cable TV; or to add DSL to a voice-grade telephone line.	*Electrical Engineering*
Broadband Communications	The result of utilities forming partnerships to offer consumers "one-stop-shopping" for energy-related and high-tech telecommunications services.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Brochure, Collaboration	Document describing The Cochrane Collaboration. Removed from the web site for updating; contact the Operations Unit for more information.	*Quality Engineering*
Broken place	an easy place to work with soft or loose coal. (N. East).	*Mining*
Broken reserves	The ore in a mine which has been broken by blasting but which has not yet been transported to surface.	*Mining*
Broken working	the second stage of bord and pillar working, i.e. abstracting the pillars. Also known as 'robbing the pillars'.	*Mining*
Broker	A retail agent who buys and sells power. The agent may also aggregate customers and arrange for transmission, firming and other ancillary services as needed.	*Energy*
Bronze powder	Particles of metals or alloys reduced to powder fineness, used in producing nacreous effects in plastics.	*Material Process*
Bronze Ropes	Wire rope made of bronze wires.	*Wire Rope & Cable*
Bronzing	A golden brown discoloration that usually appears on the lower surface of leaves and is often an advanced stage of the silvering or glazing typical of injury by PAN and other oxidants; brown coloration on needles due to spider mite infestation.	*Forestry*
Brookfield viscosity	Apparent viscosity in cP determined by Brookfield viscometer, which measures the torque required to rotate a spindle at constant speed in oil of a given temperature. Basis for ASTM Method D 2983; used for measuring low temperature viscosity of lubricants.	*Oil Analysis*
Brot	a thin stratum of coal contaminated with lime or pyrites. (Scot.).	*Mining*
Brow	A low place in the roof of a mine, giving insufficient headroom.	*Mining*
Brow or Broo	Hill or bank in Scotland, also the pit top or a haulage incline underground e.g. a 'jig brow' in Lancashire; or the face of a fault plane, (N. East).	*Mining*
Brown coal	woody or soft peaty looking coal, brown or black in color, with a high moisture content—see Lignite.	*Mining*
Brown Metal Coals	coals that when broken give much brown or red dust.	*Mining*
Brown Rake	shale with ironstone bands and balls.	*Mining*
Brown staining	reaction between exposed intermetallic layers (specifically the iron portion of the layers) and oxygen, resulting in surface color changes from gray to brown	*Materials Process*
Brown Swiss	Breed of dairy cattle that originated in Eastern Switzerland. Comes in various shades of brown.	*Agriculture*
Brownout	A controlled power reduction in which the utility decreases the voltage on the power lines, so customers receive weaker electric current. Brownouts can be used if total power demand exceeds the maximum available supply. The typical household does not notice the difference.	*Energy*
Brownout	A dip in the voltage level of a power system, which can damage electrical equipment or cause it to underperform, e.g., lights dim. (See Voltage drop.)	*Electrical*
BRS	BRS—See: Railroad Signalmen; Brotherhood of (AFL-CIO)	*Industrial Relations*

Term	Definition	*Industry*
BRSC	BRSC - See: Railway and Steamship Clerks, Freight Handlers, Express and Station Employees; Brotherhood of (AFL-CIO)	*Industrial Relations*
BRT	BRT—See: Railroad Trainmen; Brotherhood of (AFL-CIO)	*Industrial Relations*
Brunton compass	A pocket compass equipped with sights and a reflector, used for sighting lines, measuring dip and carrying out preliminary surveys.	*Mining*
Brush	the ripping face of a roadway. (Scot.) - see Ripping; or unscreened coal straight from the mine, i.e. 'run-of- mine coal'. (Bris. and Som.); or a strand torn out of a wire rope. (Scot.).	*Mining*
Brushing	Digging up the bottom or taking down the top to give more headroom in roadways.	*Mining*
BS 6755	The British Standard specification dealing with the fire testing of pipeline valves. Once a particular size and pressure class valve is tested and passes the BS 6755 fire test, like valves can be also identified with the BS 6755 standard.	*Mechanical*
BSAC	Shoe and Allied Craftsmen; Brotherhood of (AFL-CIO)	*Industrial Relations*
BSE	Bovine spongiform encephalopathy, mad-cow disease.	*Agriculture*
BSE	BSE - See: Building Service Employees' International Union (AFL-CIO)	*Industrial Relations*
BSF	British Standard Fine. A thread form based upon the British Standard Whitworth form but with a finer thread (more threads per inch for a given diameter). This thread form was first introduced in 1908, the thread form is specified in BS 84: 1956.	*Maintenance*
BSFC	brake specific fuel consumption	*Petro-Chemical Abbreviations*
BSI	British Standards Institution	*Petro-Chemical Abbreviations*
BSOIW	BSOIW - See: Iron Workers; International Association of Bridge, Structural and Ornamental (AFL-CIO)	*Industrial Relations*
BSP	The British Standard Pipe thread (BSP thread) is a family of standard screw thread types that has been adopted internationally for interconnecting and sealing pipe ends. BSP mates an external (male) thread with an internal (female) thread on pipe fittings. BSP threads can be distinguished as either Parallel (denoted by the letter G) or Tapered (denoted by the letter R). See also NPT	*Industrial*
B-stage resins	Intermediate stage of thermosetting resins. Molding powders usually in this stage. The term is not popular.	*Material Process*
BSW	BSW - See: Shoe Workers' Union; Boot and (AFL-CIO)	*Industrial Relations*
BTC	British Technical Council of the Motor and Petroleum Industries	*Petro-Chemical Abbreviations*
Btu	"British Thermal Unit"; the quantity of heat required to raise the temperature of one pound of water one degree Fahrenheit at 39 degrees F; used as the standard for the comparison of heating values of fuels.	*Chemical*
Btu --	Btu --	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Btu conversion factor	A factor for converting energy data between one unit of measurement and British thermal units (Btu). Btu conversion factors are generally used to convert energy data from physical units of measure (such as barrels, cubic feet, or short tons) into the energy-equivalent measure of Btu. (Seehttp://www.eia.gov/totalenergy/data/monthly/pdf/sec13.pdf for further information on Btu conversion factors.)	*Energy*
Btu per cubic foot	The total heating value, expressed in Btu, produced by the combustion, at constant pressure, of the amount of the gas that would occupy a volume of 1 cubic foot at a temperature of 60 degrees F if saturated with water vapor and under a pressure equivalent to that of 30 inches of mercury at 32 degrees F and under standard gravitational force (980.665 cm. per sec. squared) with air of the same temperature and pressure as the gas, when the products of combustion are cooled to the initial temperature of gas and air when the water formed by combustion is condensed to the liquid state. (Sometimes called gross heating value or total heating value.)	*Energy*
Btu	British thermal unit. A measure of the energy required to raise the temperature of one pound of water one degree Fahrenheit.	*Mining*
BTX	The acronym for the commercial petroleum aromatics-- benzene, toluene, and xylene.	*Energy*
Bubble Internal	Spherical void, or a trapped globule of air or other gas, especially in a transparent or translucent plastic (see Boil, Seed).	*Material Process*
Bubble Point	Upon heating a liquid mixture, this is the point at which bubbles first appear.	*Chemical*
Bubble radius	the maximum radial distance away from a biosparging well where the effects of sparging are observable. Analogous to radius of influence of an air sparging well.	*Chemical*
Bubble Tight	A commonly used term to describe the ability of a control valve or regulator to shut off completely against any pressure on any fluid. Unfortunately, it is totally unrealistic. Control valves are tested to ANSI B16.104 and FCI 70-2-1976 which is the American National Standard for Control Valve Seat Leakage. This standard uses six different classifications to describe a valve's seat leakage capabilities. The most stringent of these is Class VI which allows a number of bubbles per minute leakage, depending on the port size of the valve. The correct response to the question "Will that valve go 'Bubble Tight'?" is to say that it is tested to meet Class VI shutoff requirements.	*Industrial Engineering*
Bubble tower	A fractionating (distillation) tower in which the rising vapors pass through layers of condensate, bubbling under caps on a series of plates.	*Petroleum Engineering*
Bubble-tight shut-off	A phrase used in describing the sealing ability of a valve. During air pressure testing of a new valve in the closed position, leakage past the seats is collected and bubbled thru water. To qualify as "bubble tight," no bubbles should be observed in a prescribed time span.	*Mechanical*
Buck	A "buck" or "step-down" switch-mode voltage regulator is one in which the output voltage is lower than its input voltage. Note: A customer asked the origin of the term and no one seems to know! A buck regulator is a step-down regulator, as opposed to boost. We think it's an American term — in England it was always "step-down." Buck means to resist or reduce (as in "buck the trend"), and hence was used to denote a step-down. Conveniently, it alliterates with the opposite, a boost regulator.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bucket	In a dam a concave surface at the foot of a spillway for deflecting the downward flow of water.	*Civil Engineering*
Bucket	In a dam a concave surface at the foot of a spillway for deflecting the downward flow	*Civil Engineering*
Bucket Line Dredge	Unlike modern dredges; a bucket line dredge was very large. Instead of sucking up water and gravel through the use of water pressure, the bucket line dredges would scoop it up and run it through a long sluice box.	*Mining*
Bucket Makeup	Selected varieties of scrap metal, pre-determined by metallurgists, are loaded into the charge buckets.	*Steel*
Bucket-wheel excavator	a continuous digging machine equipped with a broom on which is mounted a rotating wheel with buckets along its edge. The buckets scoop up material, then empty onto a conveyor leading to a spoil bank. It is best suited for removing overburden that does not require blasting. This excavator is not widely used in the United States.	*Energy*
Buckler or Buckler machine	a machine for making new joints in a conveyor belt. (Scot.).	*Mining*
Buckminsterfullerene	Carbon molecule named in honor of Buckminster Fuller, inventor of the geodesic dome, which resembled the initial fullerene C60.	*Material Process*
Buckyball	Nickname for the buckminsterfullerene molecule C60.	*Material Process*
Buckytube Cylindrical	Buckminster fullerene molecule composed of hexagonal carbon rings.	*Material Process*
Budget plan	An agreement between the household and the utility company or fuel supplier that allows the household to pay the same amount for fuel for each month for a number of months.	*Energy*
Buff	To polish with a buffing wheel.	*Material Process*
Buffer	1. A storage area for data that is used to compensate for a speed difference, when transferring data from one device to another. Usually refers to an area reserved for I/O operations, into which data is read, or from which data is written.2. Any substance or combination of substances which, when dissolved in water, produces a solution which resists a change in its hydrogen ion concentration on the addition of an acid or alkali.	*Electronic Process*
Buffer Capacity (B)	A measure of the ability of the solution to resist pH change when a strong acid or base is added.	*General Engineering*
Buffer Chamber	(Header) pressure vessel with multiple inlets and outlets, utilized to contain and direct the discharge from Chokes in a drilling Manifold system.	*Petroleum Engineering*
Buffer strip	A visual buffer consisting of trees or other vegetation used to screen a road, streamside, or harvest unit, or to protect a riparian area.	*Forestry*
Bug dust	The fine particles of coal or other material resulting from the boring or cutting of the coal face by drill or machine.	*Mining*
Build	drilling directionally with the intent to increase well bore inclination; also refers to increasing and orienting lateral bit force magnitude to or towards the high side of the drill hole.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Buildas	A way a Butty could avoid paying for work done. He would call "buildas" half way through the working day and then pay nothing for the half days work that had been done, or pay a proportion of the wages in beer.	*Mining*
Builders	large blocks of unlaminated sandstone, which are used for rough building purposes such as foundation work or strong walls (N. Staffs.).	*Mining*
Building	a portion of the pack wall as it is built.	*Mining*
Building shell (envelope) DSM program	A DSM program that promotes reduction of energy consumption through improvements to the building envelope. Includes installations of insulation, weather stripping, caulking, window film, and window replacement. (Also see DSM, Demand-Side Management Programs.)	*Energy*
Building shell conservation feature	A building feature designed to reduce energy loss or gain through the shell or envelope of the building. Data collected by EIA on the following specific building shell energy conservation features: roof, ceiling, or wall insulation; storm windows or double- or triple-paned glass (multiple glazing); tinted or reflective glass or shading films; exterior or interior shadings or awnings; and weather stripping or caulking. (See Roof or Ceiling Insulation, Wall Insulation, Reflective or Shading Glass or Film, Storm Window or Triple-Paned Glass, Building Shell (Envelope), and Weather Stripping or Caulking.)	*Energy*
Building Wire	Wire used for light and power in permanent installations utilizing 600 volts or less. Usually in an enclosure and which will not be exposed to outdoor environments.	*Electrical*
Built-in electric units	An individual-resistance electric-heating unit that is permanently installed in the floors, walls, ceilings, or baseboards and is part of the electrical installation of the building. Electric-heating devices that are plugged into an electric socket or outlet are not considered built in. (Also see Heating Equipment.)	*Energy*
Built-in-dirt	Material passed into the effluent stream composed of foreign materials incorporated into the filter medium.	*Oil Analysis*
Bulb (Liquid-in-Glass Thermometer)	The area at the tip of a liquid-in-glass thermometer containing the liquid reservoir.	*General Engineering*
Bulging	Term which is often use, but not recommended. Need use Blister or Domed.	*Material Process*
Bulk Appearance	Appearance of an undisturbed grease surface. Bulk appearance is described by: Bleeding — free oil on the surface(or in the cracks of a cracked grease). Cracked — surface cracks. Grainy — composed of small granules or lumps of constituent thickener. Smooth — relatively free of irregularities.	*Lubrication*
Bulk density	the amount of mass of a soil per unit volume of soil; where mass is measured after all water has been extracted and total volume includes the volume of the soil itself and the volume of air space (voids) between the soil grains.	*Chemical*
Bulk factor	The ratio of the volume of loose molding powder to the volume of the molded article made from it.	*Material Process*
Bulk mining	Any large-scale, mechanized method of mining involving many thousands of tons of ore being brought to surface per day.	*Mining*
Bulk modulus	The measure of resistance to compressibility of a fluid. The reciprocal of the compressibility of this fluid.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bulk Modulus (of elasticity)	A ratio of normal stress to a change in volume. A term used in determining the compressibility of a fluid. Data for petroleum products can be found in the International Critical Tables.	*Lubrication*
Bulk Power Market	A market where wholesale purchases and sales of electricity are made.	*Energy*
Bulk Power Market	Wholesale purchases and sales of electricity.	*Energy*
Bulk Power Supply	Often this term is used interchangeably with wholesale power supply. In broader terms, it refers to the aggregate of electric generating plants, transmission lines, and related equipment. The term may refer to those facilities within one electric utility, or within a group of utilities in which the transmission lines are interconnected.	*Energy*
Bulk power transactions	The wholesale sale, purchase, and interchange of electricity among electric utilities. Bulk power transactions are used by electric utilities for many different aspects of electric utility operations, from maintaining load to reducing costs.	*Energy*
Bulk sales	Wholesale sales of gasoline in individual transactions which exceed the size of a truckload.	*Energy*
Bulk sample	A large sample of mineralized rock, frequently hundreds of tons, selected in such a manner as to be representative of the potential orebody being sampled. Used to determine metallurgical characteristics.	*Mining*
Bulk station	A facility used primarily for the storage and/or marketing of petroleum products, which has a total bulk storage capacity of less than 50,000 barrels and receives its petroleum products by tank car or truck.	*Energy*
Bulk terminal	A facility used primarily for the storage and/or marketing of petroleum products, which has a total bulk storage capacity of 50,000 barrels or more and/or receives petroleum products by tanker, barge, or pipeline.	*Energy*
Bulkheading	The construction of bulkheads; bulkheads in general.	*Civil Engineering*
Bulking value	Solid volume of a unit weight usually expressed as a gallons per pound.	*Material Process*
Bull	A male bovine. Bulls are breeding stock in beef and dairy operations.	*Agriculture*
Bull calf	An male calf that hasn't been castrated.	*Agriculture*
Bull chains	Bull chains, -see Bridle chains.	*Mining*
Bull end	return roller unit of a belt conveyor.	*Mining*
Bull float	A machine for giving the final surfacing to an area of concrete, as on a road.	*Civil Engineering*
Bull market	Term used to describe financial market conditions when share prices are going up.	*Mining*
Bull props	props set at an angle to prevent tubs running away on an incline. Various other names used; Bull Stumps, Warwicks., Derricks, (S. Derbys)., Stall,	*Mining*
Bull quartz	A prospector's term for white, coarse-grained, barren quartz.	*Mining*
Bull stakes	the four posts at the floor of the shafts to which the conductors are fixed. (Yorks.).	*Mining*
Bulldoze	To clear, level, or reshape the contours of (land) by or as if by using a bulldozer. Example: To bulldoze a building site.	*Civil Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bulldoze	To clear, level, or reshape the contours of (land) by or as if by using a bulldozer. Example—To bulldoze a building site.	*Civil Engineering*
Bulldozed	To clear away by or as if by using a bulldozer. Example: To bulldoze trees from a site.	*Civil Engineering*
Bulldozed	To clear away by or as if by using a bulldozer. Example—To bulldoze trees from a site.	*Civil Engineering*
Bulldozer	A large, powerful tractor having a vertical blade at the front end for moving earth, tree, stumps, rocks, etc.	*Civil Engineering*
Bullion	Metal formed into bars or ingots.	*Mining*
Bullion	Metal in bars, ingots or other uncoined form.	*Mining*
Bullion or Stone bullion	calcareous concretions, occasionally ironstone nodules or quartzite boulders (Lancs).	*Mining*
Bull's head	The motorized end of a boring machine. The name roughly describes its shape. Various other names used in other coalfields are, Pig's head, (Leics.), Tup, (Lancs.), Tich, (S. Derbys.).	*Mining*
Bummer	the man in charge of a group of men on the longwall face. Various other local names were used such as Coddy, (Leics.), Puffler, sometimes Fuffler, (War.), Pool-leader and Leading man, (Scot,), also Face captain and Face chargeman (Lancs.).	*Mining*
Bump	the sound caused by a break in the strata above while underground, or the actual movement due to the break; or a sudden floor uplift due to a break in the floor. Also called a 'pounce' or 'crump'.	*Mining*
Bump (or burst)	A violent dislocation of the mine workings which is attributed to severe stresses in the rock surrounding the workings.	*Mining*
Bump Steer	Refers to changes in wheel alignment (toe, camber and caster) as the wheel moves through the suspension range. Wheel alignment is set with the car stationary, so bump steer affects must be properly considered to ensure that suspension movement does not cause adverse changes in handling or grip.	*NASCAR*
Bump Test	To determine a process model, there needs to be some "excitation" of the process. This is typically accomplished through bump testing. Bump tests can be performed many ways. Some ways to do this include: Make a Setpoint Change, with the loop in MANUAL change the controller output, Make a Setpoint Change, Perform a Fast Plant Test	*Process Control*
Bump Thread	A modified thread profile patented and trade mark of the Bosco Tool Inc. The thread form has a small projection at the pitch diameter that eliminates the clearance from the thread assembly on both flanks. By doing this it is claimed that resistance to vibration loosening is significantly improved.	*Maintenance*
Bumper	a large piece of iron that was used as a counter balance on a hand windlass when winding loaded corves or tubs up and down an underground staple shaft. (Som.) and (Bris.), also iron catches fitted in a cage to hold the tubs in place during winding. (Lancs.), (Mids.).	*Mining*
Bumpsteer	A steering effect resulting from toe or camber changes as the suspension moves up and down.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Buna N (Perbunan)	Buna N (Perbunan)	*Material Process*
Buna S Synthetic	rubber produced by the copolymerization of butadiene and styrene.	*Material Process*
Bunch Stranding	A method of stranding where a single conductor is formed from any number of wires twisted together in the same direction, such that all strands have the same lay length, but no specific geometric arrangement.	*Electrical*
Bunches	small temporary areas or pillars of coal left during holing to support the coal until the holing is complete. (N. Staffs.).	*Mining*
Bundled utility service (electric)	A means of operation whereby energy, transmission, and distribution services, as well as ancillary and retail services, are provided by one entity.	*Energy*
Bunker	Bunker	*Mining*
Bunker fuels	Fuel supplied to ships and aircraft, both domestic and foreign, consisting primarily of residual and distillate fuel oil for ships and kerosene-based jet fuel for aircraft. The term "international bunker fuels" is used to denote the consumption of fuel for international transport activities. Note: For the purposes of greenhouse gas emissions inventories, data on emissions from combustion of international bunker fuels are subtracted from national emissions totals. Historically, bunker fuels have meant only ship fuel.	*Energy*
Bunker top-holes	another term for a rise heading in steep seam working (S. Wales).	*Mining*
Bunkey	A small fault in a coal seam (S. Derbys.).	*Mining*
Bunton	A beam of wood or steel placed horizontally across a shaft to act as a support or for fixing equipment or a brattice—see Main Buntons and Collaring Buntons.	*Mining*
Burden of the Past	The 30,000 Existing Chemicals estimated to be on the EU market, for which little or no information is available, in particular about their long-term effects on human health or the environment.	*Chemical*
Burgers vector	Displacement vector necessary to close a stepwise loop around a dislocation.	*Material Process*
Burgy	small coal also slack or poor coal with a high dirt content; or coal that readily breaks into smalls. (Lancs.).	*Mining*
Buried service	An application in which valves are installed in lines which are buried below ground level.	*Mechanical*
Buried Valley	A depression in an ancient land surface or in bedrock now covered by younger deposits, especially a preglacial valley filled with glacial drift.	*Petroleum Engineering*
Burn days	The number of days the station could continue to operate by burning coal already on hand assuming no additional deliveries of coal and an average consumption rate.	*Energy*
Burned	Showing evidence of thermal decomposition through some discoloration, distortion or destruction of the surface of the plastic.	*Material Process*
Burnett's coal wedge	a roller wedge patented in 1884 by C, Burnett. The wedge was used to break down coal after it had been undercut.	*Mining*
Burn-In	A long term screening test (either vibration, temperature or combined test) that is effective in weeding out infant mortalities because it simulates actual or worst case operation of the device, accelerated through a time, power, and temperature relationship.	*General Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Burnup	Amount of thermal energy generated per unit mass of fuel, expressed as Gigawatt-Days Thermal per Metric Ton of Initial Heavy Metal (GWDT/MTIHM), rounded to the nearest gigawatt day.	*Energy*
Burr	Burr—see Cank.	*Mining*
burro	A small donkey.	*Agriculture*
Burst Dimming	Burst Dimming is a method of controlling the brightness of cold cathode fluorescent lamps (CCFL) by turning the lamps on and off at a rate faster than the human eye can detect. The on/off rate is nominally 100Hz to 300Hz. The higher the ratio of on-time to off-time, the brighter the lamps will be. Because of CCFL response times, on-time to off-time ratios of less than 1% are not practical.	*Electrical Engineering*
Burst Mode	A temporary high-speed data-transfer mode that can transfer data at significantly higher rates than would normally be achieved with nonburst technology.	*Electrical Engineering*
Burst Pressure	The maximum pressure applied to a transducer sensing element or case without causing leakage.	*General*
Burst pressure rating	The maximum specified inside-out differential pressure that can be applied to a filter element without outward structural or filter-medium failure.	*Oil Analysis*
Burst Proportioning	A fast-cycling output form on a time proportioning controller (typically adjustable from 2 to 4 seconds) used in conjunction with a solid state relay to prolong the life of heaters by minimizing thermal stress.	*Electrical*
Bursted	The condition resulting from the pulling apart of filler in a laminated plastic caused by flow or speading.	*Material Process*
Bus	An electrical conductor that serves as a common connection for two or more electrical circuits.	*Energy*
Busbar	An electrical conductor that makes a common connection between several circuits. Sometimes, electrical wire cannot accommodate high-current applications, and electricity must be conducted using a more substantial busbar—a thick bar of solid metal (usually copper or aluminum). Busbars are uninsulated, but are physically supported by insulators. They are used in electrical substations to connect incoming and outgoing transmission lines and transformers; in a power plant to connect the generator and the main transformers; in industry, to feed large amounts of electricity to equipment used in the aluminum smelting process, for example, or to distribute electricity in large buildings	*Electrical*
Bushel	A dry measure commonly used as a measure of crops. In the United States a bushel equals 4 pecks, or 2150.42 cubic inches. In the United States , the bushel is the common measure of wheat and some other crops. A bushel of apples is 42 pounds.	*Agriculture*
Busheling	A widely traded form of steel scrap consisting of sheet clips and stampings from metal production. Bushel baskets were used to collect the material through World War II, giving rise to the term.	*Metallurgy*
Bushing	(1) In machinery, a removable liner fixed in a bore to improve the bearing surface; (2) In chain, a renewable liner fixed in the barrel of a link, or center link, to provide an improved bearing surface; (3) in chain, a hollow cylinder used to spa	*Equipment*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Bushing	A bushing is a cylindrical insulating component, usually made of ceramic, that houses a conductor. It enables a conductor to pass through a grounded enclosure, such as a transformer tank (the physical shell of a transformer), a wall or other physical barrier, to connect electrical installations. In the case of a transformer, bushings protect the conductors that connect a transformer's core to the power system it serves through channels in the transformer's housing.	*Electrical*
Business Process Reengineering (BPR)	Business Process Reengineering or Business Process Reorganization is itself a process that aims improving organizational performance by improving its business processes. BPR came into use after Michael Hammer and James Champy published their best-selling "Re-engineering the Corporation" in 1993. Re-engineering means 'starting over' and the defining words are fundamental, radical, dramatic and process. In short, starting with a clean piece of paper, to design an organization to perform a process. Re-engineering is not about "continuous improvement", which by definition is an examination and analysis of the status quo where minute improvements are continuously applied to the existing process. A combined approach of continuous improvement and radical change (where needed) is aimed in Business Process Management (BPM).	*Maintenance*
Buskins	sacking tied around the legs when working underground in water (S. Staffs.).	*Mining*
Butadiene also 1,3 Butadiene, divinyl, or erythrene (CH2 CHCH CH2)	A gas, a diolefin of a type that polymerizes to form rubber like substances and hence is used in the production of synthetic rubber. n-Butanol or Butyl alcohol CH3 (CH2) 2	*Material Process*
Butadiene Colorless	volatile liquid. Derived from petroleum or alcohol. The chief raw material for synthetic rubber.	*Material Process*
Butadiene, divinyl, or erythrene (CH2 CHCH CH2)	A gas, a diolefin of a type that polymerizes to form rubber like substances and hence is used in the production of synthetic rubber.	*Material Process*
Butane (C_4H_{10})	A straight-chain or branch-chain hydrocarbon extracted from natural gas or refinery gas streams, which is gaseous at standard temperature and pressure. It includes isobutane and normal butane and is designated in ASTM Specification D1835 and Gas Processors Association specifications for commercial butane.	*Energy*
Butler–Volmer equation	Expression that relates the reaction rate of an electron transfer reaction on an electrode surface to the exponential of the overpotential. The equation can be derived from the Arrhenius rate equation by accounting for the contribution of the electric potential to the activation energy.	*Chemical*
Butoxyethyl stearate (C17H35COOC2H4 OC4 H9)	A plasticizer.	*Material Process*
Butt	another word for a heading, i.e., a roadway, usually in coal (S. Wales).	*Mining*
Butt cleat	Butt cleat, -see Cleat.	*Mining*
Butt cleat	Butt cleat	*Mining*
Butt Coupling	Angles or plates designed to join conveyor sections together.	*Manufacturing*
Butt entry	A coal mining term that has different meanings in different locations. It can be synonymous with panel entry, submain entry, or in its older sense it refers to an entry that is "butt" onto the coal cleavage (that is, at right angles to the face).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Butt Joint	A splice or connection formed by placing the ends of two conductors together and joining them by welding, brazing or soldering.	*Electrical*
Butt Weld	Weld along a seam that is butted edge to edge.	*Maintenance and Repair*
Butt weld end	The end connection of a valve suitably prepared for butt welding to a connecting pipe.	*General Mechanical*
Butt weld end (BWE)	The end connection of a valve suitably prepared for butt welding to a connecting pipe.	*Mechanical*
Butt Weld Ends	Profiles that are machined on the ends of the pipework components, to allow the joining of components by circumferential weld.	*Industrial Engineering*
Butt Weld Fitting	Any fitting that has Butt weld ends.	*Petroleum Engineering*
Butt Weld Joint	A form of weld joint having specially prepared surfaces that makes a 'Full Penetration Weld'. A small gap between the adjacent pieces of pipe or fittings is left then deposited weld metal will bridge, fill, and close.	*Petroleum Engineering*
Butt Wrap	Tape wrapped in an edge: to :edge manner with no overlapping between adjacent turns.	*Electrical*
Butterfly	A detaching hook associated with cages. In the event of the cage being 'overwound' the hook detached the cage from the winding rope and prevented the cage from going through the headgear and into the winding house.	*Mining*
Butterfly valve	A shut-off valve usually found in larger pipe sizes (4 inches or greater). This type of valve can be used for non-critical flow control.	*Chemical*
Buttock	A corner formed by two coalfaces more or less at right angles, such as the end of a working face, also called the 'fast side'; or any short piece of coal approximately at right angles to the face; or the amount of coal removed from a handgot face in one operation (cycle), also called a 'turnover'.	*Mining*
Buttocking	a method of working a handgot longwall by forming a length of coal on bord, known as a 'buttock', which is then worked parallel to the face. If worked in both directions, it was known as 'double buttocking'. A modification of the buttocking system was 'continuous buttocking', where a buttock was commenced at one end of a face and was then advanced, or 'taken up', until it reaches the end of the stall in which it was started. The next stall and succeeding stalls take up the work in turn, and the first stall commences another buttock, producing a stepped face line.	*Mining*
Button Conveyor Rope	Wire ropes to which buttons or discs are attached at regular intervals to move material in a trough.	*Wire Rope & Cable*
Button-man	a man who monitors conveyor transfer points. Stopping and starting the conveyors after stoppages or breakdowns, by use of the button.	*Mining*
Buttress pack	a strong pack in the waste, stronger than and in addition to the roadside packs, placed some distance away from the roadway to protect it. If this is carried out on both sides of the roadway with comparatively narrow roadside packs, then this is termed 'Double packing'.	*Mining*
Butty	a mate or working partner in the pit. Several men could work a 'butty system' together in a working place or district within a mine, also an early name for an underground boss, contractor or Charter Master who supervised the extraction of coal for the owner. He engaged and paid the underground labor.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Buttyman	a man in charge of others who is paid for the whole job and he himself pays those under him. The 'butty system' first started with a miner employing members of his own family including his wife and children to transport coal from the workings to the pithead.	*Mining*
Butyl propionate or n-Butyl propionate	A solvent, ester.	*Material Process*
Butyl stearate (C17H35COOC4H9)	A plasticizer.	*Material Process*
Butylene (C_4H_8)	An olefinic hydrocarbon recovered from refinery or petrochemical processes, which is gaseous at standard temperature and pressure. Butylene is used in the production of gasoline and various petrochemical products.	*Energy*
Butyraldehyde CH3(CH2)2CHO	A colorless liquid. An aldehyde that can be used in place of formaldehyde in various resins. One of the better known butyraldehyde resins is vinyl butyraldehide resin.	*Material Process*
Butyrate	A salt or ester of butyric acid, an informal trade term for cellulose acetate butyrate plastics.	*Material Process*
Butyric acid CH3 (CH2) 2COOH	A colorless liquid, an acid used in the production of cellulose acetate butyrate and other butyric esters for plastics.	*Material Process*
Buy Through	An agreement between utility and customer to import power when the customer's service would otherwise be interrupted.	*Energy*
Buy-back oil	Crude oil acquired from a host government whereby a portion of the government's ownership interest in the crude oil produced in that country may or should be purchased by the producing firm.	*Energy*
Buyer	A professional purchaser. Buyers typically specialize in a given group of materials or services and are responsible for market analysis, purchase planning, and coordination with users.	*Procurement*
Buzz	A sound exemplified by loose power transformer laminations (dominated by 120 Hz where the power frequency is 60 Hz).	*Reliability Engineering*
Buzzard	small layer of inferior coal in the roof of the Arley Mine. (Lancs.).	*Mining*
Buzzer	a steam siren sounding at the beginning and end of each shift and at midnight to let in each New Year. If a miner was late for work he was said to be 'buzzed' (S. Staffs.).	*Mining*
BVR	Ball Valve Regulator—An automatic throttling valve controlling flow or pressure in a pipeline; comprising a package involving al ball valve actuator, positioner, and controlling instrument.	*Mechanical*
BWR	Boiling-Water Reactor	*Energy*
BX	Refer 6 BX	*Petroleum Engineering*
BX life	The time at which X% of the units in a population will have failed. For example, if an item has a B10 life of 100 hours, that means that 10% of the population will have failed by 100 hours of operation.	*Reliability Engineering*
By gate	the passages from the mainways to the headings. (Yorks.).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Byat	a harness, which in the south (Staffs) is described as the 'girdle', but differs from it by being a pair of straps over the shoulders, meeting in a broad piece behind, and terminating in a chain and hook, used for drawing coal dans. (N Staffs).	*Mining*
Bye work	Bye work, -see Dead work.	*Mining*
Bypass	A small passage around a large valve for warming up a line. An emergency connection around a reducing valve, trap, etc., to use in case it is out of commission.	*Maintenance and Repair*
Bypass Filtration	A system of filtration in which only a portion of the total flow of a circulating fluid system passes through a filter at any instant or in which a filter having its own circulating pump operates in parallel to the main flow.	*Oil Analysis*
Bypass Flow Regulator Valve	A valve which regulates the flow to a circuit at a constant volume, dumping excess oil.	*Mechanical, Process, and Operations*
Bypass Valve (Relief valve)	A valve mechanism that assures system fluid flow when a preselected differential pressure across the filter element is exceeded; the valve allows all or part of the flow to bypass the filter element.	*Lubrication*
Bypassed footage	Bypassed footage is the footage in that section of hole that is abandoned as the result of remedial sidetrack drilling operations.	*Energy*
By-pit	a pit or shaft situated at a higher elevation than the main winding shaft of the colliery, e.g. on a hillside. The by-pit was usually a ventilation pit that promoted natural ventilation currents.	*Mining*
Byproduct	A secondary or additional product resulting from the feedstock use of energy or the processing of nonenergy materials. For example, the more common byproducts of coke ovens are coal gas, tar, and a mixture of benzene, toluene, and xylenes (BTX).	*Energy*
Byte	The number of adjacent binary digits operated upon as a unit.	*Electrical Engineering*
C Cases	a designation made by the National Labor Relations Board of those cases on its docket involving an unfair labor practice in violation of the law.	*Industrial Relations*
C or cent.	Centigrade	*Oil Analysis*
C.I.F.	Cost Insurance & Freight—Shipper pays all freight and insurance charges. Same as F.O.B. Destination.	*Mechanical*
C/gal	Cents per gallon	*Energy*
C-4	Allison ATF specification	*Petro-Chemical Abbreviations*
C_4H	A mixture of light hydrocarbons that have the general formula C_4H_n, where n is the number of hydrogen atoms per molecule. Examples include butane (C_4H_{10}) and butylene (C_4H_8).	*Energy*
CA	Controlled atmosphere storage.	*Agriculture*
Ca Canny Strike	a procedure used by British trades unions many years ago to indicate opposition to employer policy or alleged inadequate wages.	*Industrial Relations*
CA Case	a National Labor Relations Board case involving a complaint against an employer.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
CAA	Clean Air Act	*Petro-Chemical Abbreviations*
CAAA	Clean Air Act Amendment	*Petro-Chemical Abbreviations*
Cabin	an enclosed place underground used for a particular purpose such as an underground office, e.g. Lamp cabin, Deputy's cabin, or another name for the Lamp Room on the surface.	*Mining*
Cable	A very strong rope made of strands of metal wire, as used to support cable cars or suspension bridges. A cord of metal wire used to operate or pull a mechanism.	*Civil Engineering*
Cable belt conveyor	a heavy-duty, high capacity, conveyor belt that uses two stranded steel ropes, one on either side of the belt to provide tensile pull. Molded rubber shoes along the edge of the belt grip the steel ropes, which support the belt and provide the motive power. Cable belt conveyers can carry coal up steeply inclined roadways for long distances.	*Mining*
Cable bolt	A steel cable, capable of withstanding tens of tons, cemented into a drillhole to lend support in blocky ground.	*Mining*
Cable Core	A cable core is the portion of an insulated cable lying under the protective covering or coverings.	*Electrical*
Cable Filler	The material used in multiple conductor cables to occupy the spaces formed by the assembly of components, thus forming a core of the desired shape.	*Electrical*
Cable Tool Drilling	A heavy bit is attached to the end of a wire cable and is raised and dropped repeatedly, pounding its way downward. Periodically, cuttings are bailed out of the hole. The method is slow and in most places has been replaced by rotary drilling.	*Petroleum Engineering*
Cable Tool Drilling Line	The wire rope used to operate the cutting tools in the cable tool drilling method (i.e., rope drilling).	*Wire Rope & Cable*
Cable-Laid Wire Rope	A type of wire rope consisting of several wire ropes laid into a single wire rope (e.g., 6x42 (6x6x7) tiller rope).	*Wire Rope & Cable*
CAD	Computer Aided Design. This may allow designers to manipulate parts drawings and simulate processes.	*Control Engineering*
CAD	Computer Aided Design	*Gears*
Cadmium Electroplating	Coating of threaded fasteners with cadmium can provide the parts with excellent corrosion resistance. The appearance of the coating is bright silver or yellow if subsequently passivated. The friction values associated with this coating are also comparatively low. A chromate conversion coating is frequently applied to the surface to improve corrosion resistance. Cadmium is not now frequently used because of the environmental and worker health problems associated with the coating process and should not be used in applications above 250C or when contact with food is possible.	*Maintenance*
Cadmium Ion Plating	The deposition of cadmium by a vacuum process to provide galvanic corrosion protection.	*Paint and Coatings*
Cadmium Plating	The electrolytic deposition of cadmium to provide galvanic corrosion protection. Restricted by environmental considerations.	*Paint and Coatings*

Please see the Appendix for further illustration

Term	Definition	*Industry*
CAFE	corporate average fuel economy	*Petro-Chemical Abbreviations*
Cage	A hollow cylindrical trim element that is sometimes used as a guide to align the movement of a valve plug with a seat ring. It may also act to retain the seat ring in the valve body. On some types of valve, the cage may contain different shaped openings which act to characterize the flow through the valve. The cage may also act as a noise attenuation or anti-cavitation device.	*Industrial Engineering*
Cage dip	a roadway driven to the rise in 'rearers' workings used as the intake airway (N. Staffs.).	*Mining*
Cage guides	Cage guides—see Guides.	*Mining*
Cage props	Cage props—see Keps.	*Mining*
Cager	a power operated ram. Usually hydraulically powered, but in the earlier days steam powered. Also used for pushing mine cars on and off the cage at the pit bottom or the pit top.	*Mining*
CAHE	College of Agriculture and Home Economics, at Washington State University. (College of Agriculture, 1917-1982; College of Agriculture and Home Economics, 1982-2003; College of Agricultural, Human, and Natural Resource Sciences, 2003-.)	*Agriculture*
CAHNRS	College of Agricultural, Human, and Natural Resource Sciences, at Washington State University, formerly College of Agriculture and Home Economics. (College of Agriculture, 1917-1982; College of Agriculture and Home Economics, 1982-2003.)	*Agriculture*
Caisson	A structure used in underwater work, consisting of an airtight chamber, open at the bottom and containing air under sufficient pressure to exclude the water. A boatlike structure used as a gate for a dock or the like.	*Civil Engineering*
Caisson Disease	sometimes known as "the bends." Results from the sudden changed in pressure or form the use of compressed air.	*Industrial Relations*
Caissons	(See Foundation).	*Facility Engineering*
Caking index or Agglutinating power	a method used in the laboratory for determining the degree of caking, coking power or binding together of coal when a pulverized sample is heated in a prescribed manner.	*Mining*
Calcination	A process in which a material is heated to a high temperature without fusing, so that hydrates, carbonates, or other compounds are decomposed and the volatile material is expelled.	*Energy*
Calcine	Name given to concentrate that is ready for smelting (i.e., the sulfur has been driven off by oxidation).	*Mining*
Calcium carbide (CaC2)	A rhombic gray crystalline compound. As a source of acetylene, calcium carbide is an important raw material for synthetic resins, especially vinyl ester resins and vinyl indene chloride. Acetylene is also the base material for the manufacture of many other organic compounds used in various plastics. The calcium carbide itself is used as a raw material in the production of melamine-formaldehyde resins.	*Material Process*

Term	Definition	*Industry*
Calcium cyanamide (N CN Ca)	Colorless hexagonal rhombohedral crystals. The product of calcium carbide and nitrogen passed through the electric furnace, and the source material for dicyandiamide.	*Material Process*
Calcium hypochlorite (Ca(ClO)2 4H2O)	Colorless deliquescent crystals. Bleaching powder, which is used to bleach cotton linters or other cellulosic material which is being prepared for acetylating or esterification for the production of various cellulose plastics? Fillers may also be bleached with this.	*Material Process*
Calcium oxide, or lime (CaO)	Colorless cubic crystals. A raw material for the manufacture of calcium carbide and many other synthetic materials used as intermediates or in the finished plastics of various kinds.	*Material Process*
Calcium stearate (CH3 (CH)16COO)2 Ca)	A plasticizer and waterproofing agent incorporated in small amounts in such plastics as phenolics.	*Material Process*
Calcium sulfate	A white crystalline salt, insoluble in water. Used in Keene's cement, in pigments, as a paper filler, and as a drying agent.	*Energy*
Calcium sulfite	A white powder, soluble in diluted sulfuric acid. Used in the sulfite process for the manufacture of wood pulp.	*Energy*
Cauldron button	The fossil root of a tree or fern lying on the roof of a seam of coal. It could drop without giving any warning, occasioning accidents. It derives its name from the resemblance to the bottom of a cauldron or pot; in Somersetshire, it is called a 'bell-mould'.	*Mining*
Calendar-Based Maintenance	A maintenance strategy where specified activities (typically preventative in nature) are undertaken on a predetermined schedule at fixed intervals of time.	*Maintenance*
Calender	A machine consisting of two or more large rollers revolving at differential speeds against each other, used in coating textiles and paper.	*Material Process*
Calender-van Dusen Equation	An equation that defines the resistance-temperature value of any pure metal that takes the form of RT = RO(1 + AT + BT2) for values between the ice point (0°C) and the freezing point of antimony (630.7°C) and the form RT = RO[1 + AT + BT2 + C(T-100)T2] between the oxygen point (-183.0°C) and the ice point (0°C).	*General Engineering*
Calibration	The process of adjusting an instrument or compiling a deviation chart so that its reading can be correlated to the actual value being measured.	*General Engineering*
Calibration	A test during which known values are applied to the device under test and corresponding output readings are recorded under specified conditions.	*Electrical Engineering*
Calibration Curve	A graphical representation of the calibration record.	*Electrical Engineering*
Calibration Cycle	The application of known values and recording of corresponding Output readings over the full or the specified portion of the Range, in an ascending and descending direction.	*Electrical Engineering*
Calibration verification	"The assaying of calibration materials in the same manner as patient samples to confirm that the calibration of the instrument, kit, or test system has remained stable throughout the laboratory's reportable range for patient test results." [CLSI]	*Quality*
California power exchange	A State-chartered, non-profit corporation which provides day-ahead and hour-ahead markets for energy and ancillary services in accordance with the power exchange tariff. The power exchange is a scheduling coordinator and is independent of both the independent system operator and all other market participants.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Caliper	In a disk brake, a housing for cylinder, pistons and brake shoes, connected to the hydraulic system. The caliper holds the brake shoes so they straddle the brake disc.	*Mechanical Engineering*
Caliper	In a disk brake, a housing for cylinder, pistons and brake shoes, connected to the hydraulic	*Mechanical Engineering*
Call	an option, but not an obligation to buy (See Options and Put).	*Metallurgy*
Call Back	A job where the maintenance person is called back because the asset broke down again or the job was not properly finished the first time.	*Maintenance*
Call-Back Pay	Call-Back Pay	*Industrial Relations*
Calley-stone	a type of gannister. (Yorks.).	*Mining*
Callice	Callis or Clod and callice, dirt and waste., or a shaley coal. (Lancs.)	*Mining*
Call-In Pay	the number of hours of pay guaranteed, usually by contract, to a worker who reports to work when there is insufficient work for him to do.	*Industrial Relations*
Calling course	the time at which the 'caller' made his rounds from house to house to wake the early shift men. He would then make a later call to wake the boys and day workers. In early days he would knock on the door and call 'Wake up and go to work, in the name of God!'. (19th century N East). The 'knocker-up' was still employed in the Lancashire mill towns as late as the mid. 1940s.	*Mining*
Call-Out	To Summon A Tradesperson To The Workplace During His Normal Non-Working Time So That He Can Perform A Maintenance Activity (Normally An Emergency Maintenance Task)	*Management*
Callus tissue	A protective tissue of thin-walled cells developed on wound surfaces, often beginning at the edges of a wound.	*Forestry*
Calorie	The quantity of thermal energy required to raise one gram of water 1°C at 15°C.	*Electronic Process*
Calorific value	The quantity of heat that can be liberated from one pound of coal or oil measured in BTU's.	*Mining*
Calorifier	A calorifier/storage calorifier is a large cylindrical hot water heater. The calorifier heats fluids by circulating them over heating coils, and is necessary for in-demand hot water needs for feeding a boiler. May be storage or non-storage calorifier. See also Water Heater	*Industrial*
Calvey heifer	A cow pregnant with its first calf.	*Agriculture*
CAM	Computer Aided Manufacturing is a generic term for systems help manufacturing. They include CNC and process control.	*Control Engineering*
Camber	the condition of having an arched surface	*Materials Process*
Camber Angle	The inward or outward angle which a front-wheel spindle makes with a vertical line, as viewed by either the front or the rear of the vehicle. Positive camber results when the top of the tire tilts out further than its bottom. The adjustment of this setting affects both tire wear and vehicle handling.	*Mechanical Engineering*
Camber Thrust	The lateral force developed by a tire due to its camber. A force in the same direction as the leaning of the tire.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Campbell diagram	A mathematically-constructed diagram used to check for coincidences of vibration sources (1x, 2x, etc. shaft speed) with rotor natural frequencies, resulting in rotor resonances. It plots frequency vs RPM, with plot size growing with increasing amplitude. Sometimes called an interference diagram.	*Reliability Engineering*
Campshed	To line (the bank of a river) with campshot.	*Civil Engineering*
Campshot	A facing of planks and piles placed along the bank of a river to prevent erosion.	*Civil Engineering*
Cams	Eccentric shafts used in most internal combustion engines to open and close valves.	*Lubrication*
Camshaft	The shaft in the engine which is driven by gears, belts or chain from the crankshaft. The camshaft has a series of cams that opens and closes intake and exhaust valves as it turns.	*Mechanical Engineering*
Canadian and Catholic Confederation of Labor	a labor organization, composed primarily of Catholic workers, bringing together local unions in a number of industries.	*Industrial Relations*
Canadian Congress of Labor	an organization consisting primarily of international unions originally affiliated with the C.I.O.	*Industrial Relations*
Canadian deuterium uranium reactor (CANDU)	Uses heavy water or deuterium oxide (D_2O), rather than light water (H_2O), as the coolant and moderator. Deuterium is an isotope of hydrogen that has a different neutron absorption spectrum from that of ordinary hydrogen. In a deuterium-moderated-reactor, fuel made from natural uranium (0.71U-235) can sustain a chain reaction.	*Energy*
Canadian Federation of Labor	The - members of the Knights of Labor who were in the Trades and Labor Congress seceded in 1902-3.	*Industrial Relations*
Canadian Industrial Disputes Investigation Act (1907)	a Canadian Act which provides compulsory investigation in disputes affecting public utilities, railroads, and mines.	*Industrial Relations*
Canadian Labor Congress	an organization formed in 1956 by merger of the Trades and Labor Congress of Canada and the Canadian Congress of Labor.	*Industrial Relations*
Canadian Trades and Labor Congress	an outgrowth of the Toronto Trades assembly on 1881.	*Industrial Relations*
Canal	a waterway built to let boats navigate the waters	*Agriculture*
Canaries	During a mine rescue operation, the rescue team would enter the mine wearing breathing apparatus. As the amount of air carried was limited, the breathing apparatus would not be brought into use until absolutely necessary. To avoid delay by having to stop to test for gas with a safety lamp, the team would carry two or three canaries in separate cages. At the first sign of carbon monoxide (after damp), the bird would become distressed and in some cases fall from its perch. A small cylinder of oxygen was often carried to resuscitate the bird. There are now more sophisticated electronic means of testing for gas.	*Mining*
Canch	Caunch or Kench, the face of a ripping or brushing; or the part of the roof of an underground roadway (top canch) that has to be taken down; or the portion of the floor (bottom canch) that is required to be removed to increase roadway height; or the step of rock up onto the face when dinting or pavement brushing. - see also Brush, Rip, Dinting and Lip.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Canch holes	holes drilled and fired around the 'sumpers' in shaft sinking or road heading. Also called 'side holes'.	*Mining*
Candellila wax	Natural wax obtained from a small shrub grown in Mexico and Texas softer than Carnauba wax, melting at about 156°F (68.88°C).	*Material Process*
Candle coal or Cannel coal	An unlaminated coal that breaks with a glassy, conchoidal fracture, rather like that of pitch. Composed of much-altered plant material including spores, resin, cuticles and oil algae. Probably water transported and deposited as organic sediments. It burns with a bright, smoky flame like a candle.	*Mining*
Cank or Kank	a compact, fine-grained sandstone, or any fine-grained rock that was hard to drill. (Yorks.), e.g. an irony mudstone or siltstone. The cank in the Mansfield Marine Band is an ankeritic siltstone.	*Mining*
Canker	the ochreous sediment in pit water. - see Ochre.	*Mining*
Canker	A plant disease symptom characterized by a sharply defined necrosis of cortical tissue, often sunken below bark surface.	*Forestry*
Canned Music	The term of disdain applied by the American Federation of Musicians to music produced by recording machines.	*Industrial Relations*
Cannel	Cannel, -see Candle Coal.	*Mining*
Cannel coal	A compact, tough variety of coal, originating from organic spore residues, that is non-caking, contains a high percentage of volatile matter, ignites easily, and burns with a luminous smoky flame.	*Energy*
Canopy	the roof member of a chock-type powered support.	*Mining*
Canopy	A layer or multiple layers of branches and foliage at the top or crown of a forest's trees.	*Forestry*
Canopy (Natural draft tower)	Connects the hyperbolic shell to the cooling section, acting as an air conduit and air seal between the two.	*Facility Engineering*
Canopy	A protective covering of a cab on a mining machine.	*Mining*
Canvas	Closely woven, heavy cloth, of cotton, hemp, or flax, used as a laminating material.	*Material Process*
CAODC	Canadian Association of Oilwell Drilling Contractors.	*Petroleum Engineering*
Cap	A cap is a type of fitting, often liquid or gas tight, which covers the end of a pipe. A cap has a similar function to a plug. In steam systems that use threads the cap has female threads. See also Pipe Fittings	*Industrial*
Cap block	A flat piece of wood inserted between the top of the prop and the roof to provide bearing support.	*Mining*
Cap head	a top placed upon an air-box, used in shaft sinking, &c., for the purpose of catching as much air as possible; its front is kept facing the wind by means of a vane.	*Mining*
Cap lamp	a rechargeable battery operated light worn on a miner's safety helmet.	*Mining*
Cap Rock	Formation overlaying the ore or vein stone.	*Mining*
Capability	Maximum load that a generating unit can carry without exceeding approved limits.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Capable of being fueled	A vehicle is capable of being fueled by a particular fuel(s) if that vehicle has the engine components in place to make operation possible on the fuel(s). The vehicle does not necessarily have to run on the fuel(s) in order for that vehicle to be considered capable of being fueled by the fuel(s). For example, a vehicle that is equipped to operate on either gasoline or natural gas but normally operates on gasoline is considered to be capable of being fueled by gasoline and natural gas.	*Energy*
Capacitance	**Capacitance**—The ability of a device to store an electrical charge (electrical charge is what flows in electric current). Capacitance is used in many different applications. (See Capacitor.) **The unit of capacitance is the Farad, though it can also be referred to in Coulombs per volt (Coulomb being the standard unit of electrical charge). The Farad is a very large unit and capacitances are usually on the order of microfarads, μF (1 μF = 10-6 F) and picofarads, abbreviated pF (1 pF = 10-12 F).**	*Electrical*
Capacitance (Capacity)	That property of a system of conductors and dielectrics which permits the storage of electricity when potential difference exists between the conductors.	*Electrical*
Capacitive Coupling	Electrical interaction between two conductors caused by the capacitance between them.	*Electrical*
Capacitor	This is a device that helps improve the efficiency of the flow of electricity through distribution lines by reducing energy losses. It is installed in substations and on poles. Usually it is installed to correct an unwanted condition in an electrical system	*Energy*
Capacitor (also referred to as a condenser)	A multi-purpose device that can store electrical charge in the form of an electric field. It is used, for example, for power factor correction in (inductive) AC circuits. Capacitors are used to buffer electricity (smooth out peaks) and to guard against momentary voltage losses in circuits (when changing batteries, for example). (See also Capacitance.)	*Electrical*
Capacitor bank	A number of capacitors connected in parallel. (See also Parallel.)	*Electrical*
Capacity	The maximum load a generating unit, generating station, or other electrical apparatus is rated to carry by the user or the manufacturer or can actually carry under existing service conditions.	*Energy*
Capacity (Purchased)	Energy available for purchase from outside the system.	*Energy*
Capacity Charge	An assessment on the amount of capacity being purchased.	*Energy*
Capacity factor	The ratio of the electrical energy produced by a generating unit for the period of time considered to the electrical energy that could have been produced at continuous full power operation during the same period.	*Energy*
Capacity factor	CAPACITY FACTOR—See "Cv"	*Mechanical*
Capacity Factor	The ratio of the average load on a machine or equipment for a period of time to the capacity rating of the machine or equipment.	*Energy*
Capacity transaction	The acquisition of a specified quantity of generating capacity from another utility for a specified period of time. The utility selling the power is obligated to make available to the buyer a specified quantity of power.	*Energy*
Capacity utilization	Capacity utilization is computed by dividing production by productive capacity and multiplying by 100.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Capillarity	A property of a solid-liquid system manifested by the tendency of the liquid in contact with the solid to rise above or fall below the level of the surrounding liquid; this phenomenon is seen in a small bore (capillary) tube.	*Oil Analysis*
Capillary Action	The movement of water within the spaces of a porous material (such as soil and plant roots) due to the forces of adhesion, cohesion, and surface tension.	*Petroleum Engineering*
Capillary Action	The phenomenon of liquid rising in a small interstice due to surface tension.	*Electrical*
Capillary fringe	the zone of a porous medium above the water table within which the porous medium is saturated by water under pressure that is less than atmospheric pressure.	*Chemical*
Capillary suction	the process whereby water rises above the water table into the void spaces of a soil due to tension between the water and soil particles.	*Chemical*
Capillary Viscometer	A viscometer in which the oil flows through a capillary tube.	*Lubrication*
Capillary Zone	Area above the water table where groundwater is drawn upward and held in tension in the pore spaces.	*Petroleum Engineering*
Capital cost	The cost of field development and plant construction and the equipment required for industry operations.	*Energy*
Capital gains	Profit on the sale of an asset such as timber, land, or other property.	*Forestry*
Capital Recovery Factor (CRF)	A factor used to convert a lump sum value to an annual equivalent.	*Energy*
Capital Spares	Usually large, expensive, long lead time parts that are capitalized (not expensed) on the books and depreciated. They are often deemed as a "protection" against downtime.	*Reliability Engineering*
Capital stock	Property, plant and equipment used in the production, processing and distribution of energy resources.	*Energy*
Capital stock	The total ownership of a limited liability company divided among a specified number of shares.	*Mining*
Capitalization	A financial term used to describe the value financial markets put on a company. Determined by multiplying the number of outstanding shares of a company by the current stock price.	*Mining*
Cappers	Cappers, -see 'Cap'.	*Mining*
Capping or Rope capping	the fixing of a winding rope to the top of the cage. Originally often achieved by bending back the end of the rope to form a loop and then clamping the pieces together. This proved a source of weakness and ropes are now capped using a steel socket containing the separated strands of the end of the rope where molten white metal is poured into this socket, forming, on cooling, a solid white metal cap.	*Mining*
Capscrew	A fastener having a head and whose shank is normally threaded throughout its entire length. Not used with a nut, but rather engagement is made with a female thread in the piece to be joined.	*Mechanical*
Captive Audience	a group of workers assembled by an employer during working hours to listen to the employer discuss unionization, or the employer's point of view during an organization drive, or a statement on how much the employer has done for his workers.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Captive coal	Coal produced to satisfy the needs of the mine owner, or of a parent, subsidiary, or other affiliate of the mine owner (for example, steel companies and electricity generators), rather than for open market sale.	*Energy*
Captive Customer	A customer who does not have realistic alternatives to buying power from the local utility, even if that customer had the legal right to buy from competitors.	*Energy*
Captive Mines	a term applied to the coal mines owned by steel companies.	*Industrial Relations*
Captive refinery MTBE plants	MTBE (methyltertiary butyl ether) production facilities primarily located within refineries. These integrated refinery units produce MTBE from Fluid Cat Cracker isobutylene with production dedicated to internal gasoline blending requirements.	*Energy*
Captive refinery oxygenate plants	Oxygenate production facilities located within or adjacent to a refinery complex.	*Energy*
Captive stope	A stope that is accessible only through a manway.	*Mining*
Car	a mine wagon. The name is now used for large mine tubs i.e. mine car. - see also Shuttle car; also another term for 'canker' (N. Staffs.).	*Mining*
Car	A railway wagon, especially any of the wagons adapted to carrying coal, ore, and waste underground.	*Mining*
CARB	California Air Resources Board	*Petro-Chemical Abbreviations*
Carbamide	Another name for urea.	*Material Process*
Carbide bit	More correctly, cemented tungsten carbide. A cutting or drilling bit for rock or coal, made by fusing an insert of molded tungsten carbide to the cutting edge of a steel bit shank.	*Mining*
Carbitol Trade	name for monoethyl ether of diethylene glycol used as high boiling lacquer solvent.	*Material Process*
Carbohydrate	Generic name for sugars; e.g., fructose, sucrose.	*Agriculture*
Carbolic acid	Another name for phenol.	*Material Process*
Carbon	A non-metallic element - No. 6 in the periodic table. Diamonds and graphite are pure forms of carbon. Carbon is a constituent of all organic compounds. It also occurs in combined form in many inorganic substances; i.e., carbon dioxide, limestone, etc.	*Oil Analysis*
Carbon	naturally occurring element commonly found in steel	*Materials Process*
Carbon Steel	Carbon Steel. A steel which owes its distinctive properties chiefly to the carbon (as distinguished from the other elements) which it contains. Steel is considered to be carbon steel when no minimum content is specified or required for aluminum, boron, chromium, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, or zirconium or for any other element added to obtain a desired alloying effect; when the specified minimum for copper does not exceed 0.40 percent; or when the maximum content specified for any of the following elements does not exceed the percentages noted: manganese, 1.65 percent; silicon, 0.60 percent; copper, 0.60 percent.	*Maintenance and Repair*
Carbon (deposit)	Solid black residue in piston grooves which can interfere with piston ring movement leading to wear and/or loss of power.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Carbon Black	A black pigment. It imparts useful ultraviolet protective properties, and so is frequently suspended into plastic and elastomeric compounds intended for outside weather exposure.	*Electrical*
Carbon budget	The balance of the exchanges (incomes and losses) of carbon between carbon sinks (e.g., atmosphere and biosphere) in the carbon cycle. Also see Carbon cycle and Carbon sink.	*Energy*
Carbon cycle	The circulation of carbon through its various forms in the environment. Briefly, carbon dioxide in the atmosphere is fixed (i.e., converted into solid matter) by the process of photosynthesis in plants and green algae. These then die and rot under the influence of bacteria and fungi or are consumed by higher organisms in the form of food or fuel (burning plant matter or fossil fuels). Either way, carbon is released into the atmosphere as carbon dioxide and is available again for fixation (i.e., incorporation into biomass).	*Electrical*
Carbon dioxide (CO_2)	A colorless, odorless, non-poisonous gas that is a normal part of Earth's atmosphere. Carbon dioxide is a product of fossil-fuel combustion as well as other processes. It is considered a greenhouse gas as it traps heat (infrared energy) radiated by the Earth into the atmosphere and thereby contributes to the potential for global warming. The global warming potential (GWP) of other greenhouse gases is measured in relation to that of carbon dioxide, which by international scientific convention is assigned a value of one (1). Also see Global warming potential (GWP) and Greenhouse gases.	*Energy*
Carbon dioxide equivalent	The amount of carbon dioxide by weight emitted into the atmosphere that would produce the same estimated radiative forcing as a given weight of another radiatively active gas. Carbon dioxide equivalents are computed by multiplying the weight of the gas being measured (for example, methane)by its estimated global warming potential (which is 21 for methane)."Carbon equivalent units" are defined as carbon dioxide equivalents multiplied by the carbon content of carbon dioxide (i.e., 12/44).	*Energy*
Carbon disulfide (CS2)	Colorless inflammable liquid. Used as solvent and in the manufacture of cellophane.	*Material Process*
Carbon fiber	Carbon fiber is lighter than aluminum, stronger than steel, and very expensive material. It's used to construct the chassis of a modern open wheeled car. Sheets of carbon fiber cloth are "laid up" like fiberglass by an expert fabricator using a mold, and then heated and reheated for days in an autoclave, a large, high-tech oven.	*NASCAR*
Carbon fibers	a form of carbon made by converting a precursor fiber into an all-aromatic fiber with exceptional mechanical properties	*Physics*
Carbon flux	Carbon flux: See Carbon budget.	*Energy*
Carbon intensity	The amount of carbon by weight emitted per unit of energy consumed. A common measure of carbon intensity is weight of carbon per British thermal unit (Btu) of energy. When there is only one fossil fuel under consideration, the carbon intensity and the emissions coefficient are identical. When there are several fuels, carbon intensity is based on their combined emissions coefficients weighted by their energy consumption levels. Also see Emissions coefficient and Carbon output rate.	*Energy*
Carbon monoxide (CO)	Colorless, odorless, poisonous gas. A raw material for the synthetic production of methyl alcohol and of formaldehyde.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Carbon nanotubes	synthetic tubes of carbon formed by folding one graphene plane over another	*Physics*
Carbon output rate	The amount of carbon by weight per kilowatt hour of electricity produced.	*Energy*
Carbon Residue	Coked material remaining after an oil has been exposed to high temperatures under controlled conditions.	*Lubrication*
Carbon sequestration	The fixation of atmospheric carbon dioxide in a carbon sink through biological or physical processes.	*Energy*
Carbon sink	A reservoir that absorbs or takes up released carbon from another part of the carbon cycle. The four sinks, which are regions of the Earth within which carbon behaves in a systematic manner, are the atmosphere, terrestrial biosphere (usually including freshwater systems), oceans, and sediments (including fossil fuels).	*Energy*
Carbon steel	Iron containing carbon in the form of carbides, about 0.1 to 0.3 percent carbon with no other alloying elements other than the sulfur, phosphorus, and other elements present in almost all steels.	*General Mechanical*
Carbon steel	Ferrous alloy with nominal impurity level and carbon as the primary compositional variable.	*Material Process*
Carbon steel (CS)	Iron containing carbon in the form of carbides, about 0.1 to 0.3 percent carbon with no other alloying elements other than the sulfur, phosphorus, and other elements present in almost all steels.	*Mechanical*
Carbon stocks	The quantity of carbon stored in biological and physical systems including: trees, products of harvested trees, agricultural crops, plants, wood and paper products and other terrestrial biosphere sinks, soils, oceans, and sedimentary and geological sinks.	*Energy*
Carbon tetrachloride (CCl 4)	A solvent, hydrocarbon.	*Material Process*
Carbon Type	The distinction between paraffinic, naphthenic, and aromatic molecules. In relation to lubricant base stocks, the predominant type present.	*Lubrication*
Carbonate	A sediment formed by the organic or inorganic precipitation from aqueous solution of carbonates of calcium, magnesium, or iron.	*Petroleum Engineering*
Carbonate hardness	Hardness in water caused by bicarbonates of calcium and magnesium. If alkalinity exceeds total hardness, all hardness is carbonate hardness; if hardness exceeds alkalinity, the carbonate hardness equals the alkalinity.	*Chemical Engineering*
Carbonate Rocks	A rock consisting chiefly of carbonate minerals, such as limestone and dolomite.	*Petroleum Engineering*
Carbon-carbon composite	An advanced composite system with especially high modulus and strength.	*Material Process*
Carboniferous	Containing coal.	*Mining*
Carbon-in-pulp	A method of recovering gold and silver from pregnant cyanide solutions by adsorbing the precious metals to granules of activated carbon, which are typically ground up coconut shells.	*Mining*
Carbonitriding	Similar to Carburising. Diffusion of carbon and nitrogen at about 900°C (by pack, gas, salt bath or plasma process) into low carbon steel, followed by quenching and tempering to produce martensitic case (typically 1mm thick).	*Paint and Coatings*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Carbonyl Iron Powder	A contaminant which consists of up to 99.5% pure iron spheres.	*Lubrication*
Carborundum Trade	name of silicon carbide, a very hard abrasive, produced synthetically in an electric furnace from coke, sand, sawdust, and salt.	*Material Process*
Carburetor	A fuel delivery device for producing a proper mixture of gasoline vapor and air and for delivering it to the intake manifold of an internal combustion engine. Gasoline is gravity-fed from a reservoir bowl into a throttle bore, where it is allowed to evaporate into the stream of air being inducted by the engine. Also see Diesel Fuel System and Fuel Injection.	*Energy*
Carburising (also called Case Hardening)	Diffusion of carbon at about 900 °C (by pack, gas, salt bath or plasma process) into low carbon steel, followed by quenching and tempering to produce martensitic case (typically 1mm thick).	*Paint and Coatings*
Carburization	The diffusion of carbon atoms into surface of steel for the purpose of hardening the alloy.	*Material Process*
Carcinogen	A cancer-causing substance. Certain petroleum products are classified as potential carcinogens OSHA criteria. Suppliers are required to identify such products as potential carcinogens on package labels and Material Safety Data Sheets.	*Lubrication*
Card Carrying Members	union members in good standing who have evidence of their membership.	*Industrial Relations*
Cardox	a blasting method used in gassy mines that employs gas at high pressure. The gas is carbon dioxide and steel shells or cartridges (essentially steel tubes with firing and discharge heads) are filled with liquid carbon dioxide, inserted into pr-drilled holes in the coal or rock and then actuated by a powder fuse primer. The gas then escapes through ports at the end of the shell disrupting the coal or rock by a heaving force acting through any existing planes of weakness. This method was designed to produce lumps rather than coal fines.	*Mining*
Car-dump	The mechanism for unloading a loaded car.	*Mining*
Carlot	One carlot is one railcar, or its equivalent.	*Agriculture*
Carnauba wax	A natural wax, the hardest in use, obtained from the leaves of a Brazilian palm tree, m.p. about 185°F (85 °C). It is used to modify the consistency of plastics, to polish finished articles, and as a lubricant.	*Material Process*
Carpenters and Joiners of America	United Brotherhood of (AFL-CIO) - a national union organized in Chicago in August 1881, as the Brotherhood of Carpenters and Joiners of America.	*Industrial Relations*
Carred-water or Carrod-water	Water colored with yellow ochre (hydrated oxide of iron) held in suspension (N. Staffs.).	*Mining*
Carrier Gas	Usually nitrogen or argon gas that carries powder into the thermal spray process.	*Paint and Coatings*
Carrier mobility	Drift velocity per unit electric field strength for a given charge carrier in a conducting material.	*Material Process*
Carry over	[In a cross-over trial:] The persistence, into a later period of treatment, of some of the effects of a treatment applied in an earlier period. See also: Cross-over trial	*Quality Engineering*
Carryall scraper (or pan scraper)	a self-loading machine, usually self-propelled, with a scraper-like retractable bottom. It is used to excavate and haul overburden.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Carrying bars,	log bars used to span wide underground openings. –see Bars.	*Mining*
Carrying Capacity	Amount of load that a tire can carry at a given inflation pressure as established by the Tire and Rim Association.	*Mechanical Engineering*
Carrying costs	Costs incurred in order to retain exploration and property rights after acquisition but before production has occurred. Such costs include legal costs for title defense, ad valorem taxes on nonproducing mineral properties, shut-in royalties, and delay rentals.	*Energy*
Cart	Championship Auto Racing Teams; sanctions races for Indy type cars.	*Mechanical Engineering*
Cartage	A charge made for the hauling and transferring of goods, usually on a local basis and short haul in nature.	*Procurement*
Cartage firm	A company that delivers produce from a terminal market company to that firm's customers.	*Agriculture*
Cartridge	a charge of blasting powder contained in a case.	*Mining*
Cartridge	1. The replaceable element of a fluid filter. 2. The pumping unit from a vane pump, composed of the rotor, ring, vanes and one or both side plates.	*Mechanical, Process, and Operations*
Cartridge or Filter Cartridge	A filtration or separation device (usually in the shape of a cylinder or disk—that is designed for easy installation and removal. The cartridge/cylinder design contains a porous material or media through which a liquid or gas is passed in order to separate the fluid from suspended particulate matter. The media may be a membrane or another material that contains pores of set or varying size.	*Contamination Control*
Cartridge Seal	A completely self-contained assembly including seal, gland, sleeve, mating ring, etc., usually needing no installation measurement.	*Lubrication*
Carts	a term for small tubs (S. Wales).	*Mining*
Carvings	The air roads formed by the angle of the steps in longwall working where the face is stepped.	*Mining*
CAS Number	A unique identifier for chemical substances. Chemical Abstracts Service (CAS) is a division of the American Chemical Society that is responsible for the administration, quality assurance and maintenance of the CAS registry. A CAS Number itself has no inherent chemical significance but provides an unambiguous way to identify a chemical substance or molecular structure when there are many possible systematic, generic, proprietary or trivial names.	*Petroleum Engineering*
CASAC	Clean Air Scientific Advisory Committee	*Petro-Chemical Abbreviations*
Cascade	A chain of steps for dissipating the momentum of falling water in a steep place in order to maintain a steady rate of flow.	*Civil Engineering*
Cascade	To combine logic circuitry to get more complex logic or timing control. (Inputs and outputs are wired in series.)	*Electrical Engineering*
Cascade Control	Controllers arranged such that the output of one controller manipulates the setpoint input of a second controller instead of manipulating a process variable directly.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cascading power failure	A cascade happens when a part of the power grid fails, and shifts its power load to other elements in the grid. Overloaded, these elements also begin to shut down and shift their power load onto other elements, and so on. The resulting surge current can induce ongoing failures and take down an entire power system in a very short time, "cascading" through parts and systems like a ripple on a pond until the grid collapses.	*Electrical*
Case Drain Filter	A filter located in a line conducting fluid from a pump or motor housing to reservoir.	*Lubrication*
Case drain line	A line conducting fluid from a component housing to the reservoir.	*Mechanical, Process, and Operations*
Case series	A study reporting observations on a series of individuals, usually all receiving the same intervention, with no control group.	*Quality Engineering*
Case study	A study reporting observations on a single individual. Also called: Anecdote, Case history, Single case report	*Quality Engineering*
Case-control study	Retrospective comparison of exposures of persons with disease (cases) with those of persons without the disease (controls) (see Retrospective study).	*Analysis*
Case-hardening	See Carburising	*Paint and Coatings*
Casein	A protein prepared from cows milk, informal trade term for casein plastics.	*Material Process*
Casein plastics	Hornlike substances obtained from casein, usually rennet casein, hardened through the action of formaldehyde or some other agent, and seasoned by drying.	*Material Process*
Case-series	Report of a number of cases of disease.	*Analysis*
Cash	waste obtained from holing (Scot.); or a soft band, sometimes found separating one stratum from another; when thin, called a 'cashy parting', (N. East).	*Mining*
Cash and carry	Kerosene, fuel oil, or bottled gas (tank or propane) purchased with cash, by check, or by credit card and taken home by the purchaser. The purchaser provides the container or pays extra for the container.	*Energy*
Cash crop	what a farmer raises, crop or livestock, to sell for money	*Agriculture*
Cash Discount	A form of discount the purpose of which is to secure prompt payment of an account.	*Procurement*
Cash flow	The net of the inflow and outflow of cash during an accounting period. Does not account for depreciation or bookkeeping write-offs which do not involve an actual cash outlay.	*Mining*
Cash On Delivery (C.O.D.)	Cash payment for purchases on delivery.	*Procurement*
Cash Refund Annuity	a policy which provides an annual income at retirement for life.	*Industrial Relations*
Casine law	Expression describing the scattering of light from an ideally rough surface.	*Material Process*
Casing	A steel pipe or tubing, esp. as used in oil and gas wells.	*Civil Engineering*
Casing (Carcass)	The structure of tire cords locked around wire beads, (most often used in relation to worn tires).	*Mechanical Engineering*
Casing (Well Casing)	Pipe, tubing, or other material installed in a well to support its sides.	*Petroleum Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Casing Head	A piece of well control equipment (flanged, welded or hub clamp) attached to the top of surface casing, allowing the attachment of Blowout Preventers during the drilling, phase and later used to hang and suspend a secondary string of casing set inside hung on a set of casing slips.	*Petroleum Engineering*
Casing panel	A pre-assembled or pre-cut unit of the casing.	*Facility Engineering*
Casing Spool	A piece of well control equipment attached below the Casing Head, used to suspend and seal a secondary casing string with casing slips.	*Petroleum Engineering*
Casing string	The steel tubing that lines a well once it has been drilled, formed from sections of steel tubing screwed together.	*Petroleum Drilling*
Casing string	The steel tubing that lines a well after it has been drilled. It is formed from sections of steel tube screwed together.	*Petroleum Drilling*
Casing	Pipe cemented in the well to seal off formation fluids or keep the hole from caving in.	*Petroleum Drilling*
Casinghead Gas	Gas produced with oil in oil wells. The gas is taken from the well through the casinghead at the top of the well.	*Petroleum Drilling*
Casinghead gas (or oil well gas)	Natural gas produced along with crude oil from oil wells. It contains either dissolved or associated gas or both.	*Energy*
Cassava	A gum obtained from a tropical plant, used in the manufacture of adhesives and synthetic rubber and as a modifier for some plastics.	*Material Process*
Cast	The form of a particular part of a valve, where the basic shape is formed by molding rather than fabricating.	*Mechanical*
Cast iron	The common term for cast gray iron or iron containing flake carbon in the range of _% to 2 _%. Cast iron is brittle, exhibiting very little ductility before fracturing.	*General Mechanical*
Cast resin	Resinous product prepared by pouring liquid resin into a mold and heat treating the mass of cure it. Hot liquid resin is usually used in the case of phenolics, but cold resin with accelerators may be substituted. In the case of the methacrylates, heating is usually done after pouring.	*Material Process*
Cast silicon	Crystalline silicon obtained by pouring pure molten silicon into a vertical mold and adjusting the temperature gradient along the mold volume during cooling to obtain slow, vertically advancing crystallization of the silicon. The polycrystalline ingot thus formed is composed of large, relatively parallel, interlocking crystals. The cast ingots are sawed into wafers for further fabrication into photovoltaic cells. Cast silicon wafers and ribbon silicon sheets fabricated into cells are usually referred to aspolycrystalline photovoltaic cells.	*Energy*
Cast steel	steel in the form of an object at or near finished shape, produced by pouring molten steel into a mold	*Materials Process*
Caster	toe. Also, the adjustment of components to bring them into a predetermined position for the most efficient operation of wheel and vehicle for proper even tire wear.	*Mechanical Engineering*
Caster Angle	The forward or backward tilt of the steering axis as viewed from the side. If the point of load is ahead of the point of contact, the caster angle is positive. The caster angle tends to keep wheels in a straight line. Proper caster adjustment improves both tire wear and fuel economy.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Caster	Another measure of chassis tuning related to the front wheels. The front wheels are attached to the suspension at the top and bottom of the wheel assembly. The top attachment is typically set a little farther back than the lower attachment, creating caster. The more caster used, the more the wheel resists turning forces, providing stability. Too much caster makes it very difficult to steer, and causes the tire camber to change significantly as the wheel is turned. Not enough caster results in the front end "wandering," or trying to turn on its own.	*NASCAR*
Casters	Wheels mounted in a fork (either rigid or swivel) used to support and make conveyors portable. See our caster section for information on industrial applications.	*Manufacturing*
Casting	an object at or near finished shape obtained by solidification of a metal or alloy in a mold	*Materials Process*
Casting	Material processing technique involving pouring of molten liquid into a mold, followed by solidification of the liquid. Forming a material to a desired shape by pouring it into a mold while liquid and then hardening it. Also, refers to the manufacture of film.	*Material Process*
Casual Labor	work occupations in which the demand for employment is highly variable, such as port work, farm migratory work, and other jobs of an unskilled, intermittent nature.	*Industrial Relations*
Casual Worker	workers who work occasionally and intermittently and are not attached to a particular company.	*Industrial Relations*
Cat coal	coal containing pyrites. (Yorks.).	*Mining*
Cat skinner	A person who drives or operates a Caterpillar tractor.	*Agriculture*
Cat	Abbreviation for Caterpillar tractor.	*Agriculture*
Catalyst	A substance which aids or promotes a chemical reaction without forming part of the final product.	*Chemical*
Catalyst	A substance which changes the rate of a chemical reaction but is itself not changed. Switch contact material sometimes acts as a catalyst, accelerating the formation of polymers on the contact surface.	*Electrical Engineering*
Catalyst coke	Catalyst coke: See Petroleum coke, catalyst.	*Energy*
Catalytic converter	A device containing a catalyst for converting automobile exhaust into mostly harmless products.	*Energy*
Catalytic cracking	The process of breaking up heavier hydrocarbon molecules into lighter hydrocarbon fractions by use of heat and catalysts.	*Chemical*
Catalytic cracking	The process of breaking up heavier hydrocarbon molecules into lighter hydrocarbon fractions by use of heat and catalysts.	*Petroleum Engineering*
Catalytic hydrocracking	A refining process that uses hydrogen and catalysts with relatively low temperatures and high pressures for converting middle boiling or residual material to high octane gasoline, reformer charge stock, jet fuel, and/or high grade fuel oil. The process uses one or more catalysts, depending on product output, and can handle high sulfur feed stocks without prior desulfurization.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Catalytic hydrotreating	A refining process for treating petroleum fractions from atmospheric or vacuum distillation units (e.g., naphthas, middle distillates, reformer feeds, residual fuel oil, and heavy gas oil) and other petroleum (e.g., cat cracked naphtha, coker naphtha, gas oil, etc.) in the presence of catalysts and substantial quantities of hydrogen. Hydrotreating includes desulfurization, removal of substances (e.g., nitrogen compounds) that deactivate catalysts, conversion of olefins to paraffins to reduce gum formation in gasoline, and other processes to upgrade the quality of the fractions.	*Energy*
Catalytic oxidizer	an off-gas posttreatment unit for control of organic compounds. Gas enters the unit and passes over a support material coated with a catalyst (commonly a noble metal such as platinum or rhodium) that promotes oxidation of the organics. Catalytic oxidizers can also be very effective in controlling odors. High moisture content and the presence of chlorine or sulfur compounds can adversely affect the performance of the catalytic oxidizer.	*Chemical*
Catalytic reforming	A refining process using controlled heat and pressure with catalysts to rearrange certain hydrocarbon molecules, there by converting paraffinic and naphthenic type hydrocarbons (e.g., low octane gasoline boiling range fractions) into petrochemical feedstocks and higher octane stocks suitable for blending into finished gasoline. Catalytic reforming is reported in two categories. They are:	*Energy*
Catastrophic Failure	Sudden, unexpected failure of a machine resulting in considerable cost and downtime.	*Lubrication*
Catband	an iron loop placed on the underside of the centre of a flat corf bow, in which to insert the hook, (N. East.).	*Mining*
Catch basin	A receptacle, located where a street gutter opens into a sewer, designed to retain matter that would not readily pass through the sewer.	*Civil Engineering*
Catch prop	a prop set temporarily under broken roof bars for safety during roadway repair work; or props set down the middle of a roadway for extra support, also called 'middle sets'.	*Mining*
Catcher	a safety or disengaging hook that comes into action during 'over-winding' or another name for the 'Keps'. (Lancs.); or a qualified face worker without a regular position in a face team, who covers for absentees. (S. Staffs.).	*Mining*
Catches	the cage support at the shaft top, also called 'keps' or 'keeps'; or the movable checks by which the tubs are secured in the cages.	*Mining*
Catchment	Something for catching water, as a reservoir or basin, the water that is caught in such a catchment.	*Civil Engineering*
Categorical data	Data that are classified into two or more non-overlapping categories. Race and type of drug (aspirin, paracetamol, etc.) are examples of categorical variables. If there is a natural order to the categories, for example, non-smokers, ex-smokers, light smokers and heavy smokers, the data are known as ordinal data. If there are only two categories, the data are dichotomous data. See also: Continuous data	*Quality Engineering*
Category	A group of closely related chemicals whose physico-chemical, ecotoxicological or toxicological properties follow a regular pattern because of structural similarity.	*Chemical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cathead	an ironstone ball, (N. East). Roughly spheroidal ironstone nodules larger than 'dog balls'.	*Mining*
Cathead hoist	a small, deep-flanged, spool-like winch or capsan mounted on the countershaft of the hoisting drum near the front and generally to one side of the swivel head of a diamond drill. It is used to wind a line when breaking or making up rod, casing, or pipe joints, and to operate a drive hammer.	*Petroleum Drilling*
Cathode	A negatively charged electrode (which attracts cations in electrolysis).	*Chemical Engineering*
Cathode	The switch contact connected to the negative terminal of the power supply.	*Electrical Engineering*
Cathodic	exhibiting properties of a cathode; steel is cathodic in relation to zinc	*Materials Process*
Cathodic protection	reduction or prevention of corrosion of a metal surface by making it a cathode in an electrolytic cell, using either a galvanic or impressed current; zinc cathodically protects steel, i.e. sacrificially giving up electrons to protect the steel from corrosive attack	*Materials Process*
Cathodic Protection	A technique to reduce the corrosion rate of a metal by making it the cathode of an electrochemical cell. Thermal spray zinc and aluminum coatings provide this protection to steel substrates, the coating being the anode and the steel being the cathode.	*Paint and Coatings*
Cathodic reaction	the reduction reaction occurring at the cathode in an electrochemical cell.	*Material Process*
Cation	A positively charged ion resulting from dissociation of molecules in solution.	*Chemical Engineering*
Cation	A positively charged ion.	*Paint and Coatings*
Catshead	Catshead—see 'Boilum'.	*Mining*
Catwalk	Steel platform immediately in front of the derrick substructure on which joints of drill pipe are stored prior to being lifted to the derrick floor by the catline. *	*Petroleum Drilling*
Caucus	a meeting of a small group of influential members of an organization to plan strategy or policy prior to a general meeting.	*Industrial Relations*
Causal effect	An association between two characteristics that can be demonstrated to be due to cause and effect, i.e. a change in one causes the change in the other. Causality can be demonstrated by experimental studies such as controlled trials (for example, that an experimental intervention causes a reduction in mortality). However, causality can often not be determined from an observational study.	*Quality Engineering*
Causality	The relating of causes to the effects they produce. Most of epidemiology concerns causality and several types of causes can be distinguished. It must be emphasized, however, that epidemiological evidence by itself is insufficient to establish causality, although it can provide powerful circumstantial evidence.	*Analysis*
Causeway	A raised road or path, as across low or wet ground. A highway or paved way. To pave (a road or street) with cobblestones or pebbles.	*Civil Engineering*
Causeway	A raised road or path, as across low or wet ground. A highway or paved way. To pave (a road or street) with cobblestones or pebbles.	*Civil Engineering*
Caustic	Strong base (alkaline) substance which irritates the skin. Corrosive. When the term is used alone it usually refers to caustic soda (sodium hydroxide), which is used in manufacturing hard soap. It also refers to caustic potash (potassium hydroxide), which is used in manufacturing soft soap.	*Chemistry*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Caustic cleaning	the cleaning of steel in a solution with high alkalinity; in the hot-dip galvanizing process, organic residues are removed by immersing steel in a tank of caustic solution	*Materials Process*
Caustic wash	A process in which distillate is treated with sodium hydroxide to remove acidic contaminants that contribute to poor odor and stability.	*Petroleum Engineering*
Caution period	When the track is unsafe because of an accident, debris or a sudden downpour, the officials may put the track under caution by waving yellow flags at the starter stand and around the track. This brings out the pace car to gather the field and lead them around at reduced speed until the track is safe for a restart.	*NASCAR*
Cautionary zone	a zone in which unworked coal lies at or less than a specified distance from unconsolidated deposits or other sources of danger.	*Mining*
CAV	Current Asset Value.	*Maintenance*
Cave or Caving	to allow the roof to fall by removing the supports or waste packs.	*Mining*
Caved-in	ground where the roof has fallen or where the sides of the roadway have collapsed.	*Mining*
Cavils or Cavills	a type of lottery system or draw by which is decided the working place of each individual (N. East)—see Kyevilin day. Caving, method of mining which allows the waste area behind the face to collapse on the removal of supports.	*Mining*
Cavitation	The boiling of a liquid caused by a decrease in pressure rather than an increase in temperature.	*General Engineering*
Cavitation	Formation of an air or vapor pocket (or bubble) due to lowering of pressure in a liquid, often as a result of a solid body, such as a propeller or piston, moving through the liquid; also, the pitting or wearing away of a solid surface as a result of the violent collapse of a vapor bubble. Cavitation can occur in a hydraulic system as a result of low fluid levels that draw air into the fluid, producing tiny bubbles that expand followed by rapid implosion, causing metal erosion and eventual pump destruction.	*Lubrication*
Cavitation attack	Cavitation attack takes place locally, the behavior is determined by the structural constitution to a greater extent with this type of erosion than with others. A homogenous, fine grained microstructure is required, soft inclusions and soft, or very brittle, grain boundaries reduce the resistance.	*Material Process*
Cavitation Erosion	A material-damaging process which occurs as a result of vaporous cavitation. "Cavitation" refers to the occurrence or formation of gas- or vapor- filled pockets in flowing liquids due to the hydrodynamic generation of low pressure (below atmospheric pressure). This damage results from the hammering action when cavitation bubbles implode in the flow stream. Ultra-high pressures caused by the collapse of the vapor bubbles produce deformation, material failure and, finally, erosion of the surfaces.	*Lubrication*
Cavity	Depression in a mold, usually for one article. Molds are single cavity or multicavity.	*Material Process*
Cavity block	The lower part of a mold containing the depressions.	*Material Process*
CB Case	an unfair labor practice case under the Taft-Hartley Act filed against a union.	*Industrial Relations*
CBM	See Condition Based Maintenance.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
CBOB	conventional gasoline blendstock for oxygenate blending	*Energy*
cc	Cubic centimeter	*Oil Analysis*
CCAG	See Cochrane Register of Studies Board	*Quality Engineering*
CCB	combustion by-products	*Petro-Chemical Abbreviations*
CCBBA	Committee for Commonality in Blood Banking Automation	*Gears*
CCC - Commodity Credit Corporation	CCC - Commodity Credit Corporation.	*Agriculture*
CCD	combustion chamber deposits	*Petro-Chemical Abbreviations*
CCD	Charge Coupled Device. This scanner type has is usually inexpensive and light weight. The disadvantage is that the scanner must touch the barcode and usually can only scan a barcode the same length as the device. Meaning, if you have a 4" bar-code and the CCD is only 3", there is a good chance that it may not read it correctly.	*Gears*
CCDI	combustion chamber deposit interference	*Petro-Chemical Abbreviations*
CCE	climate change emissions	*Petro-Chemical Abbreviations*
CCF	One hundred (100) cubic feet.	*Petroleum Drilling*
CCMC	Comité des Constructeurs d'Automobiles du Marché Commun (predecessor of ACEA)	*Petro-Chemical Abbreviations*
CCNet	See Cochrane Consumer Network (CCNet)	*Quality Engineering*
CCPA	Canadian Chemical Producers Association	*Petro-Chemical Abbreviations*
CCR	Conradson carbon residue	*Petro-Chemical Abbreviations*
CCRCT	See CENTRAL (Cochrane Central Register of Controlled Trials [CCRCT])	*Quality Engineering*
CCS	cold crank simulator	*Petro-Chemical Abbreviations*
CCSG	See Cochrane Collaboration Steering Group (CCSG)	*Quality Engineering*
CD-2/CF-2	API 2-stroke diesel engine oil specification	*Petro-Chemical Abbreviations*
CDA	Copper Development Association	*Metallurgy*
CDC	Centers for Disease Control	*Quality*
CDD	CDD: See Cooling Degree Days.	*Energy*
CDF	An acronym for Cumulative density function which is a function obtained by integrating the failure distribution pdf. In life data analysis, the cdf is equivalent to the unreliability function.	*Reliability Engineering*
CDP	candidate data package	*Petro-Chemical Abbreviations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
CDSR	See Cochrane Database of Systematic Reviews (CDSR)	*Quality Engineering*
Cease and Desist Order	an order issued by the National Labor Relations Board to a labor organization or employer to stop an unfair labor practice held in violation of the law.	*Industrial Relations*
CEC	California Energy Commission	*Petro-Chemical Abbreviations*
CE-CERT	College of Engineering, Center for Environmental Research and Technology of UC, Riverside	*Petro-Chemical Abbreviations*
CEED	Center for Energy and Economic Development	*Petro-Chemical Abbreviations*
CEFIC	Conseil Européen des Federations de l'Industrie Chimique (European Chemical Industry Council)	*Petro-Chemical Abbreviations*
Ceiling Hanger	A support fastened from an overhead frame work to position and carry loads.	*Equipment*
Ceiling Hangers	Lengths of steel rod, attached to the ceiling, from which conveyors may be supported to provide maximum utilization of floor space or when required height exceeds floor support capability.	*Manufacturing*
Celanese	Trade name of a rayon silk made from cellulose acetate.	*Material Process*
Celite	Celite A trade name for diatomaceous earth, used as a filler or filter aid.	*Material Process*
Cell	The smallest tower subdivision which can function as an independent unit with regard to air and water flow; it is bounded by exterior walls or partitions. Each cell may have one or more fans or stacks and one or more distribution systems.	*Facility Engineering*
Cell dimensions	(a) Width: dimensions perpendicular to tower longitudinal axis and usually at right angles to the louver area; (b) Length: dimension parallel to longitudinal axis and the plane where louvers are usually placed; (c) Height: distance from basin curb to top of fan deck but not including fan stack. Nominal width and length are measured from and to the column center lines.	*Facility Engineering*
Cellar	A pit in the ground to provide additional height between the rig floor and the well head.	*Petroleum Drilling*
Cellar coal	any seam lying a short distance below a main seam in which sumps or cellars are made. (Lancs.).	*Mining*
Cellophane	Trade name for transparent packaging film materials prepared from hydrated cellulose obtained by the precipitation of sodium cellulose xanthate in an acid bath.	*Material Process*
Cells	Refers to the un-encapsulated semi-conductor components of the module that convert the solar energy to electricity.	*Energy*
Cells to OEM (non-PV)	Cells shipped to non-photovoltaic original equipment manufacturers such as boat manufacturers, car manufacturers, etc.	*Energy*
Cellular Manufacturing	A manufacturing approach in which equipment and workstations are arranged to facilitate small-lot, continuous-flow production-often in a U-shaped cell. In a manufacturing "cell," all operations necessary to produce a component or subassembly are performed in close proximity, thus allowing for quick feedback between operators when quality problems and other issues arise. Workers in a manufacturing cell are typically cross-trained and, hence, able to perform multiple tasks as needed.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Celluloid	Trade name for a cellulose nitrate or pyroxylin plastic.	*Material Process*
Cellulose	component of plant cell walls that is not digestible by most animals	*Agriculture*
cellulose	A major component of the cell wall.	*Agriculture*
Cellulose	A basic raw material (cotton or pulped wood) used in the production of cellulose plastics, also used as a filter.	*Material Process*
Cellulose $(C_6H_{10}O_5)_x$	A white amorphous substance. Cellulosic materials are treated to purify the cellulose as much as possible, and then subjected to reagents to esterify or etherify them to yield plastics materials.	*Material Process*
Cellulose Acetate	A product of esterification of cellulose with acetic anhydride and acetic acid.	*Material Process*
Cellulose Media	A filter material made from plant fibers. Because cellulose is a natural material, its fibers are rough in texture and vary in size and shape. Compared to synthetic media, these characteristics create a higher restriction to the flow of fluids.	*Lubrication*
Cellulose nitrate	A product of the nitration of cellulose by nitric acid mixed with sulfuric acid.	*Material Process*
Cellulosics	Cellulosics has been around since 1868 when it was invented by John Wesley Hyatt. Several variations of the original cellulosics have been introduced since the early 1900s. Today, it is found in appliance housings, toys, knobs, handles, packaging, and automotive parts.	*Material Engineering*
CELSIUS	A temperature scale. 0 Celsius (or 0 Centigrade) is the freezing point of water (32 degrees F)	*Mechanical, Process, and Operations*
Celsius (centrigrade)	A temperature scale defined by 0°C at the ice point and 100°C at boiling point of water at sea level.	*Electronic Process*
Cement	A mixture of Portland cement and water.	*Petroleum Engineering*
Cement	A powder consisting of alumina, silica, lime and other substances that hardens when mixed with water. Used extensively in the oil industry to bond casing to the walls of the wellbore.	*Petroleum Drilling*
Cement Matrix	material, usually a calcium aluminosilicate, on concrete, an aggregate composite.	*Material Process*
Cement plug	A plug of cement slurry placed in the wellbore to seal the well.	*Petroleum Engineering*
Cementing	Permanently securing the casing to the wellbore or plugging and sealing the wellbore.	*Petroleum Engineering*
CEN	Comité European de Normalisation.	*Maintenance*
CENELEC	CENELEC is the European Committee for Electro-technical Standardization. It was established in 1973 as a non-profit organization under Belgian Law. The European Commission in Directive 83/189/EEC has officially recognized CENELEC as the European Standards Organization.	*Maintenance*
Censored	[In survival analysis:] A term used in studies where the outcome is the time to a particular event, to describe data from patients where the outcome is unknown. A patient might be known not to have had the event only up to a particular point in time, so 'survival time' is censored at this point.	*Quality Engineering*
Censored data	Data in which not all of the data points represent failures, i.e. there may be operation times for units that have not failed. Censoring schemes include right-censoring, left-censoring and interval censoring.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Census division	Any of nine geographic areas of the United States as defined by the U.S. Department of Commerce, Bureau of the Census. The divisions, each consisting of several States, are defined as follows:	*Energy*
Census Region	Any of four geographic areas of the United States as defined by the U.S. Department of Commerce, Bureau of the Census. The Regions, each consisting of various States selected according to population size and physical location, are defined as follows:	*Energy*
Census Region/division	An hierarchical organization of the United States according to geographic areas and sub-areas as follows:	*Energy*
Center	The axial member of a strand about which the wires are laid.	*Wire Rope & Cable*
Center Distance	The distance between the parallel axes of spur gears and parallel helical gears, or between the crossed axes of crossed helical gears and worm gears. Also, it is the distance between the centers of the pitch circles.	*Mechanical Engineering*
Center Drive	A drive assembly mounted underneath normally near the center of the conveyor, but may be placed anywhere in the conveyor length. Normally used in reversing or incline application.	*Manufacturing*
Center for Nutrition Policy and Promotion, (CNPP) - A unit within the USDA	Center for Nutrition Policy and Promotion, (CNPP) - A unit within the USDA.	*Agriculture*
Center of Gravity	The location of the resultant of gravity forces on an object or objects: sometimes called center of mass.	*Engineering Physics*
Center of Gravity (Mass Center)	The center of gravity of a body is that point in the body through which passes the resultant of weights of its component particles for all orientations of the body with respect to a uniform gravitational field.	*General Engineering*
Center of Gravity (Mass Center)	The center of gravity of a body is that point in the body through which passes the resultant of weights of its component particles for all orientations of the body with respect to a uniform gravitational field.	*Electronic Process*
Center pivot	A type of sprinkler system commonly used on large-scale farms in arid areas. Water is delivered to the center of a field by a deeply buried pipe, which attaches to main pipe that is supported on wheeled towers and pivots up to 360 degrees to irrigate the field. Center pivots may irrigate up to 200 acres. They are popular because of their labor savings. One person can manage operations of several center pivots.	*Agriculture*
Centerline	A plane dividing a tire, wheel, or vehicle into two symmetrical halves.	*Mechanical Engineering*
Centi	Hundredth	*Lubrication*
Centigrade	The temperature scale on which the freezing point of water is designed as 0° and the boiling point 100°.	*Material Process*
Centipoise (cp)	A unit of absolute viscosity. 1 centipoise = 0.01 poise.	*Oil Analysis*
Centipoise and Centistoke	A centipoise is 1/100th of the unit of absolute viscosity (the poise), e.g., the viscosity of water at 20oC is approximately one centipoise. The centipoise is derived from one kinematic unit of viscosity (the centistoke), by multiplying the latter by the density of the liquid, i.e., 1 centipoise = 1 centistoke x the density of the liquid. These units are part of the metric system, commonly used in Europe and becoming adopted in the U.S. and Canada.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
CENTIPOISE, CENTISTOKE	CENTIPOISE - A unit of absolute (dynamic) viscosity. CENTISTOKE - A unit of kinematic viscosity.	*Mechanical, Process, and Operations*
Centistoke (cst)	A unit of kinematic viscosity. 1 centistoke = 0.01 stoke.	*Oil Analysis*
CENTRAL (Cochrane Central Register of Controlled Trials [CCRCT])	The Cochrane Collaboration's register of reports of studies that may be relevant for inclusion in Cochrane Reviews. CENTRAL aims to include all relevant reports that have been identified through the work of The Cochrane Collaboration, through the transfer of this information to the US Cochrane Center. It is published in The Cochrane Library. Also called: CCRCT, Cochrane Central Register of Controlled Trials	*Quality Engineering*
Central Appalachian Region	Consists of Eastern Kentucky, Virginia, Southern West Virginia, and the Tennessee counties of: Anderson, Campbell, Claiborne, Cumberland, Fentress, Morgan, Overton, Pickett, Putnam, Roane, and Scott.	*Energy*
Central chiller	Any centrally located air conditioning system that produces chilled water in order to cool air. The chilled water or cold air is then distributed throughout the building, using pipes or air ducts or both. These systems are also commonly known as "chillers," "centrifugal chillers," "reciprocating chillers," or "absorption chillers." Chillers are generally located in or just outside the building they serve. Buildings receiving district chilled water are served by chillers located at central physical plants.	*Energy*
Central cooling	Cooling of an entire building with a refrigeration unit to condition the air. Typically central chillers and duct work are present in the centrally cooled building.	*Energy*
Central Estimate	A range of exploration drilling scenarios from which the following activity levels, based on recent historical experience, are adopted as the central estimates.	*Petroleum Drilling*
Central estimate	A range of exploration drilling scenarios from which the following activity levels, based on recent historical experience, are adopted as the central estimates.	*Petroleum Drilling*
Central Labor (Trades) Council	an organization of local A.F. and L. unions in a locality or city, to provide coordination of effort in political, economic, or other areas.	*Industrial Relations*
Central physical plant	A plant owned by, and on the grounds of, a multibuilding facility that provides district heating, district cooling, or electricity to other buildings on the same facility. To qualify as a central plant it must provide district heat, district chilled water, or electricity to at least one other building. The central physical plant may be by itself in a separate building or may be located in a building where other activities occur.	*Energy*
Central Plane	In a worm gear this is the plane perpendicular to the gear axis and contains the common perpendicular of the gear and worm axes. In the usual case with the axes at right angles, it contains the worm axis	*Mechanical Engineering*
Central warm air furnace	A type of space heating equipment where a central combustor or resistance unit generally using gas, fuel oil, or electricity provides warm air through ducts leading to the various rooms. Heat pumps are not included in this category. A forced air furnace is one in which a fan is used to force the air through the ducts. In a gravity furnace, air is circulated by gravity, relying on the natural flow of warm air up and cold air down; the warm air rises through ducts and the cold air falls through ducts that return it to the furnace to be reheated and this completes the circulation cycle.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Centralized water heating system	Equipment, to heat and store water for other than space heating purposes, which provides hot water from a single location for distribution throughout a building. A residential type tank water heater is a good example of a centralized water heater.	*Energy*
Center	Cochrane Centers have responsibility for helping to co-ordinate and support the Collaboration. Each Centre is responsible for providing support within its geographic and linguistic area. Details of Centre responsibilities and a list of the Centers responsible for any given country are available in The Cochrane Library.	*Quality Engineering*
Centre for Reviews and Dissemination (CRD)	CRD, based in York, UK, produces the Database of Abstracts of Reviews of Effects (DARE).Also called: CRD	*Quality Engineering*
Centrifugal Compressor	A centrifugal compressor compresses air or gas by means of mechanical rotating rotating vanes or impellers.	*Chemical*
Centrifugal Force	The force that tends to throw a tire away from the axis of rotation, same as radial force.	*Mechanical Engineering*
Centrifugal Pump	A pumping mechanism that spins water by means of an "impeller". Water is pushed out by centrifugal force. Centrifugal deep-well jet pumps work with two lines into the well. As water is moved at the surface by an impeller, some of the water is returned to the well to the ejector assembly above the intake. This return water creates a "venturi" effect in the ejector, sucking well water through the check valve.	*Petroleum Engineering*
Centrifugal separator	A separator that removes immiscible fluid and solid contaminants that have a different specific gravity than the fluid being purified by accelerating the fluid mechanically in a circular path and using the radial acceleration component to isolate these contaminants.	*Oil Analysis*
Centrifugally Cast Pipe	Centrifugally Cast Pipe. Pipe formed from the solidification of molten metal in a rotating mold. Both metal and sand molds are used. After casting, if required the pipe is machined, to sound metal, on the internal and external diameters to the surface roughness and dimensional requirements of the applicable material specification.	*Maintenance and Repair*
Centrifuge	A machine used to separate liquid from solids held in suspension or to separate a liquid of one density from that on another by centrifugal force.	*Material Process*
Centrifuge volume	The volume of liquid or solid or both, separated from a volume of liquid exposed to centrifugal force.	*Mechanical, Process, and Operations*
Centrifuging	the process of removing excess zinc from small hot-dip galvanized parts by placing them in a perforated, rapidly spinning cylindrical container	*Materials Process*
Centripetal Force	A force exerted on an object moving in a circular path which is exerted inward toward the center of rotation.	*General*
Centrist	the group in an organization which represents the middle position betweens the extremes of the left and right.	*Industrial Relations*
Centroid	Similar to the concept of center of gravity, except that it applies to a two dimensional shape rather than an object. For a given shape, the centroid location corresponds to the center of gravity for a thin flat plate of that shape, made from a homogeneous material.	*Engineering Physics*
CEPA	Canadian Environmental Protection Act	*Petro-Chemical Abbreviations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ceramic	Polycrystalline ferroelectric materials which are used as the sensing units in piezoelectric accelerometers. There are many different grades, all of which can be made in various configurations to satisfy different design requirements.	*General Engineering*
Ceramic cement	A ceramic –metal composite.	*Material Process*
Ceramic Dual Inline Package	A DIP package with a ceramic body.	*Electrical Engineering*
Ceramic Insulation	High-temperature compositions of metal oxides used to insulate a pair of thermocouple wires. The most common are Alumina (Al2O3), Beryllia (BeO), and Magnesia (MgO). Their application depends upon temperature and type of thermocouple. High-purity alumina is required for platinum alloy thermocouples. Ceramic insulators are available as single and multihole tubes or as beads.	*Electrical*
Ceramic magnet	ceramic material with an engineering application predominantly based on its magnetic properties.	*Material Process*
Ceramic Nonmetallic	inorganic engineering material.	*Material Process*
Ceramic-matrix-composite	Composite material in which the reinforcing phase is dispersed in a ceramic.	*Material Process*
Ceramics	any of various hard, brittle, heat and corrosion resistant material made typically of metallic elements combines with oxygen or with carbon, nitrogen, or sulfur. Most ceramics are crystalline and are poor conductors of electricity, though some recently discovered copper-oxide ceramics are superconductors at low temperatures, compounds that contain metallic atoms bonded to nonmetallic atoms such as oxygen, carbon, or nitrogen.	*Physics*
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act	*Energy*
cereal grains	Plants of the grass family that produce grain (seeds) that provide human food. They include wheat, rice, barley, oats, corn (maize), rye and triticale.	*Agriculture*
Ceresin or ceresin wax	A noncrystaline wax, white or yellow refined ozokerite, m.p. about 190°F (87.77 °C).	*Material Process*
Cermet Powders	A blended or composite powder of metal and ceramic constituents.	*Paint and Coatings*
Certificate	A type of permit for public convenience and necessity issued by a utility commission, which authorizes a utility or regulated company to engage in business, construct facilities, provide some services, or abandon service.	*Energy*
Certificate of Age	a document issued under the Fair Labor Standards Act which limits child labor.	*Industrial Relations*
Certificate of Compliance	A written statement that the materials, equipment, or services are in accordance with the specified requirements. It may have to be supported by documented evidence.	*Maintenance and Repair*
Certificate of Intent	a statement formerly filed by unions under the registration section of the Taft-Hartley Act to indicate compliance with the requirements of the law.	*Industrial Relations*
Certificate of restoration	A document issued by the BC Oil and Gas Commission certifying that an abandoned wellsite has been restored to meet regulatory requirements.	*Petroleum Engineering*
Certificate requirement	The maximum annual volume allowed for sales to resale or direct sale customers under certificate authorizations by the Federal Energy Regulatory Commission.	*Energy*
CERTIFICATION	An evaluation provided by a third party organization that confirms forests are managed sustainably, based on the implementation of a written plan that meets established standards.	*Forestry*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Certified	Describes a person who has passed an examination to do a required job.	*Mining*
Certified Farmers' Market (CFM)	locations where farmers and ranchers are allowed to sell directly to customers, exempt from USDA packaging, sizing, and labeling regulations. These locations must be certified by the County Agricultural Commissioner. Many CFMs have technically separate, but adjacent markets where prepared food, bread and other complimentary items may be sold. Farmers may also sell direct to consumers at Farm Stands.	*Agriculture*
Certified Material Test Report (CMTR)	A document attesting that the material is in accordance with specified requirements, including the actual results of all required chemical analyses, tests, and examinations.	*Maintenance and Repair*
Certified reference material, CRM	"A reference material that has one or more values certified by a technically valid procedure and is accompanied by, or is traceable to, a certificate or other document that is issued by a certifying body." [CLSI]	*Quality*
Certifying authority (CA) (Certification Authority)	An independent body appointed by the purchaser to carry out a survey of the equipment and/or materials that they are buying. It is the responsibility of the supplier to provide the C.A. with information, documents, access to works and personnel to enable the survey to be carried out.	*Mechanical*
CES	Cummins Engineering Specification	*Petro-Chemical Abbreviations*
Cesium chloride	Simple compound crystal structure.	*Material Process*
Cesium magnetometer	An geophysical instrument which measures magnetic field strength in terms of vertical gradient and total field.	*Mining*
Cesspool	An underground reservoir for liquid waste, typically household sewage.	*Energy*
Cetane Index	A value calculated from the physical properties of a diesel fuel to predict its Cetane Number.	*Lubrication*
Cetane Number	A measure of the ignition quality of a diesel fuel, as determined in a standard single cylinder test engine, which measures ignition delay compared to primary reference fuels. The higher the Cetane Number, the easier a high-speed, direct-injection engine will start, and the less "white smoking" and "diesel knock" after start-up.	*Lubrication*
Cetane Number Improver	An additive (usually an organic nitrate) that boosts the Cetane Number of a fuel.	*Lubrication*
CEU	See Cochrane Editorial Unit (CEU)	*Quality Engineering*
CF	Cubic Foot	*Energy*
CFC	CFC: See Chlorofluorocarbon.	*Energy*
CFI	cold flow improver	*Petro-Chemical Abbreviations*
cfm	Cubic feet per minute (See acfm, scfm)	*Facility Engineering*
cfm	Cubic feet per minute	*Lubrication*
CFPP	cold filter plugging point	*Petro-Chemical Abbreviations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
CFR	Code of Federal Regulations (US)	*Petro-Chemical Abbreviations*
CFS	Cubic Feet per Second	*Energy*
CFV	clean fuel vehicle	*Petro-Chemical Abbreviations*
CG	conventional gasoline	*Petro-Chemical Abbreviations*
CGSB	Canadian General Standards Board	*Petro-Chemical Abbreviations*
CH2OH	Colorless liquid. An inexpensive, widely used solvent obtained from corn by fermentation. It is widely used in lacquers because it is blush retardant, and dissolves cellulose nitrate in the presence of a minimum amount of solvent ester.	*Material Process*
CH4	Methane	*Energy*
Chain	A series of links pivotally joined together to form a medium for conveying or transmitting motion or power.	*Manufacturing*
Chain Conveyor	Any type of conveyor in which one or more chains act as the conveying element.	*Equipment*
Chain conveyor or Scraper chain conveyor	Chain conveyor or Scraper chain conveyor. - see Armored flexible conveyor.	*Mining*
Chain Drive	A power transmission device employing a drive chain and sprockets.	*Manufacturing*
Chain Driven Live Roller Conveyor	See Live Roller Conveyor.	*Equipment*
Chain growth	Polymerization process involving a rapid, chair reaction of chemically activated monomers.	*Material Process*
Chain Guard	A covering or protection for drive or conveyor chains for safety purposes.	*Manufacturing*
Chain pillar	The pillar of coal left to protect the gangway or entry and the parallel airways.	*Mining*
Chain Roller Conveyor	A conveyor in which the tread rollers have attached sprockets which are driven by a chain.	*Manufacturing*
Chain Tension	The actual pull existing at any point in a conveyor chain.	*Equipment*
Chain wheel operated valve	An overhead valve operated by a chain drive wheel instead of a handwheel.	*Mechanical*
Chained dollars	A measure used to express real prices. Real prices are those that have been adjusted to remove the effect of changes in the purchasing power of the dollar; they usually reflect buying power relative to a reference year. Prior to 1996, real prices were expressed in constant dollars, a measure based on the weights of goods and services in a single year, usually a recent year. In 1996, the U.S. Department of Commerce introduced the chained-dollar measure. The new measure is based on the average weights of goods and services in successive pairs of years. It is "chained" because the second year in each pair, with its weights, becomes the first year of the next pair. The advantage of using the chained-dollar measure is that it is more closely related to any given period covered and is therefore subject to less distortion over time.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Chainhand (also motorman)	An experienced laborer capable of maintaining most parts of the rig. The chainhand is in charge of throwing the chain to make up or break down pipe stands during tripping pipe. They are also responsible for maintaining the motors on the drilling rig	*Petroleum Drilling*
Chainless haulage	a rack and pinion mechanism between the armored face conveyor and the shearer.	*Mining*
Chair	another word foe 'shaft'.	*Mining*
Chalcocite	A sulfide mineral of copper common in the zone of secondary enrichment.	*Mining*
Chalcogenide	Compound containing S (sulfur), Se (selenium), or Te (tellirium).	*Material Process*
Chalcopyrite	A sulfide mineral of copper and iron; the most important ore mineral of copper.	*Mining*
Chaldron	the Newcastle chaldron was a measure containing 53 cwts. of coal.	*Mining*
Chalk	A soft white mineral of sea - shell origin, essentially calcium carbonate, used as a source of whiting (filler or pigment) when ground and purified.	*Material Process*
Chalker-on	Chalker-on—see Craneman.	*Mining*
Chalkford	Transition zone play involving both Austin Chalk and Eagle Ford Shale formations.	*Petroleum Drilling*
Chalking Dry	Chalk-like appearance or deposit on the surface of a plastic.	*Material Process*
Chalking deal	a flat board upon which the craneman or flat-lad apportions and keeps account of the work done by the putters in the district of which he has charge, (N. East).	*Mining*
Chamber	The space between any two gates of a lock.	*Civil Engineering*
Chamfering	The preparation of a contour, other than for a square groove weld, on the edge of a member for welding.	*Maintenance and Repair*
Chance or Chance Band	an irregular, often nodular, band of ironstone (N. Staffs.).	*Mining*
Chandler	In the early days of mining the chandler was employed at the colliery to manufacture candles.	*Mining*
Change house	A special building constructed at a mine where the miner changes to his working clothes; also known as a dry house.	*Mining*
Change Order	A purchaser's written authorization to the supplier to modify or change an existing purchase order. In public sector purchasing, these changes generally must be within the scope of the contract.	*Procurement*
Changeover	The time required to modify a system or workstation, including teardown and setup time.	*Quality*
Channel	Term used within SKF to indicate an integrated or linked production line from turning operation to packing.	*Maintenance*
Channel Associated Signaling	Some communications protocols include "signaling" functions along with data. Channel Associated Signaling protocols include signaling in the data channel (as opposed to a dedicated signaling channel). Also called Robbed Bit Signaling.	*Electrical Engineering*
Channel sample	A sample composed of pieces of vein or mineral deposit that have been cut out of a small trench or channel, usually about 10 cm wide and 2 cm deep.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Channeling	The phenomenon observed among gear lubricants and greases when they thicken due to cold weather or other causes, to such an extent that a groove is formed through which the part to be lubricated moves without actually coming in full contact with the lubricant. A term used in percolation filtration; may be defined as: a preponderance of flow through certain portions of the clay bed.	*Lubrication*
Channeling-1	Grooves in a lubricating grease formed by passing rolling elements. Unworked grease in the shoulders of the channel serves as a seal and reservoir.	*Lubrication*
Channeling-2	The low-temperature change in structure of a flow-type lubricating grease that prevents flow due to gravity.	*Lubrication*
Chap	Chap, -see Sounding and Jowl.	*Mining*
Chapman Strut	A rear suspension system which operates on the same principles as the MacPherson Strut; it uses lower links or a control arm and a long spring-shock strut.	*Mechanical Engineering*
Character	A letter, digit or other symbol that is used as the representation of data. A connected sequence of characters is called a character string.	*General Engineering*
Characteristic Life	The life at which 63.2% of the population has failed. In the rolling elements bearing industry, L1 and L10 life are generally used corresponding to the number of hours at which 1% and 10% of the population has failed, respectively. See Patterns of Failure.	*Maintenance*
Characterization	Sampling, monitoring, and analysis activities to determine the extent and nature of contamination at a facility or site. Characterization provides the necessary technical information to develop, screen, analyze, and select appropriate clean-up techniques.	*Energy*
Characterized gate or ball	A ball or gate, the shape of whose port has been specially altered to provide a specific throttling capability.	*Mechanical*
Charge	Quantity of positive or negative carriers. Also, this term use for the measurement or weight of material either performed or in powder form used to load a mold.	*Material Process*
Charge amplifier	An amplifier which converts a charge input signal (as from an accelerometer) into an output voltage; a charge-to-voltage converter.	*Reliability Engineering*
Charge capacity	The input (feed) capacity of the refinery processing facilities.	*Energy*
Charge carrier	Atomic scale species by which electricity is conducted in materials.	*Material Process*
Charge Coupled Device	One of the two main types of image sensors used in digital cameras. When a picture is taken, the CCD is struck by light coming through the camera's lens. Each of the thousands or millions of tiny pixels that make up the CCD convert this light into electrons.	*Electrical Engineering*
Charge density	Number of charge carriers per unit volume.	*Material Process*
Charge Injection	A parameter pertinent to analog switches. As an analog switch turns on and off, a small amount of charge can be capacitively coupled (injected) from the digital control line to the analog signal path.	*Electrical Engineering*
Charge neutrality	Absence of net positive	*Material Process*

Term	Definition	*Industry*
Charge pressure	The pressure at which replenishing fluid is forced into the hydraulic system (above atmospheric pressure).	*Mechanical, Process, and Operations*
Charge Pump	A power supply which uses capacitors to store and transfer energy to the output, often stepping the voltage up or down. Charge is transferred from one capacitor to another under control of regulator and switching circuitry. Maxim offers both regulated and non-regulated charge pumps, as well as ICs with on-board charge pumps to boost internal voltages.	*Electrical Engineering*
Charge Rate	This is the rate that you charge for a mechanic or engineer's time. In addition to the direct wages, it includes provision for benefits and overhead (such as supervision, clerical support, shop tools, truck expenses, and supplies).	*Maintenance*
Charge Sensitivity	For accelerometers that are rated in terms of charge sensitivity, the output voltage (V)is proportional to the charge (Q) divided by the shunt capacitance (C). This type of accelerometer is characterized by a high output impedance. The sensitivity is given in terms of charge; picocoulombs per unit of acceleration (g).	*General*
Charge, Charging	Terms used for putting raw materials into a furnace. For example, a blast furnace is charged with coke, coal, iron or scrap to make raw steel. The charge itself is the amount of material loaded into the furnace.	*Metallurgy*
Chargeman or Chargehand	a working foreman or team leader who is not a mine official.	*Mining*
Charging Current	The current produced when a d:c voltage is first applied to conductors of an unterminated cable. It is caused by the capacitive reactance of the cable, and decreases exponentially with time.	*Electrical*
Charging station	An installation at which an electric vehicle can be plugged into the grid to charge its battery. There are several types of charging station, including low-voltage, lower current installations that charge a battery over a period of several hours (for use in homes, for example), and higher-voltage, higher current fast-charging stations for a more rapid service in public places (car parks, public buildings, etc.).	*Electrical*
Charles' law	The volume of a fixed mass of gas varies directly with absolute temperature, provided the pressure remains constant.	*Mechanical, Process, and Operations*
Charolais	A beef breed that originated in France , perhaps as early as the 9th century A.D. It entered the United States from Mexico in 1836.	*Agriculture*
Charollais	A breed of sheep that originated in the same region of France as the Charolais cattle. Their development began in the early 1800's. The breed's primary use is as a sire to increase the muscling and growth rate of the lambs.	*Agriculture*
Charpy impact test	Method for measuring	*Material Process*
Charpy impact test	A destructive mechanical test conducted on a precisely machined coupon of steel to be tested. The coupon is clamped in a special machine and subjected to lateral hammer blow. The test provides a relative measure of the toughness of the steel or its resistance to shock or impact loads and is usually required for material used in low temperature applications.	*Mechanical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Charpy test	A destructive mechanical test conducted on a precisely machined coupon of steel to be tested. The coupon is clamped in a special machine and subjected to lateral hammer blow. The test provides a relative measure of the toughness of the steel or its resistance to shock or impact loads and is usually required for material used in low temperature	*General Mechanical*
Charpy V-Notch Test	A test performed (at a nominated temperature) utilizing a calibrated falling pendulum (hammer) fracturing a Specimen of Material and measuring the force required.	*Petroleum Engineering*
Charter	A document issued by a governing authority creating a company or other corporation.	*Mining*
Chartered bank	A financial institution that accepts deposits and provides loans.	*Mining*
Chase	The part of a mold which contains the charge and holds it while pressure is being applied in the closing of the mold. Also refers to the iron frame used for making Celluloid cakes.	*Material Process*
Chase or Chess (the ropes)	After the winding-engine has been standing for some time, to run the cages up and down the shaft to see that all is right before men are allowed to ride the cage.	*Mining*
Chassis	The frame, suspension system, engine, and drive train of a vehicle. The assembled parts of the automobile without the body.	*Mechanical Engineering*
Chatter	The rapid cycling on and off of a relay in a control process due to insufficient bandwidth in the controller.	*Electrical*
CHD unit	See Hydrodesulfurization (A catalytic process in which the principal purpose is to remove sulfur from petroleum fractions in the presence of hydrogen).	*Petroleum Engineering*
Check	Check—see Motty, Pin, Tally and Token.	*Mining*
Check Character	Character added to guard against undetected errors.	*Gears*
Check curtain	Sheet of brattice cloth hung across an airway to control the passage of the air current.	*Mining*
Check valve	A one-directional valve which is opened by the fluid flow in one direction and closed automatically when the flow stops or is reversed.	*Mechanical*
Check viewer	a viewer employed by the lessor to see that the provisions of the coal lease are duly observed.	*Mining*
Checker packs	square packs placed in a chess board pattern. Adopted where the available stowing material was not sufficient for complete packing of the waste.	*Mining*
Checkered flag	This black-and-white checked flag is the most famous in racing, signifying the end of the session or race. At the end of a race, the first car to receive the checkered flag at the finish line is the winner.	*NASCAR*
Checkweighman	employed by the miners to verify the weights of the tubs.	*Mining*
Chemical Abstracts System number	Chemical Abstracts System number is the producer of the world's largest and most comprehensive databases of chemical information. It is a division of the American Chemical Society.	*Chemical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Chemical cleaning	the process of immersing steel in chemical solvents to remove (dissolve) residues that would otherwise prevent the galvanized coating from forming	*Materials Process*
Chemical composition	the makeup of steel, broken down into naturally occurring elements; usually carbon, manganese, phosphorous, silicon as primary elements	*Materials Process*
Chemical Conversion Coating	A protective or decorative non-metallic coating produced in situ by chemical reaction of a metal with a chosen environment. (It is often used to prepare the surface prior to the application of an organic coating.)	*Paint and Coatings*
Chemical dosage	The amount of chemical added to a system, usually expressed as ppm, or pounds of chemical per million pounds of water.	*Chemical Engineering*
Chemical process	Assembly of two or more operations with chemical conversion.	*Material Process*
Chemical process system	A system for chemical substance processing.	*Material Process*
Chemical Reaction	A chemical process in which substances are changed into different substances with different properties.	*Chemical*
Chemical Recycling	Chemical recycling is the process of recycling waste products by partially altering their chemical structure.	*Chemical*
Chemical separation	A process for extracting uranium and plutonium from dissolved spent nuclear fuel and irradiated targets. The fission products that are left behind are high-level waste. Chemical separation is also known as reprocessing.	*Energy*
Chemical Stability	The tendency of a substance or mixture to resist chemical change.	*Lubrication*
Chemical vapor deposition	The production of thin layers of materials in the fabrication of integrated circuits by means of specific chemical reactions.	*Material Process*
Chemical Vapor Deposition (CVD)	The deposition of a coating by means of a chemical reaction in gases in a chamber producing components which deposit on and adhere to the substrate.	*Paint and Coatings*
Chemically strengthened glass	A fracture resistant glass produced by the compressive stressing of the silicate network as a results of the chemical exchange of larger radius K+ ions for the Na+ in the glass surface.	*Material Process*
chemigation	Delivering chemicals to plants through irrigation water.	*Agriculture*
chemotrophs	organisms that obtain energy from oxidation or reduction of inorganic or organic matter.	*Chemical*
Cherry coal	a freely burning non-caking coal giving a bright flame. (Scot.).	*Mining*
Chess	One of the planks forming the roadway of a floating bridge.	*Civil Engineering*
Chester White	A breed of hogs that originated in Chester County, Pennsylvania. It originally was called the Chester County White. The breed traces to importation of a white boar from England some time between 1815–1818. The boar was referred to as a Bedforshire. It was crossed with local breeds to produce the ancestors of today's Chester White, which is registered by the Chester White Swine Registry.	*Agriculture*
Cheviot	A breed of sheep that originated on the Cheviot Hills along the border of England and Scotland . Its history traces at least to 1372. It was introduced to the United States in 1838, from Scotland . Cheviot are distinctive white-faced sheep with wool-free face and legs. They have black muzzles and feet.	*Agriculture*
CHEVRON PACKING	A type of packing used in packing boxes consisting of a nest of "V" cross-section rings.	*Mechanical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Chevrons	Cracks start on a microscopic level as voids. If they are on the same plane they will eventually join to become a tiny crack with a relatively smooth surface. If however these tiny cracks do not all lie on the same plane, then as they get bigger and get closer to each other there will be a point when they will join from a tearing action. Visually consider if you will, two columns of 10 dots each. Now start a crack at the upper left dot and progress downward along the same column connecting the dots; at the same time start a crack at the lower right dot and progress upwards, again, connecting the dots in the same column. You can see that as the cracks approach each other there is less solid area between them. At some point, depending upon the type of material it is, there will not be enough material left between them and the two cracks will join. The location of this change in direction is known as a "chevron mark." On a very large scale these chevron marks join and they clearly show to the naked eye the direction of travel of the crack. This is very important when trying to determine where the crack started in	*Reliability Engineering*
Chewing insects	Insects that consume all tissues of leaves or portions of leaves, using robust mandibles for chewing.[1] Fin.	*Forestry*
Chianina	The Chianina (pronounced kee-a-nee-na) is one of the oldest breeds of cattle. It provided models for Roman sculptures. Chianina originated in Italy where it was used primarily as draft animals until the advent of modern mechanized farming. These large, gentle animals then became important for their meat-producing qualities. The breed was first introduced into the United States via semen imports in 1971. Its main use in the U.S. cattle industry is for crossing with beef breeds. It is registered by the American Chianina Association.	*Agriculture*
Chicane	A quick succession of sharp, slow turns, usually intended to reduce straight-away speeds.	*NASCAR*
Chief steward	Any time cars are on the racing surface, the chief steward is in charge of the entire facility. He is stationed in race control with radio communications all around the circuit, and he also has at his disposal a full bank of television monitors that give him a view of the entire circuit.	*NASCAR*
Chilean Mill	A machine, somewhat like the arastra, in which heavy stone wheels turn about a central shaft and crush ore.	*Mining*
Chinley or Shingly coals	coals that are neither round (or large) nor small, but are such that they will pass over the screens and are some of the best coals, (N. East).	*Mining*
Chip	A thin slice of crystalline semiconductor upon which electrical circuitry is produced by controlled diffusion.	*Material Process*
Chip	A die (unpackaged semiconductor device) cut from a silicon wafer, incorporating semiconductor circuit elements such as resistors, diodes, transistors, and/or capacitors.	*Electrical Engineering*
Chip control (grit control, last-chance) filter	A filter intended to prevent only large particles from entering a component immediately downstream.	*Oil Analysis*
Chip sample	A method of sampling a rock exposure whereby a regular series of small chips of rock is broken off along a line across the face.	*Mining*
"Chipped area"	A surface irregularity near the edge of a molded piece, appearing as if chipped away, but usually due to an imperfect mold.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Chi-squared test	A statistical test based on comparison of a test statistic to a chi-squared distribution. Used in RevMan analyses to test the statistical significance of the heterogeneity statistic.	*Quality Engineering*
Chittery coal	bright coal, free from fusain or muddy partings, with a conchoidal fracture and brittle nature (Yorks.), i.e., tending to chip.	*Mining*
Chloramine	A compound formed when chlorine reacts with ammonia or a chemical containing the ammonium ion. The result is mono-, di-, tri-, and organochloramines. The resulting chloramines are weak oxidants or nonoxidants. They are a component of total chlorine. These are very weak biocides.	*Chemical Engineering*
Chlorides	A compound of chlorine and silver.	*Mining*
Chlorinate	To treat with chlorine gas.	*Material Process*
Chlorinated diphenyl (ClC6H4C6H5)	A crystalline compound. A plasticizer for certain plastics such as ethyl cellulose.	*Material Process*
Chlorinated Polyethylene (CPE)	A synthetic rubber jacketing compound.	*Electrical*
Chlorinated Wax	Certain solid hydrocarbons treated with chlorine gas to form straight-chain hydrocarbons with a relatively high chlorine component. Chlorinated waxes are used primarily as polyvinyl chloride plasticizers, extreme-pressure additives for lubricants, and formulation components for many cutting fluids	*Lubrication*
Chlorination	Adding chlorine or a chlorine derivative to water to prevent the growth of various organisms that cause biofouling.	*Chemical Engineering*
Chlorination, dechlorination	The act of removing chlorine from water, usually via a reducing agent or strong aeration.	*Chemical Engineering*
Chlorine	A poisonous yellow gas with chemical symbol Cl2 used for water treatment. It is soluble in water but can be removed by reducing aeration and reaction with sunlight.	*Chemical Engineering*
Chlorine	Powerful oxidizing agent sometimes used as a germicide.	*Chemistry*
Chlorine Bleach	A group of strong oxidizing agents commonly sold in an approximately 5% solution of sodium hypochlorite. As a laundry additive, liquid chlorine removes stains, aids in soil removal, whitens, disinfects, and deodorizes. Dry forms of chlorine bleach are frequently used in cleansers and automatic dishwasher detergents. Bleach should not be used with silk, woolens, dyes sensitive to hypochlorite, and on certain stains such as rust (which it can set). Chlorine bleach deactivates enzymes in laundry cleaners.	*Chemistry*
Chlorine demand	The relation of the amount of chlorine to be added to a system to react with chlorine-oxidizable material until a free residual in a given system is achieved.	*Chemical Engineering*
Chlorine dioxide	A compound with the symbol ClO2, used mainly for bleaching wood pulp for paper. It is also used for the taste and odor control of phenolic compounds in water and can be used as a disinfectant in cooling towers.	*Chemical Engineering*
Chlorine, free	The total amount of hypochlorous ion and hypochlorous acid in the system.	*Chemical Engineering*
Chlorine, residual	The amount of available chlorine present in water at any given time subsequent to the addition of chlorine.	*Chemical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Chloroacetyl chloride	A solvent.	*Material Process*
Chlorofluorocarbon (CFC)	Any of various compounds consisting of carbon, hydrogen, chlorine, and flourine used as refrigerants. CFCs are now thought to be harmful to the earth's atmosphere.	*Energy*
Chlorophorm	A solvent.	*Material Process*
Chloroprene	Colorless, volatile liquid b.p. 140 °F (60 °C). Derived from acetylene, coal and lime, and salt. Raw material for one type of oil resistant synthetic rubber.	*Material Process*
Chlorosis	Yellowing of plant tissue due to failure of chlorophyll synthesis or to chlorophyll destruction.	*Forestry*
Chlorosulfonated Polyethylene (CSPE)	A synthetic rubber jacketing compound manufactured by Du Pont under trade name of Hypalon.	*Electrical*
Chlorotic dwarf	An abiotic disease of Pinus strobus characterized by reduced growth, chlorosis and mottling of the needles, and premature abscission of all but current needles. [1]	*Forestry*
Chock	Large hydraulic jacks used to support roof in longwall and shortwall mining systems.	*Mining*
Chock blocks	square section, rectangular wooden blocks used to assemble a chock.	*Mining*
Chogs	blocks of wood used as packing behind the pipes in a pumping shaft. (Yorks.).	*Mining*
Choke	A restriction, the length of which is large with respect to its cross-sectional dimension. CIRCUIT - An arrangement of components interconnected to perform a specific function within a system.	*Mechanical, Process, and Operations*
Choke Manifold	A complete assembly of valves, Fittings, Flanges and Chokes configured to control and regulate the flow of fluid from a well bore.	*Petroleum Engineering*
Choked Flow	Also known as critical flow. This condition exists when at a fixed upstream pressure the flow cannot be further increased by lowering the downstream pressure. This condition can occur in gas, steam or liquid services. Fluids flow through a valve because of a difference in pressure between the inlet (Pl) and outlet (P2) of the valve. This pressure difference (Delta-P) or pressure drop is essential to moving the fluid. Flow is proportional to the square root of the pressure drop, which means that higher pressure drops allow more fluid to be moved through the valve. If the inlet pressure to a valve remains constant, then the differential pressure can only be increased by lowering the outlet pressure. For gases and steam, which are compressible, the maximum velocity of the fluid through the valve is limited by the velocity of the propagation of a pressure wave which travels at the speed of sound in the fluid. If the pressure drop is sufficiently high, the velocity in the flow stream at the vena contracta will reach the velocity of sound. Further decrease in the outlet pressure will not be felt upstream because the pressure wave can only travel at sonic velocity and the signal will never translate upstream. Choked Flow can also occur in liquids but only if the fluid is in a flashing or cavitating condition. The vapor bubbles block or choke the flow and prevent the valve from passing more flow by lowering the outlet pressure to increase the pressure drop. A good rule of thumb for gas and steam services is that if the pressure drop across the valve equals or exceeds one half the absolute inlet pressure, then there is a good chance of a choked flow condition.	*Industrial Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Chokedamp or blackdamp	an accumulation of carbon dioxide.	*Mining*
Choker Rope	ROPE A short wire rope sling that forms a slip noose around an object that is to be moved or lifted.	*Wire Rope & Cable*
Chopping	The rock that appears on the surface indicating the presence of a lode.	*Mining*
Chordal Addendum	Addendum: The height from the top of the tooth to the chord subtending the circular-thickness arc.	*Mechanical Engineering*
Chordal Thickness	Thickness: Length of the chord subtended by the circular thickness arc (the dimension obtained when a gear-tooth caliper is used to measure the thickness at the pitch circle).	*Mechanical Engineering*
CHP	Combined heat and power, an acronym for the co-generation of heat and power. (See Co-generation.)	*Electrical*
Christmas tree	The valves and fittings installed at the top of a gas or oil well to control and direct the flow of well fluids.	*Energy*
Christmas Tree	The assembly of fittings and valves on the top of the casing which control the production rate of oil.	*Petroleum Drilling*
Christmas tree	The assembly of fittings and valves on the top of the casing which control the production rate of oil.	*Petroleum Drilling*
Chromate quenching	treating metal in a tank of containing a solution of chronium compounds to produce a conversion coating consisting of trivalent and hexavalent chromium compounds; chromate passivations sometimes are used on galvanized reinforcing bar to control reactions between zinc and concrete while the concrete cures, particularly the hydrogen evolution that adversely affects bonding; chromate quenching other galvanized articles prevents the formation of wet storage stain	*Materials Process*
Chromating	chromate quenching a galvanized article	*Materials Process*
Chromatography	Chromatography is a process for separating mixtures such as gases into their component parts for analytical purposes.	*Chemical*
Chromatography	An analytical technique whereby a complex substance is adsorbed on a solid or liquid substrate and progressively eluted by a flow of a substance (the eluant) in which the components of the substance under investigation are differentially soluble. The eluant can be a liquid or a gas. When the substrate is filter paper and the eluant a liquid, a chromatogram of colored bands can be developed by use of indicators. For gas chromatography, electronic detectors are normally used to indicate passage of the various components from the system.	*Lubrication*
CHROMEGA®	A chromium-nickel alloy which makes up the positive leg of type K and type E thermocouples (registered trademark of OMEGA ENGINEERING, INC.).	*Electrical*
Chromising	High temperature (approx. 900oC) pack or gaseous diffusion of chromium into the surface of a component to enhance high temperature corrosion and oxidation resistance.	*Paint and Coatings*
Chromite	The chief ore mineral of chromium.	*Mining*
Chromium	A steel-gray, lustrous, hard and brittle metallic element that takes its name from the Greek word for color—chrome—because of the brilliant colors of its compounds. It is found primarily in chromite. Resistant to tarnish and corrosion, it is a primary component of stainless steel and is used to harden steel alloys.	*Metallurgy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Chromosome	The structure in plants and animals that carries genes.	*Agriculture*
Chronic injury	Injury which develops after long-term or repeated low dose exposure to an air pollutant expressed as chlorosis, bronzing, premature senescence, reduced growth, etc.	*Forestry*
Chrysotile	A fibrous, hydrated magnesium silicate, a common mineral also known asbestos.	*Material Process*
Chummings (chum'uns)	empty tubs. (N. East).	*Mining*
Chute	A trough through which objects are lowered by gravity. Can either be a slider bed or roller/wheel bed.	*Manufacturing*
CI	cetane index	*Petro-Chemical Abbreviations*
Cidal Or "Cide"	Generally refers to agents with the ability to kill microorganisms.	*Chemistry*
CIDI	compression ignition direct injection (diesel)	*Petro-Chemical Abbreviations*
CIF (cargo, insurance and freight)	CIF refers to cargos for which the seller pays for the transportation and insurance up to the port of destination.	*Energy*
CIF (cost, insurance, freight)	This term refers to a type of sale in which the buyer of the product agrees to pay a unit price that includes the f.o.b. value of the product at the point of origin plus all costs of insurance and transportation. This type of a transaction differs from a "delivered" purchase, in that the buyer accepts the quantity as determined at the loading port (as certified by the Bill of Lading and Quality Report) rather than pay based on the quantity and quality ascertained at the unloading port. It is similar to the terms of an f.o.b. sale, except that the seller, as a service for which he is compensated, arranges for transportation and insurance.	*Energy*
CIFER	Colorado Institute for Fuels and High Altitude Research	*Petro-Chemical Abbreviations*
CIM	Computer Integrated Manufacturing is a term used to describe an operation which makes all or most of its information available through a fully integrated data management network. The object is to increase efficiency by integrating all the facility's data management systems.	*Control Engineering*
CIM	Computer Integrated Manufacturing	*Gears*
CIMAC	Congrès International des Machines à Combustion	*Petro-Chemical Abbreviations*
CINAHL (Cumulative Index to Nursing and Allied Health Literature)	Electronic database covering the major journals in nursing and allied health.	*Quality Engineering*
Cinder coal	Coal near a 'trap' or a 'whin dyke', which has been altered by the heat of the hot rock.	*Mining*
Cinnabar	A vermilion-colored ore mineral of mercury.	*Mining*
Circuit	Conductor for electric current.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Circuit breaker	Devices that interrupt high currents to protect electrical equipment from damage caused by current surges, e.g., from a short circuit or a lightning strike. (On a much smaller scale, they are used as an alternative to fuses in the home.)	*Electrical*
Circuit breakers	Circuit breakers are typically classified according to the medium they use to inhibit arc formation between the open contacts of the breaker. Media used include air, sulfur hexafluoride gas, oil and a vacuum.	*Electrical*
Circuit card	A flat board that holds chips and other components on the top side and has printed electrically conductive paths in multiple layers for the components on its bottom side.	*Reliability Engineering*
Circuit, Regenerative	A circuit in which pressurized fluid discharged from a component is returned to the system to reduce power input requirements. On single rod end cylinders the discharge from the rod end is often directed to the bore end to increase rod extension speed.	*Mechanical, Process, and Operations*
Circuit, Sequence	A circuit which establishes the order in which two or more functions of a circuit occur.	*Mechanical, Process, and Operations*
Circuit, Servo	A closed loop circuit which is controlled by some type of feedback; i.e., the output of the system is sensed or measured and is compared with the input. The actual output and the input controls the circuit. The system output may be position, velocity, force, pressure, level flow rate, or temperature, etc.	*Mechanical, Process, and Operations*
Circuit-mile	The total length in miles of separate circuits regardless of the number of conductors used per circuit.	*Energy*
Circular Mil	A unit of area equal to the area of a circle whose diameter is 1 mil (0.001 inch). Used chiefly in specifying cross-sectional areas of round conductors.	*Electrical*
Circular Pitch	Length of the arc of the pitch circle between the centers or other corresponding points of adjacent teeth. Normal Circular Pitch is the circular pitch in the normal plane.	*Gears*
Circular Thickness	The length of arc between the two sides of a gear tooth, on the pitch circle unless otherwise specified. Normal Circular Thickness is the circular thickness in the normal plane.	*Gears*
Circulating Header System	A lubrication system having isolated lube zones wherein the lube pump runs continuously and circulates oil through the header, a return filter and back to tank during the idle period. When lubrication is required, a normal open solenoid valve in the return loop is actuated, allowing pump pressure to build. The zone valves are then sequentially opened to provide lubricant to the individual zones. Oil dispensed to the friction points is not reused, therefore, the system is a terminating type.	*Lubrication*
Circulating load	Over-sized chunks of ore returned to the head of a closed grinding circuit before going on to the next stage of treatment.	*Mining*
Circulating lubrication	A system of lubrication in which the lubricant, after having passed through a bearing or group of bearings, is recirculated by means of a pump.	*Oil Analysis*
Circulating Oil	A lubrication system wherein the oil pump runs continuously and circulates oil to the friction points on a continuous basis. The oil is drained back to tank, filtered, cooled as required and reused.	*Lubrication*
Circulating System	A lubricating system in which oil is recirculated from a central sump to the parts requiring lubrication and then returned to the sump.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Circulating water rate	Quantity of water pumped from the tower basin to the equipment to be cooled, usually expressed as gallons per minute (gpm).	*Chemical Engineering*
City Gate	The location where natural gas transfers from the interstate gas pipeline to the local utility's distribution system	*Energy*
City Gate	City Gate Station - The metering and pressure reducing station where gas is transferred from a high pressure cross-country transmission line to a low pressure distribution piping system within a city.	*Mechanical*
Citygate	A point or measuring station at which a distributing gas utility receives gas from a natural gas pipeline company or transmission system.	*Energy*
CIV	customs import value	*Energy*
Civil engineer	A person who designs public works, as roads, bridges, canals, dams, and harbors, or supervises their construction or maintenance.	*Civil Engineering*
Cladding	A method of coating metals by which the coating becomes an integral part of the material. This can be done by casting or hot working. It is generally done on valves where special trims are required for difficult applications.	*Mechanical*
Cladding	The application of a thick (generally above 1mm) coating which melts or diffuses into the substrate. Processes include weld cladding and plasma transferred arc (PTA).	*Paint and Coatings*
Claggy	a seam of coal is said to have a "claggy" top when it adheres to the roof and is with difficulty separated, (N. East).	*Mining*
Claim	A piece of land 25 to 300 feet wide and 1,500 feet long, which the government sells to the man who finds mineral within its limits.	*Mining*
Claim	A portion of mining land held under federal or provincial law.	*Mining*
Clam	a clip used for retaining pipes or electrical cables etc.; or a haulage clip, an appliance for attaching mine-cars or tubs to a haulage rope.	*Mining*
Clamp Hub	'Hub Clamp Connector' a type of end connector documented in API Spec 16A that joins with a hub and attaches with a Clamp.	*Petroleum Engineering*
Clamping Force	The compressive force which a fastener exerts on the joint.	*Maintenance*
Clapper	The hinged closure element of a swing check valve.	*Mechanical*
Clarification	Process of clearing dirty water by removing suspended material.	*Mining*
Clarty	muddy. (N. East).	*Mining*
Class	A designation of pressure capability. See "ANSI," "MWP."	*Mechanical*
Class 4	A theoretical rather than practical class, now obsolete.	*Fastening*
Class 5	For a wrench fit. Used principally for studs and their mating tapped holes. A force fit requiring the application of high torque for semi-permanent assembly.	*Fastening*
Class A amplifiers	The simplest type of amplifier, class A amplifiers are those in which the output transistors conduct (i.e. do not fully turn off) irrespective of the output signal waveform. This type of amplifier is typically associated with high linearity but low efficiency.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Class A pressure rating expressed as a dimensionless number.	The class rating charts give actual pounds per square inch maximum allowable pressure at a given temperature.	*General Mechanical*
Class AB amplifiers	Class AB amplifiers combine Class A and Class B to achieve an amplifier with more efficiency than Class A but with lower distortion than class B. This is achieved by biasing both transistors so they conduct when the signal is close to zero (the point where class B amplifiers introduce non-linearities). The transistors transition to class B operation for large excursions.	*Electrical Engineering*
Class C amplifiers	Class C amplifiers are very efficient because the transistors are off most of the time and when they are on, they are in full conduction. They deliver high distortion and are often used in RF circuits, where tuning circuits restore some of the original signal and reduce distortion. They are also used in low-fidelity applications where the distortion is not important, such as a siren speaker driver.	*Electrical Engineering*
Class D amplifiers	Class D amplifiers are those that output a switching waveform, at a frequency far higher than the highest audio signal that needs to be reproduced. The low-pass filtered, average value of this waveform corresponds to the actual required audio waveform.	*Electrical Engineering*
Class G amplifiers	Class G amplifiers are more efficient than class AB amplifiers since they use the maximum supply voltage only when required, while a class AB amplifier always uses the maximum supply voltage.	*Electrical Engineering*
Class H amplifiers	Class H amplifiers modulate the supply voltage to the amplifier output devices so that it is never higher than necessary to support the signal swing. This reduces dissipation across the output devices connected to that supply and allows the amplifier to operate with an optimized class AB efficiency regardless of output power level. Class H amplifiers are generally more complex than other designs, with extra control circuitry required to predict and control the supply voltage.	*Electrical Engineering*
Class of Fit	The Class of Fit is a measure of the degree of fit between mating internal and external threads. Three main Classes of Fit are defined for metric screw threads as fine, medium, and course.	*Maintenance*
Class of Fit, Coarse	This has a tolerance class of 7H for internal threads and 8g for external threads.	*Maintenance*
Class of Fit, Fine	This has a tolerance class of 5H for internal threads and 4h for external threads.	*Maintenance*
Class of Fit, Medium	This has a tolerance class of 6H for internal threads and 6g for external threads.	*Maintenance*
Class rate schedule	An electric rate schedule applicable to one or more specified classes of service, groups of businesses, or customer uses.	*Energy*
Classes	Classes of thread are distinguished from each other by the amounts of tolerance and allowance specified. External threads or bolts are designated with the suffix "A"; internal or nut threads with "B".	*Fastening*
Classes 1A And 1B	For work of rough commercial quality where loose fit for spin-on-assembly is desirable.	*Fastening*
Classes 2A And 2B	The recognized standard for normal production of the great bulk of commercial bolts, nuts and screws.	*Fastening*
Classes 3A And 3B	Used where a closed fit between mating parts for high quality work is required.	*Fastening*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Classes of service	Customers grouped by similar characteristics in order to be identified for the purpose of setting a common rate for electric service. Usually classified into groups identified as residential, commercial, industrial, and other.	*Energy*
Classification	Group, or family designation based on wire rope constructions with common strengths and weights listed under the broad designation.	*Wire Rope & Cable*
Classifier	A mineral-processing machine which separates minerals according to size and density.	*Mining*
Clastic	Pertaining to a rock or sediment composed principally of broken fragment derived from pre-existing rocks or minerals that have been transported some distance from their places of origin.	*Petroleum Engineering*
Clatch harness or Clatch iron	the cross bar of iron attached to the fall of the rope with chains and hook at each end to suspend the corve by. (Yorks.).	*Mining*
Clay	A fine-grained material composed of hydrous aluminum silicates.	*Mining*
Clay	Fine grained soil, composed chiefly of hydrous aluminosilicate minerals.	*Material Process*
Clay Filtration	A refining process using fuller's earth (activated clay), bauxite or other mineral to absorb minute solids from lubricating oil, as well as remove traces of water, acids, and polar compounds.	*Lubrication*
Clay vein	A body of clay-like material that fills a void in a coal bed.	*Mining*
Clayband	an argillaceous ironstone, usually found in bands a few inches in thickness, or in nodules.	*Mining*
Clay-dyke	a vertical fissure sometimes met with in coal seams, which has been filled in with clay.	*Mining*
Clay-seam	inferior coal between the Hards and Top Softs of the Barnsley Seam. (Yorks.).	*Mining*
Clay-seam dirt	a clay parting between the Clay Seam and the Top Softs of the Barnsley Seam. (Yorks.).	*Mining*
Clea	100 particles >10 micron per milliliter	*Oil Analysis*
Clead	to cover with planks or deals, (N. East).	*Mining*
Cleading	the rope grooves in a winding drum.	*Mining*
Clean	100 particles >10 micron per milliliter - in regards to an oil sample bottle cleanliness	*Lubrication*
Clean air	When a car is running by itself on the track, it's in "clean air" because the air is not being disturbed by other cars. See Dirty air.	*NASCAR*
Clean Air	The ideal conditions. Climate controlled or sterile area.	*Electrical Engineering*
Clean Air Act Amendments of 1990	A comprehensive set of amendments to the federal law governing the nation's air quality. The Clean Air Act was originally passed in 1970 to address significant air pollution problems in our cities. The 1990 amendments broadened and strengthened the original law to address specific problems such as acid deposition, urban smog, hazardous air pollutants and stratospheric ozone depletion.	*Mining*
Clean coal	a coal seam free from dirt partings; or coal from which impurities have been separated.	*Mining*

Term	Definition	*Industry*
Clean Coal Technologies	A number of innovative, new technologies designed to use coal in a more efficient and cost-effective manner while enhancing environmental protection. Several promising technologies include: fluidized-bed combustion, integrated gasification combined cycle, limestone injection multi-stage burner, enhanced flue gas desulfurization (or "scrubbing"), coal liquefaction and coal gasification.	*Mining*
Clean Development Mechanism (CDM)	A Kyoto Protocol program that enables industrialized countries to finance emissions-avoiding projects in developing countries and receive credit for reductions achieved against their own emissions limitation targets. Also see Kyoto Protocol.	*Energy*
Clean locker	the locker in the pit head baths where a miner stores his everyday clean clothes between shifts. - see also Dirty locker.	*Mining*
Clean room	A facility or enclosure in which air content and other conditions (such as temperature, humidity, and pressure) are controlled and maintained at a specific level by special facilities and operating processes and by trained personnel.	*Oil Analysis*
Clean Water Act	The federal law that regulates discharges into waterways.	*Petroleum Drilling*
Cleanable	A filter element which, when loaded, can be restored by a suitable process, to an acceptable percentage of its original dirt capacity.	*Oil Analysis*
Cleaned coal or prepared coal	has been processed to reduce the amount of impurities present and improve the burning characteristics.	*Energy*
Cleaning	the process of chemically or mechanically removing unwanted residue or contaminants (mill scale, rust, dirt, oil) from the surface of a steel article prior to galvanizing	*Materials Process*
Cleaning solutions	liquids used to remove unwanted residue or contaminants (mill scale, rust, dirt, oil) from the surface of steel prior to galvanizing, typically alkalai caustic solution, hydrochloric or sulfuric acid, and zinc ammonium chloride flux solution	*Materials Process*
Cleaning up	filling coal or stone from where it has fallen, cleaning up spillages.	*Mining*
Cleanliness Level	A measure of relative freedom from contaminants.	*Lubrication*
Cleanliness, Level	The analogue of contamination level.	*Mechanical, Process, and Operations*
Clear	To restore a device to a prescribed initial state, usually the zero state.	*General Engineering*
Clearance	The amount by which the dedendum in a given gear exceeds the addendum of its mating gear. It is also the radial distance between the top of a tooth and the bottom o the mating tooth space.	*Mechanical Engineering*
Clearance Bearing	A journal bearing in which the radius of the bearing surface is greater than the radius of the journal surface.	*Lubrication*
Clear-cut harvest	A harvest practice that removes all trees within a given area.	*Forestry*
Clearing House	Part of a commodities exchange that monitors buying and selling of contracts, matches the buys and the sales.	*Metallurgy*
Cleat	An attachment fastened to the conveying surface to act as a pusher, support, check or trip, etc. to help propel material, parts or packages along the normal path of conveyor travel.	*Manufacturing*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cleat spar	Whitish, crystalline mineral usually mixed carbonates of iron, lime and magnesium (ankerite) in the cleat of coal.	*Mining*
Cleated Belt	Belt: A belt having raised sections spaced uniformly to stabilize flow of material.	*Equipment*
Cleavage	The tendency of a mineral to split along crystallographic planes.	*Mining*
Cleveland Open Cup	A flash point test in which the surface of the sample is completely open to the atmosphere, and which is therefore relatively insensitive to small traces of volatile contaminants.	*Lubrication*
Cleveloc Nut	A torque prevailing nut of all metal construction. The collar of the nut is elliptical in cross section and it is this that provides the flexible locking element. The nut is pre-lubricated to reduce the torque needed when tightening and to minimize galling.	*Maintenance*
Clevis	A "U" shaped connecting yoke at the end of a stem or rod, between the ends of which a gate or other part may be pinned or bolted.	*Mechanical*
Clevis (hinge) pendulum	A "U" shaped mounting device which Contains a common pin hole at right angle to the axis of symmetry through each arm of the U. A clevis usually connects with an eye.	*Mechanical, Process, and Operations*
Clevis or Clivey	a spring-loaded hook attached to the winding rope; or a shackle for the easy coupling and uncoupling on chain haulage, winding etc.	*Mining*
CLIA	Clinical Laboratory Improvement Amendments of 1988	*Quality*
CLIB	See Cochrane Library (CLIB)	*Quality Engineering*
Click/Pop Reduction	A feature that eliminates "clicks" and "pops" — unwanted transient noise signals during power-up, shutdown, connection, etc.	*Electrical Engineering*
Click-and-Pop	Click-and-pop refers to the unwanted transient signals in the audio band that are reproduced by the headphone and/or speaker when the audio device driving it is either: powered up (power applied), powered down (power removed), brought out of shutdown (power applied previously), forced into shutdown (power still applied).	*Electrical Engineering*
Client Needs Analysis (CNA)	The Client Needs Analysis is a quick, SKF facilitated assessment with focus on the SKF AEO solution. The Client Needs Analysis can be completed in just a few hours and asks 10 assessment questions for each of the four main facets of the AEO Process: maintenance strategy, work identification, work control, and work execution. These 40 questions are designed to investigate, quantify, and visualize the situation at the your facility. Results are displayed in a graphical "spider chart" format which provides a visual footprint of a particular plant assessment in accordance with international standards/models of business excellence.	*Maintenance*
Cliffe's Hook	a safety device comprising a spring attached to the end of the gin rope to stop the loose bar from disengaging.	*Mining*
Clift	Clift, another word for "shale" (S. Wales).	*Mining*
Clift-cwar	Clift-cwar, another word for 'siltstone'. (S. Wales).	*Mining*
Climate change	A term used to refer to all forms of climatic inconsistency, but especially to significant change from one prevailing climatic condition to another. In some cases, "climate change" has been used synonymously with the term "global warming"; scientists, however, tend to use the term in a wider sense inclusive of natural changes in climate, including climatic cooling.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Climax community	A relatively stable, undisturbed plant community that has evolved through stages and adapted to its environment.	*Forestry*
Clinical guideline	A systematically developed statement for practitioners and participants about appropriate health care for specific clinical circumstances.	*Quality Engineering*
Clinical quality requirement	Used here for a quality requirement that states the medically important change in a test result or describes the gray zone or decision interval for interpreting a test result.	*Quality*
Clinical reportable range, CRR	Defined by CAP (College of American Pathologists) as the lowest and highest numeric results that can be reported after accounting for any specimen dilution or concentration that is used to extend the analytical measurement range.	*Quality*
Clinical sensitivity, diagnostic sensitivity	A measure of how frequently a test is positive when a particular disease is present. Generally given as a percentage of individuals with a given disease who have a positive test result. Ideally, a test should have a sensitivity of 100%, i.e., the test should always give a positive result when the patient has the particular disease. CLSI prefers the term true positive ratio, TPR.	*Quality*
Clinical specificity, diagnostic specificity	A measure of how frequently a test is negative in the absence of a particular disease. Generally given as the percentage of individuals without a given disease who have a negative test result. Ideally, a test should have a specificity of 100%, i.e., the test should always give a negative result when the patient does not have the disease. CLSI prefers the term true negative ratio, TNR.	*Quality*
Clinical trial	An experiment to compare the effects of two or more healthcare interventions. Clinical trial is an umbrella term for a variety of designs of healthcare trials, including uncontrolled trials, controlled trials, and randomized controlled trials. Also called: Intervention study	*Quality Engineering*
Clinically significant	A result (e.g. a treatment effect) that is large enough to be of practical importance to patients and healthcare providers. This is not the same thing as statistically significant. Assessing clinical significance takes into account factors such as the size of a treatment effect, the severity of the condition being treated, the side effects of the treatment, and the cost. For instance, if the estimated effect of a treatment for acne was small but statistically significant, but the treatment was very expensive, and caused many of the treated patients to feel nauseous, this would not be a clinically significant result. Showing that a drug lowered the heart rate by an average of 1 beat per minute would also not be clinically significant.	*Quality Engineering*
Clinically significant, clinically significant difference	Used in method validation to describe a difference or error that is larger than allowable for the clinical or medical use of a test. An important conclusion when judging the acceptability of a method's performance, in contrast to a statistically significant difference, which only infers that a difference is larger than the experimental uncertainty of the data.	*Quality*
Clinker	Powdered cement, produced by heating a properly proportioned mixture of finely ground raw materials (calcium carbonate, silica, alumina, and iron oxide) in a kiln to a temperature of about 2,700 degrees Fahrenheit.	*Energy*
Clinometer	An instrument for determining angles of inclination or slope.	*Civil Engineering*
Clip	Fitting for clamping two parts of wire rope to each other.	*Wire Rope & Cable*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Clipper Lacing	Lacing attached to the belt with a clipper lacing machine.	*Manufacturing*
Clippers or Clippus	s the hook used in shaft sinking to attach the rope to the corf, a corruption of Cliffe's hook.	*Mining*
Clipping	The term applied to the phenomenon which occurs when an output signal is limited in some way by the full range of an amplifier, ADC or other device. When this occurs, the signal is flattened at the peak values, the signal approaches the shape of a square wave, and high frequency components are introduced. Clipping may be hard, as is the case when the signal is strictly limited at some level; or it may be soft, in which case the clipping signal continues to follow the input at some reduced gain.	*General Engineering*
Clivvy hook	the hook which attaches the rope to the kibble or hoppit in shaft sinking and is provided with a special locking tongue, designed to suit the particular form of kibble in use.	*Mining*
Clock	The device that generates periodic signals for synchronization.	*General Engineering*
Clock and Data Recovery	The process of extracting and reconstructing clock and data information from a single-wire/channel, serial data stream.	*Electrical Engineering*
Clock Jitter	A periodic waveform (especially a clock) is expected to cross certain thresholds at precisely timed moments. Variations from this ideal are called jitter.	*Electrical Engineering*
Clod or Clot	a soft shale lying directly above the coal seam. It invariably falls as the coal is taken from beneath it and has to be separated from the coal and discarded. Often traversed by numerous oblique, discontinuous, slippery surfaces (slickensides or listric surfaces). Also known as clot. (Som.). In the Bristol area it was called 'come-down' or 'comb-dung'; or a thick fireclay above or below a seam of coal. (Lancs.), (Scot.); also known as bannocking dirt (Yorks.). Clod was also a term used for any lenticular or irregular friable dirt below, and particularly above a coal seam.	*Mining*
Clonal lines	A group of plants originating from buds or cuttings from the same individual. [1]	*Forestry*
Closed center circuit	One in which flow through the system is blocked in neutral and pres- sure is maintained at the maximum pressure control setting.	*Mechanical, Process, and Operations*
Closed center system	A hydraulic system in which the control valves are closed during neutral, stopping oil flow. Flow in this system is varied, but pressure remains constant.	*Mechanical, Process, and Operations*
Closed Center Valve	A valve in which inlet and outlet ports are closed in the neutral position, stopping flow from the pump.	*Mechanical, Process, and Operations*
Closed circuit	A loop in the milling process wherein a selected portion of the product of a machine is returned to the head of the machine for finishing to required specification.	*Mining*
Closed Control System (CCS)	This is a system used to regulate a process using feedback control (as opposed to an open control system, which relies on feed forward control). A closed system responds to actual system conditions with a range of responses. It is slower to react to changes in process conditions than an open system, but it is more specific in its responses and is able to deal with a broader range of conditions. An example of closed loop control is a driver steering a car. If the car veers to the left, the driver steers right to compensate.	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Closed Crankcase Ventilation (CCV)	A system in which crankcase vapors are discharged into the engine intake system (usually via the intake manifold) where they are burned during the combustion process rather than being discharged into the atmosphere.	*Mechanical Engineering*
Closed loop	A system in which the output of one or more elements is compared to some other signal to provide an actuating signal to control the output of the loop.	*Mechanical, Process, and Operations*
Closed Loop Control	Responses are measured and fed back to the control system so as to refine or modify drive signals in order to bring responses closer to the reference or desired motions. See iterative closed loop control.	*Reliability Engineering*
Closed loop system	Generally refers to drillers operating with a water cycle that is never exposed to the open air, unlike containment ponds. Closed loop drillers might operate on a well pad that is too isolated or too small to allow for construction of a pond.	*Petroleum Drilling*
Closed Socket	A wire rope end termination consisting of basket and bail made integral.	*Wire Rope & Cable*
Closed State	The state a pinch valve is in when the tubing is pinched.	*Mechanical*
Closed Systems	See open systems. Closed systems are the opposite to open systems. In other words, they are proprietary.	*Control Engineering*
Closeness of Control	Total temperature variation from a desired set point of system. Expressed as "closeness of control" is ±2°C or a system bandwidth with 4°C, also referred to as "amplitude of deviation."	*Electrical*
Closer	Closer, a short link rail. Clump, -see 'Clunch'. (Lancs.).	*Mining*
Closing Line	Wire rope that performs two functions: 1) closes a clamshell or orange peel bucket, and 2) operates as a hoisting rope.	*Wire Rope & Cable*
Closure	The ends of a bolted construction ball valve, bolted to the body, which often contain the seat rings.	*General Mechanical*
Closure element	The moving part of a valve, positioned in the flow stream, which controls the flow through the valve, e.g., wedge, plug, clapper, ball.	*General Mechanical*
Closure Member	The movable part of the valve which is positioned in the flow path to modify the rate of flow through the valve. Some of the different types of closure members are the Ball, Disk, Gate, and Plug.	*Industrial Engineering*
Cloud condensation nuclei	Aerosol particles that provide a platform for the condensation of water vapor, resulting in clouds with higher droplet concentrations and increased albedo.	*Energy*
Cloud Point	The temperature at which a cloud of wax crystals appears when a lubricant or distillate fuel is cooled under standard conditions. Indicates the tendency of the material to plug filters or small orifices under cold weather conditions.	*Lubrication*
Clour	a small depression of roof into the coal, mostly in a post roof, (N. East).	*Mining*
CLR	Committee on Lubricants Research	*Petro-Chemical Abbreviations*
CLSI	Clinical Laboratory and Standards Institute, formerly National Committee for Clinical Laboratory Standards (NCCLS)	*Quality*
CLUG	See Cochrane Library Users' Group (CLUG)	*Quality Engineering*
Clunch	an unlaminated mudstone with rootlets, the fireclay floor or seatearth underclay of some coal seams, also known as 'spavin' - see Stone clunch.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cluster randomized trial	A trial in which clusters of individuals (e.g. clinics, families, geographical areas), rather than individuals themselves, are randomized to different arms. In such studies, care should be taken to avoid unit of analysis errors.	*Quality Engineering*
Clutch	A device to permit engagement or disengagement of equipment while in motion or at rest.	*Equipment*
Clutch Drive	Drive used to disengage motor from reducer and stop conveyor immediately without stopping the motor or cutting the power.	*Manufacturing*
Clutch-Starter Interlock	A safety device that prevents a truck from being started while it's in gear. The clutch must be depressed for the engine to start.	*Mechanical Engineering*
Clydesdale	A breed of heavy draft horse developed in Scotland by the farmers of Lanarkshire, through which the River Clyde flows. It was bred to meet the needs of agriculture, commerce for the Lanarkshire coalfields of Lanarkshire and for all types of heavy freight on the streets of Glasgow. The Clydesdale Breeders of the United States was formed in 1879. Although not the most popular work horse in America, the Clydesdale is the best known. It is the breed that pulls the famous Budweiser beer wagon.	*Agriculture*
cm	Centimeter	*Oil Analysis*
CMA	Chemical Manufacturers Association	*Petro-Chemical Abbreviations*
CMAG	See Feedback Management Advisory Group (FMAG) (formerly Criticism Management Advisory Group (CMAG))	*Quality Engineering*
CMAQ	Congestion Mitigation and Air Quality Improvement Program	*Petro-Chemical Abbreviations*
CMMS	See Computerized Maintenance Management System	*Plant Engineering*
CMMS	For computerized maintenance management system. A software package that houses a database of information related to an organization's maintenance operations and functions. Its functionality is tied to scheduling, tracking and monitoring departmental activities and providing a historical overview of cost, budgetary, inventory and personnel data.	*Reliability Engineering*
CMR (Common-Mode Rejection)	The ability of a panel meter to eliminate the effect of AC or DC noise between signal and ground. Normally expressed in dB at dc to 60 Hz. One type of CMR is specified between SIG LO and PWR GND. In differential meters, a second type of CMR is specified between SIG LO and ANA GND (METER GND).	*Electrical*
CMS	Centers for Medicare and Medicaid Services	*Quality*
CMSA	consolidated metropolitan statistical area	*Energy*
CMV (Common-Mode Voltage)	The AC or DC voltage which is tolerable between signal and ground. One type of CMV is specified between SIG LO and PWR GND. In differential meters, a second type of CMV is specified between SIG HI or LO and ANA GND (METER GND).	*Electrical*
CMV (Common-Mode Voltage)	The AC or DC voltage which is tolerable between signal and ground. One type of CMV is specified between SIG LO and PWR GND. In differential meters, a second type of CMV is specified between SIG HI or LO and ANA GND (METER GND).	*Electronic Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
CN	cetane number	*Petro-Chemical Abbreviations*
CNC	Computer Numerical Control allows machines to be operated from PLCs by means of a numerical code.	*Control Engineering*
CNG	compressed natural gas	*Petro-Chemical Abbreviations*
CNPC	China National Petroleum Corporation	*Petro-Chemical Abbreviations*
CNPP	Center for Nutrition Policy and Promotion, a unit within the USDA.	*Agriculture*
cnt	Cent	*Energy*
CO	Carbon Monoxide	*Energy*
CO control period ("seasons")	The portion of the year in which a CO nonattainment area is prone to high ambient levels of carbon monoxide. This portion of the year is to be specified by the Environmental Protection Agency but is to be not less than 4 months in length.	*Energy*
CO nonattainment area	Areas with carbon monoxide design values of 9.5 parts per million or more, generally based on data for 1988 and 1989.	*Energy*
CO or Controller Output	Same as output.	*Process Control Engineering*
CO_2	Carbon Dioxide	*Energy*
Coal	A readily combustible black or brownish-black rock whose composition, including inherent moisture, consists of more than 50 percent by weight and more than 70 percent by volume of carbonaceous material. It is formed from plant remains that have been compacted, hardened, chemically altered, and metamorphosed by heat and pressure over geologic time.	*Energy*
Coal analysis	Determines the composition and properties of coal so it can be ranked and used most effectively.	*Energy*
Coal balls	nodular calcareous rounded inclusions in coal seams, often containing well preserved plant fragments.	*Mining*
Coal bed	A bed or stratum of coal. Also called a coal seam.	*Energy*
Coal bed degasification	This refers to the removal of methane or coal bed gas from a coal mine before or during mining.	*Energy*
Coal Blending	The process of combining two or more coals with different characteristics to obtain coal with a certain quality, such as low sulfur content.	*Energy*
Coal briquets	Anthracite, bituminous, and lignite briquets comprise the secondary solid fuels manufactured from coal by a process in which the coal is partly dried, warmed to expel excess moisture, and then compressed into briquets, usually without the use of a binding substance. In the reduction of briquets to coal equivalent, different conversion factors are applied according to their origin from hard coal, peat, brown coal, or lignite.	*Energy*
Coal carbonized	The amount of coal decomposed into solid coke and gaseous products by heating in a coke oven in a limited air supply or in the absence of air.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Coal chemicals	Coal chemicals are obtained from the gases and vapor recovered from the manufacturing of coke. Generally, crude tar, ammonia, crude light oil, and gas are the basic products recovered. They are refined or processed to yield a variety of chemical materials.	*Energy*
Coal Classification	In the United States, coals are classified by rank progressively from lignite (least carbonaceous) to anthracite (most carbonaceous) based on the proximate analyses of various properties (fixed carbon, volatile matter, heating value, and agglomerating character), following methods prescribed by the American Society for Testing and Materials. The International Coal Classification of the Economic Commission for Europe recognizes two broad categories of coal, "brown coal" and "hard coal." In terms of U.S. coal classification, the international classification of brown coal includes lignite and lower-ranked subbituminous coal, whereas hard coal includes all higher rank coals. See Coal Rank.	*Energy*
Coal cleaning	a process that separates coal from other foreign material such as shale or sandstone etc. usually utilizing the difference in their specific gravities. The unwanted material is generally heavier than the coal.	*Mining*
Coal coke	Coal coke: See Coke (coal).	*Energy*
Coal consumption	The quantity of coal burned for the generation of electric power (in short tons), including fuel used for maintenance of standby service.	*Energy*
Coal cutter	Coal cutter, -see Cutter.	*Mining*
Coal delivered	Coal which has been delivered from the coal supplier to any site belonging to the electric power company.	*Energy*
Coal dust	Particles of coal that can pass a No. 20 sieve.	*Mining*
Coal exports	Amount of U.S. coal shipped to foreign destinations, as reported in the U.S. Department of Commerce, Bureau of Census, "Monthly Report EM 545."	*Energy*
Coal face	This is the exposed area from which coal is extracted.	*Energy*
Coal face working or weighting	movement of the coal due to strata pressure. –see Weight and Weighting.	*Mining*
Coal financial reporting regions	A geographic classification of areas with coal resources which is used for financial reporting of coal statistics.	*Energy*
Coal fines	Coal with a maximum particle size usually less than one-sixteenth inch and rarely above one-eighth inch.	*Energy*
Coal flour	very fine coal dust.	*Mining*
Coal Fly Ash	A by-product of coal burning at electricity plants. It is called "fly" ash because it is transported from the combustion chamber by exhaust gases.	*Environmental Engineering*
Coal gas	Substitute natural gas produced synthetically by the chemical reduction of coal at a coal gasification facility.	*Energy*
Coal gasification	The process of converting coal into gas. The basic process involves crushing coal to a powder, which is then heated in the presence of steam and oxygen to produce a gas. The gas is then refined to reduce sulfur and other impurities. The gas can be used as a fuel or processed further and concentrated into chemical or liquid fuel.	*Energy*
Coal Gasification	The conversion of coal into a gaseous fuel.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Coal gate	the main gate or roadway leading away from a coalface along which the coal travels, either in tubs on a haulage road or by conveyor belt. Sometimes called the 'mothergate'. (Mids.). - see also Main gate.	*Mining*
Coal grade	This classification refers to coal quality and use.	*Energy*
Coal head	the working place in a coal heading.	*Mining*
Coal imports	Amount of foreign coal shipped to the United States, as reported in the U.S. Department of Commerce, Bureau of the Census, "Monthly Report IM 145."	*Energy*
Coal jig or Wash box	a plunger type of jig used to wash or separate coal from shale and other impurities, working on the principle of density difference. Principally consisting of a perforated plate upon which the run of mine coal rests and alternative upwards and downwards currents of water are passed through by the action of plungers causing the lighter coal to stratify in the upper layers of the bed and the heavier refuse to settle to the lower layers for removal.	*Mining*
Coal liquefaction	A chemical process that converts coal into clean-burning liquid hydrocarbons, such as synthetic crude oil and methanol.	*Energy*
Coal mine	An area of land and all structures, facilities, machinery, tools, equipment, shafts, slopes, tunnels, excavations, and other property, real or personal, placed upon, under, or above the surface of such land by any person, used in extracting coal from its natural deposits in the earth by any means or method, and the work of preparing the coal so extracted, including coal preparation facilities. British term is "colliery".	*Mining*
Coal mining productivity	Coal mining productivity is calculated by dividing total coal production by the total direct labor hours worked by all mine employees.	*Energy*
Coal pipe	the carbonized bark of a fossil plant; also a very thin seam or scare of coal, (N. East).	*Mining*
Coal plough	Coal plough, -see Plough.	*Mining*
Coal preparation	The process of sizing and cleaning coal to meet market specifications by removing impurities such as rock, sulfur, etc. It may include crushing, screening, or mechanical cleaning.	*Energy*
Coal preparation plant	the place on the surface of the mine that cleans the coal and prepares it for sale.	*Mining*
Coal Preparation Processes (Cleaning/ Beneficiation/Processing)	In its broadest sense, preparation is any processing of mined coal to prepare it for market, including crushing and screening or sieving the coal to reach a uniform size, which normally results in removal of some non-coal or waste material. The term coal preparation most commonly refers to processing, including crushing and screening, passing the material through one or more processes to remove impurities, sizing the product, and loading for shipment. Many of the processes separate rock, clay, and other minerals from coal in a liquid medium; hence, the term washing is widely used. In some cases, coal passes through a drying step before loading. See Coal Washing.	*Energy*
Coal producing districts	A classification of coal fields defined in the Bituminous Coal Act of 1937. The districts were originally established to aid in formulating minimum prices of bituminous and subbituminous coal and lignite. Because much statistical information was compiled in terms of these districts, their use for statistical purposes has continued since the abandonment of that legislation in 1943. District 24 was added for the anthracite-producing district in Pennsylvania.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Coal production	The sum of sales, mine consumption, issues to miners, and issues to coke, briquetting, and other ancillary plants at mines. Production data include quantities extracted from surface and underground mines, and normally exclude wastes removed at mines or associated reparation plants.	*Energy*
Coal rank	The classification of coals according to their degree of progressive alteration from lignite to anthracite. In the United States, the standard ranks of coal include lignite, subbituminous coal, bituminous coal, and anthracite and are based on fixed carbon, volatile matter, heating value, and agglomerating (or caking) properties.	*Energy*
Coal reserves	Measured tonnages of coal that have been calculated to occur in a coal seam within a particular property.	*Mining*
Coal sampling	The collection and proper storage and handling of a relatively small quantity of coal for laboratory analysis. Sampling may be done for a wide range of purposes, such as: coal resource exploration and assessment, characterization of their serves or production of a mine, to characterize the results of coal cleaning processes, to monitor coal shipments or receipts for adherence to coal quality contract specifications, or to subject a coal to specific combustion or reactivity tests related to the customer's intended use. During pre-development phases, such as exploration and resource assessment, sampling typically is from natural outcrops, test pits, old or existing mines in the region, drill cuttings, or drilled cores. Characterization of a mine's reserves or production may use sample collection in the mine, representative cuts from coal conveyors or from handling and loading equipment, or directly from stockpiles or shipments (coal rail cars or barges). Contract specifications rely on sampling from the production flow at the mining or coal handling facility or at the loadout, or from the incoming shipments at the receiver's facility. In all cases, the value of a sample taken depends on its being representative of the coal under consideration, which in turn requires that appropriate sampling procedures be carefully followed. For coal resource and estimated reserve characterization, appropriate types of samples include:	*Energy*
Coal stocks	Coal quantities that are held in storage for future use and disposition. *Note*: When coal data are collected for a particular reporting period (month, quarter, or year), coal stocks are commonly measured as of the last day of this period.	*Energy*
Coal sulfur	Coal sulfur occurs in three forms: organic, sulfate, and pyritic. Organic sulfur is an integral part of the coal matrix and cannot be removed by conventional physical separation. Sulfate sulfur is usually negligible. Pyritic sulfur occurs as the minerals pyrite and marcasite; larger sizes generally can be removed by cleaning the coal.	*Energy*
Coal synfuel	Coal-based solid fuel that has been processed by a coal synfuel plant; and coal-based fuels such as briquettes, pellets, or extrusions, which are formed from fresh or recycled coal and binding materials.	*Energy*
Coal tar	A viscous residue formed in the manufacture of gas from coal, an important source for plastics, dyes, and other synthetics.	*Material Process*
Coal type	The classification is based on physical characteristics or microscopic constituents. Examples of coal types are banded coal, bright coal, cannel coal, and splint coal. The term is also used to classify coal according to heat and sulfur content. See Coal grade.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Coal Washing	The treatment of coal to remove waste material such as: *Dense (heavy) medium processes* use a thick solution, usually a mixture of magnetite and water, to separate coal from impurities, such as sulfur, ash, and mercury, by gravity separation. *Flotation processes* treat fine-sized coal with an oil-based reagent that attracts air bubbles in a liquid medium; the coal floats to the surface as froth, leaving the refuse below. *Hydraulic processes* use currents of water to separate coal from impurities. *Pneumatic processes* use currents of air to separate coal from impurities.	*Energy*
Coal zone	A series of laterally extensive and (or) lenticular coal beds and associated strata that arbitrarily can be viewed as a unit. Generally, the coal beds in a coal zone are assigned to the same geologic member or formation.	*Energy*
Coal	A carbonaceous rock mined for use as a fuel.	*Mining*
Coalbed	A geological layer or stratum of coal parallel to the rock stratification.	*Petroleum Drilling*
Coalbed gas (CBG)	The natural gas found in most coal deposits; it is formed during coalification, a process that converts deposits of plant material into coal. It is also referred to as coalbed methane (CBM) or natural gas in coal (NGC).	*Petroleum Engineering*
Coalbed methane (CBM)	A form of natural gas extracted from coal beds. In recent decades it has become an important source of energy in United States, Canada, and other countries.	*Petroleum Drilling*
Coalbed Methane Well Gas	Methane produced from coal seams. Coalbed methane is formed during coalification, which is the geologic process that transforms organic material into coal.	*Energy*
Coal-cutting machine	A **coal-cutting machine** is used in conventional mining to undercut, top cut, or shear the coal face so that coal can be fractured easily when blasted. It cuts 9 to 13 feet into the bed.	*Energy*
Coal-derived liquid fuels	coal-derived liquid fuels	*Energy*
Coalescor	A separator that divides a mixture or emulsion of two immiscible liquids using the interfacial tension between the two liquids and the difference in wetting of the two liquids on a particular porous medium.	*Lubrication*
Coalification	The metamorphic processes of forming coal.	*Mining*
Coal-producing regions	A geographic classification of areas where coal is produced.	*Energy*
Coal-Producing States	The States where mined and/or purchased coal originates are defined as follows: Alabama, Alaska, Arizona, Arkansas, Colorado, Illinois, Indiana, Kansas, Kentucky Eastern, Kentucky Western, Louisiana, Maryland, Mississippi, Missouri, Montana, New Mexico, North Dakota, Ohio, Oklahoma, Pennsylvania anthracite, Pennsylvania bituminous, Tennessee, Texas, Utah, Virginia, Washington, West Virginia Northern, West Virginia Southern, and Wyoming.	*Energy*
Coating	A material applied to the surface of a conductor to prevent environmental deterioration, facilitate soldering or improve electrical performance.	*Electrical*
Coating thickness	the thickness of the zinc coating, measured in mils (0.001 inches) or micrometers (10-6 meters)	*Materials Process*
Cob	the large round mass of an ear of corn where kernels grow	*Agriculture*
Cobbles	the market name for coal of the size of a double-fist, about 3 to 6 inches in dimensions.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Coble Creep	a form of diffusion controlled creep. In Coble creep the atoms diffuse along grain boundaries to elongate the grains along the stress axis. This causes Coble creep to have a stronger grain size dependence than N-H creep. For Coble creep k is related to the diffusion coefficient of atoms along the grain boundary, Q = Qgrain boundary diffusion, m=1, and b=3. Because Qgrain boundary diffusion < Qself diffusion, Coble creep occurs at lower temperatures than N-H creep. Coble creep is still temperature dependent, as the temperature increases so does the grain boundary diffusion. However, since the number of nearest neighbors is effectively limited along the interface of the grains, and thermal generation of vacancies along the boundaries is less prevalent, the temperature dependence is not as strong as in Nabarro–Herring creep. It also exhibits the same linear dependence on stress as N-H creep.	*Metallurgy*
Cobs or Cobbles	large lumps of coal. Cobs were larger than cobbles. (Lancs).	*Mining*
COC	Cleveland open cup	*Petro-Chemical Abbreviations*
Cochrane Collaboration Steering Group (CCSG)	It has overall responsibility for overseeing the development and implementation of policy affecting The Cochrane Collaboration. The CCSG also has legal responsibility as the Board of Directors for The Cochrane Collaboration as a registered charity. Also called: CCSG	*Quality Engineering*
Cochrane Collaboration, The	An international organization that aims to help people make well-informed decisions about health care by preparing, maintaining, and ensuring the accessibility of systematic reviews of the effects of healthcare interventions.	*Quality Engineering*
Cochrane Consumer Network (CCNet)	A registered field in The Cochrane Collaboration, responsible for coordinating and facilitating consumer involvement. Also called: CCNet	*Quality Engineering*
Cochrane Database of Systematic Reviews (CDSR)	One of the databases in The Cochrane Library. It brings together all the currently available Cochrane Reviews and Protocols for Cochrane Reviews. It is updated quarterly, and is available via the Internet and CD-ROM. See also: Cochrane Library (CLIB) Also called: CDSR	*Quality Engineering*
Cochrane Editorial Unit (CEU)	The remit of the Cochrane Operations Unit (CEU) includes any function relevant to The Cochrane Library (the product). This covers both direct functions such as Cochrane Review preparation and editorial processes carried out by review groups and authors, but also those functions such as training, methods and ICT, which underpin The Cochrane Library. Also called: CEU, Editorial Unit	*Quality Engineering*
Cochrane Groups	See Entities	*Quality Engineering*
Cochrane Handbook for Systematic Reviews of Interventions (formerly Cochrane Reviewers' Handbook)	Document containing guidance and advice on how to prepare and maintain Cochrane reviews. Accessible on the Collaboration web site and in the RevMan software. Updated regularly. Also called: Handbook	*Quality Engineering*
Cochrane Library (CLIB)	A collection of regularly updated online databases containing the Cochrane Database of Systematic Reviews, the Cochrane Central Register of Controlled Trials, the Database of Abstracts of Reviews of Effects, the Cochrane Methodology Register, the HTA Database, NHSEED, and information about The Cochrane Collaboration. (Also available on DVD)See also: Cochrane Database of Systematic Reviews (CDSR) Also called: CLIB, The Cochrane Library	*Quality Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cochrane Operations Unit (COU)	In order to provide clarity on the core functions of the Collaboration's centrally funded management infrastructure, the Steering Group approved the renaming of the Secretariat to the Cochrane Operations Unit (COU) with effect from November 2011. This matches the name of the Cochrane Editorial Unit (CEU), and denotes the diversity of the high-level executive functioning of the COU. The remit of the Cochrane Operations Unit includes financial, administrative and legal management, oversight of marketing and communications, partnership building, and consumer support for the Collaboration as a whole. The COU maintains a Secretariat function to the Collaboration, and general administrative and business enquiries should continue to be sent to secretariat@cochrane.org.See also: Secretariat Also called: COU, Operations Unit	*Quality Engineering*
Cochrane Policy Manual (previously called the Cochrane Manual)	Document describing the policies and operating procedures of The Cochrane Collaboration. Accessible via the Collaboration web site.	*Quality Engineering*
Cochrane Review	Cochrane Reviews are systematic summaries of evidence of the effects of healthcare interventions. They are intended to help people make practical decisions. For a review to be called a 'Cochrane Review' it must be in CDSR or CMR. The specific methods used in a Review are described in the text of the review. Cochrane Reviews are prepared using Review Manager (RevMan) software provided by the Collaboration, and adhere to a structured format that is described in the Cochrane Handbook for Systematic Reviews of Interventions. See also: Systematic review (synonym: systematic overview)	*Quality Engineering*
Cochrane Review Group (CRG)	CRGs are made up of individuals sharing an interest in a particular healthcare problem or type of problem. The main purpose of a CRG is to prepare and maintain systematic reviews of the effects of healthcare interventions within the scope of the CRG. Members participate in the CRG not only by preparing Cochrane Reviews but also by hand searching journals and other activities that help the CRG to fulfill its aim. Each CRG is coordinated by an editorial team, responsible for regularly updating and submitting an edited module of Cochrane Reviews and information about the CRG, for publication in The Cochrane Library. Also called: CRG, Review Group	*Quality Engineering*
Cochrane Review Methodology Database (CRMD)	See Cochrane Methodology Register (CMR, formerly the Cochrane Review Methodology Database [CRMD])	*Quality Engineering*
Cochrane, Archie	The Cochrane Collaboration is named in honor of Archie Cochrane, a British medical researcher who contributed greatly to the development of epidemiology as a science.	*Quality Engineering*
Cockelshell	black shale full of mussels (Particularly in the Adwalton Stone Coal, (Yorks.).	*Mining*
Cocker	roadway timber support consisting of two uprights and two bars forming the cross-member in the roof in the shape of a shallow inverted 'V'. (N. Staffs.); or inclined prop set against overhanging coal tops for safety reasons. (S. Staffs.).	*Mining*
Cockering, herring-bone supports	A method of support by which a centre support, of beams or bars of timber running longitudinally along the roof of the roadway is supported systematically by inclined struts or props with their base spragged in the side of the road. The whole structure having a herring-bone like appearance (N. Staffs.).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cockermegs or Cockersprags	a set of three sprags to hold the coal on the face during holing. One 6ft sprag is placed horizontally in the middle of the seam and the other two 3ft sprags are set at an angle up to the roof and down to the floor from this middle sprag (N. Staffs.).	*Mining*
Cockle Bed	fossil band comprising non-marine lamellibranches or 'mussels'.	*Mining*
Cockle-bed	a bed containing 'mussels' or non-marine lamellibranches.	*Mining*
Cockwood	an 8–10 inch offcut piece of wood taken home and used for firelighting (S. Staffs.).	*Mining*
Cocoon	A covering, composed partly or wholly of silk or other sticky fiber, spun or constructed by many larvae as a protection for the pupal stage.	*Forestry*
Cod	a bearing of cast iron, bolted to the underside of a tram, (N. East).	*Mining*
Codabar	Standard bar code symbology used principally by the blood products industry.	*Gears*
Code 39	Standard bar code symbology and one of the most widely used.	*Gears*
Code Division Multiple Access	A digital cellular technology that uses spread-spectrum techniques. Unlike GSM and other competing systems that use TDMA, CDMA does not assign a specific frequency to each user. Instead, every channel uses the full available spectrum.	*Electrical Engineering*
Code of federal regulations	A compilation of the general and permanent rules of the executive departments and agencies of the Federal Government as published in the Federal Register. The code is divided into 50 titles that represent broad areas subject to Federal regulation. Title 18 contains the FERC regulations.	*Energy*
Code of practice	ACC Petroleum Additives Product Approval Code of Practice - a set of practices that are used in the approval testing of an engine oil formulation.	*Mechanical, Process, and Operations*
Coefficient of expansion	The thermal expansivity, the increase in length per unit length per degree. Centigrade rise in temperature.	*Material Process*
Coefficient of Friction	A numerical expression of the ratio between the force of contact existing between two surfaces and the resistant force tending to oppose the motion of one with respect to the other. The coefficient of friction is used in determini	*Equipment*
Coefficient of Friction	The number obtained by dividing the friction force resisting motion between two bodies by the normal force pressing the bodies together.	*Lubrication*
coefficient of permeability	coefficient of permeability - see hydraulic conductivity.	*Chemical*
Coefficient of Storage	The volume of water an aquifer releases from or takes into storage per unit surface area of the aquifer, per unit change in head.	*Petroleum Engineering*
Coefficient of Transmissivity	The rate at which groundwater can flow through an aquifer section of unit width under a unit hydraulic gradient. It is the average permeability of a section of the entire aquifer at a given location multiplied by the thickness of the formation.	*Petroleum Engineering*
Coefficient of variation, CV	The relative standard deviation, i.e., the standard deviation expressed as a percentage of the mean [CV=100(s/x)].	*Quality*
Coercive field	Magnitude of a reverse electric field necessary to return a polarized ferroelectric to zero polarization.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cofferdam	A watertight enclosure placed or constructed in waterlogged soil or under water and pumped dry so that construction or repairs can proceed under normal conditions.	*Civil Engineering*
Coffering	Coffering, -see Tubbing.	*Mining*
Cofiring	The process of burning natural gas in conjunction with another fuel to reduce air pollutants.	*Energy*
Cog	Cog, -see Chock.	*Mining*
Cog and rung gin	an early form of winding plant operated by horses. This comprised a drum with spokes or rungs, working on a horizontal shaft and mounted directly over the mine shaft. The drum was driven by a crude horizontal cog wheel the vertical shaft of which was rotated by a long pole or lever to the outer end of which was harnessed a horse or horses, which ran in a circular track around the shaft top. –see Horse whim.	*Mining*
COGCC	Colorado Oil and Gas Conservation Commission	*Petroleum Drilling*
Cogeneration	Production of heat energy and electrical or mechanical power from the same fuel in the same facility. A typical cogeneration facility produces electricity and steam for industrial process use.	*Energy*
Co-generation	A particularly efficient method of electricity generation that diverts heat, produced as a by-product of the power generation process, to domestic and industrial heating systems. The heat is produced by combustion of fuel in the power station to create the steam that drives the generating turbines. It would otherwise be released to the atmosphere.	*Electrical*
Cogeneration system	A system using a common energy source to produce both electricity and steam for other uses, resulting in increased fuel efficiency.	*Energy*
Cogenerator	A generating facility that produces electricity and another form of useful thermal energy (such as heat or steam), used for industrial, commercial, heating, or cooling purposes. To receive status as a qualifying facility (QF) under the Public Utility Regulatory Policies Act (PURPA), the facility must produce electric energy and "another form of useful thermal energy through the sequential use of energy" and meet certain ownership, operating, and efficiency criteria established by the Federal Energy Regulatory Commission (FERC).(See the Code of Federal Regulations, Title 18, Part 292.)	*Energy*
Cogenerator	A facility that produces electricity and/or other energy for heating and cooling.	*Energy*
Cogger	a miner engaged on building cogs.	*Mining*
COGIS	Colorado Oil and Gas Information Systems	*Petroleum Drilling*
cognitive map	a sketch that presents a causal picture of the association of components within a complex dynamic system, for the primary purpose of better understanding dependency relationships and general cause/effect.	*Petroleum Drilling*
Coherence	A measure of the similarity of vibration at two locations, giving insight into possible cause and effect relations.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Coherence Function	A frequency domain function computed to show the degree of a linear, noise-free relationship between a system's input and output. The value of the coherence function ranges between zero and one, where a value of zero indicates there is no causal relationship between the input and the output. A value of one indicates the existence of linear noise-free frequency response between the input and the output.	*General*
Coherent	Light source in which the light waves are in phase.	*Material Process*
Coherent interface	Interface between a matrix and precipitate at which the crystallographic structures maintain registry.	*Material Process*
Coherent Sampling	Describes the sampling of a periodic signal, where an integer number of its cycles fits into a predefined sampling window.	*Electrical Engineering*
Cohesion	Molecular attraction between grease particles contributing to its resistance to flow.	*Lubrication*
Cohort study	Follow-up of exposed and non-exposed defined groups, with a comparison of disease rates during the time covered.	*Analysis*
Coil	Circular bundle or package of wire rope that is not affixed to a reel.	*Wire Rope & Cable*
Coil Heat Exchanger	Heating coils are typically modified pipe with cross-flow, or looping arrangements, and are usually made from Finned-Tube. Also known as Tubulare heat exchangers.	*Industrial*
Coil shed	Portion of the tower structure housing atmospheric (tubular) heat exchangers.	*Facility Engineering*
Coil Springs	Suspension components that compress and respond to road inputs, permitting the up-and-down movement of a vehicle as it goes over road bumps and dips.	*Mechanical Engineering*
Coincidence Factor	The ratio of the coincident maximum demand of two or more loads to the sum of their noncoincident maximum demands for a given period. The coincidence factor is the reciprocal of the diversity factor and is always less than or equal to one.	*Energy*
Coincident site lattice (CSL)	Array of atomic sites common to both crystal lattice orientations of the grains adjacent to a given grain boundary.	*Material Process*
Coincidental Demand	Two or more demands that occur at the same time.	*Energy*
Coincidental Peak Load	Two or more peak loads that occur at the same time.	*Energy*
Co-interior Angles	They lie 'inside' the parallel lines and on the same side of the transversal. They are supplementary.	*Math*
Co-intervention	The application of additional diagnostic or therapeutic procedures to people receiving a particular program of treatment. In a controlled trial, members of either or both the experimental and the control groups might receive co-interventions.	*Quality Engineering*
Co-interventions	Interventions other than the treatment under study that are applied differently to the treatment and control groups. Cointervention is a serious problem when double blinding is absent or when the use of very effective non-study treatments is permitted.	*Analysis*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Coke	A hard, dry carbon substance produced by heating coal to a very high temperature in the absence of air.	*Mining*
Coke	A high carbon-content residue remaining from the destructive distillation of petroleum residue.	*Petroleum Engineering*
Coke (coal)	A solid carbonaceous residue derived from low-ash, low-sulfur bituminous coal from which the volatile constituents are driven off by baking in an oven at temperatures as high as 2,000 degrees Fahrenheit so that the fixed carbon and residual ash are fused together. Coke is used as a fuel and as a reducing agent in smelting iron ore in a blast furnace. Coke from coal is grey, hard, and porous and has a heating value of 24.8 million Btu per ton.	*Energy*
Coke (petroleum)	A residue high in carbon content and low in hydrogen that is the final product of thermal decomposition in the condensation process in cracking. This product is reported as marketable coke or catalyst coke. The conversion is 5 barrels (of 42 U.S. gallons each) per short ton.	*Energy*
Coke Battery	A series of coke ovens stacked in rows into which coal is loaded and processed into coke.	*Energy*
Coke breeze	The term refers to the fine sizes of coke, usually less than one-half inch, that are recovered from coke plants. It is commonly used for sintering iron ore.	*Energy*
Coke button	A button-shaped piece of coke resulting from standard laboratory tests that indicates the coking or free-swelling characteristics of a coal; expressed in numbers and compared with a standard.	*Energy*
Coke Oven	A chamber of brick or other heat-resistant material in which coal is heated to separate the coal gas, coal water, and tar. The coal gas and coal water fuse together with carbon and the remaining ash, forming a hard residue commonly referred to as coke. Coke is primarily used in steel production. There are two types of coke ovens: (1) beehive ovens, which were originally built round with a spherical top like an old-fashioned beehive, and have an opening in the top and various small openings for draft at the base. The ovens were developed into banks (rows) of joining cubicles. During the heating process of the coal, tar, gas, and other byproducts are lost. (2) Byproduct ovens, which were built in rectangular form with the front and back removable, and which are arranged so that all volatile byproducts can be pumped out.	*Energy*
Coke oven gas	The mixture of permanent gases produced by the carbonization of coal in a coke oven at temperatures in excess of 1,000 degrees Celsius.	*Energy*
Coke plants	Plants where coal is carbonized for the manufacture of coke in slot or beehive ovens.	*Energy*
Coking	Thermal refining processes used to produce fuel gas, gasoline blendstocks, distillates, and petroleum coke from the heavier products of atmospheric and vacuum distillation. Includes:	*Energy*
Coking	The undesirable accumulation of carbon (coke) deposits in the internal combustion engine or in a refinery plant. The process of distilling a petroleum product to dryness	*Lubrication*
Coking coal	Bituminous coal suitable for making coke. See coke (coal).	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
COLA	Originally, Commission for Office Laboratory Accreditation	*Quality*
Colback	A black hat of felt or sheepskin common to Asia Minor also known as a Calpac.	*Breakroom*
Cold Working	Deformation of a metal plastically. Although ordinarily done at room temperature, cold working may be done at the temperature and rate at which strain hardening occurs. Bending of steel piping at 1300°F (704°C) would be considered a cold-working operation.	*Maintenance and Repair*
Cold Bending	The bending of pipe to a predetermined radius at any temperature below some specified phase change or transformation temperature but especially at or near room temperature. Frequently, pipe is bent to a radius of 5 times the nominal pipe diameter.	*Maintenance and Repair*
Cold Cranking Amps (CCA)	A rating, measured in amperes. Used for comparing cranking strength of vehicles batteries during extremely cold (0 F or lower) weather.	*Mechanical Engineering*
Cold Cranking Simulator (CCS)	An intermediate shear rate viscometer that predicts the ability of an oil to permit a satisfactory cranking speed to be developed in a cold engine.	*Lubrication*
Cold flow	Distortion which takes place in plastics under lead at low temperatures (room temperature).	*Material Process*
Cold Flow	Any permanent deformation due to pressure or mechanical force, without the aid of eat softening.	*Electrical*
Cold Inflation	The pressure in a tire that has been driven less than 1 mile at moderate speed or has been standing for three hours or more.	*Mechanical Engineering*
Cold Joint	A soldered joint made with insufficient heat.	*Electrical*
Cold molding	A procedure in which a plastic composition is shaped by pressure at ordinary room temperature and hardened by subsequent baking.	*Material Process*
Cold Rating	The maximum pressure that a valve or fitting is designed to withstand at room temperature.	*Industrial Engineering*
Cold slug well	Space cut near the spruce opening in an injection mold to trap the cold slug.	*Material Process*
Cold slugs	Surface or body imperfection in a molded article caused by nonuniformity of temperature of the charge as it flows into the mold.	*Material Process*
Cold Spray (Cold Gas-dynamic Spraying)	A process that uses the energy stored in high pressure compressed gas to propel fine powder particles at very high velocities at a substrate to form a coating.	*Paint and Coatings*
Cold stretch	Stretching operation applied to filaments to improve physical properties through orientation of molecules.	*Material Process*
Cold Test	Any test to determine the performance of cables during or after subjection to a specified low temperature for a specified time.	*Electrical*
Cold vent	An area of the ocean floor where hydrogen sulfide, methane and other hydrocarbon-rich fluid seepage occurs, often in the form of a brine pool. Constitutes a biome supporting several endemic species. More commonly a “cold seep”	*Petroleum Drilling*
Cold water basin	A device underlying the tower to receive the cold water from the tower and direct its flow to the suction line or sump.	*Facility Engineering*
Cold water temperature (CWT)	Temperature of the water entering the cold water basin before addition of make-up.	*Facility Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cold Welding	Cohesion between two surfaces of a metal, generally under the influence of externally applied pressure at room temperature.	*Paint and Coatings*
Cold Work	The hardening and embrittlement of metal by repeated flexing action.	*Electrical*
Cold-deck imputation	A statistical procedure that replaces a missing value of an item with a constant value from an external source such as a value from a previous survey. See Imputation.	*Energy*
Cold-galvanizing	Cold-galvanizing – See zinc-rich paint	*Materials Process*
Cold-rolled steel	steel that has been produced from a hot-rolled pickled coil and given substantial cold reduction at room temperature; cold-rolled steel is characterized by improved surface smoothness, greater uniformity in thickness and improved mechanical properties when compared to hot-rolled steel	*Materials Process*
Cold-Rolling (CR)	Rolling steel without first reheating it. This process reduces thickness of the steel, produces a smoother surface and makes it easier to machine.	*Metallurgy*
Cold-working	bending or forming ambient-temperature steel; this action induces stresses that may be released during the galvanizing process	*Materials Process*
Collaborative production management (CPM)	A method of unifying disparate yet interdependent production systems in order to optimize productivity. Computerized CPM solutions are software applications that enable process manufacturers to plan, track, analyze and direct their operations.	*Electrical*
Collaborative Trialists' Group	Investigators who conduct similar randomized controlled trials and agree to contribute individual patient data from their trials to a meta-analysis.	*Quality Engineering*
Collapse	An inward structural failure of a filter element which can occur due to abnormally high pressure drop (differential pressure) or resistance to flow.	*Oil Analysis*
Collapse pressure	The minimum differential pressure that an element is designed to withstand without permanent deformation.	*Oil Analysis*
Collapse pressure	The outside-iD differential pressure that causes Structural failure.	*Mechanical, Process, and Operations*
Collar	The term applied to the timbering or concrete around the mouth of a shaft; also used to describe the top of a drill hole.	*Mining*
Collaring buntons	buntons in a shaft for steadying the pumps and taking the vibration.	*Mining*
Collector Region	in a transistor that receives charge carriers.	*Material Process*
Colliery	British name for coal mine.	*Mining*
Collinear	When the rotational centers of two shafts form a single, straight line then the shafts are said to be collinear.	*Maintenance*
Colloid	Colloidal systems are stable dispersions of microscopic solid particles.	*Chemical*
Colloquia/Colloquium	The annual conferences of The Cochrane Collaboration, which usually take place in October. They last for five or six days, and have between 600 and 1200 participants. Colloquia take place in countries where there is a Cochrane Centre, which volunteers to host a Colloquium, and is responsible for organizing it.	*Quality Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Colloquium Policy Advisory Committee (CPAC)	The CPAC is an advisory group to the CCSG. Its remit is to maintain a record of policy decisions about Cochrane Colloquia, to move forward new policies after appropriate consultation, and to help ensure that hosts of future Colloquia know about and adhere to such policies. (Formerly the Colloquium Policy Advisory Group). Also called: CPAC	*Quality Engineering*
Color	The predominant hue of lubricating grease (such as amber, brown or perhaps green, red, or blue for dyed grease) and intensity (light, medium, or dark) when viewed to eliminate Bloom.	*Lubrication*
Color Visual	sensation associated with various portions of the electromagnetic spectrum with wavelengths between 400 and 700 nm.	*Material Process*
Color Code	The ANSI established color code for thermocouple wires in the negative lead is always red. Color Code for base metal thermocouples is yellow for Type K, black for Type J, purple for Type E and blue for Type T.	*General Engineering*
Color Code	A color system for circuit identification by use of solid colors tracers, braids surface Printing, etc.	*Electrical*
Color Subcarrier	A modulated carrier, added to a television signal, to carry the color components. Examples: In NTSC television, a 3.579545MHz color subcarrier is quadrature-modulated by two color-difference signals and added to the luminance signal. The PAL television standard uses a subcarrier frequency of 4.43362MHz.	*Electrical Engineering*
Colorant	Additive for a polymer for a purpose of providing color.	*Material Process*
Color Code	The ANSI established color code for thermocouple wires in the negative lead is always red. Color Code for base metal thermocouples is yellow for Type K, black for Type J, purple for Type E and blue for Type T.	*Electrical*
Columbia	A breed of sheep developed by the United States Department of Agriculture to replace cross breeding on the range. In 1912, long wool breed rams were crossed with Rambouillet ewes to produce large ewes that yielded more pounds of wool and more pounds of lamb.	*Agriculture*
Column	Framework member; a main vertical supporting member in the tower framework.	*Facility Engineering*
Column anchor	(See Anchor Casting).	*Facility Engineering*
Column flotation	A precombustion coal cleaning technology in which coal particles attach to air bubbles rising in a vertical column. The coal is then removed at the top of the column.	*Mining*
Column flotation	A milling process, carried out in a tall cylindrical column, whereby valuable minerals are separated from gangue minerals based on their wettability properties.	*Mining*
Column sample	a channel or drill core sample taken to represent the entire geologic coalbed; it includes all partings and impurities that may exist in the coalbed.	*Energy*
Colzaline	a petroleum spirit used to fuel safety lamps.	*Mining*
Combination Adaptor Ring Gasket	A custom Ring Gasket that allows two flanges with different ring grooves to join and seal when Made-up.	*Petroleum Engineering*
Combine	a machine used for harvesting grain	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
combine	Harvester and threshing equipment combined into one machine. A primitive horse-drawn combine was introduced in Michigan in 1836. Use grew slowly until the 1930s when tractor-drawn models became available.	*Agriculture*
Combined air and flue gas systems	Combined air and flue gas systems allow heating boilers to operate independently of the room air. The air required for combustion is drawn in directly from the outside atmosphere. Such combined systems operate on the basis of a pipe-in-pipe concept: the inner pipe serves as flue pipe, while the combustion air is delivered to the heating boiler via the shaft between inner and outer pipe.	*Thermal Management*
Combined Chlorine (new)	The amount of chloramine or chloro-organic compounds present in water.	*Chemical Engineering*
Combined Cycle	Similar to the combustion turbine simple cycle, but includes a heat recovery steam generator that extracts heat from the combustion turbine exhaust flow to produce steam. This steam in turn powers a steam turbine engine.	*Energy*
Combined Cycle Plant	An electric generating station that uses waste heat from its gas turbines to produce steam for conventional steam turbines.	*Energy*
Combined cycle unit	An electric generating unit that consists of one or more combustion turbines and one or more boilers with a portion of the required energy input to the boiler(s) provided by the exhaust gas of the combustion turbine(s).	*Energy*
Combined heat and power (CHP) plant	A plant designed to produce both heat and electricity from a single heat source. Note: This term is being used in place of the term "cogenerator" that was used by EIA in the past. CHP better describes the facilities because some of the plants included do not produce heat and power in a sequential fashion and, as a result, do not meet the legal definition of cogeneration specified in the Public Utility Regulatory Policies Act (PURPA).	*Energy*
Combined household energy expenditures	The total amount of funds spent for energy consumed in, or delivered to, a housing unit during a given period of time and for fuel used to operate the motor vehicles that are owned or used on a regular basis by the household. The total dollar amount for energy consumed in a housing unit includes state and local taxes but excludes merchandise repairs or special service charges. Electricity, and natural gas expenditures are for the amount of those energy sources consumed. Fuel oil, kerosene, and LPG expenditures are for the amount of fuel purchased, which may differ from the amount of fuel consumed. The total dollar amount of fuel spent for vehicles is the product of fuel consumption and price.	*Energy*
Combined hydroelectric plant	A hydroelectric plant that uses both pumped water and natural streamflow for the production of power.	*Energy*
Combined pumped-storage plant	A pumped-storage hydroelectric power plant that uses both pumped water and natural stream flow to produce electricity.	*Energy*
Combined standard uncertainty	Standard uncertainty of the result of a measurement when that result is obtained from the values of a number of other quantities, equal to the positive square root of a sum of terms, the terms being the variances or covariances of these other quantities weighted according to how the measurement result varies with changes in these quantities. [ISO]	*Quality*
Combined-cycle power plant	conventional thermal power stations produce steam to drive turbines that generate electricity. In a combined cycle plant, two turbines are used. The first is driven by oil or gas, and waste heat from that process contributes to the production of steam to drive the second turbine	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Combustion	Chemical oxidation accompanied by the generation of light and heat.	*Energy*
Combustion chamber	An enclosed vessel in which chemical oxidation of fuel occurs.	*Energy*
Combustion Turbine	A fossil-fuel-fired power plant that uses the conversion process known as the Brayton cycle. The fuel, oil, or gas is combusted and drives a turbine-generator.	*Energy*
Come-Along	Device for making a temporary grip on a wire rope.	*Wire Rope & Cable*
cometabolism	the simultaneous metabolism of two compounds, in which the degradation of the second compound (the secondary substrate) depends on the presence of the first compound (the primary substrate). For example, in the process of degrading methane, some bacteria can degrade hazardous chlorinated solvents that they would otherwise be unable to attack.	*Chemical*
Command signal (Or input signal)	An external signal to which the servo must respond.	*Mechanical, Process, and Operations*
Commercial	Kerosene-type jet fuel intended for use in commercial aircraft.	*Energy*
Commercial building	A building with more than 50 percent of its floor space used for commercial activities. Commercial buildings include, but are not limited to, stores, offices, schools, churches, gymnasiums, libraries, museums, hospitals, clinics, warehouses, and jails. Government buildings are included except for buildings on military bases or reservations.	*Energy*
Commercial facility	An economic unit that is owned or operated by one person or organization and that occupies two or more commercial buildings at a single location. A university and a large hospital complex are examples of a commercial multi-building facility.	*Energy*
Commercial Field	An oil and/or gas field judged to be capable of producing enough net income to make it worth developing.	*Petroleum Drilling*
Commercial field	An oil and/or gas field judged to be capable of producing enough net income to make it worth developing.	*Petroleum Drilling*
Commercial Operation	Commercial operation occurs when control of the generator is turned over to the system dispatcher.	*Energy*
Commercial operation (nuclear)	The phase of reactor operation that begins when power ascension ends and the operating utility formally declares the nuclear power plant to be available for the regular production of electricity. This declaration is usually related to the satisfactory completion of qualification tests on critical components of the unit.	*Energy*
Commercial sector	An energy-consuming sector that consists of service-providing facilities and equipment of businesses; Federal, State, and local governments; and other private and public organizations, such as religious, social, or fraternal groups. The commercial sector includes institutional living quarters. It also includes sewage treatment facilities. Common uses of energy associated with this sector include space heating, water heating, air conditioning, lighting, refrigeration, cooking, and running a wide variety of other equipment. Note: This sector includes generators that produce electricity and/or useful thermal output primarily to support the activities of the above-mentioned commercial establishments.	*Energy*
Commercialization	Programs or activities that increase the value or decrease the cost of integrating new products or services into the electric sector.	*Energy*

Term	Definition	*Industry*
Commingling	The mixing of one utility's generated supply of electric energy with another utility's generated supply within a transmission system.	*Energy*
Comminution	The breaking, crushing, or grinding of coal, ore, or rock.	*Mining*
Commissioned agent	An agent who wholesales or retails a refined petroleum product under a commission arrangement. The agent does not take title to the product or establish the selling price, but receives a percentage of fixed fee for serving as an agent.	*Energy*
Commodity	an agricultural good	*Agriculture*
Commodity Agreement	Primary source agreements designated for supply of goods or services to the University established as a result of a competitive quotation for indefinite quantities during a period of time at firm prices or with an established basis for price changes.	*Procurement*
Commodity Credit Corporation	A federally owned and operated corporation within USDA. It was created to stabilize, support, and protect agricultural prices and farm income through loans, purchases, payments, and other operations.	*Agriculture*
Commodity Manager	The Strategic Sourcing Manager assigned responsibility on a University-wide basis for coordinating standards and specification development covering specific commodities or groups of commodities commonly used by two or more campuses, and for developing, negotiating, and monitoring pool purchases, commodity agreements, and price schedules for assigned commodities.	*Procurement*
Common carrier	Truck or trucking company licensed and regulated by the Surface Transportation Board. (They are different from exempt haulers who are truckers not regulated by the Interstate Commerce Commission.)	*Agriculture*
Common Costs	A common cost is a cost that is common to a number of costing objects but cannot be traced to them individually. For example, the wage cost of the pilot of a 747 airliner is a common cost of all of the passengers on the aircraft. Without the pilot, there would be no flight and no passengers. But no part of the pilot's wage is caused by any one passenger taking the flight.	*Procurement*
Common equity (book value)	The retained earnings and common stock earnings plus the balances in common equity reserves and all other common stock accounts. This also includes the capital surplus, the paid-in surplus, the premium on common stocks, except those balances specifically related to preferred or preference stocks; less any common stocks held in the treasury.	*Energy*
Common Mode	The output form or type of control action used by a temperature controller to control temperature, i.e. on/off, time proportioning, PID.	*Electrical*
Common Mode Rejection Ratio	The ability of an instrument to reject interference from a common voltage at its input terminals with relation to ground. Usually expressed in db (decibels).	*General Engineering*
Common stock	Shares in a company which have full voting rights which the holders use to control the company in common with each other. There is no fixed or assured dividend as with preferred shares, which have first claim on the distribution of a company's earnings or assets.	*Mining*
Common Strand	Galvanized strand made of galvanized iron wire whose grade is common iron.	*Wire Rope & Cable*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Commonly occurring in milk sugar or lactose. White crystals soluble in water and alcohol, slightly soluble in glycerol	commonly occurring in milk sugar or lactose. White crystals soluble in water and alcohol, slightly soluble in glycerol.	*Material Process*
Common-Mode Signals	Common-mode signals are identical signal components on both the + and - inputs of a differential amplifier or instrumentation amplifier. A common example is in a balanced pair, where a noise voltage is induced in both conductors. Another example is where a DC component is added (e.g. due to a difference in ground between the signal source and the receiver). In an ideal differential amp, the common-mode element is cancelled out, since the differential (+ and -) inputs should subtract out the identical components. A measurement of the actual ability to do this is called the Common Mode Rejection Ratio, or CMRR.	*Electrical Engineering*
Common-Mode Signals	Common-mode signals are identical signal components on both the + and - inputs of a differential amplifier or instrumentation amplifier. A common example is in a balanced pair, where a noise voltage is induced in both conductors. Another example is where a DC component is added (e.g. due to a difference in ground between the signal source and the receiver).	*Electrical Engineering*
Communication	Transmission and reception of data among data processing equipment and related peripherals.	*General Engineering*
Community Supported Agriculture (CSA)	a farm that is funded by a group of community members. Members pay an annual or quarterly fee in exchange for a weekly assortment of farm fresh produce or other farm products. Many CSAs are year round, but in the foothills, most provide produce from spring through fall. CSA helps local farmers increase cash flow and diversifies risk over multiple crops.	*Agriculture*
Co-morbidity	Coexistence of a disease or diseases in a study participant in addition to the index condition that is the subject of study.	*Analysis*
Compact fluorescent bulbs	These are also known as "screw-in fluorescent replacements for incandescent" or "screw-ins." Compact fluorescent bulbs combine the efficiency of fluorescent lighting with the convenience of a standard incandescent bulb. There are many styles of compact fluorescent, including exit light fixtures and floodlights (lamps containing reflectors). Many screw into a standard light socket, and most produce a similar color of light as a standard incandescent bulb. Compact fluorescent bulbs come with ballasts that are electronic (lightweight, instant, no-flicker starting, and 10to 15% more efficient) or magnetic (much heavier and slower starting). Other types of compact fluorescent bulbs include adaptive circulation and PL and SL lamps and ballasts. Compact fluorescent bulbs are designed for residential uses; they are also used in table lamps, wall sconces, and hall and ceiling fixtures of hotels, motels, hospitals, and other types of commercial buildings with residential-type applications.	*Energy*
Compact round conductor	A conductor constructed with a central core surrounded by one or more layers of helically laid wires and formed into final shape by rolling, drawing, or other means.	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Compact Stranded Conductor	A unidirectional or conventional concentric conductor manufactured to a specified diameter, approximately 8 to 10% below the nominal diameter of a non-compact conductor of the same cross-sectional area.	*Electrical*
Compaction	the compression of air spaces in the soil by heavy machinery	*Agriculture*
Companion Flange	A pipe flange suited to connect with another flange or with a flanged valve or fitting. A loose flange which is attached to a pipe by threading, van stoning, welding, or similar method as distinguished from a flange which is cast integrally with a fitting or pipe.	*Maintenance and Repair*
Company	Company: See Firm.	*Energy*
Company automotive (retail) outlet	Any retail outlet selling motor fuel under the brand name of a company reporting in the EIA Financial Reporting System.	*Energy*
Company man	An operating company employee who supervises the well or drilling site operations. Also referred to as a company hand or operator's representative.	*Petroleum Drilling*
Company outlet	Company outlet: See Company-operated automotive outlet.	*Energy*
Company-lessee automotive outlet	One of three types of company automotive (retail) outlets. This type of outlet is operated by an independent marketer who leases the station and land and has use of tanks, pumps, signs, etc. A lessee dealer typically has a supply agreement with a refiner or a distributor and purchases products at dealer tank wagon prices. The term includes outlets operated by commissioned agents and is limited to those dealers who are supplied directly by a refiner or any affiliate or subsidiary company of a refiner.	*Energy*
Company-open automotive outlet	One of three types of company automotive (retail) outlets. This type of outlet is operated by an independent marketer who owns or leases (from a third party that is not a refiner) the station or land of a retail outlet and has use of tanks, pumps, signs, etc. An open dealer typically has a supply agreement with a refiner or a distributor and purchases products based on either rack or dealer tank wagon prices.	*Energy*
Company-operated automotive outlet	One of three types of company automotive (retail) outlets. This type of outlet is operated by salaried or commissioned personnel paid by the reporting company.	*Energy*
Company-operated outlet	See Company-operated retail outlet.	*Energy*
Company-operated retail outlet	Any retail outlet (i.e., service station) which sells motor vehicle fuels and is under the direct control of a firm that sets the retail product price and directly collects all or part of the retail margin. The category includes retail outlets operated by (1) salaried employees of the firm and/or its subsidiaries and affiliates, (2) licensed or commissioned agents, and/or (3) personnel services contracted by the firm.	*Energy*
Comparability	When a transmission owner provides access to transmission services at rates, terms and conditions equal to those the owner incurs for its own use.	*Energy*
Comparative method, comparative analytical method	Used here to indicate the analytical method to which the test method (the one under study) is compared in the comparison of methods experiment. This term make no inference about the quality of the method. Other terms such as definitive method, reference method, designated comparative method, or field method can be used to make some inference about the quality of the comparative method.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Comparison	A term applied to calibration (*e.g.* of an accelerometer) in which sensitivity is tested against a standard. See also absolute calibration.	*Reliability Engineering*
Comparison graph, comparison plot	Used here to refer to the display of paired test results in which the test method values are plotted on the y-axis versus the comparison method values on the x axis.	*Quality*
Comparison group	Any group to which the index group is compared. Usually synonymous with control group.	*Analysis*
Comparison of methods experiment	A method validation experiment in which a series of patient samples are analyzed both by the test method (the one under study) and a comparison method (an established method). The purpose is to assess whether a systematic difference (i.e., bias or inaccuracy) exists between the two methods. The differences in results by the two methods are interpreted as analytical errors between the methods.	*Quality*
Compatibility	The ability of two or more substances to mix with each other to form a homogeneous composition of useful properties.	*Material Process*
Compensated Connector	A connector made of thermocouple alloys used to connect thermocouple probes and wires.	*Electrical*
Compensating Alloys	Alloys used to connect thermocouples to instrumentation. These alloys are selected to have similar thermal electric properties as the thermocouple alloys (however, only over a very limited temperature range).	*Electrical*
Compensating Loop	Lead wire resistance compensation for RTD elements where an extra length of wire is run from the instrument to the RTD and back to the instrument, with no connection to the RTD.	*Electrical*
Compensation	An addition of specific materials or devices to counteract a known error.	*General Engineering*
Compensation	Procedure of providing a supplemental device, circuit, or special materials to counteract known sources of error (e.g., ambient temperature change). Compensation is often related to temperature compensation only.	*Electrical Engineering*
Compensator control	A displacement control for variable pumps and motors which alters displacement in response to pressure changes in the system as related to its adjusted pressure setting.	*Mechanical, Process, and Operations*
Competent rock	Rock which, because of its physical and geological characteristics, is capable of sustaining openings without any structural support except pillars and walls left during mining (stalls, light props, and roof bolts are not considered structural support).	*Mining*
Competing failure modes	A model whereby items that fail due to more than one failure mode can be represented as a series reliability system with each block representing a failure mode. The failure modes are considered to be "competing" amongst each other to see which one will cause the item to fail.	*Reliability Engineering*
Competition	The struggle between trees and other plant life to obtain sunlight, nutrients, water, and growing space.	*Forestry*
Competitive Bidding	This is a procedure that utilities use to select suppliers of new electric capacity and energy. Under competitive bidding, an electric utility solicits bids from prospective power generators to meet current or future power demands. When offers from independent power producers began exceeding utility needs in the mid-1908's, utilities and state regulators began using competitive bidding systems to select more fairly among numerous supply alternatives.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Competitive Franchise	A process whereby a municipality (or group of municipalities) issues a franchise to supply electricity in the community to the winner of a competitive bid process. Such franchises can be for bundled electricity and transmission/distribution, or there can be separate franchises for the supply of electricity services and the transmission and distribution function. Franchises can be, but typically are not, exclusive licenses.	*Energy*
Competitive Quotation	Responsive price quotations from a minimum of three qualified suppliers submitted in accordance with a solicitation from the Director of Business Services or Associate Director of Procurement Services.	*Procurement*
Competitive transition charge	A non-bypassable charge levied on each customer of the distribution utility, including those who are served under contracts with nonutility suppliers, for recovery of the utility's stranded costs that develop because of competition.	*Energy*
Competitive Transition Charge (CTC)	A "nonbypassable" charge generally placed on distribution services to recover utility costs incurred as a result of restructuring (stranded costs - usually associated with generation facilities and services) and not recoverable in other ways.	*Energy*
Compiler	A program that translates a high-level language, such as Basic, into machine language.	*General Engineering*
Complement	The angle that needs to be added to a given angle to give 90°.	*Math*
Complementary Output	Having both N.O. and N.C. outputs are available for use. A circuit that provides sink or source capability with a single input. Output that can be both light operated and dark operated. (Also known as 4: wire DC controls.)	*Electrical Engineering*
Complementary	Two angles that add up to 90°.	*Math*
Complete	Engineering noting a determinate truss having the least number of members required to connect the panel points so as to form a system of triangles.	*Civil Engineering*
Complete data	A data set consisting only of failure times.	*Reliability Engineering*
Complete solid solution	Binary phase diagram representing two components that can dissolve in all proportions.	*Material Process*
Completed well	A well that has had the necessary work done to enable production.	*Petroleum Engineering*
Completing wells	in additional zones	*Petroleum Drilling*
Completion	A generic term used to describe the events and equipment necessary to bring a wellbore into production once drilling operations have been concluded, including but not limited to the assembly of downhole tubulars and equipment required to enable safe and efficient production from an oil or gas well. Completion quality can significantly affect production from shale reservoirs.	*Petroleum Drilling*
Completion	The installation of permanent wellhead equipment for the production of oil and natural gas.	*Petroleum Drilling*
Completion (oil/gas production)	The term refers to the installation of permanent equipment for the production of oil or gas. If a well is equipped to produce only oil or gas from one zone or reservoir, the definition of a "well" (classified as an oil well or gas well) and the definition of a "completion" are identical. However, if a well is equipped to produce oil and/or gas separately from more than one reservoir, a "well" is not synonymous with a "completion." (See Well.)	*Energy*

Term	Definition	*Industry*
Completion date (oil/gas production)	The date on which the installation of permanent equipment has been completed as reported to the appropriate regulatory agency. The date of completion of a dry hole is the date of abandonment as reported to the appropriate agency. The date of completion of a service well is the date on which the well is equipped to perform the service for which it was intended.	*Energy*
Completion	The installation of permanent wellhead equipment for the production of oil and gas.	*Petroleum Drilling*
Complex directional well	basically same as 3D directional well.	*Petroleum Drilling*
Complex failure	Material fracture involving the sequential operation of two distinct mechanism.	*Material Process*
Complex Function	Any mathematically defined relationship given by the following expression: y(x) = a(x) + ib(x), Where: x = the real variable, a(x) = the real part of y(x), b(x) = the imaginary part of y(x), Complex functions are usually expressed in terms of both their amplitude and phase.	*General*
Complex Grease	A lubricating grease thickened by a complex soap consisting of a normal soap and a complexing agent.	*Lubrication*
Complex instruction set computer	Computer hardware designed to support complex instructions, as opposed to RISC (reduced instruction set computer) architecture.	*Electrical Engineering*
Complex ore	An ore containing a number of minerals of economic value. The term often implies that there are metallurgical difficulties in liberating and separating the valuable metals.	*Mining*
Complex Soap	A soap crystal or fiber formed usually by co-crystallization of two or more compounds. Complex soaps can be a normal soap (such as metallic stearate or oleate), or incorporate a complexing agent which causes a change in grease characteristics usually recognized by an increase in dropping point.	*Lubrication*
Complex system	A block diagram that cannot be reduced to series and/or parallel systems.	*Reliability Engineering*
Complex Wave	The resultant form of a number of sinusoidal waves that are summed together forming a periodic wave. Such waves may be analyzed in the frequency domain to readily determine their component parts.	*General Engineering*
Complexation	a reaction in which a metal ion and one or more anionic ligands chemically bond. Complexes often prevent the precipitation of metals.	*Chemical*
Compliance coal	A coal or a blend of coals that meets sulfur dioxide emission standards for air quality without the need for flue gas desulfurization.	*Energy*
Compliance coal	a coal, or a blend of coal, that meets sulfur dioxide emission standards for air quality without the need for flue-gas desulfurization.	*Energy*
Compliance Steer	A steering effect caused by the deflection or compliance of bushings, joints, and other suspension components under loads and forces.	*Mechanical Engineering*
Compliance Test	Test used to show whether or not a characteristic or a property of an asset complies with state requirements.	*Maintenance*
Compliance.	The reciprocal of s*tiffness*, *i.e.* displacement divided by force.	*Reliability Engineering*
Component	A Subassembly Of An Asset, Usually Removable In One Piece And Interchangeable With Other, Standard Components (e.g., Truck Engine).	*Plant Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Component (of a vector)	Any vector can be expressed as a collection of vectors whose sum is equal to the original vector. Each vector in this collection is a component of the original vector. It is common to express a vector in terms of components which are parallel to the x and y axes.	*Engineering Physics*
Components	A single hydraulic unit.	*Mechanical, Process, and Operations*
Composite	A solid material made of two or more different substances, combined to produce a new substance whose properties are superior to the original components in a specific application.	*Chemical*
Composite	Material composed of a microscopic scale combination of individual materials from the categories of metals, ceramics, glasses, and polymers.	*Material Process*
Composite Coating	Mixture of two or more materials. Many thermal spray coatings could be considered as composites.	*Paint and Coatings*
Composite Headlamps	Usually manufactured with replaceable halogen bulbs and separate hard acrylic or glass lenses. This type of lamp provides superior illumination compared to the long-conventional sealed beam unit.	*Mechanical Engineering*
Composite Powder	A powder in which each particle consists of two or more distinct materials joined together.(Not the same as a powder blend.)	*Paint and Coatings*
Composite sample	a recombined coalbed sample produced by averaging together thickness-weighted coal analyses from partial samples of the coalbed, such as from one or more bench samples, from one or more mine exposures or outcrops where the entire bed could not be accessed in one sample, or from multiple drill cores that were required to retrieve all local sections of a coal seam.	*Energy*
Composites	complex materials, such as wood or fiberglass, in which two or more distinct, structurally complementary substances, especially metals, ceramics, glasses, and polymers, combine to produce structural or functional properties not present in any individual component. A material formed by blending two materials in distinct phases causing a new material with different properties than either parent	*Physics*
Composition	A process variable. Represents the amount of one material in a solution, or gas.	*Process Control Engineering*
Composition	A mix of two or more materials not chemically united.	*Material Process*
Compound	A compound (or molecule) is a combination of two or more different chemical elements (atoms) held together by chemical bonds.	*Chemical*
Compound	(1) chemically speaking, a distinct substance formed by the combination of two or more elements in definite proportions by weight and possessing physical and chemical properties different from those of the combining elements. (2) in petroleum processing, generally connotes fatty oils and similar materials foreign to petroleum added to lubricants to impart special properties.	*Lubrication*
Compound semiconductor	Semi conductor consisting of a chemical compound, rather than a single element.	*Material Process*
Compounded oil	A petroleum oil to which has been added other chemical substances.	*Oil Analysis*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Compounding	The addition of fatty oils and similar materials to lubricants to impart special properties. Lubricating oils to which such materials have been added are known as compounded oils.	*Lubrication*
Compounding (see Blending)	The mixing or otherwise combining lubricant components with other components for the purpose of securing chemical and/or physical properties not usually obtainable by blending of fluid lubricant components alone.	*Lubrication*
Compounds	Substances formed from the chemical bonding of two or more atoms.	*Chemical Engineering*
Compregnated wood	Proprietary term rapidly becoming generic to describe wood veneer material impregnated with resin and bonded under high pressure.	*Material Process*
Comprehensive National Energy Policy Act	Federal legislation in 1992 that opened the U.S. electric utility industry to increase competition at the wholesale level and left authority for retail competition to the states.	*Energy*
Compressed natural gas (CNG)	Natural gas compressed to a pressure at or above 200-248 bar (i.e., 2900-3600 pounds per square inch) and stored in high-pressure containers. It is used as a fuel for natural gas-powered vehicles.	*Energy*
Compressibility	The change in volume of a unit volume of a fluid when it is subjected to a unit change in pressure.	*Mechanical, Process, and Operations*
Compressible Fluid	A gaseous fluid such as steam, which has a significant change in volume and density as pressure increases.	*Industrial Engineering*
Compression molding	Processing technique for thermosetting species with distance. Process of molding in which a measured quantity of plastic is placed in the cavity of a heated open mold and the mold is closed under pressure to consolidate the compound and form to the shape of the mold. Thermosetting compounds are then hardened by further heat under pressure, thermoplastic compounds by chilling the mold.	*Material Process*
Compression Ratio	The volume of the combustion chamber and cylinder when the piston is at the bottom of its stroke, divided by the volume of the combustion chamber and cylinder when the piston is at the top of its stroke. Higher compression ratios tend to increase engine efficiency.	*Mechanical Engineering*
Compression train	In the oil and gas industry, the compression train is the entire line of equipment that contributes to process of compressing gas - It includes valves, scrubbers, coolers and recycling loops.	*Electrical*
Compressive strength	The crushing load at failure of piece divided by the number of square inches of resisting surface.	*Material Process*
Compressor	A machine used to boost natural gas pressure to move it through pipelines or other facilities.	*Petroleum Engineering*
Compressor	A device which converts mechanical force and motion into pneumatic fluid power.	*Lubrication*
Compressor (Air Conditioning)	The mechanism is an air conditioner that pumps vaporized refrigerant out of the evaporator, compresses it to a high pressure, and then delivers it to the condenser.	*Mechanical Engineering*
Compressor station	Any combination of facilities that supply the energy to move gas in transmission or distribution lines or into storage by increasing the pressure.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Computer-Aided Design (CAD)	Computer-based systems for product design that may incorporate analytical and "what if" capabilities to optimize product designs. Many CAD systems capture geometric and other product characteristics for engineering-data-management systems, production and cost analysis, and performance analysis. In many cases, CAD-generated data is used to generate tooling instructions for computer-numerical-control (CNC) systems.	*Maintenance*
Computer-aided manufacturing (CAM)	Computerized systems in which manufacturing instructions are downloaded to automated equipment or to operator workstations.	*Quality*
Computer-aided process planning (CAPP)	Software-based systems that aid manufacturing engineers in creating a process plan to manufacture a product whose geometric, electronic, and other characteristics have been captured in a CAD database. CAPP systems address such manufacturing criteria as target costs, target lead times, anticipated production volumes, availability of equipment, production routings, opportunity for material substitution, and test requirements.	*Quality*
Computer-integrated manufacturing (CIM)	A variety of approaches in which computer systems communicate or interoperate over a local-area network. Typically, CIM systems link management functions with engineering, manufacturing, and support operations. In the factory, CIM systems may control the sequencing of production operations, control operation of automated equipment and conveyor systems, transmit manufacturing instructions, capture data at various stages of the manufacturing or assembly process, facilitate tracking and analysis of test results and operating parameters, or a combination of these.	*Quality*
Computerized Maintenance Management System	A Computerized System To Assist With The Effective And Efficient Management Of Maintenance Activities Through The Application Of Computer Technology. It Generally Includes Elements Such As A Computerized Work Order System, As Well As Facilities For Scheduling Routine Maintenance Tasks, And Recording And Storing Standard Jobs, Bills Of Materials And Applications Parts Lists, As Well As Numerous Other Features.	*Plant Engineering*
Computerized Maintenance Management System (CMMS)	Hardware and software system used to track work orders, equipment histories, and preventive/predictive maintenance schedules; usually integrated with support systems such as inventory control, purchasing, accounting, and manufacturing; computerized system, to track, monitor, measure and control maintenance and warehouse activities. (McKenna T & Oliverson R, "Glossary of Reliability and Maintenance Terms", Gulf Publishing Company, ISBN 0-88415-360-6 (1997))	*Maintenance*
Computerized maintenance management systems (CMMS)	Software-based systems that analyze operating conditions of production equipment - vibration, oil analysis, heat, etc. - and equipment-failure data, and apply that data to the scheduling of maintenance and repair inventory orders and routine maintenance functions. A CMMS prevents unscheduled machine downtime and optimizes a plant's ability to process product at optimum volumes and quality levels.	*Quality*
Computerized process simulation	Use of computer simulation to facilitate sequencing of production operations, analysis of production flows, and layout of manufacturing facilities.	*Quality*
Computerized SPC	See "statistical process control."	*Quality*
CONCAWE	Conservation of Clean Air and Water-Europe	*Petro-Chemical Abbreviations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Concealed Coalfield	the part of the coalfield where the coal measures are covered by younger rock strata such as the Permo-Trias. –See also 'Exposed Coalfield'.	*Mining*
Concealment of allocation	The process used to ensure that the person deciding to enter a participant into a randomized controlled trial does not know the comparison group into which that individual will be allocated. This is distinct from blinding, and is aimed at preventing selection bias. Some attempts at concealing allocation are more prone to manipulation than others, and the method of allocation concealment is used as an assessment of the quality of a trial. See also: Bias prevention Also called: Allocation concealment, Randomisation blinding	*Quality Engineering*
Concentrate	The retained sample after filtration is complete.	*Pollution Engineering*
Concentrate	The undiluted form of a dilutable cleaning product.	*Chemistry*
Concentrate	A fine, powdery product of the milling process containing a high percentage of valuable metal.	*Mining*
Concentrated force	A force considered to act along a single line in space. Concentrated forces are useful mathematical idealizations, but cannot be found in the real world, where all forces are either body forces acting over a volume or surface forces acting over an area.	*Engineering Physics*
Concentrated load	An external force which a concentrated force.	*Engineering Physics*
Concentrating solar power or solar thermal power system	A solar energy conversion system characterized by the optical concentration of solar rays through an arrangement of mirrors to generate a high temperature working fluid. Also see Solar trough, Solar power tower, or Solar dish. Concentrating solar power (but not Solar thermal power) may also refer to a system that focuses solar rays on a photovoltaic cell to increase conversion efficiency.	*Energy*
Concentration	The process of increasing solids per unit volume of solution, usually by evaporation of the liquid; also, the amount of material dissolved in a unit volume of solution. This occurs in a cooling tower due to evaporation that cools the water. It is normally expressed directly as ppm or indirectly as mhos conductivity.	*Chemical Engineering*
Concentration gradient	Change in concentration of a given diffusion species with distance.	*Material Process*
Concentration Polarization	The accumulation of retained solute on the surface of the membrane. This is caused by a combination of factors including transmembrane pressure, viscosity, solute concentration and crossflow velocity.	*Pollution Engineering*
Concentrator	A reflective or refractive device that focuses incident insolation onto an area smaller than the reflective or refractive surface, resulting in increased insolation at the point of focus.	*Energy*
Concentrator	A milling plant that produces a concentrate of the valuable minerals or metals. Further treatment is required to recover the pure metal.	*Mining*
Concentric	Having the same centers.	*Mechanical*
Concentric lay Conductor	Conductor constructed with a central core surrounded by one or more layers of helically laid wires. Several types are as follows:	*Electrical*
Concentric Reducer	A pipe fitting that reduces from a larger to a smaller size on each end. Available in threaded (swage nipple) or butt weld preparations, with the ends concentric along a common axis.	*Petroleum Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Concentric Stranding	A method of stranding, wherein a single conductor is formed from a central wire surrounded by one or more layers of helically laid wires. Each layer is applied with an opposite direction of lay. The first layer has six wires, and each additional layer has six more wires than does the previous one. Thus the second layer has twelve wires, the third layer has eighteen wires, etc.	*Electrical*
Concentricity	In a wire or cable, the measurement of the location of the center of the conductor with respect to the geometric center of the circular insulation.	*Electrical*
Concession	The operating right to explore for and develop petroleum fields in consideration for a share of production in kind (equity oil).	*Energy*
Concessionary purchases	The quantity of crude oil exported during a reporting period, which was acquired from the producing government under terms that arise from the firm's participation in a concession. It includes preferential crude where the reporting firm's access to such crude is derived from a former concessionary relationship.	*Energy*
Conclusion	Summing up of points and statements	*Management Discussion*
Concrete	A mixture of water, cement, and sand or gravel.	*Petroleum Engineering*
Concrete	a material of construction not usually used under severe corrosive conditions other than as a substrate. Composite of aggregate, cement, water, and, in some cases, admixtures.	*Material Process*
Concrete cooling tower	Cooling tower in which the structure is made of concrete.	*Facility Engineering*
Concurrent engineering	A cross-functional, team-based approach in which the product and the manufacturing process are designed and configured within the same time frame, rather than sequentially. Ease and cost of manufacturability, as well as customer needs, quality issues, and product-life-cycle costs are taken into account earlier in the development cycle. Fully configured concurrent-engineering teams include representation from marketing, design engineering, manufacturing engineering, and purchasing, as well as supplier - and even customer companies.	*Quality*
Condensate	the liquid that separates from a vapor during condensation.	*Chemical*
Condensate	Hydrocarbons which are in the gaseous state under reservoir conditions and which become liquid when temperature or pressure is reduced. A mixture of pentanes and higher hydrocarbons.	*Petroleum Drilling*
Condensate (lease condensate)	Light liquid hydrocarbons recovered from lease separators or field facilities at associated and non-associated natural gas wells. Mostly pentanes and heavier hydrocarbons. Normally enters the crude oil stream after production.	*Energy*
Condensate Recovery	Condensate recovery is the process of capturing, drainage, and resupply of the surplus condensate water that occurs after heat exchange. Typically the recovered condensate gets pumped into the feed water tank. Retaining this water not only save costs on input water, but minimizes loss due to cooling of the heat exchange device. See also Reticulation and Flashing	*Industrial*
Condensate	Liquid hydrocarbons recovered by surface separators from natural gas. It is also referred to as natural gasoline and distillate.	*Petroleum Drilling*
Condensate	Hydrocarbons which are in the gaseous state under reservoir conditions and which become liquid when temperature or pressure is reduced. A mixture of pentanes and higher hydrocarbons.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Condensation	The process of changing from a gaseous to a liquid, usually due to a drop in temperature or pressure.	*Industrial*
Condensation resins	Resins formed by chemical reaction in which water is separated. Examples urea resins.	*Material Process*
Condenser	A condenser is a water-cooled shell and tube heat exchanger installed on the exhaust steam system, which converts steam from its gaseous form to a liquid state at a pressure below atmospheric pressure.	*Industrial*
Condenser (Air Conditioning)	Air conditioning component used to remove heat from the inside of a vehicle.	*Mechanical Engineering*
Condenser cooling water	A source of water external to a boiler's feed system is passed through the steam leaving the turbine in order to cool and condense the steam. This reduces the steam's exit pressure and recaptures its heat, which is then used to preheat fluid entering the boiler, thereby increasing the plant's thermodynamic efficiency.	*Energy*
Condenser reflux	Condensate that is returned to the original unit to assist in giving increased conversion or recovery.	*Petroleum Engineering*
Condensing boiler	A condensing boiler operates with infinitely variable temperature; unlike conventional boilers, it additionally utilizes the condensation heat contained in the flue gas. The condensing boiler cools the flue gases so that the water vapor contained in the flue gas condenses. The heat liberated in the process is used for heating purposes. Gas-fired condensing boilers achieve standard efficiency values of up to 110 %.	*Thermal Management*
Condition Based Depreciation (CBD)	A form of depreciation that directly assesses and measures the run down in service potential of an asset. It is based on an auditable and cost-justified asset renewal plan. The cost of replacing lost service potential over the next 10-30 years (the exact period depends on the agency and the nature of the assets involved) is expressed as an annuity over the period. That annuity is the depreciation estimate. CBD is re-estimated on a continuous basis, based on a rolling future period. It is only used for assets which are essentially renewable rather than replaceable, i.e. infrastructure assets.	*Reliability Engineering*
Condition Based Maintenance	An Equipment Maintenance Strategy Based On Measuring The Condition Of Equipment In Order To Assess Whether It Will Fail During Some Future Period, And Then Taking Appropriate Action To Avoid The Consequences Of That Failure. The Condition Of Equipment Could Be Monitored Using Condition Monitoring, Statistical Process Control Techniques, By Monitoring Equipment Performance, Or Through The Use Of The Human Senses. The Terms Condition Based Maintenance, On-Condition Maintenance And Predictive Maintenance Can Be Used Interchangeably.	*Plant Engineering*
Condition Monitoring	The Use Of Specialist Equipment To Measure The Condition Of Equipment. Vibration Analysis, Tribology And Thermography Are All Examples Of Condition Monitoring Techniques.	*Plant Engineering*
Condition Monitoring	A component of predictive maintenance, it is the process of examining parameters of machinery health in order to identify the onset of developing failure. A deviation from a reference value triggers specified actions. Maintenance is scheduled or actions taken to avoid the consequence of failure before it occurs.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Condition monitoring (CM)	The measurement, recording and analysis of machinery parameters (such as acceleration) to determine machinery health. Today's condition is compared with earlier condition, as when a machine was new. Also called machinery health monitoring, MHM.	*Reliability Engineering*
Conditional Probability of Failure	The Probability That An Item Will Fail During A Particular Age Interval, Given That It Survives To Enter That Age.	*Management*
Conditionally effective rates	An electric rate schedule that has been put into effect by the FERC subject to refund pending final disposition or refiling.	*Energy*
Conditioning	The process of subjecting a material to a stipulated influence or combination of influences for a stipulated period of time. The influences may be relative humidity, temperature, light, pressure, air, composition or other factors used jointly or separately. Average room conditions: 40% relative humidity at 77 °F (25°C). Dry room conditions: 15% relative humidity at 85 °F (26.94°C). Most room conditions: 75% relative humidity at 77 °F (25°C).	*Material Process*
Conductance	The measure of the ability of a solution to carry an electrical current. (See Equivalent Conductance)	*Electrical*
Conduction	The conveying of electrical energy or heat through or by means of a conductor.	*Electrical*
Conduction band	A range of electron energies in a solid associated with an unoccupied energy level in an isolated atom. An electron in a semiconductor becomes a charge carrier upon promotion to this band.	*Material Process*
Conduction electron	A negative charge carrier in a semiconductor.	*Material Process*
Conductivity	The ability of water to conduct electricity. When measured with a standard apparatus, it is called specific conductivity and is a function of the total ionic dissolved solids. As a rule of thumb, TDS = 2/3 specific conductance measured as micromhos.	*Chemical Engineering*
Conductivity	a coefficient of proportionality describing the rate at which a fluid (e.g., water or gas) can move through a permeable medium. Conductivity is a function of both the intrinsic permeability of the porous medium and the kinematic viscosity of the fluid which flows through it.	*Chemical*
Conductor	An object or substance which conducts or leads electric current. A wire, cable, busbar, rod, or tube can serve as a path for electricity to flow. The most common conductor is an electrical wire.	*Energy*
Conductor	A wire or combination of wires not insulated from one another, suitable for carrying an electric current.	*Electrical*
Conductor Core	The center strand or member about which one of more layers of wires or members are laid helically to form a concentric:lay or rope:lay conductor.	*Electrical*
Conduits	Conduits—see Congates.	*Mining*
Cone crusher	A machine which crushes ore between a gyrating cone or crushing head and an inverted, truncated cone known as a bowl.	*Mining*
Cone of Depression	Cone of depression (or influence) is the drawdown of the water table or potentiometric surface (the level to which water will rise in a tightly cased, or sealed, well) that has the shape of an inverted cone and develops around a well when it	*Petroleum Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	is pumped (water is being withdrawn). It defines the area of influence of a well. The drawdown cones of two wells close together may overlap so, if the wells are pumped simultaneously, they will compete with each other for available groundwater (well interference).	
Cone of depression	the area around a discharging well where the hydraulic head (potentiometric surface) in the aquifer has been lowered by pumping. In an unconfined aquifer, the cone of depression is a cone-shaped depression in the water table where the media has actually been dewatered.	*Chemical*
Cone Proof Load	This is an axial applied force applied to a nut when it is seated on a cone shaped washer which has an included angle of 120 degrees. Failure in this test is usually due to the nut splitting. The intention of the test is to introduce a nut dilation operation which will assess the potential detrimental effects of surface discontinuities. This type of test is sometimes applied to nuts which are intended for high temperature service.	*Maintenance*
Coneloc Nut	The Coneloc is an all metal prevailing torque type self-locking nut. The locking action is achieved by localized precision deformation of the thread in the cone section on top of the nut. When the nut is tightened onto the bolt, the thread is gripped on the flanks providing the locking action. Coneloc is a trade mark of NUTS BOLTS Limited	*Maintenance*
Conference abstracts/ proceedings	Short summaries of presentations at conferences, which may be published as proceedings. Abstracts from Cochrane Colloquia are available on the Collaboration web site.	*Quality Engineering*
Conference of the parties (COP)	The collection of nations that have ratified the Framework Convention on Climate Change(FCCC). The primary role of the COP is to keep implementation of the FCCC under review and make the decisions necessary for its effective implementation. Also see Framework Convention on Climate Change (FCCC).	*Energy*
Confidence bounds	A measure of the precision of a statistical estimate. This is represented by a range of values that the particular estimate should fall between a specified percentage of the time. For example, if we perform ten different reliability tests for our items and analyze the results, we will obtain slightly different parameters for the distribution each time, and thus slightly different reliability results. However, by employing confidence bounds, we obtain a range within which these reliability values are likely to occur a certain percentage of the time. This helps us gauge the utility of the data and the accuracy of the resulting estimates.	*Reliability Engineering*
Confidence interval	A measure of the uncertainty around the main finding of a statistical analysis. Estimates of unknown quantities, such as the odds ratio comparing an experimental intervention with a control, are usually presented as a point estimate and a 95% confidence interval. This means that if someone were to keep repeating a study in other samples from the same population, 95% of the confidence intervals from those studies would contain the true value of the unknown quantity. Alternatives to 95%, such as 90% and 99% confidence intervals, are sometimes used. Wider intervals indicate lower precision; narrow intervals, greater precision. Also called: CI, Logo, Cochrane	*Quality Engineering*

Term	Definition	*Industry*
Confidence interval (CI)	The range of numerical values in which we can be confident (to a computed probability, such as 90 or 95%) that the population value being estimated will be found. Confidence intervals indicate the strength of evidence; where confidence intervals are wide, they indicate less precise estimates of effect. See Precision	*Analysis*
Confidence interval, confidence range	The interval or range of values which will contain the population parameter with a specified probability.	*Quality*
Confidence Level	The range (with a specified value of uncertainty, usually expressed in percent) within which the true value of a measured quantity exists.	*General Engineering*
Configuration maps	Geographic information containing transmission line, substation, and terminal information. It shows the normal operating voltages and includes information about other operational and political boundaries.	*Energy*
confined aquifer	a fully saturated aquifer overlain by a confining layer. The potentiometric surface (hydraulic head) of the water in a confined aquifer is at an elevation that is equal to or higher than the base of the overlying confining layer. Discharging wells in a confined aquifer lower the potentiometric surface which forms a cone of depression, but the saturated media is not dewatered.	*Chemical*
Confined Aquifer (Artesian Aquifer)	An aquifer in which the water is confined by both an upper and lower impermeable layer, isolating the groundwater from the atmosphere at the point of discharge. Water is held under pressure and the water level in wells stands above the top of the aquifer. Confined groundwater is generally subject to pressure greater than atmospheric.	*Petroleum Engineering*
Confining layer	a geologic formation characterized by low permeability that inhibits the flow of water (see also aquitard).	*Chemical*
Confining Unit	A geological layer either of unconsolidated material, usually clay or hardpan, or bedrock, usually shale, through which virtually no water moves.	*Petroleum Engineering*
Confirmation	A form delivered by a broker to the client, setting forth the details of stock sales or purchases for the client.	*Mining*
Conflict Of Interest	A situation in which an individual has a personal interest (or responsibility as well as a job responsibility) and a clear possibly exists that there may be a conflict between the two. The individual's actions may be influenced by his/her personal interest to the detriment of performing the professional responsibility effectively (e.g., buying from a supplier owned by a family member).	*Procurement*
Conflict of interest declaration (or Competing interests declaration)	A statement by a contributor to a report or review of personal, financial, or other interests that could have influenced someone.	*Quality Engineering*
Conformity	Fulfillment by a product, process, or service of the specified requirements.	*Maintenance*
Conformity Error	For thermocouples and RTD's, the difference between the actual reading and the temperature shown in published tables for a specific voltage input.	*Electrical*
Conformity Error	For thermocouples and RTDs, the difference between the actual reading and the temperature shown in published tables for a specific voltage input.	*Electronic Process*
Confounded comparison	A comparison between two treatment groups that will give a biased estimate of the effect of treatment due to the study design. For a comparison to be unconfounded, the two treatment groups must be treated identically apart from the	*Quality Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	randomized treatment. For instance, to estimate the effect of heparin in acute stroke, a trial of heparin alone versus placebo would provide an unconfounded comparison. However, a trial of heparin alone versus aspirin alone provides a confounded comparison of the effect of heparin. See also: Unconfounded comparison	
Confounder	A factor that is associated with both an intervention (or exposure) and the outcome of interest. For example, if people in the experimental group of a controlled trial are younger than those in the control group, it will be difficult to decide whether a lower risk of death in one group is due to the intervention or the difference in ages. Age is then said to be a confounder, or a confounding variable. Randomisation is used to minimize imbalances in confounding variables between experimental and control groups. Confounding is a major concern in non-randomized studies. See also: Adjusted analysis	*Quality Engineering*
Confounding variable, Confounder	A variable that can cause or prevent the outcome of interest, is not an intermediate variable, and is associated with the factor under investigation. A confounding variable may be due chance or bias. Unless it is possible to adjust for confounding variables, their effects cannot be distinguished from those of factor(s) being studied.	*Analysis*
Congates	near horizontal drivages driven cross-measures through a thick coal seam (S. Staffs.). Also called 'conduits'.	*Mining*
Congestion	A condition that occurs when insufficient transfer capacity is available to implement all of the preferred schedules for electricity transmission simultaneously.	*Energy*
Conglomerate	A sedimentary rock consisting of rounded, water-worn pebbles or boulders cemented into a solid mass.	*Mining*
Congruent melting	The case in which the liquid formed upon melting has the same composition as the solid from which it was formed.	*Material Process*
Conical Drum	Grooved hoisting drum of tapering diameter.	*Wire Rope & Cable*
CONK	The fruiting structure of a wood-rotting fungus, especially of one of the Polyporaceae.	*Forestry*
Connected load	The sum of the continuous ratings or the capacities for a system, part of a system, or a customer's electric power consuming apparatus.	*Energy*
Connecting Rod	The metal rod that connects a piston to the crankshaft.	*Mechanical Engineering*
Connection	The physical connection (e.g., transmission lines, transformers, switch gear, etc.) between two electric systems permitting the transfer of electric energy in one or both directions.	*Energy*
Connection Head	An enclosure attached to the end of a thermocouple which can be cast iron, aluminum or plastic within which the electrical connections are made.	*Electrical*
Connection	The connection between two electrical systems that permit the transfer of energy.	*Energy*
Connector	Pressure containing/pressure controlling wellhead equipment that allows a mechanical joint that can provide a pressure seal can be Flange, Hub, Union connection.	*Petroleum Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Consequence of Failure (CoF)	This is the usually negative effects that arise/occur as a result of failure of a system, equipment or product	*Reliability Engineering*
Conservation	A foregoing or reduction of electric usage for the purpose of saving natural energy resources and limiting peak demand in order to ultimately reduce the capacity requirements for plant and equipment.	*Energy*
Conservation	The protection, improvement, and wise use of natural resources for present and future generations.	*Forestry*
Conservation easement	A legally enforceable transfer of usage rights for the purposes of conserving land and prohibiting real estate development.	*Forestry*
Conservation feature	A feature in the building designed to reduce the usage of energy.	*Energy*
Conservation program	A program in which a utility company furnishes home weatherization services free or at reduced cost or provides free or low cost devices for saving energy, such as energy efficient light bulbs, flow restrictors, weather stripping, and water heater insulation.	*Energy*
Conservation Reserve Program	A federal program under which producers voluntarily retire environmentally sensitive crop land for 10 to 15 years in return for annual rental payments through which the government shares the cost of establishing approved conservation practices. Payments are through the USDA Commodity Credit Corporation.	*Agriculture*
Conservative	(a) in the case of a contaminant, one that does not degrade and the movement of which is not retarded; is unreactive. (b) in the case of an assumption, one that leads to a worst-case scenario, one that is most protective of human health and the environment.	*Chemical*
Consideration	compensation paid to hewers for unforeseen difficulties met with in their work.	*Mining*
Consistency	The degree to which a semisolid material such as grease resists deformation. (See ASTM designation D 217.) Sometimes used qualitatively to denote viscosity of liquids.	*Lubrication*
Consistency (Hardness)	The resistance of a lubricating grease to deformation under load. Usually indicated by ASTM Cone Penetration, ASTM D-217 (IP 50) or ASTM D-1403.	*Lubrication*
Console	A console is the term for the actual screen and keyboard used in the work stations.	*Control Engineering*
Consolidated entity	Consolidated entity: See Firm.	*Energy*
Consolidated Formations	Formations of relatively large, unmoving pieces of material, such as particles of limestone and fractured rock.	*Petroleum Engineering*
Consolidated Metropolitan Statistical Area (CMSA)	An area that meets the requirements of a metropolitan statistical area, has a population of one million or more, and consists of two or more component parts that are recognized as primary metropolitan statistical areas.	*Energy*
Constant percentage filter	A bandpass filter whose bandwidth relates (1/3 x, 1/10 x, etc.) to center frequency. May be synthesized digitally.	*Reliability Engineering*
Constant Speed Drive	A drive with no provisions for variable speed or a drive with the characteristics necessary to maintain a constant speed.	*Manufacturing*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Constant systematic error, CE	An error that is always the same direction and magnitude even as the concentration of analyte changes.	*Quality*
Constantan	A copper–nickel alloy used as the negative lead in Type E, Type J, and Type T thermocouples.	*Electrical*
Constant-bandwidth filter	A bandpass filter whose bandwidth is independent of center frequency. Filters simulated digitally by an FFT process are constant bandwidth.	*Reliability Engineering*
Constituent	an essential part or component of a system or group (e.g., an ingredient of a chemical mixture). For instance, benzene is one constituent of gasoline.	*Chemical*
Construction	An energy-consuming subsector of the industrial sector that consists of all facilities and equipment used to perform land preparation and construct, renovate, alter, install, maintain, or repair major infrastructure or individual systems therein. Infrastructure includes buildings; industrial plants; and other major structures, such as tanks, towers, monuments, roadways, tunnels, bridges, dams, pipelines, and transmission lines.	*Energy*
Construction costs (of the electric power industry)	All direct and indirect costs incurred in acquiring and constructing electric utility plant and equipment and proportionate shares of common utility plants. Included are the cost of land and improvements, nuclear fuel and spare parts, allowance for funds used during construction, and general overheads capitalized, less the cost of acquiring plant and equipment previously operated in utility service.	*Energy*
Construction expenditures (of the electric power industry)	The gross expenditures for construction costs (including the cost of replacing worn out plants), and electric construction costs, and land held for future use.	*Energy*
Construction pipeline (of a nuclear reactor)	The various stages involved in the acquisition of a nuclear reactor by a utility. The events that define these stages are the ordering of a reactor, the licensing process, and the physical construction of the nuclear generating unit. A reactor is said to be "in the pipeline" when the reactor is ordered and "out of the pipeline" when it completes low power testing and begins operation toward full power.	*Energy*
Construction work in progress (CWIP)	The balance shown on a utility's balance sheet for construction work not yet completed butin process. This balance line item may or may not be included in the rate base.	*Energy*
Constructional Stretch	The stretch that occurs when the rope is loaded-it is due to the helically laid wires and strands creating a constricting action that compresses the core and generally brings all of the rope's elements into close contact.	*Wire Rope & Cable*
Constructive Case	Arguments that build (construct) your case	*Management Discussion*
Constructive surplus or deficit	The amounts representing the exchange of services, supplies, etc., between the utility department and the municipality and its other departments without charge or at a reduced charge. Charges to this account include utility and other services, supplies, etc., furnished by the utility department to the municipality or its other departments without charge, or the amount of the reduction, if furnished at a reduced charge. Credits to the account consist of services, supplies, office space, etc., furnished by the municipality to the utility department without charge on the amount of the reduction, if furnished at a reduced charge.	*Energy*

Term	Definition	*Industry*
Consumable Insert	Preplaced filler metal which is completely fused into the root of the joint and becomes part of the weld.	*Maintenance and Repair*
Consumer (energy)	Any individually metered dwelling, building, establishment, or location using natural gas, synthetic natural gas, and/or mixtures of natural and supplemental gas for feedstock or as fuel for any purpose other than in oil or gas lease operations; natural gas treating or processing plants; or pipeline, distribution, or storage compressors.	*Energy*
Consumer (healthcare consumer)	Someone who uses, is affected by, or who is entitled to use a health related service.	*Quality Engineering*
Consumer advocate or representative	Consumer who is actively involved with other consumers and able to represent the perspectives and concerns of that broader group of people. Consumer representatives work in Cochrane entities to ensure that consumers' views are taken account of when review questions are being decided and results presented.	*Quality Engineering*
Consumer charge	An amount charged periodically to a consumer for such utility costs as billing and meter reading, without regard to demand or energy consumption.	*Energy*
Consumer Education	Efforts to provide consumers with skills and knowledge to use their resources wisely in the marketplace.	*Energy*
Consumer Price Index (CPI)	These prices are collected in 85 urban areas selected to represent all urban consumers about 80 percent of the total U.S. population. The service stations are selected initially and on a replacement basis, in such a way that they represent the purchasing habits of the CPI population. Service stations in the current sample include those providing all types of service (i.e., full, mini, and self service).	*Energy*
Consumption	Consumption: See Energy consumption.	*Energy*
Consumption (Fuel)	Amount of fuel used for gross generation.	*Energy*
Consumption per square foot	The aggregate ratio of total consumption for a particular set of buildings to the total floorspace of those buildings.	*Energy*
Contact	The place or surface where two different kinds of rocks meet. Applies to sedimentary rocks, as the contact between a limestone and a sandstone, for example, and to metamorphic rocks; and it is especially applicable between igneous intrusions and their walls.	*Mining*
Contact Bounce	The intermittent opening of relay contacts during closure.	*Reliability Engineering*
Contact Diameter	The smallest diameter on a gear tooth with which the mating gear makes contact.	*Mechanical Engineering*
Contact Discharge	An ESD test method where the ESD generator makes direct contact with the device under test (DUT).	*Electrical Engineering*
Contact metamorphism	Metamorphism of country rocks adjacent to an intrusion, caused by heat from the intrusion.	*Mining*
Contact Patch	The part of the tire in contact with the road surface.	*Mechanical Engineering*
Contact Ratio	The ratio of the arc of action to the circular pitch. It is sometimes thought of as the average number of teeth in contact. For involute gears, the contact ration is obtained most directly as the ration of the length of action to the base pitch.	*Mechanical Engineering*
Contact Stress	The maximum compressive stress within the contact area between mating gear tooth profiles. It is also called Hertz stress.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Contact Vein	A vein along the contact plane of, or between, two dissimilar rock masses.	*Mining*
Contact	A geological term used to describe the line or plane along which two different rock formations meet.	*Mining*
containerization	Shipping method in which standardized containers are packed in the field, sealed and transported by truck and/or train to ships. They aren't opened until they reach their receiver.	*Agriculture*
Containment	the act, process, or means to keep within prescribed limits	*Materials Process*
Containment ponds (also called reserve pits)	Man-made ponds intended to capture waste from power plants, industrial complexes, and drilling sites. Challenges in using this conventional method include managing the volume of waste product; installation and maintenance costs; contamination of land and/or water due to pit failure and associated cleanup costs; potential for pollution due to leaching.	*Petroleum Drilling*
Contaminant	An impurity not intended to be present in the product that may be introduced through such things as poor cleaning, processing, lack of appropriate environmental and personnel controls during the manufacturing process, handling and distribution.	*Chemical*
Contaminant (Dirt, ACFTD) capacity	The weight of a specified artificial contaminant that must be added to the influent to produce a given differential pressure across a filter at specified conditions. Used as an indication of relative service life.	*Oil Analysis*
Contaminant Capacity (Dirt, ACFTD)	The weight of a specified artificial contaminant which must be added to the influent to produce a given differential pressure across a filter at specified conditions. Used as an indication of relative service life.	*Lubrication*
Contaminant Failure	Any loss of performance due to the presence of contamination. Two basic types of contamination failure are: Perceptible -- gradual loss of efficiency or performance, and Catastrophic -- dramatic, unexpected failure.	*Oil Analysis*
Contaminant Failure	Any loss of performance due to the presence of contamination. Two basic types of contamination failure are: Perceptible	*Lubrication*
Contaminant Lock	A particle or fiber-induced jam caused by solid contaminants.	*Lubrication*
Contaminant, Artificial	Contaminant of known composition and particle size distribution which is introduced into fluid systems or fluid systems components for test purposes. The most commonly used artificial contaminants include standardized fine air cleaner test dust, standardized coarse air cleaner test dust, carbonyl iron, glass beads, cotton linters, red iron oxide and black iron oxide.	*Mechanical, Process, and Operations*
Contaminant, Built-in	Initial residual contamination in a component, fluid, or system. Typical built-in contaminants are burrs, chips, flash, dirt, dust, fiber, sand moisture, pipe dope, weld spatter, paints and solvents, flushing solutions, incompatible fluids and operating fluid impurities.	*Mechanical, Process, and Operations*
Contaminants	Any element or natural substance whose concentration locally exceeds the background concentration or any substance that does not occur naturally in the environment. These include point source contaminants, where potential contaminants are concentrated or stored in one spot (e.g. manure piles, fuel storage, etc.), and nonpoint, where potential contamination spreads out over a greater area (e.g. pesticide or fertilizer applied to fields).	*Petroleum Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Contamination	The degradation of natural water quality.	*Petroleum Engineering*
Contamination	Entry of undesirable organisms into some material or object.	*Chemistry*
Contamination Control	A broad subject which applies to all types of material systems (including both biological and engineering). It is concerned with planning, organizing, managing, and implementing all activities required to determine, achieve and maintain a specified contamination level.	*Lubrication*
Contamination level	A quantitative term specifying the degree of contamination.	*Mechanical, Process, and Operations*
Contango	Market condition where the spot price is less than the three-month delivery price. This is considered the "normal" market state because the costs of storing and shipping metal are assumed to be higher in three months than at present (See Backwardation).	*Metallurgy*
Context	The conditions and circumstances that are relevant to the application of an intervention, for example the setting (in hospital, at home, in the air); the time (working day, holiday, night-time); type of practice (primary, secondary, tertiary care; private practice, insurance practice, charity); whether routine or emergency.	*Quality Engineering*
Contingency table	A table of frequencies or counts. In a two-way contingency table, sub-categories of one characteristic are indicated horizontally (in rows) and subcategories of another characteristic are indicated vertically (in columns). Tests of association between the characteristics can be readily applied. The simplest two-way contingency table is the 2x2 table, which is used in clinical trials to compare dichotomous outcomes, such as death, for an experimental intervention and control group.	*Quality Engineering*
Continuity equation	The mass rate of fluid flow into a fixed space is equal to the mass flow rate out. Hence, the mass flow rate of fluid past all cross sections of a conduit is equal.	*Mechanical, Process, and Operations*
Continuity generated	Contamination created by the operation of a fluid system or component. Generated contaminants are products of erosion, fretting, scouring, wear, corrosion, decomposition, oxidation, and fluid-breakdown. Air bubbles may also be generated under some operating conditions.	*Mechanical, Process, and Operations*
Continuous	Symbologies in which intercharacter gaps are treated as characters.	*Gears*
Continuous auger machine	used in mining coalbeds less than 3 feet thick. The auger has a cutting depth of about 5 feet and is 20 to 28 inches in diameter. Continuous auger mining usually uses a conveyor belt to haul the coal to the surface.	*Energy*
Continuous Chlorination	Involves the continuous addition of low levels of chlorine to a water supply.	*Petroleum Engineering*
Continuous cogs	a chock devised and used in N. Staffs., (Talk O' th' Hill Colliery), erected along the roadside forming a good air-tight packing. The timbers were side-lapped at their ends.	*Mining*
Continuous data	Data with a potentially infinite number of possible values within a given range. Height, weight and blood pressure are examples of continuous variables. See also: Categorical data	*Quality Engineering*
Continuous delivery energy sources	Those energy sources provided continuously to a building.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Continuous Duty	Energizing a solenoid valve at a constant level of power for its entire on-time.	*Mechanical*
Continuous fiber	Composite reinforcing fiber without a break within the dimensions of the matrix.	*Material Process*
Continuous Improvement	Reduction to maintenance input (hours, materials, management time) to provide a given level of maintenance service. Increases in the number of assets, or use of assets with fixed or decreasing inputs.	*Maintenance*
Continuous Improvement	A structured, measurement-driven process that continually reviews and improves performance. Actions are taken to eliminate waste and anything that is deemed to be non-value-added. It is a key tenet of lean manufacturing and the Toyota Production System.	*Reliability Engineering*
Continuous miner	A machine that constantly extracts coal while it loads it. This is to be distinguished from a conventional, or cyclic, unit which must stop the extraction process in order for loading to commence.	*Mining*
Continuous mining	A form of room pillar mining in which a continuous mining machine extracts and removes coal from the working face in one operation; no blasting is required.	*Energy*
Continuous mining machine	used during continuous mining, cuts or rips coal from the face and loads it into shuttle cars or conveyors in one operation. It eliminates the use of blasting devices and performs many functions of other equipment such as drills, cutting machines, and loaders. A continuous mining machine typically has a turning "drum" with sharp bits that cut and dig out the coal for 16 to 22 feet before mining stops so that the mined area can be supported with roof bolts. This machine can mine coal at the rate of 8 to 15 tons per minute.	*Energy*
Continuous reactor	Reactor that operates without interruption. This type of reactor is characterized by its steady-state operation.	*Chemical*
Continuous Replenishment Programs	Arrangement with supplier companies in which the supplier monitors the customer's inventory and automatically replaces used materials, eliminating the need for purchase orders and related paperwork.	*Maintenance*
Continuous Spectrum	A frequency spectrum that is characterized by non-periodic data. The spectrum is continuous in the frequency domain and is characterized by an infinite number of frequency components.	*Electrical*
Continuous Spectrum	A frequency spectrum that is characterized by non-periodic data The spectrum is continuous in the frequency domain and is characterized by an infinite number of frequency components.	*Electronic Process*
Continuous Stirred Tank Reactor	This may be thought of as a tank to which reactants flow in, and products flow out. In an ideal CSTR the contents of the reactor are uniformly distributed.	*Chemical*
continuous surface miner	used in some lignite mines, is equipped with crawlers, a rotating cutting head, and a conveyor. It travels over the bed, excavating a swath up to 13 feet wide and 2 feet deep.	*Energy*
Continuous Vulcanization	Simultaneous extrusion and vulcanization of wire coating materials. It is abbreviated CV.	*Electrical*
Continuously Variable Transmission (CVT)	Operates like an automatic transmission, with no need for a clutch pedal, but contains no gears. Instead, power is transmitted in a continuous flow from the engine to the drive wheels.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Continuous-Welded Pipe, Furnace	welded pipe produced in continuous lengths from coiled skelp and subsequently cut into individual lengths, having its longitudinal butt joint forge-welded by the mechanical pressure developed in rolling the hot-formed skelp through a set of round pass welding rolls.	*Maintenance and Repair*
Continuous Bend	Reeving of wire rope over sheaves and drums so that it bends in the same direction, as opposed to reverse bend.	*Wire Rope & Cable*
Contour	To build (a road, railroad track, etc.) in conformity with the contour of the land.	*Civil Engineering*
Contour mining	practiced when the coal is mined on hillsides. The mining follows the contour of the hillside until the overburden becomes uneconomical to remove. This method creates a shelf, or bench, on the hillside. Several variations of contour mining have been developed to control environmental problems. These methods include slope reduction (overburden is spread so that the angle of the slope on the hillside is reduced), head-of-hollow fill (overburden is placed in narrow V-shaped valleys to control erosion), and block-cut (overburden from current mining is backfilled into a previously mined cut).	*Energy*
Contour plot	This is a graphical representation of the possible solutions to the likelihood ratio equation. This is employed to determine confidence bounds as well as comparisons between two different data sets	*Reliability Engineering*
Contour	An imaginary line that connects all points on a surface having the same elevation.	*Mining*
Contraband	matches, lighters, cigarettes, etc. banned in the mine.	*Mining*
Contract	A written or oral agreement between two or more competent parties that defines a job or service to be performed and that is legally enforceable.	*Procurement*
Contract Acceptance Sheet	A Document That Is Completed By The Appropriate Contract Supervisor And Contractor To Indicate Job Completion And Acceptance. It Also Forms Part Of The Appraisal Of The Contractors Performance.	*Management*
Contract for Differences	A financial instrument used to hedge against the daily or hourly fluctuating prices that would be offered by an ISO or a "power exchange." A customer would be able to purchase a financial hedge from another party who may or may not have contractual rights to any specific generation.	*Energy*
Contract Management	Contract management is a niche within the procurement profession. It ranges from administrative aspects to the excitement and challenge of major contract negotiation. Both procurement and contract management demand competence in such areas as contract law, administration, accounting, psychology, management, and planning. (From National Contract Management Association, Vienna, Virginia, USA).	*Maintenance*
Contract Path	The most direct physical transmission tie between two interconnected entities. When utility systems interchange power, the transfer is presumed to take place across the "contract path", notwithstanding the electric fact that power flow in the network will distribute in accordance with network flow conditions. This term can also mean to arrange for power transfer between systems.	*Energy*
Contract Price	Price marketed on a contract basis for one or more years.	*Energy*
Contract Production	Natural gas liquids accruing to a company because of its ownership of liquids extraction facilities that it uses to extract liquids from gas belonging to others, thereby earning a portion of the resultant liquids.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Contract Receipts	Purchases that cover at least one year.	*Energy*
Contract Reserves	Natural gas liquid reserves corresponding to the contract production defined above.	*Energy*
Contracted gas	Any gas for which Interstate Pipeline has a contract to purchase from any domestic or foreign source that cannot be identified to a specific field or group. This includes tailgate plant purchases, single meter point purchases, pipeline purchases, natural gas imports, SNG purchases, and LNG purchases.	*Energy*
Contracting Officer	The government contracting officer, often at an installation other than the one making the contract, who handles the business administration of the contract.	*Procurement*
Contraction	the shrinkage of steel due to cooling of the part after removal from the galvanizing kettle	*Materials Process*
Contrahelical	A term meaning the application of two or more layers of spirally twisted, served, or wrapped materials where each successive layer is wrapped in the opposite direction to the preceding layer.	*Electrical*
Contribution to net income	The FRS (Financial Reporting System survey) segment equivalent to net income. However, some consolidated items of revenue and expense are not allocated to the segments, and therefore they are not equivalent in a strict sense. The largest item not allocated to the segments is interest expense since this is regarded as a corporate level item for FRS purposes.	*Energy*
Control	Including the terms "controlling," "controlled by," and "under common control with," means the possession, direct or indirect, of the power to direct or cause the direction of the management and policies of a person, whether through the ownership of voting shares, by contract, or otherwise.	*Energy*
Control Piping	All piping, valves, and fittings used to interconnect air, gas, or hydraulically operated control apparatus or instrument transmitters and receivers.	*Maintenance and Repair*
Control Action	The nature of the change of the output affected by the input of a controller or a controlling system.	*Process Control*
Control Action	Feedback Control action in which a measured variable is compared to its desired value to produce an actuating error signal which is acted upon in such a way as to reduce the magnitude of the error.	*Process Control*
Control Action, Adaptive Control	Control Action, Adaptive Control action whereby automatic means are used to change the type or influence (or both) of control parameters in such a way as to improve the performance of the control system.	*Process Control*
Control Action, Cascade Control	Control Action, Cascade Control action where the output of one controller is the setpoint for another controller.	*Process Control*
Control Action, Derivative (Rate)	Control action in which the controller output is proportional to the rate of change of the input.	*Electrical Engineering*
Control Action, Derivative (Rate) Control	Control Action, Derivative (Rate) Control action in which the output is proportional to the rate of change of the input.	*Process Control*
Control Action, Direct Digital Control	Control Action, Direct Digital Control action in which control is performed by a digital device, which establishes the signal to the final controlling element.	*Process Control*
Control Action, Integral (Reset)	Control action in which the controller output is proportional to the time integral of the error signal.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Control Action, Proportional	Control action in which the controller output has a linear relationship to the error signal. Controller - A device which receives a measurement of the process variable, compares that measurement with a set- point representing the desired control point, and adjusts its output based on the selected control algorithm to minimize the error between the measurement and the setpoint. If an increase in the measured process variable above the setpoint causes an increase in the magnitude of the controller output, the controller is said to be "direct acting." If a process variable increase above the setpoint causes a decrease in the magnitude of the controller output, the controller is "reverse	*Electrical Engineering*
Control Area	A power system or systems to which an automatic control is applied.	*Energy*
Control Arm	A suspension element that has one joint at one end and two joints at the other end, typically on the chassis side. Also known as a wishbone or an A-arm.	*Mechanical Engineering*
Control Base	The unit remote from sensor in which amplification and conditioning of the input signal takes place. Usually contains a power supply and an output device.	*Electrical Engineering*
Control Character	A character whose occurrence in a particular context starts, modifies or stops an operation that affects the recording, processing, transmission or interpretation of data.	*Electrical*
Control Character	A character whose occurrence in a particular context starts, modifies or stops an operation that effects the recording, processing, transmission or interpretation of data.	*Electronic Process*
Control chart	"A graphical method for evaluating whether a process is or is not in a 'state of statistical control.' The determinations are made through comparison of the values of some statistical measure(s) for an ordered series of samples, or subgroups, with control limits" [ASQ]. In healthcare laboratories, the Levey–Jennings chart is commonly used to plot the result observed for a stable control material versus time, usually the day or run number.	*Quality*
Control Enclosure	The type of construction of the housing or case which encloses a control component or assembly of components. The common types of enclosures are designated by NEMA.	*Equipment*
Control Engineering	Control engineering is the area of method and technique to automatically control industrial processes. A commonly used industry method is the PID (Proportional, Integrative and Differential) control algorithm, implemented in PLCs (Programmable Logic Controllers).	*Maintenance*
Control event rate	See Risk	*Quality Engineering*
Control group	1. [In a controlled trial:] The arm that acts as a comparator for one or more experimental interventions. 2. [In a case-control study:] The group without the disease or outcome of interest. See also: Aggregate data, Control Also called: Comparison group	*Quality Engineering*
Control Joints	grooves that are tooled or cut into the surface of wet concrete to make it crack in straight lines at planned locations, rather than cracking rather than cracking randomly.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Control limits	"Limits on a control chart which are used as criteria for signaling the need for action, or for judging whether a set of data does or does not indicate a 'state of control'" [ASQ]. Used here to refer to the defined limits or ranges of results expected due to the random error of the method, and beyond which some course of action should be taken. It is common in clinical laboratories to use Levey-Jennings control charts with limits set as either the mean plus or minus 2 standard deviations, or the mean plus or minus 3 standard deviations.	*Quality*
Control material, control product	A control solution that is available, often commercially, liquid or lyophilized, and packaged in aliquots that can be prepared and used individually.	*Quality*
Control measurements, Control observations	The analytical results obtained for control solutions or control materials (that are analyzed for purposes of quality control).	*Quality*
Control Mode	The output form or type of control action used by a temperature controller to control temperature, i.e., on/off, time proportioning, PID.	*Electrical*
Control parameters	numeric values that are internal to a controller, but directly affect the output of the controller. Control parameters must be "tuned", that is, determined by iterative experience, in conjunction with a subjective goal or a quantitative metric about system performance.	*Petroleum Drilling*
Control Point	The temperature at which a system is to be maintained.	*General Engineering*
Control procedure, QC procedure	The protocol and materials that are necessary for an analyst to assess whether the method is working properly and patient test results can be reported - that part of an analytical process that is concerned with testing the quality of the analytical results, in contrast to the measurement procedure, which produces the result. A control procedure can be described by the number of control measurements and the decision criteria (control rules) used for judging the acceptability of the analytical results.	*Quality*
Control program	[In communicable (infectious) diseases:] Programs aimed at reducing or eliminating the disease.	*Quality Engineering*
Control Room	the main communications centre for the colliery.	*Mining*
Control rule	A decision criterion for interpreting control data and making a judgment on the control status of an analytical run. Symbolized here by AL, where A is the abbreviation for a particular statistic or states the number of control measurements, and L is the control limit. An analytical run is rejected when the control measurements fulfill the stated conditions, i.e., when a certain statistic or number of control measurements exceeds the specified control limits.	*Quality*
Control System	A system in which deliberate guidance or manipulation is used to achieve a prescribed value of a variable. Note: It is subdivided into a controlling system and a controlled system.	*Process Control*
Control System, Multi-Element (Multi-Variable)	A control system utilizing input signals derived from two or more process variables of the purpose of jointly affecting the action of the control system.	*Process Control*
Control System, Non-Interacting	A multi-element control system designed to avoid disturbances to other controlled variables due to the process-input adjustments, which are made for the purpose of controlling a particular process variable.	*Process Control*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Control total	The number of elements in the population or a subset of the population. The sample weights for the observed elements in a survey are adjusted so that they add up to the control total. The value of a control total is obtained from an outside source. The control totals are given by the number of households in one of the 12 cells by categorizing households by the four Census regions and by three categories of metropolitan status (Metropolitan Statistical Area central city, Metropolitan Statistical Area outside central city, and non Metropolitan Statistical Area). The control totals are obtained from the Current Population Survey.	*Energy*
Control Valve	Control valves are used to control flow, pressure, temperature, and liquid level by fully or partially opening or closing in response to signals received from controllers. The opening or closing of control valves is done by means of electrical, hydraulic or pneumatic systems. See also Actuator	*Industrial*
Control Valve Gain	The relationship between valve travel and the flow rate through the valve. It is described by means of a curve on a graph expressed as an installed or inherent characteristic.	*Industrial Engineering*
Control, Outside temperature-based control	The feed temperature of the heating medium is controlled in accordance with the outside temperature. The relationship between momentarily prevailing outside temperature and the feed temperature to be selected is reflected in the heating characteristic set on the controller.	*Thermal Management*
Control, Room-temperature-based control	The feed temperature of the heating medium is controlled in accordance with the existing and desired room temperature of a selected reference room All factors acting on the room, such as additional heat due to sunlight, are included when measuring the temperature of the room and taken into account accordingly when determining the feed temperature.	*Thermal Management*
CONTROL, SERVO	CONTROL, SERVO - A control actuated by a feedback system which compares the output with the reference signal and makes corrections the reduce the difference.	*Mechanical, Process, and Operations*
Controllable	a general term given to a system component for which the control thereof is direct. For example, consider driving an automobile with an automatic transmission. Gear selection, the gas pedal (accelerator), and the brake pedal are examples of controllables, while speed is an observable.	*Petroleum Drilling*
Controlled (clinical) trial (CCT)	See clinical trial. This is an indexing term used in MEDLINE and CENTRAL. Within CENTRAL it refers to trials using quasi-randomisation, or trials where double blinding was used but randomisation was not mentioned.	*Quality Engineering*
Controlled atmosphere, (CA)	Controlled atmosphere storage. This technology controls gases in the atmosphere of cold storage facilities in a way that greatly prolongs the life of fruit, such as apples.	*Agriculture*
Controlled before and after study	A non-randomized study design where a control population of similar characteristics and performance as the intervention group is identified. Data are collected before and after the intervention in both the control and intervention groups.	*Quality Engineering*
Controlled blasting	Blasting patterns and sequences designed to achieve a particular objective. Cast blasting, where the muck pile is cast in a particular direction, and deck blasting, where holes are loaded once but blasted in successive blasts days apart, are examples.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
CONTROLLED BURN	CONTROLLED BURN — (See Prescribed Burn.)	*Forestry*
Controlled Cooling	A process of cooling from an elevated temperature in a predetermined manner to avoid hardening, cracking, or internal damage or to produce a desired metallurgical microstructure. This cooling usually follows the final hot-forming or postheating operation.	*Maintenance and Repair*
Controlled devitrification	Processing technique for glass ceramics in which a glass is transformed to a fine grained, crystalline ceramic.	*Material Process*
Controlled trial	A clinical trial that has a control group. Such trials are not necessarily randomized. See also: Aggregate data	*Quality Engineering*
Controller	A device which controls another machine in the process directly, usually being wired to it directly.	*Control Engineering*
Controller, Direct–Acting	A controller in which the absolute value of the output signal increases, as the absolute value of the input (measured variable) increases.	*Process Control*
Controller, Integral (Reset) (I)	A controller which produces integral control action only. Note: may also be referred to as controller, proportional speed floating.	*Process Control*
Controller, Multi-position	A controller having two or more discrete values of output.	*Process Control*
Controller, On-off	A multi-position controller having two discrete values of output, fully on, or fully off.	*Process Control*
Controller, Proportional (P)	A controller which produces proportional control action only.	*Process Control*
Controller, Proportional Plus Derivative (Rate), (PD)	A controller which produces proportional plus derivative (rate) control action.	*Process Control*
Controller, Proportional Plus Integral (Reset), (PI)	A controller which produces proportional plus integral (reset) control action.	*Process Control*
Controller, Proportional Plus Integral (Reset), Plus Derivative (Rate), (PID)	A controller which produces proportional plus integral (reset) plus derivative (rate) control action.	*Process Control*
Controller, Ration	A controller that maintains a predetermined ration between two or more variables.	*Process Control*
Controller, Reverse-Acting	A controller in which the absolute value of the output signal decreases, as the absolute value of the input (measured variable) increases.	*Process Control*
Controller, Sampling	A controller using intermittently observed values of a signal such as the setpoint signal, the actuating error signal, or the signal representing the controlled variable, to effect control action.	*Process Control*
Controller, Self-Operated (Regulator)	A controller in which all the energy to operate the final controlling element is derived from the controlled system, through the sensing element.	*Process Control*
Controller, Time Proportioning	A controller whose output consists of periodic pulses whose duration is varied to relate, in some prescribed manner, the time average of the output to the actuating error signal.	*Process Control*
Controller, Time Schedule	A controller in which the setpoint (or reference input signal) automatically adheres to a predetermined time schedule.	*Process Control*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Controllers	The temperature band where heat is turned off upon rising temperature and turned on upon falling temperature expressed in degrees. The area where no heating (or cooling) takes place.	*Electrical*
Controlling System	1. Of a feedback control system, that portion which compares functions of a directly controlled variable and a setpoint; and adjusts a manipulated variable as a function of the difference. It includes the reference input elements; summing point; forward and final controlling elements; and feedback elements (including sensing element). 2. Of an automatic control system without feedback, that portion of the control system which manipulates the controlled system.	*Process Control*
Convection	1. The circulatory motion that occurs in a fluid at a nonuniform temperature owing to the variation of its density and the action of gravity. 2. The transfer of heat by this automatic circulation of fluid. Counts: The number of time intervals counted by the dual-slope A/D converter and displayed as the reading of the panel meter, before addition of the decimal point.	*Electrical*
Convection	1. The circulatory motion that occurs in a fluid at a non-uniform temperature owing to the variation of its density and the action of gravity. 2. The transfer of heat by this automatic circulation of fluid.	*Electronic Process*
Convection Heating	The transfer of heat through a fluid (liquid or gas) caused by molecular motion. See also Radiation Heating	*Industrial*
Convenience sample	A group of individuals being studied because they are conveniently accessible in some way. This could make them particularly unrepresentative, as they are not a random sample of the whole population. A convenience sample, for example, might be all the people at a certain hospital, or attending a particular support group. They could differ in important ways from the people who haven't been brought together in that way: they could be more or less sick, for example.	*Quality Engineering*
Conventional Agriculture	the modern form of industrialized agriculture which emphasizes maximum productivity and profitability, practiced on the majority of US farms. Conventional agriculture is characterized by mechanization, monocultures, and the use of synthetic fertilizers and pesticides. Conventional agriculture may also use genetically modified organisms. This form of industrialized agriculture has become "conventional" only within the last 60 years or so.	*Agriculture*
Conventional blendstock for oxygenate blending (CBOB)	Motor gasoline blending components intended for blending with oxygenates to produce finished conventional motor gasoline.	*Energy*
Conventional concentric conductor	Conductor constructed with a central core surrounded by one or more layers of helically laid wires. The direction of lay is reversed in successive layers and generally with an increase in length of lay for successive layers.	*Electrical*
Conventional gasoline	Finished motor gasoline not included in the oxygenated or reformulated gasoline categories. Note: This category excludes reformulated gasoline blendstock for oxygenate blending (RBOB) as well as other blendstock.	*Energy*
Conventional hydroelectric plant	A plant in which all of the power is produced from natural streamflow as regulated by available storage.	*Energy*
Conventional mill (uranium)	A facility engineered and built principally for processing of uraniferous ore materials mined from the earth and the recovery, by chemical treatment in the mill's circuits, of uranium and/or other valued coproduct components from the processed one.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Conventional mining	The oldest form of room pillar mining, which consists of a series of operations that involve cutting the coal bed, so it breaks easily when blasted with explosives or high pressure air, and then loading the broken coal.	*Energy*
Conventional natural gas	Natural gas consisting of a mixture of hydrocarbon compounds, primarily methane, and small quantities of various non-hydrocarbons.	*Petroleum Engineering*
Conventional oil and natural gas production	Crude oil and natural gas that is produced by a well drilled into a geologic formation in which the reservoir and fluid characteristics permit the oil and natural gas to readily flow to the wellbore.	*Energy*
Conventional treatment	Whatever the standard or usual treatment is for a particular condition at that time. Also called: Standard treatment	*Quality Engineering*
Conventionally fueled vehicle	A vehicle that runs on petroleum-based fuels such as motor gasoline or diesel fuel.	*Energy*
Convergent Beam	A variation of the diffuse scanning mode. A photoelectric control whose optical system is key to its operation. It simultaneously focuses and converges a very small, intense beam to a fixed-focal point in front of the control. The control is essentially blind a short distance before and beyond this focal point. Convergent beam scanning is used to detect the presence or absence of small objects while ignoring nearby background surfaces.	*Electrical Engineering*
Converging	A section of roller or wheel conveyor where two conveyors meet and merge into one conveyor.	*Manufacturing*
Conversion company	An organization that performs vehicle conversions on a commercial basis.	*Energy*
Conversion Cost	Direct labor cost plus manufacturing overhead cost.	*Procurement*
Conversion factor	A factor for converting data between one unit of measurement and another (such as between short tons and British thermal units, or between barrels and gallons). (See Appendices (heat rates, conversion factors, and more) for further information on conversion factors.) See Btu Conversion Factor and Thermal Conversion Factor.	*Energy*
Conversion of a service well to an oil or gas well in a different zone	Conversion of a service well to an oil or gas well in a different zone	*Petroleum Drilling*
Conversion of an oil or gas well to a service well in a different zone	Conversion of an oil or gas well to a service well in a different zone	*Petroleum Drilling*
Converted (alternative-fuel) vehicle	A vehicle originally designed to operate on gasoline/diesel that was modified or altered to run on an alternative fuel after its initial delivery to an end-user.	*Energy*
Converter	An electrical device, comprising a rectifier and inverter, used to alter the voltage and frequency of incoming alternating current in an electrical system. The term may also refer to inverters, rectifiers or frequency converters. (See also Converter station, Inverter, Rectifier, Frequency converter).	*Electrical*
Converter station	Special equipment is needed to convert electricity from alternating current (AC) to direct current (DC), or vice versa. High-voltage DC (HVDC) converter stations use power electronic devices called thyristors to make these conversions. (See also HVDC and HVDC Light.)	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Convertible Output	The output that can be wired either as Normally Open or Normally Closed, but not at the same time.	*Electrical Engineering*
Conveying Surface	Normal working surface of the conveyor.	*Manufacturing*
Conveyor	A horizontal, inclined, or vertical device for moving or transporting bulk materials, packages or objects in a path predetermined by the design of the device and having points of loading and discharge fixed, or selective; included are skip hoist	*Equipment*
Conveyor Belt	A belt used to carry materials and transmit the power required to move the load being conveyed.	*Equipment*
Conveyor track	the part of a longwall face occupied by the face conveyor.	*Mining*
Conveyor Width	(1) In unit handling, the dimension inside to inside of frame rails; (2) In belt conveyors for bulk materials, the width of the belt; (3) In vibrating conveyors, distance between side walls; (4) In slat conveyors, the length of the slat.	*Equipment*
Convoy	the brake formerly applied to one of the wheels of a coal.	*Mining*
Coolant	The mixture of water and anti-freeze that picks up heat from the engine and transfers it to the air passing through the radiator. This transfer of heat keeps the engine operating within its optimum temperature and preventing premature engine wear.	*Mechanical Engineering*
Cooler	A heat exchanger in which hot liquid hydrocarbon is passed through pipes immersed in cool water to lower its temperature.	*Petroleum Engineering*
Cooler	A heat exchanger which removes heat from a fluid. (See "Heat Exchanger.")	*Mechanical, Process, and Operations*
Cooling	Conditioning of room air for human comfort by a refrigeration unit (such as an air conditioner or heat pump) or by circulating chilled water through a central cooling or district cooling system. Use of fans or blowers by themselves, without chilled air or water, is not included in this definition of cooling.	*Energy*
Cooling fixture	Fixture used to maintain shape or dimensional accuracy of a molding or casting after it is removed from the mold, until it is cool enough to retain its shape.	*Material Process*
Cooling Bed	The leveler ensures uniformly flat material.	*Steel*
Cooling Degree Days (CDD)	A measure of how warm a location is over a period of time relative to a base temperature, most commonly specified as 65 degrees Fahrenheit. The measure is computed for each day by subtracting the base temperature (65 degrees) from the average of the day's high and low temperatures, with negative values set equal to zero. Each day's cooling degree days are summed to create a cooling degree day measure for a specified reference period. Cooling degree days are used in energy analysis as an indicator of air conditioning energy requirements or use.	*Energy*
Cooling loss	The cooling loss is that portion of the thermal energy that the heating boiler loses into the ambient air in an uncontrolled manner. A warm	*Thermal Management*
Cooling pond	A natural or manmade body of water that is used for dissipating waste heat from power plants.	*Energy*
Cooling range	(See Range).	*Facility Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cooling system	An equipment system that provides water to the condensers and includes water intakes and outlets; cooling towers; and ponds, pumps, and pipes.	*Energy*
Cooling water	Water circulated through a cooling system to remove heat from certain areas.	*Chemical Engineering*
Cooperative (Co-Op)	Rural electric cooperatives generate and/or purchase wholesale power, arrange for the transmission of that power, and then distribute the power to serve the demand of rural customers. Co-ops typically become involved in ancillary services such as energy conservation, load management and other demand-side management programs in order to serve their customers at the least cost. (All Co-ops do not necessarily generate electricity.)	*Energy*
Cooperative Electric Utility	A utility established to be owned by and operated for the benefit of those using its services.	*Energy*
Coordinating Editor (of a Cochrane Review Group)	This member of the CRG's editorial team has the primary responsibility for ensuring that the CRG is productive and efficient, and operates according to the principles of The Cochrane Collaboration.	*Quality Engineering*
Coordination number	Number of adjacent ions (or atoms) surrounding a reference ion (or atom).	*Material Process*
Coordination service	The sale, exchange, or transmission of electricity between two or more electric utilities that typically have sufficient generation and transmission capacity to supply their load requirements under normal conditions.	*Energy*
Coordination service pricing	The typical price components of a bulk power coordination sale are an energy charge, a capacity, or reservation charge, and an adder. The price for a particular sale may embody some or all of these components. The energy charge is made on a per-kilowatt basis and is intended to recover the seller's system incremental variable costs of making a sale. Because the nonfuel expenses are usually hard to quantify, and small relative to fuel expense, energy charges quoted are usually based on fuel cost. A capacity charge is set at a certain level per kilowatt and is normally paid whether or not energy is taken by the buyer. An adder is added to that energy charge to recover the hard quantify nonfuel variable costs. There are three types of adders percentage, fixed, and split savings. A percentage adder increases the energy charge by a certain percentage. A fixed adder adds a fixed amount per kilowatt hour to the energy charge. Split savings adders are used only in economy energy transactions. They split production costs savings between the seller and the buyer by adding one half of the savings to the energy cost.	*Energy*
COP	Code of Practice	*Petro-Chemical Abbreviations*
Copal	A natural resin of vegetable origin, occurring largely as fossilized material. Used in adhesives and finishes, especially varnishes.	*Material Process*
Coplanar Line	A line which is in the same plane as another line. Any two intersecting lines must lie in the same plane, and therefore be coplanar.	*Electrical Engineering*
Copolymer Resin	formed by simultaneous polymerization of two or more dissimilar substances. Has properties different from those of either polymer alone. Alloylike results of polymerization of an intimate solution of different types of monomers.	*Material Process*
Copolymerization	The polymerization of two or more substances in admixture. Also, used synonymously with inter polymerization, the polymerization of two or more substances together to yield a product which is not the same as a mixture of the respective separate polymers, as vinyl chloride acetate copolymer.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Copper alloy	Metal alloy composed of predominantly copper.	*Material Process*
Copper alloys	Metals made from a mixture of copper and another metal (Example brass = copper + zinc).	*Chemical Engineering*
Copper Cake	A by-product of electolytic zinc refining, usually containing a fair amount of cobalt.	*Metallurgy*
Copper Plating	The electrolytic deposition of copper to provide either a corrosion barrier (often as an undercoat for hard chrome plate) or for reclamation of worn parts.	*Paint and Coatings*
Copper strip corrosion	A qualitative measure of the tendency of a petroleum product to corrode pure copper.	*Oil Analysis*
Copper Strip Corrosion	The gradual eating away of copper surfaces as the result of oxidation or other chemical action. It is caused by acids or other corrosive agents.	*Lubrication*
Copper, No. 1 and No. 2	Generally, No. 1 copper consists of copper clippings, punchings and so on that are clean and unalloyed, whereas the lesser-priced No. 2 should have a minimum 94-percent copper content. These items are known as "candy" and "cliff" when traded internationally by wire. Comp solids refers to composition or red brass scrap, solids being one thing and borings/turnings another (the latter typically comes from machine shop production). It should be noted that ingot makers often have their own specs for these scrap items, so what one could be buying as a No. 1 could be downgraded to a No. 2 by another consumer. The trading community uses these specs based on the Institute of Scrap Recycling Industries, Washington, which publishes its definitions and is available from any member of ISRI.	*Metallurgy*
Cord	Fabric or steel wire strands forming plies and belts in tires.	*Mechanical Engineering*
Cord	Small, flexible insulated cable usually size l0AWG or smaller.	*Electrical*
Cord of Ore	128 cubic feet of broken ore; about seven tons in quartz rock.	*Mining*
Cord of wood	A cord of wood measures 4 feet by 4feet by 8 feet, or 128 cubic feet.	*Energy*
Cordillera	The continuous chain of mountain ranges on the western margin of North and South America.	*Mining*
Corduroy	Constructed of logs laid together transversely, as a road across swampy ground.	*Civil Engineering*
Core	The long cylinder of rock, about one inch or more in diameter, that is recovered by the diamond drill.	*Mining*
Core	Any portion of a cable over which some other cable component, such as a shield, jacket, sheath or armor, is applied.	*Electrical*
Core barrel	That part of a string of tools in diamond drilling in which the core specimen collects.	*Mining*
Core barrel	That part of a string of tools in a diamond drill hole in which the core specimen is collected.	*Mining*
Core competency	The processes, functions, and activities in a plant or company that are its "life blood" - typically those activities for which the enterprise derives the greatest return for its investments or those that intrinsically align the enterprise with its core market.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Core Damage	When a normally re-buildable component is damaged so badly that it cannot be repaired.	*Reliability Engineering*
Core pin	A pin for forming a hole or opening in a molded piece. Also, called core or core piece.	*Material Process*
Core sample	A cylinder sample generally 1-5" in diameter drilled out of an area to determine the geologic and chemical analysis of the overburden and coal.	*Mining*
Core Size	The core size is the measurement of the diameter of the cardboard tube that contains the labels.	*Gears*
Cored structure	Microstructure in which concentration gradients occur in individual grains.	*Material Process*
Core plugs	Coreplugs, -see Stemming.	*Mining*
Corf, Corfe, or Corve, (Dutch Korf)	a large wicker basket, usually made of hazel, used for transporting coal from the workings underground to the surface. The corf held about 4 to 7 cwt. of coal; or a shallow wooden box on runners like a sled used for hauling coal out of low workings. (Derbys.); or a measure of capacity for coal used throughout the British coalfields. The weight of the corf varied from area to area and over a period of time. Also called 'pit boxes'.	*Mining*
Coring	Taking rock samples from a well with a special tool referred to as a core barrel.	*Petroleum Drilling*
Coring Line	Wire rope used to operate the coring tool for taking core samples during the drilling of a well.	*Wire Rope & Cable*
Coring	Taking rock samples from a well by means of a special tool -- a "core barrel".	*Petroleum Drilling*
Coriolis Force	A result of centripetal force on a mass moving with a velocity radially outward in a rotating plane.	*General Engineering*
Corn Ears	the part of a corn plant containing the corn cob, husk, and kernels	*Agriculture*
Corn Husk	the leaf like layer on the outside of corn ears, also known as a "shuck"	*Agriculture*
Corner Frequency	For first order time constants, the "corner frequency" is the frequency where the amplitude ratio starts to turn and the phase lag equals 45 degrees. Also: corner frequency = 1/(time constant) radians/time	*Process Control*
Corner Joint	A joint between two members located approximately at right angles to each other in the form of an L.	*Maintenance and Repair*
Corner rackings	triangular beams of wood used at the corners of rectangular shafts.	*Mining*
Corner weights	This refers to the distribution of a car's weight among the four wheels. Management of corner weights is very important to handling. This weight is usually adjusted through raising and lowering each corner by rotating a threaded spring perch on each shock absorber or at some other point in the suspension linkage.	*NASCAR*
Cornering	As the car leans in a turn, the anti-roll bar resists this leaning by transferring more weight to the outside tire. It provides a means to achieve good handling from stiff roll resistance while maintaining a comfortable ride through soft springs.	*Mechanical Engineering*
Cornering Force	The force that turns a vehicle around a corner. The opposite of lateral or centrifugal force.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cornicles	The posterior dorsal erect or semi-erect tubules of aphids which secrete a waxy defensive liquid to protect the insect against enemies; short, blunt horns or rounded projections occurring on the abdomen.[1]	*Forestry*
Cornish Pump	A type of pump developed in Cornwall, England, and commonly used in deep mines of the nineteenth century to raise underground water.	*Mining*
Corona	A luminous discharge due to ionization of the gas surrounding a conductor around which exists a voltage gradient exceeding a certain critical value.	*Electrical*
Corona Resistance	The time that insulation will withstand a specified level field-intensified ionization that does not result in the immediate complete breakdown of the insulation. Also called voltage endurance.	*Electrical*
Corona Test	A test to determine the ability of a cable to withstand the formation of corona under an increasing applied voltage, and to extinguish corona when a corona-producing voltage is reduced.	*Electrical*
Correction (Balancing) Plane	A plane perpendicular to the shaft axis of a rotor in which correction for unbalance is made.	*General Engineering*
Corrective Factor	The mathematical factor that, when multiplied by the sensing distance of a given sensor, will adjust sensing distance for the different metals being used as targets.	*Electrical Engineering*
Corrective Maintenance	Any planned or unplanned maintenance activity required to correct a failure that has occurred or is in the process of occurring. This activity may consist of repair, restoration, or replacement of components.	*Maintenance*
Correl Percentage	The percentage of peaks in the used oil infrared spectrum which match those in the reference oil. A sudden decrease in this value usually means that the oil was mixed with a different type.	*Oil Analysis*
Correlation	1. See association. (Positive correlation is the same as positive association, and negative correlation is the same as negative association.) 2. [In statistics:] Linear association between two variables, measured by a correlation coefficient. A correlation coefficient can range from -1 for perfect negative correlation, to +1 for perfect positive correlation (with perfect meaning that all the points lie on a straight line). A correlation coefficient of 0 means that there is no linear relationship between the variables. See also: Association, Test of association	*Quality Engineering*
Correlation (statistical term)	In its most general sense, correlation denotes the interdependence between quantitative or qualitative data. It would include the association of dichotomized attributes and the contingency of multiple classified attributes. The concept is quite general and may be extended to more than two variates. The word is most frequently used in a somewhat narrower sense to denote the relationship between measurable variates or ranks.	*Energy*
Correlation coefficient, r	A statistic that estimates the degree of association between two variables, such as the measurement result by a test method and the measurement result by a comparison method. A value of 1.000 indicates perfect association, i.e., as one variable increases, the other increases proportionately. A value of 0.000 indicates no correlation, i.e., as one variable changes, the other may or may not change. A value of -1.000 indicates perfect negative correlation, i.e., as one variable increases, the other decreases proportionately. For data from a comparison of methods experiment, the correlation coefficient is often calculated along	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	with regression statistics to assess whether the range of concentrations is wide and, therefore, whether the estimates of the slope and intercept from ordinary regression analysis will be reliable.	
Correlative Rights Theory	The theory adopted by the courts in several states that all landowners whose tracts overlay a producing formation have correlative rights in the formation. This theory is termed the "qualified ownership" theory.	*Petroleum Drilling*
Corresponding Angles	These are in corresponding or matching positions relative to the transversal and a parallel line. They are equal if the lines are parallel. There are 4 pairs in the diagrams above.	*Math*
Corrity, cross-bedded.	Corrity, cross-bedded.	*Mining*
Corrode	Lose material to a surrounding solution in an electrochemical process.	*Material Process*
Corrosion	To be dissolved away, usually by oxidation or acidification. This usually refers to metal loss in cooling systems, often recognized by the local reaction of the dissolved metal with oxygen, carbon dioxide, acids or galvanic action. May result in general (widespread) or pitting loss of the metal.	*Chemical Engineering*
Corrosion	Process of gradual eating away by chemical action.	*Chemistry*
Corrosion (Moisture)	Corrosion (rust) is a chemical reaction on metal surfaces. When steel is in contact with moisture, such as water or acid, oxidation takes place, and subsequently, the formation of corrosion pits and flaking occur.	*Maintenance*
Corrosion coupon	A small piece of metal that is inserted into a circulating system that can be analyzed to find the corrosive nature of the system's water.	*Chemical Engineering*
Corrosion fatigue	The weakening of a pipe or similar piece of metal due to corrosion acting on it.	*Chemical Engineering*
Corrosion Fatigue	The process in which a metal fractures prematurely under conditions of simultaneous corrosion and repeated cyclic loading at lower stress levels or fewer cycles than would be required in the absence of the corrosive environment.	*Paint and Coatings*
Corrosion fatigue failure	Metal fracture due to the combined action of a cyclic stress and corrosive environment.	*Material Process*
Corrosion inhibitor	Chemical used in a system to prevent corrosion.	*Chemical Engineering*
Corrosion Potential	The potential of a corroding surface in an electrolyte relative to a reference electrode measured under open circuit conditions.	*Paint and Coatings*
Corrosion Resistant Alloy	Non ferrous alloys where the total sum of the specified amount one or more of the following alloy elements exceeds 50%: cobalt, chromium, titanium, molybdenum, Nickel often used in critical service applications for flanges, spools, valves etc.	*Petroleum Engineering*
Corrosion Resistant Material	Nonferrous or Ferrous alloys, more corrosion resistant than low alloy steels. Examples:- Stainless Steels, Duplex Steel, CRA's etc.	*Petroleum Engineering*
Corrosion Resistant Ring Grooves	(CRA) Ring Grooves can be lined (overlaid) with corrosion resistant material such as either CRA (Like 410SS) or an austenitic stainless steel.	*Petroleum Engineering*
Corrosion-Resisting Steel	Chrome-nickel steel alloys designed for increased resistance to corrosion.	*Wire Rope & Cable*
Corrosive medium	Aqueous corrosive media are electrolyte solutions, and hence by far the greatest proportion of damage arising through corrosion is due to electrochemical processes.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Corrosive Wear	Wear caused by chemical reaction.	*Lubrication*
Corrosive Wear	Wear in which chemical or electrochemical reaction with the environment is significant.	*Paint and Coatings*
Corrugated	Term used to describe the grooves of a SHEAVE or DRUM after these have been worn down to a point where they show an impression of a wire rope.	*Wire Rope & Cable*
Corundum	Compound crystal structure.	*Material Process*
Cost Avoidance	A purchasing action by means of which certain material/supplier increases are not incurred by the purchasing firm. Since it is not always possible to reduce existing costs, cost "avoidances" often are reported as savings when measuring or evaluating purchasing performance.	*Procurement*
Cost Behavior	The way in which a cost reacts or responds to changes in the level of business activity.	*Procurement*
Cost iron	Ferrous alloy with greater than 2 wt% carbon.	*Material Process*
Cost model for undiscovered resources	A computerized algorithm that uses the uranium endowment estimated for a given geological area and selected industry economic indexes to develop random variables that describe the undiscovered resources ultimately expected to be discovered in that area at chosen forward cost categories.	*Energy*
Cost Object	Anything for which cost data are desired. Examples of possible cost objects are products, product lines, customers, jobs, and organizational subunits such as departments or divisions of a company.	*Procurement*
Cost of capital	The rate of return a utility must offer to obtain additional funds. The cost of capital varies with the leverage ratio, the effective income tax rate, conditions in the bond and stock markets, growth rate of the utility, its dividend strategy, stability of net income, the amount of new capital required, and other factors dealing with business and financial risks. It is a composite of the cost for debt interest, preferred stock dividends, and common stockholders' earnings that provide the facilities used in supplying utility service.	*Energy*
Cost of debt	The interest rate paid on new increments of debt capital multiplied by 1 minus the tax rate.	*Energy*
Cost of Goods Manufactured	The manufacturing costs associated with the goods that were finished during the period.	*Procurement*
Cost of Goods Sold (COGS)	Total (annual) cost of material, labor, and utilities to produce the product.	*Maintenance*
Cost of preferred stock	The preferred stock dividends divided by the net price of the preferred stock.	*Energy*
Cost of quality	The sum of all costs associated with conformance and nonconformance. Cost of conformance includes prevention costs (employee training, tooling maintenance, planned preventive maintenance, suggestion awards) and appraisal costs (inspection, testing, gages and instrumentation, audit expenses). The cost of nonconformance includes internal costs (unscheduled maintenance, pre-shipment scrap and rework, workers' compensation) and external costs (warranty, customer complaint investigation, rework of returned goods, and product liability insurance.)	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cost of Quality	The costs that are generated as a result of producing defective material.	*Reliability Engineering*
Cost of retained earnings	The residual of an entity's earnings over expenditures, including taxes and dividends, that are reinvested in its business. The cost of these funds is always lower than the cost of new equity capital, due to taxes and transactions costs. Therefore, the cost of retained earnings is the yield that retained earnings accrue upon reinvestment.	*Energy*
Cost of service	A ratemaking concept used for the design and development of rate schedules to ensure that the filed rate schedules recover only the cost of providing the electric service at issue. This concept attempts to correlate the utility's costs and revenue with the service provided to each of the various customer classes.	*Energy*
Cost of Un-Reliability (CoUR)	This is the cost of lost opportunity. CoUR programs study plants as links in a chain for a reliability system, and the costs incurred when the plant, or a series of plants, fail to produce the desired result. The cost can be categorized in maintainability and reliability cost.	*Reliability Engineering*
Cost, insurance, freight (CIF)	A type of sale in which the buyer of the product agrees to pay a unit price that includes the f.o.b. value of the product at the point of origin plus all costs of insurance and transportation. This type of transaction differs from a "delivered" purchase in that the buyer accepts the quantity as determined at the loading port (as certified by the Bill of Lading and Quality Report) rather than pay on the basis of the quantity and quality ascertained at the unloading port. It is similar to the terms of an f.o.b. sale except that the seller, as a service for which he is compensated, arranges for transportation and insurance.	*Energy*
Cost-based rates (electric)	A ratemaking concept used for the design and development of rate schedules to ensure that the filed rate schedules recover only the cost of providing the service. FERC definition	*Energy*
Cost-benefit analysis	An economic analysis that converts effects into the same monetary terms as costs and compares them. See also: Economic analysis (economic evaluation)	*Quality Engineering*
Cost-effectiveness analysis	An economic analysis that views effects in terms of overall health specific to the problem, and describes the costs for some additional health gain (e.g. cost per additional stroke prevented).See also: Economic analysis (economic evaluation)	*Quality Engineering*
Cost-of-service regulation	A traditional electric utility regulation under which a utility is allowed to set rates based on the cost of providing service to customers and the right to earn a limited profit.	*Energy*
Costs (imports of natural gas)	All expenses incurred by an importer up to the U.S. point of delivery for the reported quantity {of natural gas} imported.	*Energy*
Cost-share assistance	An assistance program offered by various state and federal agencies that pays a fixed rate or percentage of the total cost necessary to implement some forestry or agricultural practice.	*Forestry*
Cost-utility analysis	An economic analysis that expresses effects as overall health improvement and describes how much it costs for some additional utility gain (e.g. cost per additional quality-adjusted life-year). See also: Economic analysis (economic evaluation)	*Quality Engineering*
Cottered	a term applied to stone or coal when hard or tough, (N. East).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cotton	The fiber of plants of the genus Gossypium as a chemical raw material it is a source of cellulose derivatives including cellulose acetate, pyroxylin, cellulose ethers, and regenerated cellulose.	*Material Process*
Cotton flock	Minutely divided cotton fiber, used as filler.	*Material Process*
cotyledon	An embryo or seed leaf that usually serves as a food reserve.	*Agriculture*
COU	See Cochrane Operations Unit (COU)	*Quality Engineering*
Coulisse	Of or using runners or slides as a guiding mechanism; as in a "Coulisse" style gate valve.	*Mechanical*
Coulomb	A measurement of the quantity of electrical charge, usually expressed as pico coulomb (10-12 coulombs).	*Electronic Process*
Coulomb Sensitivity	Charge/unit acceleration, expressed in Pc/g (charge sensitivity).	*General Engineering*
Coulombic attraction	Tendency toward bonding between oppositely charged species.	*Material Process*
Coumarone-Indene	Coumarone-indene is mixed with other products to meet commercial applications. They are mostly used as extenders and plasticizers, as processing aids, and in asphalt floor tile.	*Material Engineering*
Counter Weight	A weight added to a body so as to reduce a calculated unbalance at a desired place.	*General Engineering*
Counterbalance Pressure Control Valve	A pressure control valve which maintains back pressure to prevent a load from falling.	*Mechanical, Process, and Operations*
Counterflow tower	One in which air, drawn in through the louvers (induced draft) or forced in (forced draft) at the base by the fan, flows upward through the fill material and interfaces counter currently with the falling hot water.	*Facility Engineering*
Counterfort	A buttress, esp. one for strengthening a basement wall against the pressure of earth. A cantilevered weight, as in a retaining wall, having the form of a pier built on the side of the material to be retained.	*Civil Engineering*
Countershaft	An intermediate or secondary shaft between the drive shaft of a conveyor and the source of power.	*Equipment*
Counting calibration factor	Ratio of the effective filtration area on the test pad membrane to the area counted, SAE-ARP-598.	*Mechanical, Process, and Operations*
Countries no longer members of OPEC include	Countries no longer members of OPEC include:	*Energy*
Country rock	Loosely used to describe the general mass of rock adjacent to an orebody. Also known as the host rock.	*Mining*
Counts	The number of time intervals counted by the dual-slope A/D converter and displayed as the reading of the panel meter, before addition of the decimal point.	*General Engineering*
County agent	A government specialist in agriculture or home economics. County agents work in the Cooperative Extension Service of USDA, with additional funding from states and counties. In recent years some states have adopted other nomenclature, such as county faculty.	*Agriculture*
Coup, an exchange of cavils, (N. East).	Coup, an exchange of cavils, (N. East).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Couple	A system of forces composed of two equal forces of opposite direction, offset by a distance. A couple is statically equivalent to a moment whose magnitude equals the magnitude of the force times the offset distance.	*Engineering Physics*
Coupler	a man or boy who coupled tubs together; the term also applied to the coupling device. Course, -see Strike.	*Mining*
Coupling	A coupling connects two pipes to each other. If the material and size of the pipe are not the same, the fitting may be called a 'reducing coupling' or reducer, or an adapter. A coupling is similar to a union. See also Pipe Fittings and Quick Couplings	*Industrial*
Coupling	A straight connector for fluid lines.	*Lubrication*
Coupling transformer	A coupling transformer is a device that permits two (usually) separate circuits to influence one another. Such a setup can be desirable for control purposes. It can also be used, for example, to inject high frequency signals into power lines for communications purposes.	*Electrical*
Coupling, quick disconnect	A coupling which can quickly join or separate lines.	*Oil Analysis*
Coursing or Pillar airing	a method of ventilation in gassy pits where the ventilation current is channeled or 'coursed' (or 'shethed' in the N. East) through the waste.	*Mining*
Covalent bond Primary	chemical bond involving at a relatively high temperature under constant load over a long time period.	*Material Process*
Covalent Bonding	sharing of electron pairs between two atoms	*Physics*
Cover	Any plant that intercepts rain drops before they reach the soil or that holds soil in place.	*Forestry*
Cover crop	A crop grown to protect soil from erosion or nutrient leaching, rather than for production of food or fiber.	*Agriculture*
Cover mold	Stationary half of an injection mold.	*Material Process*
Cover or Cover rock	the strata overlying a coal seam, or the earth and soft material from the surface down to the first layer of rock.	*Mining*
Cover	The overburden of any deposit.	*Mining*
Covered Electrode	A filler metal electrode, used in arc welding, consisting of a metal core wire with a relatively thick covering which provides protection for the molten metal from the atmosphere, improves the properties of the weld metal, and stabilizes the arc. Covered electrodes are extensively used in shop fabrication and field erection of piping of carbon, alloy, and stainless steels.	*Maintenance and Repair*
Cow	a safety device attached to the back tub of a 'run' on a steep inclined road. (N. East). - see Backstay, Devil and Monkey.	*Mining*
Cowl	a type of hudge for winding water from the sump to the surface. Often fitted with a valve that opened automatically for filling and emptying. (Som.).	*Mining*
Cox model	See Proportional hazards model	*Quality Engineering*
Coyote	The process of digging in river-borne gravels by tunneling until bedrock is hit. The tunnel is dug in hopes of finding a rich bedrock deposit deep in the gravel bar.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
CPAC	See Colloquium Policy Advisory Committee (CPAC)	*Quality Engineering*
CPC	Chinese Petroleum Corporation	*Petro-Chemical Abbreviations*
CPG	Through the Comprehensive Procurement Guideline (CPG), EPA designates items that must contain recycled content when purchased by federal, state, and local agencies, or by government contractors using appropriated federal funds. Under E.O. 13101 EPA is required to update the CPG every 2 years.	*Environmental Engineering*
CPI Consumer Price Index	CPI: Consumer Price Index	*Energy*
C-Pillar	The roof support between a vehicle's rearmost side window and its rear window. Also known as a C-Post. On a vehicle with four side pillars, the rearmost roof support may be called a D-pillar.	*Mechanical Engineering*
Cpk	A statistical calculation of process capability based on the relationship between process variability and design specifications. A good Cpk value indicates that the process is consistently under control, i.e., within specification limits-and is also centered on the target value. A Cpk value of 1.33 is typically considered a minimum acceptable process capability; as the Cpk value approaches 2.0, the process approaches Six Sigma capability (3.4 defective units per million). The ability to achieve high Cpk values is often related to how tight the specifications are set.	*Maintenance*
CPPI	Canadian Petroleum Products Institute	*Petro-Chemical Abbreviations*
CPS	Cycles per second; the rate or number of periodic events in one second, expressed in Hertz (Hz).	*General Engineering*
CPU	Central processing unit. The part of the computer that contains the circuits that control and perform the execution of computer instructions.	*General Engineering*
CQI	Continual Quality Improvement.	*Maintenance*
CR Competitive Retailer	CR: Competitive Retailer	*Energy*
Crab or Ground crab	a type of windlass used underground near the face. (Lancs.); or a type of capstan usually worked by horses and used for raising and lowering heavy weights such as pumps etc. in the shaft.	*Mining*
Crack	A fracture-type imperfection characterized by a sharp tip and high ratio of length and depth to opening displacement.	*Maintenance and Repair*
Cracket	a low wooden stool or seat used by the hewer when under-cutting the coal (N. East)—see also Cratch and Stool.	*Mining*
Cracking	The breaking of plastics materials that have been molded around inserts. Chemical process by which a complex compound is broken down into simpler ones.	*Material Process*
Cracking (concrete)	the breaking of concrete due to the expansive forces caused by the formation of iron-oxide corrosion products on unprotected reinforcement bars	*Materials Process*
Cracking pressure	The pressure at which a pressure actuated valve begins to pass fluid. CUSHION - A device sometimes built into the end of a cylinder which restricts outlet flow and thereby slows down the Piston.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cracking Pressure	The pressure at which a pressure operated valve begins to pass fluid.	*Lubrication*
CRADA	Cooperative Research and Development Agreement	*Petro-Chemical Abbreviations*
Cradle	a tool used for gathering a crop once it is finished growing	*Agriculture*
Cradling	the stone walling in a shaft.	*Mining*
Craftsperson	Alternative To Tradesperson. A Skilled Maintenance Worker Who Has Typically Been Formally Trained Through An Apprenticeship Program.	*Management*
Cramp	a device for bending tub rails to set the track around a curve on the haulage road. - see also Jim Crow and Rail bender.	*Mining*
Crampet	a bracket used in a pumping shaft to hold the pumps and pipes in place. (Derbys.).	*Mining*
Crane	used to hoist the corves of coal from the tram and swing them on to the rolley, the coals being put by the barrow-man from the working places to the crane, and drawn thence by horses to the shaft, (N. East).	*Mining*
Crane Barge	A large barge, capable of lifting heavy equipment onto offshore platforms. Also known as a derrick barge.	*Petroleum Drilling*
Crane barge	A large barge, capable of lifting heavy equipment onto offshore platforms. Also known as a "derrick barge".	*Petroleum Drilling*
Crane boards	a return airway connected directly with the furnace. (N. East).	*Mining*
Crane brae	a short incline in steep working. (Scot.).	*Mining*
Crane place	the place in the pit where baskets of coal are transferred from the inbye rollies, using cranes, to the railway wagons for onward transport to the shaft, (N. East).	*Mining*
Craneman or Crane-hoister	a boy managing the crane by which the corves are transferred from the tram to the rolleys and for 'chalking-on', i.e. keeping an account of the number transferred (N. East)—see Flatman.	*Mining*
Crank, small coals (S. Wales)	Crank, small coals. (S. Wales).	*Mining*
Crankcase	A case that encloses the crankshaft. In most engines, the oil pan and the lower portion of the cylinder block form the crankcase.	*Mechanical Engineering*
Crankcase Oil	Lubricant used in the crankcase of the internal combustion engine.	*Lubrication*
Crankshaft	A shaft with one or more cranks, or "throws," that are coupled by connecting rods to the engine's pistons. The combustion process creates reciprocating motion in the rods and pistons which in turn is converted to a rotating motion by the crankshaft.	*Mechanical Engineering*
Crapply, friable	Crapply, friable.	*Mining*
Crash packing	a technique which allows the roof to cave in under its own weight as the face advances, thus filling in the waste. Also known as 'cropping', 'drawing the wood' or 'total caving'.	*Mining*
Cratch or Cratcher	a small stool of varying design used by colliers when holing-out under the coal particularly when working inclined seams. (Lancs.). - see also Cracket and Stool.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Craw coal, Craws or Crow	a thin seam of inferior coal. (Scot.).	*Mining*
Craw picker	a person who picked stone from coal or shale at the pit top. (Scot.).	*Mining*
Crawler	The first instar motile nymphal stage of scale insects and mealybugs, which moves to a new feeding site before settling down to a sessile existence for the rest of its developmental life.[1]	*Forestry*
Crawley	a short chain conveyor connecting the face conveyor with belt road conveyor.	*Mining*
Crazing	Minute lines appearing in or near the surface of materials, such as ceramics and plastics usually resulting as a response to environment. Crazing cannot be felt by running a fingernail across it. If the fingernail catches, it is a crack, not crazing.	*Electrical*
CRC	Co-ordinating Research Council, Incorporated	*Petro-Chemical Abbreviations*
CRD	See Centre for Reviews and Dissemination (CRD)	*Quality Engineering*
CRDPF	continuously regenerating diesel particulate filter	*Petro-Chemical Abbreviations*
Crease	a wooden tramway on inclines down which iron shod sledges slide. (Som.).	*Mining*
Credit Memo	A document used to correct an overcharge, pay a rebate, or credit the value of goods returned.	*Procurement*
Creel	a wicker basket used by 'bearers' for carrying coal on their back with a head strap for steadying. (Scot.); or a large wicker basket used for winding coal up the shaft. (Scots.).	*Mining*
Creep	Creep is deformation with time when a part is subjected to constant stress. Metals creep can occur at elevated temperature however with gasket materials it can occur at normal ambient temperatures. Creep resistance is an important property of gasket materials. Gasket materials are designed to flow under stress to fill any irregularities in the flange surface. The amount of creep sustained tends to increase with temperature. . However once the tightening is completed it is important that no further flow occurs since such deformation will lead to a reduction in bolt extension and subsequently the stress acting on the gasket. If this stress is reduced to below a certain minimum, which depends upon the type and construction of the gasket and the operating temperature, a high rate of leakage can be anticipated to occur.	*Maintenance*
Creep	The dimensional change with time of a material under load. At room temperature, it is sometimes called cold flow.	*Electrical*
Creep or Plastic Flow of Metals	At sufficiently high temperatures, all metals flow under stress. The higher the temperature and stress, the greater the tendency to plastic flow for any given metal.	*Maintenance and Repair*
Creep and Thrust	The gradual lifting of the floor or the gradual caving of the roof and sides caused by the weight of the surrounding strata.	*Mining*
Creep curve	Characteristic plot of a strain versus time for a material undergoing creep deformation.	*Material Process*
Creep rupture failure	Material fracture following plastic deformation at a relatively high temperature, under constant load over a long time period.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Creepage	Electrical leakage on a solid dielectric surface.	*Electrical*
Creeper	a mechanical device, such as a powered chain drive, placed between the rails to assist tubs or mine cars, by engaging the axles of the mine cars, up short inclines or to advance mine cars at a loader or in the pit bottom.	*Mining*
Cresols	A series of three different (ortho-, meta-, para) hydroxyl derivatives of toluene obtained from coal tar or wood tar.	*Material Process*
Cresylic acid	A term used especially to denote a crude mixture of the three cresols.	*Material Process*
Cresyl-p-toluene sulfonate ($CH_3C_6H_4SO_2OC_6H_4CH_3$)	A common plasticizer, known also as Santicizer.	*Material Process*
Crevice	A narrow opening, resulting from a crack; a fissure.	*Mining*
Crevice Corrosion	Localized corrosion of a metal surface at, or immediately adjacent to, an area that is shielded from the full exposure to the environment because of close proximity between the metal and the surface of another material.	*Paint and Coatings*
Crevices corrosion	Crevices corrosion are also created by deposits of corrosion products on the surface, scratches in the paint film, etc. The environmental conditions in the crevice can change with time from those of the nearby clean surface.	*Material Process*
CRG	See Cochrane Review Group (CRG)	*Quality Engineering*
CRG module	See Module	*Quality Engineering*
Crib	A barrier projecting part of the way into a river and then upward, acting to reduce the flow of water and as a storage place for logs being floated downstream. A lining for a well or other shaft.	*Civil Engineering*
Cribbing	A timber or plank lining of a shaft; the confining of a wall-rock.	*Mining*
Cribs	segments of timber, iron or concrete, encircling a shaft to form a foundation for the walling or tubbing, also known as a 'curb'. They were supported at intervals, generally of about 3ft, by a few vertical props and were hung together by planks, termed 'stringing deals', which were nailed against them.	*Mining*
Crimp Termination	A wire termination that is applied by physical pressure of terminal to wire.	*Electrical*
Crinkling	Bending or twisting of foliage without breaking; wrinkling.	*Forestry*
Criteria for acceptability	CLIA's term for the decision criteria applied to assess the validity of an analytical run. Another name for QC procedure, with emphasis on definition of the decision criteria or control rules for interpreting control measurements.	*Quality*
Criteria pollutant	A pollutant determined to be hazardous to human health and regulated under EPA's National Ambient Air Quality Standards. The 1970 amendments to the Clean Air Act require EPA to describe the health and welfare impacts of a pollutant as the "criteria" for inclusion in the regulatory regime.	*Energy*
Critical appraisal	The process of assessing and interpreting evidence by systematically considering its validity, results, and relevance.	*Quality Engineering*
Critical current density	Current flow at which a material stops being superconducting.	*Material Process*
Critical Damping	Critical damping is the smallest amount of damping at which a given system is able to respond to a step function without overshoot.	*Electrical*

Please see the Appendix for further illustration

Term	Definition	Industry
Critical Diameter	Diameter of the smallest bend for a given wire rope which permits the wires and strands to adjust themselves by relative movement while remaining in their normal position.	*Wire Rope & Cable*
Critical Flow	See the definition for choked flow.	*Industrial Engineering*
Critical frequency	A particular resonant frequency (see ***resonance***) at which damage or degradation in performance is likely.	*Reliability Engineering*
Critical machines	Machines (in a plant) that are vital to continued operation. Vibration should be monitored continuously.	*Reliability Engineering*
Critical magnetic field	Field above which a material stops being superconducting.	*Material Process*
Critical random error, REcrit	The size of random error that causes a 5% maximum defect rate for the analytical process. Calculated as (TEa- biasmeas)/1.65smeas, where TEa is the allowable total error, biasmeas is the inaccuracy, and smeas is the imprecision (standard deviation) of the measurement procedure.	*Quality*
Critical resolved shear stress	Stress operating on a slip system and great enough to produce slip by dislocation motion.	*Material Process*
Critical Speed	The rotational speed of the rotor or rotating element at which resonance occurs in the system. The shaft speed at which at least one of the "critical" or natural frequencies of a shaft is excited.	*General Engineering*
Critical speeds	Any rotating speed which results in high vibration amplitudes. Often these are speeds which correspond to system natural frequencies.	*Reliability Engineering*
Critical systematic error, Secrit	The size of the systematic error that needs to be detected to maintain a defined quality requirement. Calculated as [(TEa - biasmeas)/smeas] - 1.65, where TEa is the allowable total error, biasmeas is the inaccuracy, and smeas is the imprecision (standard deviation) of the measurement procedure.	*Quality*
Critical-error graph	A power function graph on which is imposed the critical-error that needs to be detected. Facilitates the estimation and comparison of the probability for error detection by different QC procedures.	*Quality*
Criticality	The Priority Rank Of A Failure Mode Based On Some Assessment Criteria.	*Plant Engineering*
Criticality Analysis	A method for identifying product or process criticality for the purpose of prioritizing activities like design and maintenance. It is a process of decomposing product or process into hierarchical components, followed by study of their failure modes and effects, and (where appropriate) their causes. Criticality is the combined measure of the failure mode probability and the severity of its effects.	*Reliability Engineering*
Criticality matrix	This is a matrix in which each element represents the number of failures of a certain severity within a certain probability interval of occurrence.	*Reliability Engineering*
Crop	where a seam of coal rises to and is exposed at the surface, short for 'outcrop'; or to leave a portion of coal at the bottom of a seam in working; also to set out, (N. East). – see also Basset.	*Mining*
Crop coal	Coal at the outcrop of the seam. It is usually considered of inferior quality due to partial oxidation, although this is not always the case.	*Mining*
Crop residue	Organic residue remaining after the harvesting and processing of a crop.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Crop tree	Tree selected for quality, species, size, timber potential, or wildlife value that is favored for growing to final harvest.	*Forestry*
Croppers	shots place around the sides of a sinking shaft after the 'sumping shots' have been fired.	*Mining*
Cropping	see crash packing; also a fine for not sending out a full tub.	*Mining*
Cross	A Fitting with four connections in the same plan with two of these connections forming an in-line run. Crosses can also be 5 Way and 6 Way.	*Petroleum Engineering*
Cross banding	Placing veneers in transverse order. Sometimes called face crossing.	*Material Process*
Cross Bracing	Rods and turnbuckles placed diagonally across roller bed or live roller type conveyors to aid in squaring frames, necessary for tracking purposes.	*Manufacturing*
Cross Cut	A level driven across the course of a vein.	*Mining*
Cross entry	An entry running at an angle with the main entry.	*Mining*
Cross Functional Teams	Teams of employees representing different functional disciplines and/or different process segments who tackle a specific problem or perform a specific task, frequently on an ad hoc basis.	*Maintenance*
Cross linking	Joining of adjacent, linear polymeric molecules by chemical bonding. For example, vulcanization of rubber.	*Material Process*
Cross Linking	The establishment of chemical bonds between polymer molecule chains. It may be accomplished by heat, vulcanization, irradiation or the addition of a suitable chemical agent.	*Electrical*
Cross pack	packs arranged across from one roadside pack to another or from one longitudinal pack to another to check the leakage of air through the waste.	*Mining*
Cross Pattern	The sequential torquing of the lug nuts in a pattern across from one another.	*Mechanical Engineering*
Cross Sectional Area	The area of the cut surface of an object cut at right angles to the length of the object.	*Electrical*
Cross Sectional Area of a Conductor	The sum of cross sectional areas of all the individual wires composing the conductor. It is generally expressed in circular mils.	*Electrical*
Cross street	A street crossing another street. A short street connecting main streets.	*Civil Engineering*
Cross struts	Framework that holds up the hyperbolic shell of a natural draft tower. The number of cross struts varies according to shell size.	*Facility Engineering*
Cross Ties	Structural members which maintain frame rail spacing on unit handling conveyors.	*Equipment*
Cross Contamination	The process of transferring bacteria from one person or an object to another person or object. Similar term to cross-infection.	*Chemistry*
Cross-axis sensitivity	**Cross-axis sensitivity**. See transverse sensitivity.	*Reliability Engineering*
Crossbar	The horizontal member of a roof timber set supported by props located either on roadways or at the face.	*Mining*
Crosscut	A horizontal opening driven across the course of a vein or structure, or in general across the strike of the rock formation; a connection from a shaft to an ore structure.	*Mining*

Term	Definition	*Industry*
Cross-cut or crut	a roadway connecting two other more important roads; or a double-handled saw; or a roadway driven through the strata from one seam to another where the seams are steeply inclined, also called a 'cross measures drivage.'	*Mining*
Crosscut	A horizontal opening driven from a shaft and (or near) right angles to the strike of a vein or other orebody.	*Mining*
Crossflow	Flow of solution adjacent or parallel to the surface of the membrane. This contrasts with direct flow seen in traditional filters, in which the liquid flows perpendicular to the surface of the filter. In crossflow, only a fraction of the crossflow solution passes through the membrane.	*Pollution Engineering*
Crossflow tower	One in which air, drawn or forced in through the air intakes by the fan, flows horizontally across the fill section and interfaces perpendicularly with the falling hot water.	*Facility Engineering*
Cross-functional teams	Teams of employees representing different functional disciplines and/or different process segments that tackle a specific problem or perform a specific task, frequently on an ad hoc basis.	*Quality*
Crossgate	a roadway driven at approximately 30-45º to the main gate roads, also known as a 'slant', used to eliminate the need to maintain long lengths of gate roads and to facilitate the removal of coal from the face and gates to the main haulage in longwall working. Can be driven in the goaf and is then known as a 'scour'.	*Mining*
Crossmember	One of several horizontal members in a vehicle frame which join the side members and add to overall strength and stability.	*Mechanical Engineering*
Crossover	A bridge or other structure for crossing over a river, highway, etc.	*Civil Engineering*
Cross-over Fitting	Any pipe fitting, or component, having two different end connection types such as, e.g. line pipe one end X 8 Round Tubing Threads other end, male or female, and various sizes and combinations of male or female connectors, in various connection types.	*Petroleum Engineering*
Crossover frequency	In sinusoidal vibration testing, the unique forcing frequency at which the required displacement yields the desired acceleration and *vice versa*.	*Reliability Engineering*
Cross-over trial	A type of clinical trial comparing two or more interventions in which the participants, upon completion of the course of one treatment, are switched to another. For example, for a comparison of treatments A and B, the participants are randomly allocated to receive them in either the order A, B or the order B, A. Particularly appropriate for study of treatment options for relatively stable health problems. The time during which the firs interventions is taken is known as the first period, with the second intervention being taken during the second period. See also: Carry over, Period effect	*Quality Engineering*
Cross-piece	Cross-piece, -see Collar, Bar and Crowntree.	*Mining*
Cross-Section Width	External sidewall-to-sidewall measurement of inflated tire, exclusive of ornamental ribs and lettering. Sometimes called section width.	*Mechanical Engineering*
Cross-sectional study	A study measuring the distribution of some characteristic(s) in a population at a particular point in time. Also called: Survey	*Quality Engineering*

Term	Definition	*Industry*
Cross-subsidization	This refers to the transfer of assets or services from the regulated portion of an electric utility to its unregulated affiliates to produce an unfair competitive advantage. Also, cross-subsidization can refer to one rate class (such as industrial customers) subsidizing the rates of another class (such as residential customers).	*Energy*
Cross-talk	Interference or noise in a sensor or channel, coming from another sensor or channel.	*Reliability Engineering*
Cross-training	Skill-development practices that require or encourage production workers and other employees to master multiple job skills, thus enhancing workforce flexibility.	*Quality*
Crosswalk	A lane marked off for pedestrians to use when crossing a street, as at an intersection.	*Civil Engineering*
Crow coal	a term sometimes used for anthracite due to its shiny black appearance.	*Mining*
Crow picker	Crow picker, -see Craw picker and Batt-picker.	*Mining*
Crowbar Circuit	A crowbar circuit is a power supply protection circuit that rapidly short-circuits ("crowbars") the supply line if the voltage and/or current exceeds defined limits. In practice, the resulting short blows a fuse or triggers other protection, effectively shutting down the supply.	*Electrical Engineering*
Crowd Rope	A wire rope used to drive or force a power shovel bucket into the material that is to be handled.	*Wire Rope & Cable*
Crown	The highest point of any construction of convex section or outline, as an arch, vault, deck, or road.	*Civil Engineering*
Crown	The branches and foliage at the top of a tree.	*Forestry*
Crown (or Kerf)	the cutting edge.	*Petroleum Drilling*
Crown Block	The set of pulleys or sheaves at the top of a mast on a rig.	*Petroleum Drilling*
Crown down	an old term for ripping or taking down the roof of a roadway to make more headroom. (Bris., Som.).	*Mining*
Crown Lace Pulley	A pulley with greater diameter at the center than at the ends.	*Equipment*
Crown land	Land and land covered by water owned by the Province.	*Petroleum Engineering*
Crown or Crowntree	a flat bar or 'cross-piece' used in roof support, (Mids.); or the centre section of a metal arched roof support. Also known in other coalfields as a 'bow'; or an iron socket on the end of the winding rope that was attached to the cage chains. It was in use before the development of safety devices to prevent overwinding. (Som.).	*Mining*
Crown-class	A tree classification system based on the tree's relative height, foliage density, and ability to intercept light. Classifications include dominant, co-dominant, intermediate, and suppressed.	*Forestry*
Crowned	when the roof lids and posts all fit well together (N. Staffs.).	*Mining*
Crowned Pulley	A pulley which tapers equally from both ends toward the center, the diameter being the greatest at the center.	*Manufacturing*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Crowned Road	A road design with a slope or pitch from its center to the curb or shoulder in order to facilitate water drainage.	*Mechanical Engineering*
Crown-in	collapse at the surface due to subsidence forming a 'crown hole', a circular depression or hole.	*Mining*
Crowntrees	half-round lengths of timber fixed under a roof of a working place. (Scot.).	*Mining*
Crow-stone	Crow-stone, a term used for 'ganister'.	*Mining*
Crozle	to cake or harden, e.g., crozzling—the aggregation of coal when burning, usually in coke making. (Derbys.).	*Mining*
CRP	CRP—Conservation Reserve Program.	*Agriculture*
CRR	Clinically Reportable Range	*Quality*
CRT	constantly regenerating trap	*Petro-Chemical Abbreviations*
Crude assay	A procedure for determining the general distillation and quality characteristics of crude oil.	*Petroleum Engineering*
Crude oil	A mixture of hydrocarbons that exists in liquid phase in natural underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Depending upon the characteristics of the crude stream, it may also include 1. Small amounts of hydrocarbons that exist in gaseous phase in natural underground reservoirs but are liquid at atmospheric pressure after being recovered from oil well (casing head) gas in lease separators and are subsequently comingled with the crude stream without being separately measured. Lease condensate recovered as a liquid from natural gas wells in lease or field separation facilities and later mixed into the crude stream is also included; 2. Small amounts of nonhydrocarbons produced with the oil, such as sulfur and various metals; 3. Drip gases, and liquid hydrocarbons produced from tar sands, oil sands, gilsonite, and oil shale.	*Energy*
Crude oil	A naturally occurring mixture of hydrocarbons that usually includes small quantities of sulfur, nitrogen, and oxygen derivatives of hydrocarbons as well as trace metals.	*Petroleum Engineering*
Crude Oil (acquisition stock)	Crude oil that has not been added by a refiner to inventory and that is thereafter sold or otherwise disposed of without processing for the account of that refiner shall be deducted from its crude oil purchases at the time when the related cost is deducted from refinery inventory in accordance with accounting procedures generally applied by the refiner concerned. Crude oil processed by the respondent for the account of another is not a crude oil acquisition.	*Energy*
Crude oil acquisitions (unfinished oil acquisitions)	The volume of crude oil either:	*Energy*
Crude oil f.o.b. price	The crude oil price actually charged at the oil producing country's port of loading. Includes deductions for any rebates and discounts or additions of premiums, where applicable. It is the actual price paid with no adjustment for credit terms.	*Energy*
Crude oil input	The total crude oil put into processing units at refineries.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Crude oil landed cost	The price of crude oil at the port of discharge, including charges associated with purchasing, transporting, and insuring a cargo from the purchase point to the port of discharge. The cost does not include charges incurred at the discharge port (e.g., import tariffs or fees, wharfage charges, and demurrage).	*Energy*
Crude oil less lease condensate	A mixture of hydrocarbons that exists in liquid phase in natural underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Such hydrocarbons as lease condensate and natural gasoline recovered as liquids from natural gas wells in lease or field separation facilities and later mixed into the crude stream are excluded. Depending upon the characteristics of the crude stream, crude oil may also include: 1. Small amounts of hydrocarbons that exist in gaseous phase in natural underground reservoirs but are liquid at atmospheric pressure after being recovered from oil well (casinghead) gas in lease separators and are subsequently comingled with the crude stream without being separately measured; 2. Small amounts of on hydrocarbons produced with the oil, such as sulfur and various metals.	*Energy*
Crude oil losses	Represents the volume of crude oil reported by petroleum refineries as being lost in their operations. These losses are due to spills, contamination, fires, etc., as opposed to refining processing losses.	*Energy*
Crude oil production	The volume of crude oil produced from oil reservoirs during given periods of time. The amount of such production for a given period is measured as volumes delivered from lease storage tanks (i.e., the point of custody transfer) to pipelines, trucks, or other media for transport to refineries or terminals with adjustments for (1) net differences between opening and closing lease inventories, and (2) basic sediment and water (BSw).	*Energy*
Crude oil qualities	Refers to two properties of crude oil, the sulfur content, and API gravity, which affect processing complexity and product characteristics.	*Energy*
Crude oil stocks	Stocks of crude oil and lease condensate held at refineries, in pipelines, at pipeline terminals, and on leases.	*Energy*
Crude oil stream	Crude oil produced in a particular field or a collection of crude oils with similar qualities from fields in close proximity, which the petroleum industry usually describes with a specific name, such as West Texas Intermediate or Saudi Light.	*Energy*
Crude oil used directly	Crude oil consumed as fuel by crude oil pipelines and on crude oil leases.	*Energy*
Crude Oil	Liquid petroleum as it comes out of the ground as distinguished from refined oils manufactured out of it.	*Petroleum Drilling*
Crude oil, refinery receipts	Receipts of domestic and foreign crude oil at a refinery. Includes all crude oil in transit except crude oil in transit by pipeline. Foreign crude oil is reported as a receipt only after entry through customs. Crude oil of foreign origin held in bonded storage is excluded.	*Energy*
Crumb Rubber	Fine granular or powdered rubber capable of being used to make a variety of products. It is recovered from scrap tires using thermal and/or mechanical processing techniques. Crumb rubber also is derived from the tire retreading process, when worn tire tread is removed during a buffing process before the new tread is affixed.	*Environmental Engineering*
Crump	Crump, - see Bump or Weight.	*Mining*

Term	Definition	*Industry*
Crush	the crumbling of pillars or the sides of roadways due to strata pressures.	*Mining*
Crush Resistance Test	A test to determine the ability of a cable to resist damage from radial compression, such as might be encountered in service.	*Electrical*
Crushed Powder	Powder formed from a solid which is then crushed to the appropriate size for spraying.	*Paint and Coatings*
CRUSHER	A machine for crushing rock, such as a gyratory crusher, jaw crusher, stamp mill, etc.	*Mining*
Crusher	A machine for crushing rock or other materials. Among the various types of crushers are the ball mill, gyratory crusher, Handsel mill, hammer mill, jaw crusher, rod mill, rolls, stamp mill, and tube mill.	*Mining*
Crust	The outermost layer of the Earth; includes both continental and oceanic crust.	*Mining*
Crut	a cross-measure tunnel or drift.	*Mining*
Cryogenic plant	A type of natural gas processing plant that uses low temperatures to condense the collected natural gas to a liquid state, making it easier to separate the component hydrocarbons and transport the gas.	*Petroleum Drilling*
Cryogenic Temperature	Any temperature below about -240°F.	*Mechanical*
Cryogenic Valve	A term used to describe valves designed to operate below –40°C.	*Industrial Engineering*
Cryogenics	Measurement of temperature at extremely low values, i.e., below -200°C.	*Electronic Process*
Cryptic	Hidden or concealed.	*Forestry*
Crystal (Bravais) lattice	The 14 possible arrangements of points (with equivalent environment) in 3D-three dimension space.	*Material Process*
Crystal system	The seven, unique unit cell shapes that can be stacked together to fill three dimension space.	*Material Process*
Crystalline	Having constituent atoms stacked together in a regular, repeating pattern.	*Material Process*
Crystalline fully refined wax	A light colored paraffin wax having the following characteristics:	*Energy*
Crystalline other wax	A paraffin wax having the following characteristics:	*Energy*
Crystallite	Trade name for a methyl methacrylate plastics material.	*Material Process*
Crystals	soluble in alcohol, benzene, ether, insoluble in water.	*Material Process*
Crystobalite	Compound crystal structure.	*Material Process*
CSA	Canadian Standards Administration.	*General Engineering*
CSA	CSA - Canadian Standards Administration.	*Electronic Process*
CSG (coal seam gas) or CBM (coal bed methane)	Methane that forms in the gaps between coal molecules.[1] (not to be confused with csg, an abbreviation for the well casing)	*Petroleum Drilling*
CSREES	Cooperative State Research Education & Extension Service, an agency of the USDA.	*Agriculture*
cSt	Centistokes	*Petro-Chemical Abbreviations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
C-stage resins	State of the resins in the final molded articles, usually applied to cast resins.	*Material Process*
CSTCC	continuously slipping torque converter clutch	*Petro-Chemical Abbreviations*
cu in	Cubic inch	*General*
Cube or Cupola	a shaft sunk near to the top of a furnace upcast, and holed into the shaft a few fathoms below the surface, with a wide chimney erected over it, rising 30 or 40 feet above the surface. It relieves the pit top from smoke. Called also a tube.	*Mining*
Cubic	Simplest of the seven crystal systems.	*Material Process*
Cubic Foot	A standard unit used to measure quantity of gas (at atmospheric pressure); 1 cubic foot = 0.0283 cubic meters.	*Petroleum Drilling*
Cubic foot (cf), natural gas	The amount of natural gas contained at standard temperature and pressure (60 degrees Fahrenheit and 14.73 pounds standard per square inch) in a cube whose edges are one foot long.	*Energy*
Cubic foot	A standard unit used to measure quantity of gas (at atmospheric pressure); 1 cubic foot = 0.0283 cubic meters.	*Petroleum Drilling*
Cuddie or Cuddy	a bogie loaded with weights, as in: 'Cuddie brae'- a self-acting incline where the cuddie was used to counter balance the weight of the full hutches being lowered down the steep inclined road. (Scots.).	*Mining*
CULL	A tree or log of marketable size that is useless for all but firewood or pulpwood because of crookedness, rot, injuries, or damage from disease or insects.	*Forestry*
Cull wood	Wood logs, chips, or wood products that are burned.	*Energy*
Culm	Waste from Pennsylvania anthracite preparation plants, consisting of coarse rock fragments containing as much as 30 percent small sized coal; sometimes defined as including very fine coal particles called silt. Its heat value ranges from 8 to 17 million Btu per short ton.	*Energy*
Culm and silt	**Culm and silt** are waste materials from preparation plants. In the anthracite region, culm consists of coarse rock fragments containing as much as 30 percent small-sized coal. Silt is a mixture of very fine coal particles (approximately 40 percent) and rock dust that has settled out from waste water from the plants. The terms culm and silt are sometimes used interchangeably and are sometimes called refuse. Culm and silt have a heat value ranging from 8 to 17 million Btu per ton.	*Energy*
Cultivar	A horticulturally or agriculturally derived variety of a plant.	*Energy*
Cultivate	to improve the land by plowing and fertilizing	*Agriculture*
Culvert	A drain or channel crossing under a road, sidewalk. Example: sewer, conduit.	*Civil Engineering*
Cumarone, or Benzofuran	Cumarone is a liquid. A constituent of high boiling naphtha, which will polymerize alone or with indene to form a resin with properties suited for use as a binder or coating material.	*Material Process*
Cum-dividend	Buyer entitled to pending dividend payment.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cumulative control limits	Control limits calculated from estimates of the mean and standard deviation that represent a time period longer than a month. Common practice is for laboratories to calculate monthly control statistics. Cumulative statistics can be easily calculated from monthly statistics that tabulate the sum of the individual values and the sum of the squares of those values. See the lesson QC - The Calculations for more detailed discussion, equations, and examples.	*Quality*
Cumulative damage model	An accelerated life testing model used to model accelerated tests where the stress levels vary with time.	*Reliability Engineering*
Cumulative density function (cdf)	A function obtained by integrating the failure distribution pdf. In life data analysis, the cdf is equivalent to the unreliability function.	*Reliability Engineering*
Cumulative depletion	The sum in tons of coal extracted and lost in mining as of a stated date for a specified area or a specified coal bed.	*Energy*
Cumulative meta-analysis	A meta-analysis in which studies are added one at a time in a specified order (e.g. according to date of publication or quality) and the results are summarized as each new study is added. In a graph of a cumulative meta-analysis, each horizontal line represents the summary of the results as each study is added, rather than the results of a single study.	*Quality Engineering*
Cundie or Cundy	a low narrow passage cut between two roadways to allow supplies to pass through or for ventilation - see also Slit, Sniggett and Snicket; or a water culvert, or the unfilled space between two packwalls; or, in steep longwall workings, a long narrow roadway without rails down which the coal was rolled to be loaded into 'hutches' at the bottom. (Scot.).	*Mining*
Cupola	a chimney erected above or close to the upcast shaft to carry away the smoke from the ventilation furnace; or another name for the ventilation furnace.	*Mining*
Cupriferous - Containing copper	Cupriferous - Containing copper.	*Mining*
Curb	A rim, especially of joined stones or concrete, along a street or roadway, forming an edge for a sidewalk.	*Civil Engineering*
Curb Guard	A rubber protrusion running circumferentially around some tires just above the whitewall to prevent curb scuffing on the whitewall area of a tire.	*Mechanical Engineering*
Curb Weight	The total weight of a vehicle with no passengers and a full tank of gas.	*Mechanical Engineering*
Curbing	The material forming a curb, as along a street.	*Civil Engineering*
Curbstone	One of the stones, or a range of stones forming a curb as along a street.	*Civil Engineering*
Cure	(See Vulcanization.)	*Electrical*
Cure Point	The temperature at which a normally magnetic material goes through a magnetic transformation and becomes non-magnetic.	*General Engineering*
Curing	The change of a binder from a soluble fusible condition to an insoluble-infusible condition by chemical reaction.	*Material Process*
Current	The rate at which electrons flow through a circuit is defined as the current. If an electric circuit is likened to water flowing through a system of pipes, the current is analogous to the rate at which the water is flowing. Electric current is measured in amps.	*Electrical*

Term	Definition	*Industry*
Current	Time value of movement of free electrons. One ampere equals one coulomb per second. Conventional reference is opposite to direction of actual electron movement.	*Electrical Engineering*
Current (Electric)	Flow of electrons in an electric conductor.	*Energy*
Current Asset Value (CAV)	See Estimated Replacement Value	*Maintenance*
Current assets	Cash and other assets that are expected to be turned into cash, sold, or exchanged within the normal operating cycle of the utility, usually one year. Current assets include cash, marketable securities, receivables, inventory, and current prepayments.	*Energy*
Current assets	Assets of company which can and are likely to be converted into cash within a year. Includes cash, marketable securities, accounts receivable and supplies.	*Mining*
Current Consumption	The amount of current required to power a sensor or control (excluding load). See supply current.	*Electrical Engineering*
Current Contents	Electronic database that provides access to the tables of contents and bibliographic data from current issues of the world's leading scholarly research journals in the sciences, social sciences, arts, and humanities.	*Quality Engineering*
Current liabilities	A debt or other obligation that must be discharged within one year or the normal operating cycle of the utility by expending a current asset or the incurrence of another short-term obligation. Current liabilities include accounts payable, short-term notes payable, and accrued expenses payable such as taxes payable and salaries payable.	*Energy*
Current Proportioning	An output form of a temperature controller which provides a current proportional to the amount of control required. Normally, a 4 to 20 milliamp current proportioning band.	*Electrical*
Current ratio	The ratio of current assets divided by current liabilities that shows the ability of a utility to pay its current obligations from its current assets. A measure of liquidity, the higher the ratio, the more assurance that current liabilities can be paid.	*Energy*
Current Sinking	An output type such that when it is On, current flow is from the load into the device's output, then to ground. Output is Normally High. The sensor "sinks" current from the load through the sensor to ground. The load is connected between the positive lead of the supply and the output lead of the sensor.	*Electrical Engineering*
Current Sourcing	An output type such that when it is On, current flow is from the device into the load. Output is Normally Low. The sensor "sources" current to the load. The load is connected between the output lead and the negative ground lead of the supply.	*Electrical Engineering*
Current Transformers	These are used in conjunction with metering equipment. They are designed to permit measurement of currents beyond the range of a meter.	*Energy*
Current carrying Capacity	The maximum current an insulated conductor or cable can continuously carry without exceeding its temperature rating. It is also called ampacity.	*Electrical*
Current-Mode Controller	A DC-DC switching regulator which regulates its output voltage by varying the peak inductor current on a cycle-by-cycle basis to output a regulated voltage despite variations in load-current and input-voltage.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Current-Sense Amplifier	An amplifier that measures current by measuring the voltage drop across a resistor placed in the current path. The current sense amp outputs either a voltage or a current that is proportional to the current through the measured path.	*Electrical Engineering*
Curry pit	a hole, or shallow shaft, between two coal seams, used as a return airway. (Leics.).	*Mining*
Curtain Side Airbags	Designed to cushion and protect occupants' heads. Located on both the left and right sides of the vehicle, curtain side airbags deploy from above the front and rear side windows in a side-impact collision. Advanced systems deploy the bags when sensors detect an impending rollover. The bags inflate within a fraction of a second and deflate after a few seconds. They also help shield occupants from broken side glass. In some vehicles with three rows of seats, the curtain airbags do not reach backseat occupants. Curtain-side airbags deploy from above the side windows during a side-impact collision or when a rollover situation is sensed.	*Mechanical Engineering*
Curve	This is the point in a directional well where it turns from a vertical hole to a horizontal hole. You may hear directional drillers speaking of "building the curve." This is the process of using an mud motor with a specific bend in it to gently create a curve in the wellbore over a distance of several hundred feet. Once the curve has been built, mud motors more suited for horizontal drilling, and made only for applying slight corrections are typically used.	*Petroleum Drilling*
Curve Conveyor	Any skatewheel, roller, or belt conveyor which is produced with a degree of bend so as to convey products away from the straight flow.	*Manufacturing*
Curve Fitting	Curve fitting is the process of computing the coefficients of a function to approximate the values of a given data set within that function. The approximation is called a "fit". A mathematical function, such as a least squares regression, is used to judge the accuracy of the fit.	*General Engineering*
Curved Belt Conveyor	Belt Conveyor: Unit load belt conveyor usually operating horizontally through various angle turns, usually 30, 45, 60, 90, or 180 degrees.	*Equipment*
Curving	cutting into the whole coal as the preparatory course to blasting or wedging it down.	*Mining*
Cushion pack	a pack formed with loose dirt without walls.	*Mining*
Cushion, Cylinder	A cushion built into a cylinder to restrict flow at the outlet port thereby arresting the motion of the piston rod.	*Mechanical, Process, and Operations*
Custom smelter	A smelter which processes concentrates from independent mines. Concentrates may be purchased or the smelter may be contracted to do the processing for the independent company.	*Mining*
Custom Wheel	An aftermarket wheel designed to improve performance and enhance appearance and comprised of one, two, or three different pieces.	*Mechanical Engineering*
Customer Assistance Programs	Alternative collection program set up between a utility company and a customer that allows customers to pay utility bills on a percentage-of-the-bill they owe or percentage-of-customer-income instead of paying the full amount owed. These programs are for low-income people who can't pay their bills. These customers must agree to make regular monthly payments based on their new payment plans.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Customer Charge	Part of the monthly basic distribution charge to partially cover costs for billing, meter reading equipment, service line maintenance and equipment. This charge is the same no matter how much electricity you use.	*Energy*
Customer choice	The right of customers to purchase energy from a supplier other than their traditional supplier or from more than one seller in the retail market.	*Energy*
Customer Class	A distinction between users of electric energy. Customer class is usually defined by usage patterns, usage levels, and conditions of service. Classes are usually categorized generically by customer activity (e.g. residential, commercial, industrial, agricultural, street lighting).	*Energy*
Customer Costs	Costs that are related to and vary with the number of customers. Customer costs include meters, meter readers, or service equipment costs.	*Energy*
Customer Lead-Time	The time elapsed from receipt of an order until the finished product is either shipped or delivered to the customer.	*Maintenance*
Customer reject rate	A quality measure - expressed in parts per million - reflecting the number of completed units rejected or returned by external customers. Calculation should include parts reworked by customers. Applies to all shipped units, including parts.	*Quality*
Customer retention rate	The number of customers active three years ago and still active, divided by the total number of customers active three years ago.	*Quality*
Customer Service Charge	That portion of the customer's bill which remains the same from month to month. The charge is determined separately from the amount of energy used. It is based on the costs associated with connecting a customer to the company's distribution system, including the service connection and metering equipment. This charge also recovers expenses such as meter reading, billing costs, customer accounting expenses records and collections, and a portion of general plant items such as office space for customer service personnel.	*Energy*
Customer Service Protection	The rules governing grounds for denial of service, credit determination, deposit and guarantee practices, meter reading and accuracy, bill contents, billing frequency, billing accuracy, collection practices, notices, grounds for termination of service, termination procedures, rights to reconnection, late charges, disconnection/reconnection fees, access to budget billing and payment arrangements, extreme weather, illness or other vulnerable customer disconnection protections, and the like. In a retail competition model, would include protections against "slamming" and other hard-sell abuses.	*Energy*
Customs district (coal)	Customs districts, as defined by the Bureau of the Census, U.S. Department of Commerce, " Monthly Report EM 545, " are as follows:	*Energy*
Customs import value (C.I.V.)	The price for a one-time open market transaction for near-term delivery of a specific quantity of product at a specific location where the commodity is purchased LDQUO; on the spot RDQUO; at current market rates. See also spot market terms associated with specific energy types.	*Energy*
Cut	a shaft underground from one seam to another. – see Drop Shaft and Staple.	*Mining*
Cut Thread	Threads are cut or chased; the unthreaded portion of shank will be equal to major diameter of thread.	*Fastening*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cut value	Applies to assays that have been reduced to some arbitrary maximum to prevent erratic high values from inflating the average.	*Mining*
Cut through	Through:Resistance of solid material to penetration by an object under conditions of pressure, temperature, etc.	*Electrical*
Cut through Resistance	The ability of a given material to withstand penetration by a solid object of specified dimensions and weight, which is permitted to free fall onto this material from a specified height.	*Electrical*
Cut-and-cover	A method for digging a tunnel, laying pipe, etc., by cutting a trench, constructing the tunnel or laying the pipe in it, and covering with the excavated material.	*Civil Engineering*
Cut-and-fill	A method of stopping in which ore is removed in slices, or lifts, and then the excavation is filled with rock or other waste material (backfill), before the subsequent slice is extracted.	*Mining*
Cut-chain inclines	inclines using chains with links where tubs can be attached at intermediate points. (Scot.).	*Mining*
Cut-off	a break in the roof next to the face.	*Mining*
Cut-off	The line where the several sections of a mold are joined, sometimes called flash ridge.	*Material Process*
Cut-off grade (uranium)	The lowest grade, in percent U3O8, of uranium ore at a minimum specified thickness that can be mined at a specified cost.	*Energy*
Cut-out	A defect of laminated plastics consisting of a depressed area caused by material cut out of the body material.	*Material Process*
Cutter loader	a machine that cuts coal from the face and loads it on to a conveyor.	*Mining*
Cutter or Coal cutter	a name given to several different types of coal	*Mining*
Cutter pick	a replaceable cutting tool in a machine used for mining coal or for ripping.	*Mining*
Cutter; Cutting machine	A machine, usually used in coal, that will cut a 10- to 15-cm slot. The slot allows room for expansion of the broken coal. Also applies to the man who operates the machine and to workers engaged in the cutting of coal by prick or drill.	*Mining*
Cutting Torch	A device used in oxygen, air, or powder cutting for controlling and directing the gases used for preheating and the oxygen or powder used for cutting the metal.	*Maintenance and Repair*
Cutting contract	A written, legally binding document used in the sale of standing timber specifying the provisions covering the expectations and desires of both buyer and seller.	*Forestry*
Cutting cycle	The planned time interval between timber harvest operations within the same stand. For example, on a 10year cutting cycle some trees are harvested every 10 years.	*Forestry*
Cutting fluid	Any fluid applied to a cutting tool to assist in the cutting operation by cooling, lubricating or other means.	*Oil Analysis*
Cutting horizon	a level, usually predetermined, at which a cut is made in the coal on the coalface. This will often be a line in the seam at some distance below the roof or above the floor.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cutting machines	cutting machines, but particularly one that has a flat jib fitted with a chain and cutter picks, used mainly to undercut the coal prior to firing down with explosives.	*Mining*
Cutting Oil	A lubricant used in machining operations for lubricating the tool in contact with the workpiece, and to remove heat. The fluid can be petroleum based, water based, or an emulsion of the two. The term "emulsifiable cutting oil" normally indicates a petroleum-based concentrate to which water is added to form an emulsion which is the actual cutting fluid.	*Lubrication*
Cutting side	Cutting side, -see Fast side.	*Mining*
Cutting through, or removing a core of material	Example - to bore a tunnel through the	*Civil Engineering*
Cuttings	Rock chips cut from the formation by the drill bit, and brought to the surface with the mud. Used by geologists to obtain formation data.	*Petroleum Drilling*
Cuttings	Rock chips cut from the formation by the drill bit, and brought to the surface with the mud. Used by geologists to obtain formation data.	*Petroleum Drilling*
Cutwater	Civil Engineering a sharply pointed upstream face of a bridge pier, for resisting the effects of moving water or ice.	*Civil Engineering*
Cv	The valve flow coefficient is the number of US gallons per minute of 60°F water that will flow through a valve at a specified opening with a pressure drop of 1psi across the valve.	*Industrial Engineering*
Cv	Flow coefficient expressed as the number of gallons of water that would flow through an opening, such as a valve port, in 1 minute under a differential pressure of 1 psi.	*Mechanical*
CV (Continuous Vulcanization)	Simultaneous extrusion and vulcanization of wire coating materials.	*Electrical*
Cv Flow	A coefficient expressed as the number of gallons of water that would flow through an opening, such as a valve port, in 1 minute under a differential pressure of 1 psi.	*General Mechanical*
CVD	See Chemical Vapor Deposition	*Paint and Coatings*
CVMA	Canadian Vehicle Manufacturers Association	*Petro-Chemical Abbreviations*
CVS	constant volume sampling	*Petro-Chemical Abbreviations*
CVT	continuously variable transmission	*Petro-Chemical Abbreviations*
Cwar	Cwar, another word for sandstone. (S. Wales).	*Mining*
CWIP	Construction Work In Progress	*Energy*
CWP	Cold working pressure - the maximum allowable pressure under non-shock conditions at ambient temperature (-20° F to +100° F).	*Mechanical*
CWP Cold working pressure	The maximum allowable pressure under non-shock conditions at ambient temperature (-20° F to +100° F).	*General Mechanical*

Term	Definition	*Industry*
Cwt	Abbreviation for hundredweight. A Cwt weighs 100 pounds in the United States and 112 pounds in Great Britain .	*Agriculture*
Cyanidation	A method of extracting gold or silver by dissolving it in a weak solution of sodium cyanide.	*Mining*
Cyanide	A chemical species containing carbon and nitrogen used to dissolve gold and silver from ore.	*Mining*
Cycle	The time period running from the startup of one reactor cycle to the startup of the following cycle.	*Energy*
Cycle	One complete sequence of variations in an alternating current. The number of cycles occurring in one second is called the frequency.	*Electrical*
Cycle gas oil	Cracked gas oil returned to a cracking unit.	*Petroleum Engineering*
Cycle mining	A system of mining in more than one working place at a time, that is, a miner takes a lift from the face and moves to another face while permanent roof support is established in the previous working face.	*Mining*
Cycle test	A procedure whereby a product is put through an interval of time during which a phenomena is completed. This can be a set number of events or it can be a continuous operation until something in the product fails.	*Mechanical*
Cycle Time	The time usually expressed in seconds for a controller to complete one on/off cycle.	*General Engineering*
Cycle/reactor history	A group of assemblies that have been irradiated in the same cycles in an individual reactor and are said to have the same cycle/reactor history.	*Energy*
Cycles of Concentration	Compares dissolved solids in makeup water with solids concentrated through evaporation in the circulating water. Since chlorides are soluble in water, for example, the cycles of concentration are equal to the ratio of chlorides in circulating water to chlorides in makeup water.	*Chemical Engineering*
Cyclic Redundancy Check	A check value calculated from the data, to catch most transmission errors. A decoder calculates the CRC for the received data and compares it to the CRC that the encoder calculated, which is appended to the data. A mismatch indicates that the data was corrupted in transit. Depending on the algorithm and number of CRC bits, come CRCs contain enough redundant information that they can be used to correct the data.	*Electrical Engineering*
Cycling (natural gas)	The practice of producing natural gas for the extraction of natural gas liquids, returning the dry residue to the producing reservoir to maintain reservoir pressure and increase the ultimate recovery of natural gas liquids. The reinjected gas is produced for disposition after cycling operations are completed.	*Energy*
Cyclohexane	A solvent-hydrocarbon.	*Material Process*
Cyclohexanol	A solvent alcohol.	*Material Process*
Cyclohexanone	A solvent-ketone.	*Material Process*
Cyclohexyl-p-toluene sulfonamide	Cyclohexyl-p-toluene sulfonamide (CH3C6H4SO2NHC6H11) A plasticizer known as Santicizer.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Cycloid	The curve formed by the path of a point on a circle as it rolls along a straight line. When this circle rolls along the outer side of another circle, the curve is called an Epicycloid; when it rolls along the inner side of another circle it is called a Hypocycloid. These curves are used in defining the former American Standard composite tooth form.	*Gears*
cyclone	a type of separator for removal of larger particles from an exhaust gas stream. Gas laden with particulates enters the cyclone and is directed to flow in a spiral causing the entrained particulates to fall out and collect at the bottom. The gas exits near the top of the cyclone.	*Chemical*
Cylinder	(See Fan Stack).	*Facility Engineering*
Cylinder Block	The basic part of the engine to which other engine parts are attached. It is usually a casting and includes engine cylinders and the upper part of the crankcase.	*Mechanical Engineering*
Cylinder Head	The removable part of the engine that attaches to the cylinder block directly above the cylinders. The head is cast from aluminum or iron and houses the combustion chambers, the intake and exhaust ports, spark plugs or injectors and much or all of the valve train. It has oil and water passages for cooling and lubrication.	*Mechanical Engineering*
Cylinder Oil	A lubricant for independently lubricated cylinders, such as those of steam engines and air compressors; also for lubrication of valves and other elements in the cylinder area. Steam cylinder oils are available in a range of grades with high viscosities to compensate for the thinning effect of high temperatures; of these, the heavier grades are formulated for super-heated and high-pressure steam, and the less heavy grades for wet, saturated, or low-pressure steam. Some grades are compounded for service in excessive moisture; see compounded oil. Cylinder oils lubricate on a once-through basis.	*Lubrication*
Cylinder operator	A power-piston valve operator using either hydraulic or pneumatic pressure. A sealed piston converts applied pressure into a linear piston rod (stem) motion. See "Power Operators."	*Mechanical*
Cylindrical Drum	Hoisting drum of uniform diameter.	*Wire Rope & Cable*
D/A converter	A device that converts a digital signal (discrete values) into an analog voltage.	*Reliability Engineering*
DA	Day Ahead	*Energy*
DAC	Digital to Analogue Convertor	*Control Engineering*
Dacromet	A high performance surface coating that can be applied to fasteners. The coating consists of passivated zinc flakes that are stoved onto the metal surface. The coating can be colored and eliminates the risk of hydrogen embrittlement associated with electroplated metal. DACROMET is a registered trademark of Metal Coatings International, Inc. of Chardon Ohio	*Maintenance*
Dadd	to dash out a small fire of gas, or a small accumulation of gas with a jacket, (N. East).	*Mining*
DAG	Acronym for "Data Acquisition Geek," a computer expert who maintains a team's Data Acquisition system and analyzes the data.	*NASCAR*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dago	American slang used to denote contempt for common laborers or Italian, Spanish, or Portuguese extraction.	*Industrial Relations*
Dailey Commission	a commission set up in 1921 to investigate the building trades in Chicago and the collusion going on in the handling of labor in the building industry.	*Industrial Relations*
Daily Labor Report	one of the special labor services of the Bureau of National Labor Affairs, Inc.	*Industrial Relations*
Daily Peak	The greatest amount of electricity used during a certain period in a day, such as an hour, half-hour or quarter hour.	*Energy*
Daily Peak	The maximum amount of energy or service demanded in one day from a company or utility service.	*Energy*
Daily Rate	the amount of pay received for a standard or fixed number of hours per day, exclusive of overtime or premium pay.	*Industrial Relations*
Daisy Chain	A method of propagating signals along a bus in which the devices are connected in series and the signal passed from one device to the next. The daisy chain scheme permits assignment of device priorities based on the electrical position of the device on the bus.	*Electrical Engineering*
Daitler—see Dataller	Daitler—see Dataller.	*Mining*
Dam	A barrier to obstruct the flow of water, esp. one of earth, masonry, etc., built across a stream or river. A body of water confined by a dam. To furnish with a dam; obstruct or confine with a dam.	*Civil Engineering*
Damage	Something that reduces the value, effectiveness, or usefulness of the thing affected.	*Maintenance*
Damage Suits	civil claims for alleged injury resulting from actions violation of law.	*Industrial Relations*
Damaged Work	Provisions found in some agreements which seek to protect the employee when damage results to the product or equipment because of a mistake.	*Industrial Relations*
Dammar (dammar gum)	A resin of vegetable origin used in the manufacture of rubber and lacquer composition and as a modifier for plastics, a yellowish-white amorphous solid m.p. 120 °C (248 °F).	*Material Process*
Damp	any noxious gas met with in mines.	*Mining*
Damp (not dampen)	To reduce the "Q" or maximum resonant response, by extracting energy, usually by converting motion into heat. Your automobile's shock absorbers damp body motion.	*Reliability Engineering*
Damper	One form adheres or is sprayed onto relatively thin metal panels so as to extract energy when panels flex. Lowers "Q" of each panel mode. Goal: to reduce air flow (over the panel)-induced vibration and radiated noise.	*Reliability Engineering*
Damping	The reduction of vibratory movement through dissipation of energy. Types include viscous, coulomb, and solid.	*General Engineering*
Damping parameter	A measure of the time required as a function of the maximum pressure excursion of the power supply output to attain essentially steady state operation after an abrupt disturbance. Specifically, it is the transient recovery time divided by the maximum excursion.	*Mechanical, Process, and Operations*
Dampsheet	a piece of brattice cloth fixed across a roadway to divert the air current (S. Staffs.).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dams	'stoppings' constructed to prevent air entering and gas escaping from old workings. A more solid and thicker type of dam was built to hold back accumulated water.	*Mining*
Dan	a small wagon used for hauling dirt—see also Horned danny; or a small shallow box mounted on a sled for drawing coal out of the workings; or a tub or barrel used to convey water out of the workings to be tipped in the sump or wound up the shaft. (Mids.); or a small flatbed tub, wagon or tram used for supplies.	*Mining*
Dan tin	a sheet metal box used to convey coal where there were no rails. Also called a 'Duck tin'.	*Mining*
Dander	ash or clinker. (Scot.).	*Mining*
Dandered coal	coal burned and generally mixed with 'trap'. (Scot.).	*Mining*
Dandies	impure coal forming the top and bottom layers of the Parkgate Seam, (Yorks.).	*Mining*
Dandy	a wagon used on the surface for carting pit dirt and rubble to the tip. (Radstock, Som.).	*Mining*
Danger Zone Bonus	a premium or bonus paid to workers for working in an area which is unusually hazardous.	*Industrial Relations*
Danny	a flat truck used for hauling materials. - see also Bogie and Horned danny; or a small truck, running on rails along the face, hauled by a hand rope to transport the coal from the stall to the gate end.	*Mining*
Dant	small coals, wet slack (Lancs.); or soft, sooty coal (N. East).—see also Smut.	*Mining*
Danty	a soft structureless variety of coal devoid of cleats and having the appearance of having been crushed. (N. East).	*Mining*
DAP	Detroit Advisory Panel of API	*Petro-Chemical Abbreviations*
Darcy's formula	A formula used to determine the pressure drop due to flow friction through a conduit.	*Mechanical, Process, and Operations*
Darcy's law	Equation that gives the velocity vector as proportional to the pressure gradient. Often used to describe flow in porous media.	*Chemical*
Darcy's Law	an empirical relationship between hydraulic gradient and the viscous flow of water in the saturated zone of a porous medium under conditions of laminar flow. The flux of vapors through the voids of the vadose zone can be related to a pressure gradient through the air permeability by Darcy's Law.	*Chemical*
DARE	See Database of Abstracts of Reviews of Effects (DARE)	*Quality Engineering*
Darg	fixed amount of coal to be worked for a fixed price. Equivalent to the 'hewing' or 'score price' of the Newcastle area. (N. East) (Scot.). - see also Stint, or the amount of coal a collier sent out of the pit in one day. (Scot.).	*Mining*
Dark Operated (D.O.)	The control operating mode in which the output (load) is energized when the light is blocked (retro/thru scan) or object not present (diffuse), the photosensor is dark.	*Electrical Engineering*
Darlington Case	landmark case in which the U.S. Supreme Court held that an employer has the absolute right to terminate his entire business for any reason he chooses.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dashing air	mixing air and gas together until by being completely incorporated the mixture ceases to be inflammable, (N. East).	*Mining*
Dashpot	A mechanical device used to decrease plunger velocity for controlling noise.	*Mechanical*
Dass	a slice or cut taken out of a pillar in 'stooping'. (Scot.).	*Mining*
Data acquisition	Teams use sophisticated sensors, transmitters, computers and software to provide information on what the car and the driver are doing. Everything from engine stress to the driver's heartbeat can be monitored. The information is analyzed to improve handling, performance and even driver technique. Data can be acquired by connecting a computer to the car or by wireless telemetry.	*NASCAR*
Data Base	A large amount of data stored in a well-organized manner. A data base management system (DBMS) is a program that allows access to the information.	*Electrical*
Data Converter	An electronic circuit that converts analog signals to digital, or vice-versa. An analog signal is a continuously varying voltage or current. Its digital counterpart is a stream of digital numbers, each representing the amplitude of the analog signal at a moment in time.	*Electrical Engineering*
Data derived analyses	See Unplanned analyses	*Quality Engineering*
Data dredging	Performing many analyses on the data from a study, for example looking for associations among many variables. Particularly used to refer to unplanned analyses, where there is no apparent hypothesis, and only statistically significant results are reported.	*Quality Engineering*
Data Highway	A high-speed serial or parallel data path which connects several units of a distributed control or data collection system. Z = compressibility factor, dimensionless 1 = specific weight, upstream conditions = damping factor	*Electrical Engineering*
Data Manipulation Language (or Data Management Language)	A language that allows data to be manipulated in a database. In SQL, commands such as DELETE and INSERT are DML commands.	*Electrical Engineering*
Data monitoring committee	An expert committee set up to monitor the results of a continuing trial periodically, and assess whether or not the trial should continue or stop on ethical grounds, that is, if a treatment appears to be dramatically effective or harmful, and providing it or denying it to half the participants has become unethical. See also: Equipoise	*Quality Engineering*
Data Over Cable Service Interface Specification	A standard for delivering data over cable TV systems, typically for subscriber Internet access services.	*Electrical Engineering*
Database of Abstracts of Reviews of Effects (DARE)	A collection of structured abstracts and bibliographic references of systematic reviews of the effects of healthcare interventions produced by the NHS Centre for Reviews and Dissemination in York, UK. One of the databases in The Cochrane Library. Also called: DARE	*Quality Engineering*
Dataller, O.E.D., day-taler, day + reckoning	Men employed on a day-rate of pay or fixed rate per shift as distinct from a contract worker, a 'byeworker'. Sometimes spelt 'daitler'.	*Mining*
Daugh	the soft fireclay floor found below, above, or in the coal seam. (Scot.); or a holing fireclay (Lancs.).	*Mining*
Daugher	a pick designed for holing in a narrow 'daugh' band. It was usually longer and thinner than a normal pick. (Scot.).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Daughters of St. Crispin	the woman's auxiliary of the Knights of St. Crispin.	*Industrial Relations*
Davis-Bacon Act	a federal statute passed in 1931 and amended in 1935, 1940, and 1964.	*Industrial Relations*
Davy lamp	a safety lamp designed, by Sir Humphry Davy in 1818, for use in gassy conditions, incorporating a wire gauze around the flame.	*Mining*
Day drift	Day drift, -see Day hole.	*Mining*
Day level	Day level, - see 'Day hole'.	*Mining*
Day order	An order to buy or sell shares, good only on the day the order was entered.	*Mining*
Day Shift	where the plant or company operates on more than one shift, the day shift is the first working shift during daylight hours.	*Industrial Relations*
Day Wage	the wage paid for a definite number of hours per day.	*Industrial Relations*
Day Work	the time put in during a regular day shift and compensated for on the basis of a fixed number of hours.	*Industrial Relations*
Day Worker	a person hired by the day.	*Industrial Relations*
Day-ahead and hour-ahead markets	Forward markets where electricity quantities and market clearing prices are calculated individually for each hour of the day on the basis of participant bids for energy sales and purchases.	*Energy*
Day-Ahead Market	The forward market for energy and ancillary services to be supplied during the settlement period of a particular trading day that is conducted by the Independent System Operator, the power exchange, and other Scheduling Coordinators. This market closes with the Independent System Operator's acceptance of the final day-ahead schedule.	*Energy*
Day-ahead schedule	A schedule prepared by a scheduling coordinator or the independent system operator before the beginning of a trading day. This schedule indicates the levels of generation and demand scheduled for each settlement period that trading day.	*Energy*
Day-eye	the entrance to a drift mine or adit, or the speck of daylight seen on looking back towards the entrance of a drift	*Mining*
Daylight mine	Daylight mine, a drift mine. (Scot.).	*Mining*
Daylighting	A practice in which trees shading an access road are removed to increase the sunlight on the roadway and along its periphery.	*Forestry*
Daylighting controls	A system of sensors that assesses the amount of daylight and controls lighting or shading devices to maintain a specified lighting level. The sensors are sometimes referred to as "photocells."	*Energy*
Days of inventory	Calculate days of inventory by dividing the average inventory on hand (raw-materials inventory, work-in-process inventory, finished-goods inventory, or total inventory) by average daily usage.	*Quality*
Daytime Running Lamps	DRLs are white lights mounted on the front of an automobile. Mandated in many countries, they automatically switch on when the key is turned and are intended for daytime use, to increase the visibility of the automobile. They are typically built with LEDs.	*Electrical Engineering*
Daytime Running Lamps (DRLs)	Lights that automatically turn on when a vehicle is started, making it more visible during daylight hours.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
dB	Decibel	*General*
dB (Decibel)	20 times the log to the base 10 of the ratio of two voltages. Every 20 dBs correspond to a voltage ratio of 10, every 10 dBs to a voltage ratio of 3.162. For instance, a CMR of 120 dB provides voltage noise rejection of 1,000,000/1. An NMR of 70 dB provides voltage noise rejection of 3,162/1.	*General Engineering*
dB Decibels	A method for specifying the ratio of two signals. dB = 10 times the log of the ratio of the power of the two signals. This is equal to 20 times the ratio of their voltages, if the signals are driving equal impedances.	*Electrical Engineering*
dBm	A unit that defines a signal level by comparing it to a reference level. The reference level of 0dBm is defined as 1mW. The signal level in dBm is 10 times the log of the signal's power over that of the 0dBm reference.	*Electrical Engineering*
DBT	(Abbr.) (See Dry-Bulb Temperature).	*Facility Engineering*
DC	Direct current; an electric current flowing in one direction only and substantially constant in value.	*Electrical*
DC	Direct current; an electric current flowing in one direction only and substantially constant in value.	*Electronic Process*
DC grid	Today's electrical transmission systems are almost exclusively based on alternating current (AC), but the development of high-voltage, direct current (DC) technology has made it possible to build a DC grid (DC transmission network) that can handle bulk power flows over long distances. Power from such DC grids can be fed into the AC networks as needed. Overlay DC grids would handle fluctuations and instability in the network better than AC systems and are a part of the "smart grid" concept (see also Smart grid).	*Electrical*
d-Camphor (C11H16O)	Colorless crystals with a characteristic odor. The chief plasticizer for cellulose nitrate plastics imparting its characteristics odor to Celluloid.	*Material Process*
DCC	DaimlerChrysler Corporation	*Petro-Chemical Abbreviations*
DCS	A Distributed Control System is designed to have a series of decentralized control centers which have some degree of autonomy, but are still integrated into a whole system (except in an emergency shutdown). The centre has hierarchical control over the rest, but most control takes place away from the centre.	*Control Engineering*
DCT	dual clutch transmission	*Petro-Chemical Abbreviations*
DDC	Direct Digital Control. A control technique in which a digital computer is used as the sole controller and its out- put is used to set the final control element. This is in contrast to supervisory control.	*Electrical Engineering*
DDE	Direct Digital Embedding.	*Control Engineering*
DDE Windows Dynamic Data Exchange	A standard software method for communicating between applications under Microsoft Windows. Created by Microsoft starting with Windows 3.1. DDE is being replaced by OLE for process control, OPC.	*Process Control*
DDT	dichloro-diphenyl-trichloroethane, a chlorinated hydrocarbon used as an insecticide.	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
De Minimis Doctrine	the legal doctrine that the law does not concern itself with minor or trifling matters.	*Industrial Relations*
Dead	a term meaning not ventilated, (N. East).	*Mining*
Dead Band	The range through which an input may vary without changing the output. In a mechanical instrument such as a meter movement or strip-chart recorder, the dead band is caused by friction and slack or "play" in the readout mechanism. In a controller, dead band is a zone around the setpoint in which the measurement may vary without initiating a compensating controller response.	*Electrical Engineering*
Dead Band	1. For chart records - the minimum change of input signal required to cause a deflection in the pen position. 2. For temperature controllers - the temperature band where heat is turned off upon rising temperature and turned on upon falling temperature expressed in degrees. The area where no heating (or cooling) takes place.	*Electronic Process*
Dead Break	Imperfect snap action in which the normally closed circuit of the switch opens before the plunger reaches the operating point, or the normally open circuit opens before the plunger reaches the release point.	*Electrical Engineering*
Dead coal	coal that is difficult to break down from the face.	*Mining*
Dead ground	where a coal seam thins out or becomes unworkable; or the seam hits a fault. The area beyond, until the seam becomes workable again, is also known as 'dead ground'. - see also Barren ground.	*Mining*
Dead Loads	The combined weight of the conveyor elements and supports.	*Equipment*
Dead Make	Imperfect snap action in which a switch fails to close its circuit when the plunger reaches the operating or release point.	*Electrical Engineering*
Dead Time	The interval of time lag between the initiation of a controller output or stimulus and the start of the resulting observable process response.	*Electrical Engineering*
Dead Time, Equivalent	To a controller, a process may appear to have more dead time than what it actually has. That is, the controller cannot be tuned tight enough (without going unstable) to make the process variable respond appreciably before an equivalent dead time. More accurately, the characteristic time of the loop is determined by equivalent dead time. Equivalent dead time consists of pure dead time plus process components contributing more than 180 degrees of phase lag.	*Process Control*
Dead Time, Pure	Pure dead time processes are usually found in plug flow or solids transportation loops. Examples are paper machine and conveyor belt loops. Dead time is also called delay. A controller cannot make the process variable respond before the process dead time.	*Process Control*
Dead Volume	The volume of the pressure port of a transducer at room temperature and ambient barometric pressure.	*General Engineering*
Dead work	any kind of miner's work other than actual coal getting and transport; or work done by a contractor or collier not provided for in his yardage or tonnage contract rates. Also called 'bye work'.	*Mining*
Dead Work	In mining or quarrying, the nonproductive work necessary to prepare the mine for productive work.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dead working	workings without adequate ventilation.	*Mining*
Deadband	1. For chart records: the minimum change of input signal required to cause a deflection in the pen position. 2. For temperature	*Electrical*
Dead-End Job	a job which has no future.	*Industrial Relations*
Deadhead	a person passed over in a promotion by a junior employee who may be better qualified.	*Industrial Relations*
Dead-Horse Rule	a procedure used by printers to increase the amount of make-work in setting up type.	*Industrial Relations*
Dead-Line	In drilling, it is the end of the rotary drilling line fastened to the anchor or dead-line clamp.	*Wire Rope & Cable*
Deads	waste material, such as shale, produced in the process of working the coal.	*Mining*
Deadweight tons	The lifting capacity of a ship expressed in long tons (2,240 lbs.), including cargo, commodities, and crew.	*Energy*
Deaeration	Deaeration is the process of removing air and gases from the boiler feedwater prior to its introduction to the boiler. High temperatures in the deaeration tower tank reduces the waters ability to retain oxygen and other dissolved gases. The oxygen is hence forced out the water through air vents. Deaeration is necessary in order to remove oxygen and carbon dioxide, ensuring improved heat transfer, continuous system operation, and for overall energy savings. See also Water Treatment	*Industrial*
Deaerator	A separator that removes air from the system fluid through the application of bubble dynamics.	*Oil Analysis*
Dealer tank wagon (DTW) sales	Wholesale sales of gasoline priced on a delivered basis to a retail outlet.	*Energy*
De-areator tank	This tank is used to process ore into gold in hard rock mining.	*Mining*
Dearn	a wooden sough or drain used to de-water a mine. (War).	*Mining*
Deasphalting	Process of removing asphaltic materials from reduced crude using liquid propane to dissolve nonasphaltic compounds.	*Petroleum Engineering*
Debenture	Debenture - See bonds.	*Mining*
Debris	Sediment from mines.	*Mining*
Debris Monitoring	See Oil Debris Monitoring.	*Maintenance*
Debt financing	Method of raising capital whereby companies borrow money from a lending institution.	*Mining*
Debug	To find and correct mistakes in a program.	*Electrical*
Debutanizer	A fractionating column used to remove butane and lighter components from liquid streams.	*Petroleum Engineering*
Debye-H¸ckel	Equation: Used in relating the activity coefficient (fi) to ion strength (see Activity coefficient):where I is the ionic strength, A and B the temperature-dependent constants (see Table A.5), Zi the valence of the ion (i), and Â the ion-size parameter in angstroms.	*General*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Debye-H¸ckel Equation	Used in relating the activity coefficient (fi) to ion strength (see Activity coefficient) - where I is the ionic strength, A and B the temperature-dependent constants (see Table A.5), Zi the valence of the ion (i), and Â the ion-size parameter in angstroms.	*Electronic Process*
Decade	The interval between two frequencies which differ by exactly 10:1.	*Reliability Engineering*
Decalin or decahydronaphthalene	A solvent hydrocarbon.	*Material Process*
Decasualization	the process of regularizing employment of the casual worker.	*Industrial Relations*
Decatherm	Ten therms or 1,000,000 Btu.	*Energy*
Decatherm (or, Dekatherm)	Ten therms or 1 million Btu. One decatherm is equal to approximately 1,000 cubic feet (Mcf).	*Energy*
Decay	A failing pressure.	*Mechanical, Process, and Operations*
Decay rate	The ratio of pressure decay to time.	*Mechanical, Process, and Operations*
Deceleration Stress	The additional stress that is imposed on a wire rope as a result of a decrease in the load velocity.	*Wire Rope & Cable*
Decentralized Purchasing	When a firm approaches purchasing in a decentralized manner, individual departments (in a single-site organization) or location managers (in a multi-site organization) control the purchasing functions. There is no central purchasing department with specialized buying expertise in a single-site operation, although in a multi-site operation each plant may have its own purchasing department.	*Procurement*
Decertification	the procedure of removing a union as certified bargaining representative of employees in an appropriate bargaining unit.	*Industrial Relations*
Decibel	Ratios of identical quantities are expressed in decibel or deciBel or dB units. The number of dB is ratioed against some standard or reference value in terms of the base 10 logarithm of that ratio. In measuring acoustic or vibration power (as in PSD or ASD of random vibration), the number of dB = 10 log10 P/P_o. P_o, the reference level, equals 0 dB. In measuring the more common voltage-like quantities such as acceleration, the number of dB = 20 log10 E/E_o E_o, the reference level, equals 0 dB.-	*Reliability Engineering*
Decibel	Unit to express differences of power level. It is used to express power loss in cables.	*Electrical*
Decibels	It is used to describe a signal level by comparing it to a reference level. The reference is usually defined as 0dB and the dB value of the signal is 10 times the log of the signal's power over that of the reference. A letter is sometimes added to signify the reference. For instance, dBm is relative to 0 dBm = 1mW.	*Electrical Engineering*
Deciduous	A plant that sheds all its leaves, usually in the fall.	*Agriculture*
Decimal	Refers to a base ten number system using the characters 0 through 9 to represent values.	*General Engineering*

Term	Definition	*Industry*
Decision	a conclusion, usually by a court, which involves the interpretation or application of law to the facts of a particular case.	*Industrial Relations*
Decision analysis	A technique that formally identifies the options in a decision-making process, quantifies the probable outcomes (and costs) of each (and the uncertainty around them), determines the option that best meets the objectives of the decision-maker and assesses the robustness of this conclusion.	*Quality Engineering*
Decision Interval, Dint	Used here to represent the gray zone, or interval of uncertainty, in interpreting a test result. An example is the NCEP (National Cholesterol Education Program) guidelines that indicate a cholesterol of less than or equal to 200 mg/dL is okay and that a value of more than or equal to 240 should have followup testing, which defines a gray zone of 40 mg/dL between 200 to 240, which is 20% at a decision level of 200 mg/dL. Dint can also be defined more generally by the change in a test result that is judged to be medically significant.	*Quality*
Decision level for critical interpretation (Xc)	See medical decision level.	*Quality*
Deck	Civil Engineering (of a bridge truss) having a deck or floor upon or above the structure.	*Civil Engineering*
Deck Batt	(See Splash Bar).	*Facility Engineering*
Deck Stringer	Holds the splash bars of the fill deck in a fixed position with respect to air and water flow.	*Facility Engineering*
Deck support	A horizontal member supporting the fill decks.	*Facility Engineering*
Deck	The area around the shaft collar where men and materials enter the cage to be lowered underground.	*Mining*
Decking	the operation of loading and unloading the tubs or mine cars from the cage at the top or bottom of the shaft. When the tubs or mine cars are loaded or unloaded at the same time from different decks, this is known as 'simultaneous decking'. When loading is carried out by means of mechanical equipment it is known as 'power-operated decking'.	*Mining*
Decline Conveyor	A conveyor transporting down a slope.	*Manufacturing*
Decline	A sloping underground opening for machine access from level to level or from surface; also called a ramp.	*Mining*
Decoder	Converts signal from scanner into a signal which the computer can understand.	*Gears*
Decommissioning	Retirement of a nuclear facility, including decontamination and/or dismantlement.	*Energy*
Decomposition	Separation by chemical change into constituent parts, elements, or different compounds. More specifically related to fluid and seat chemical changes. The materials affected are primarily organic in nature. The products of change may be introduced into the system as contamination.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Decomposition method	A method for determining the reliability of complex systems. The decomposition method is an application of the law of total probability, which involves choosing a "key" component and then calculating the reliability of the system twice: once as if the key component failed and once as if the key component succeeded. These two probabilities are then combined to obtain the reliability of the system, since at any given time the key component will be failed or operating.	*Reliability Engineering*
Decompression	The slow release of confined fluid to gradually reduce pressure on the fluid.	*Mechanical, Process, and Operations*
Decompression Point	The point at which there is zero pressure at the joint interface as a result of forces applied to the joint. If the applied force is increased beyond the decompression point, a gap will form at the interface. Analytically, a criteria of joint failure is often taken as when the applied force on the joint reaches the decompression point. This is because forces acting on the bolt(s) can dramatically increase at this point. Loading beyond this point can also result in fretting at the interface that will lead to bolt tension loss that will subsequently lower the decompression point. This process can continue until bolt failure does occur. The failure can be by fatigue or other mechanism but the underlying cause was loading of the joint beyond the decompression point. It is for this reason that it is frequently taken as a failure criteria in analysis work.	*Maintenance*
Decompression Pressure Control Valve	A pressure control valve that controls the rate at which the contained energy of the compressed fluid is released.	*Mechanical, Process, and Operations*
Decontamination	Removal of unwanted radioactive or hazardous contamination by a chemical or mechanical process.	*Energy*
Dedendum	The depth of tooth space below the pitch circle or the radial dimension between the pitch circle and the bottom of the tooth space.	*Mechanical Engineering*
Dedicated Control	Using one controller to control one process variable.	*Electrical Engineering*
Dedicated reserves	The volume of recoverable, salable gas reserves committed to, controlled by, or possessed by the reporting pipeline company and used for acts and services for which both the seller and the company have received certificate authorization from the Federal Energy Regulatory Commission (FERC). Reserves include both company-owned reserves (including owned gas in underground storage), reserves under contract from independent producers, and short-term and emergency supplies from the intrastate market. Gas volumes under contract from other interstate pipelines are not included as reserves, but may constitute part or all of a company's gas supply.	*Energy*
Dedicated vehicle	A vehicle that operates only on an alternative fuel, as when a vehicle is configured to operate on compressed natural gas. Note: A vehicle powered by an electric motor is not to be treated as dedicated.	*Energy*
Deductions	generally refer to the check-off of union dues, fines, and other assessments.	*Industrial Relations*
Deeds	colliery waste tipped on the spoil tip. (N. East).	*Mining*
Deepen	To increase the distance below a specified reference datum.	*Petroleum Drilling*
Deepening from one zone to another	Deepening from one zone to another	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Deepest total depth	The deepest total depth of a given well is the distance from a surface reference point (usually the Kelly bushing) to the point of deepest penetration measured along the well bore. If a well is drilled from a platform or barge over water, the depth of the water is included in the total length of the well bore.	*Energy*
Deepside	the lower side or dip side of the face.	*Mining*
Deer	Diesel Engine Emission Reduction (Conference)	*Petro-Chemical Abbreviations*
De-ethanizer	A fractionating column designed to remove ethane and gases from heavier hydrocarbons.	*Petroleum Engineering*
Default	The value(s) or option(s) that are assumed during operation when not specified.	*General Engineering*
Default Service	The electric generation service provided to any consumer who does not or is not unable to arrange for or maintain electric generation services with an electric supplier.	*Energy*
Defect	A flaw or an imperfection of such size, shape, orientation, location, or properties as to be rejectable per the applicable minimum acceptance standards.7	*Maintenance and Repair*
Defendant	the individual or organization having the responsibility of defending its position before a tribunal or court.	*Industrial Relations*
Deferred charges	Expenses incurred but not charged against the current year's operation.	*Mining*
Deferred cost	An expenditure not recognized as a cost of operation of the period in which incurred, but carried forward to be written off in future periods.	*Energy*
Deferred fuel costs	An expenditure for fuel that is not recognized for bookkeeping practices as a cost in the operating period incurred, but carried forward to be written off in future periods.	*Energy*
Deferred income tax (liability)	A liability in the balance sheet representing the additional Federal income taxes that would have been due if a utility had not been allowed to compute tax expenses differently for income tax reporting purposes than for ratemaking purposes.	*Energy*
Deferred Retirement Date	the date to which is fixed or normal date set for retirement is postponed.	*Industrial Relations*
Definitive method, DM	"An analytical method that has been subjected to thorough investigation and evaluation for sources of inaccuracy, including nonspecificity." [CLSI]	*Quality*
Deflection	This word usually carries the same meaning as displacement, although it is sometimes used in place of deformation.	*Engineering Physics*
Deflocculation	The ability of some materials such as polyphosphides to peptize and disperse suspensions of colloidal particles.	*Chemical Engineering*
Defoamer	Substance used to reduce or eliminate foam.	*Chemistry*
Defoaming agents	During start-up air can become trapped in a system. Pumping creates air bubbles (foaming) which can lead to pump cavitations, possibly damaging pumps and other system components. Our proprietary additive package contains defoaming agents to help keep air from foaming in the oil.	*Lubrication*
Defoliant	A chemical that causes leaves to wither and die on plants.	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Defoliator	Any chewing insect that consumes the leaves or needles of plants.[1] Fin.Swe.	*Forestry*
Deforestation	The net removal of trees from forested land.	*Energy*
Deform	To undergo deformation	*Civil Engineering*
Deformation	A change in the shape of an object or material.	*Engineering Physics*
Deformation (by overload)	Overloading by static or shock loads, which leads to plastic deformations (i.e. the formation of shallow depressions in steel surfaces).	*Maintenance*
Deformeter	A gauge used to determine stresses in a structure by tests on a model of the structure.	*Civil Engineering*
Degas	Removing air from a liquid, usually by ultrasonic and/or vacuum methods.	*Oil Analysis*
Degasification system	The methods employed for removing methane from a coal seam that could not otherwise be removed by standard ventilation fans and thus would pose a substantial hazard to coal miners. These systems may be used prior to mining or during mining activities.	*Energy*
Degradable organic carbon	The portion of organic carbon present in such solid waste as paper, food waste, and yard waste that is susceptible to biochemical decomposition.	*Energy*
Degradation	The progressive failure of a machine or lubricant.	*Lubrication*
Degradation analysis	Analysis involving the measurement and extrapolation of degradation or performance data that can be directly related to the presumed failure of the product in question. Degradation analysis allows the user to extrapolate to an assumed failure time based on the measurements of degradation or performance over time.	*Reliability Engineering*
Degradation potential	the degree to which a substance is likely to be reduced to a simpler form by bacterial activity.	*Chemical*
Degreaser	A product specifically formulated to remove grease, oil and greasy soils.	*Chemistry*
Degreasing	The removal of grease and oil from a surface. Degreasing by immersion in liquid organic solvents or by solvent vapors condensing on the parts to be cleaned.	*Paint and Coatings*
Degree	An incremental value in the temperature scale, i.e., there are 100 degrees between the ice point and the boiling point of water in the Celsius scale and 180°F between the same two points in the Fahrenheit scale.	*General Engineering*
Degree Day	See Heating Degree Days; Cooling Degree Days; Population-weighted Degree Days.	*Energy*
Degree of Decline	Angle of slope (in degrees that a conveyor is installed.	*Equipment*
Degree of Freedom	A displacement quantity which defines the shape and location of an object. In the two dimensional plane, a rigid object has three degrees of freedom: two translations and one rotation. In three dimensional space, a rigid object has six degrees of freedom (three translations and three rotations).	*Engineering Physics*
Degree of freedom	Number of independent variables available in specifying an equilibrium microstructure.	*Material Process*
Degree of Incline	Angle of slope (in degrees that a conveyor is installed.	*Manufacturing*
Degree of polymerization	Average number of mers in a polymeric molecule.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	Industry
Degree-day	A unit measuring the extent to which the outdoor mean (average of maximum and minimum) daily dry-bulb temperature falls below (in the case of heating) or rises above (in the case of cooling) an assumed base. The base is normally taken as 65 degrees for heating and cooling unless otherwise designated.	*Energy*
Degrees API	Degrees API = (141.5 / sp.gr.60 deg.F/60 deg.F) - 131.5	*Energy*
Degrees of freedom	A concept that refers to the number of independent contributions to a sampling distribution (such as chi-squared distribution). In a contingency table, it is one less than the number of row categories multiplied by one less than the number of column categories; e.g. a 2 x 2 table comparing two groups for a dichotomous outcome, such as death, has one degree of freedom.	*Quality Engineering*
Degrees of freedom, df	This is the number of independent comparisons that can be made among N observations. It may be thought of as the number of measurements in a series minus the number of restrictions on the series. For example, there are N-1 degrees of freedom for the standard deviation because the mean has already been calculated prior to the calculation of the standard deviation. There are N-2 degrees of freedom for the standard deviation about the regression line because the slope and intercept have already been calculated.	*Quality*
Dehydrator	Equipment used to remove water from the natural gas.	*Petroleum Engineering*
Dehydrator	A separator that removes water from the system fluid.	*Lubrication*
Dehydrogenation	A chemical reaction involving the removal of hydrogen from a compound.	*Material Process*
Dehydrogenation	A reaction in which hydrogen atoms are eliminated from a molecule. Dehydrogenation is used to convert ethane, propane, and butane into olefins (ethylene, propylene, and butenes).	*Petroleum Engineering*
Dejonge Case	a decision by the U.S. Supreme Court which held that the "peaceable assembly for lawful discussion" was not a crime.	*Industrial Relations*
Delacomania	The process of transferring pictures from a paper support to another surface to be decorated.	*Material Process*
Delaminate	To split a laminated plastics material along the plane of its layers.	*Material Process*
Delamination Wear	A complex wear process where a machine surface is peeled away or otherwise removed by forces of another surface acting on it in a sliding motion.	*Lubrication*
Delaware River Basin Commission (DRBC)	This multi-state agency includes the governors of Pennsylvania, New Jersey, Delaware, and New York on its board. It regulates water withdrawals from the Delaware River as well as effluent into the river. It has been at the center of the debate over drilling in Northeastern Pennsylvania. Recently it issued an executive order halting most drilling in its watershed. It has promised to study the impacts of hydrofracturing and issue new permanent rules, possibly in the fall of 2010.	*Petroleum Drilling*
Delay	This term is often used in place of dead time. See dead time.	*Process Control Engineering*
Delay Allowances	the time factor allowed for unintentional or undue delay caused on the job because of machine or material delay.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Delayed Coking	A process by which heavier crude oil fractions can be thermally decomposed under conditions of elevated temperatures and pressure to produce a mixture of lighter oils and petroleum coke. The light oils can be processed further in other refinery units to meet product specifications. The coke can be used either as a fuel or in other applications such as the manufacturing of steel or aluminum.	*Energy*
Delf-low	the spoil-heap of a mine or shaft (N. Staffs.).	*Mining*
Delignification	The dissolving of the lignin portion of cooling water wood usually by strong alkaline and/or oxidizing agents.	*Chemical Engineering*
Delineation well	A well that extends the boundary of a previously discovered pool.	*Petroleum Engineering*
Delinquent Members	those members of the union who have not paid their dues as of a definite date during the month.	*Industrial Relations*
Deliquescent	To ramify into fine divisions, such as abnormal numbers of buds, twigs, branches, or leaves, e.g., witches' broom development.	*Forestry*
Deliverability	Represents the number of future years during which a pipeline company can meet its annual requirements for its presently certificated delivery capacity from presently committed sources of supply. The availability of gas from these sources of supply shall be governed by the physical capabilities of these sources to deliver gas by the terms of existing gas-purchase contracts, and by limitations imposed by State or Federal regulatory agencies.	*Energy*
Delivered (gas)	The physical transfer of natural, synthetic, and/or supplemental gas from facilities operated by the responding company to facilities operated by others or to consumers.	*Energy*
Delivered cost	The cost of fuel, including the invoice price of fuel, transportation charges, taxes, commissions, insurance, and expenses associated with leased or owned equipment used to transport the fuel.	*Energy*
Delivered energy	The amount of energy delivered to the site (building); no adjustment is made for the fuels consumed to produce electricity or district sources. This is also referred to as net energy.	*Energy*
Deliveries (electric)	Energy generated by one system and delivered to another system through one or more transmission lines.	*Energy*
Deliveries of fuel to an electric plant	Deliveries of fuel to an electric plant	*Energy*
Delivering Party	The entity supplying the capacity and/or energy to be transmitted at Point(s) of Receipt.	*Energy*
Delivery	The volume of fluid discharged by a pump in a given time, usually expressed in gallons per minute	*Mechanical, Process, and Operations*
Delivery drift	when water is pumped up a shaft it was not usually lifted higher than was necessary ; it was delivered into a drift or adit driven from low ground into the shaft. This is called a delivery or off-take drift.	*Mining*
Delivery Terms	Conditions in a contract that relate to carrier and routing, freight charges, place of delivery, time of delivery, etc.	*Procurement*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Delocalized electron molecule	An electron equally probable to be associated with any of a large number of adjacent atoms.	*Material Process*
Delph rags, pit rags or pit clothes	the dirty clothes used by the miner for working underground.	*Mining*
Delph, a quarry or mine.	Delph, a quarry or mine.	*Mining*
Delta	Change. A specific "Delta-P," or a pressure differential across a filter surface, is the trigger for self-cleaning in many sophisticated filtration systems.	*Filtration*
Delta layer	the second layer of zinc-iron alloy growth from the base steel formed during the galvanizing process; the Delta layer's chemical composition is approximately 90% zinc and 10% iron; the Delta layer is 60% harder than the base steel it protects from abrasion and corrosion	*Materials Process*
DELTA P (^P)	DELTA P (^P) - See "Differential Pressure," "Pressure Drop."	*Mechanical*
Delta-P	Differential Pressure. The inlet pressure (Pl) minus the outlet pressure (P2).	*Industrial Engineering*
Delta-Sigma	An analog-to-digital converter (ADC) architecture consisting of a 1-bit ADC and filtering circuitry which over-samples the input signal and performs noise-shaping to achieve a high-resolution digital output. The architecture is relatively inexpensive compared to other ADC architectures. Sometimes called a "sigma-delta" converter.	*Electrical Engineering*
Delver, a miner or quarrier. (Yorks.)	Delver, a miner or quarrier. (Yorks.).	*Mining*
Demand	The amount of electricity that a customer uses at any given moment or averaged over period of time. Demand is usually in expressed in kilowatts or Megawatts. The primary source of demand is the power-consuming equipment of customers.	*Energy*
Demand (electric)	The rate at which electric energy is delivered to or by a system, part of a system, or a piece of equipment. Demand is expressed in kW, kVA, or other suitable units at a given instant or over any designated period of time. The primary source of "demand" is the power-consuming equipment of the customers.	*Energy*
Demand bid	A bid into the power exchange indicating a quantity of energy or an ancillary service that an eligible customer is willing to purchase and, if relevant, the maximum price that the customer is willing to pay.	*Energy*
Demand Billing	The electric capacity requirement for which a large user pays. It may be based on the customer's peak demand during the contract year, on a previous maximum or on an agreed minimum. It is measured in kilowatts.	*Energy*
Demand Charge	The sum to be paid by a large electricity consumer for its peak usage level.	*Energy*
Demand charge credit	Compensation received by the buyer when the delivery terms of the contract cannot be met by the seller.	*Energy*
Demand Controller	An electrical, mechanical, or electromechanical device or system that monitors the customer demand and causes that demand to be leveled and/or limited.	*Energy*
Demand flow scheduling systems	Software systems designed to optimize demand-based manufacturing techniques.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Demand indicator	A measure of the number of energy-consuming units, or the amount of service or output, for which energy inputs are required.	*Energy*
Demand interval	The time period during which flow of electricity is measured (usually in 15-, 30-, or 60-minute increments.)	*Energy*
Demand Ratchet	This is the minimum billing demand based upon a given percentage of the actual demand use, recorded during the last eleven months of demand history.	*Energy*
Demand response programs	Demand response programs are incentive-based programs that encourage electric power customers to temporarily reduce their demand for power at certain times in exchange for a reduction in their electricity bills. Some demand response programs allow electric power system operators to directly reduce load, while in others, customers retain control. Customer-controlled reductions in demand may involve actions such as curtailing load, operating onsite generation, or shifting electricity use to another time period. Demand response programs are one type of demand-side management, which also covers broad, less immediate programs such as the promotion of energy-efficient equipment in residential and commercial sectors.	*Energy*
Demand Side Management (DSM)	Processes and investments in equipment made by power companies and commercial customers to reduce the customers' "demand" for electricity or to shift the customers use away from periods of high electrical demand.	*Energy*
Demand See Energy demand	Demand: See Energy demand.	*Energy*
Demand-metered	Having a meter to measure peak demand (in addition to total consumption) during a billing period. Demand is not usually metered for other energy sources.	*Energy*
Demand-response	The term demand-response refers to a variety of technologies required to make demand for electricity more responsive to the supply available. As utilities generate more electricity from intermittent sources of energy such as wind and solar, demand-response technologies are needed to help consumers use power when it is plentiful and reduce their consumption when there is less available.	*Electrical*
Demand-Side Management (DSM)	A technology or program that encourages customers to use electricity differently.	*Energy*
Demand-side management costs	The costs incurred by the utility to achieve the capacity and energy savings from the Demand-Side Management Program. Costs incurred by customers or third parties are to be excluded. The costs are to be reported in thousands of dollars (nominal) in the year in which they are incurred, regardless of when the savings occur. The utility costs are all the annual expenses (labor, administrative, equipment, incentives, marketing, monitoring and evaluation, and other incurred by the utility for operation of the DSM Program), regardless of whether the costs are expensed or capitalized. Lump sum capital costs (typically accrued over several years prior to start up) are not to be reported. Program costs associated with strategic load growth activities are also to be excluded.	*Energy*
Demarcation Dispute	the name for a jurisdictional dispute among British unions.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Deming regression	An alternate regression calculation that can be employed when ordinary linear regression may not be reliable. This technique takes into account the imprecision of both the test and comparative methods. When the analytical range of comparison results is narrow, ordinary linear regression may give a slope that is too low and a y-intercept that is too high. The correlation coefficient is used as a practical measure of when alternate regression techniques should be applied. When r is less than 0.99 or 0.975, depending on the source of the recommendation, Deming regression or Passing-Bablock regression should be used instead of ordinary linear regression.	*Quality*
Democracy	term generally applied to political government where control and power rests in the majority of the people.	*Industrial Relations*
Demonstrated reserve base (coal)	A collective term for the sum of coal in both measured and indicated resource categories of reliability, representing 100 percent of the in-place coal in those categories as of a certain date that meet specific minability criteria. Includes beds of bituminous coal and anthracite 28 or more inches thick and beds of subbituminuous coal 60 or more inches thick that can occur at depths of up to 1,000 feet. Includes beds of lignite 60 or more inches thick that can be surface mined. Includes also thinner and/or deeper beds that presently are being mined or for which there is evidence that they could be mined commercially at a given time. Represents that portion of the identified coal resource from which reserves are calculated.	*Energy*
Demonstrated reserves	Demonstrated reserves: See Energy reserves.	*Energy*
Demonstrated resources	Same qualifications as identified resources, but include measured and indicated degrees of geologic assurance and excludes the inferred.	*Energy*
Demonstration	The application and integration of a new product or service into an existing or new system. Most commonly, demonstration involves the construction and operation of a new electric technology interconnected with the electric utility system to demonstrate how it interacts with the system. This includes the impacts the technology may have on the system and the impacts that the larger utility system may have on the functioning of the technology.	*Energy*
Demonstration and test vehicles	Vehicles operated by a motor vehicle dealer solely for the purpose of promoting motor vehicle sales or permitting potential purchasers to drive the vehicle for pre-purchase or pre-lease evaluation; or a vehicle that is owned and operated by a motor vehicle manufacturer or motor vehicle component manufacturer, or owned or held by a university research department, independent testing laboratory, or other such evaluation facility, solely for the purpose of evaluating the performance of such vehicles for engineering, research and development, or quality control reasons.	*Energy*
Demotion	the process of moving an employee to a position lower in the wage scale on in rank.	*Industrial Relations*
Demulsibility	A measure of a fluid's ability to separate from water.	*Lubrication*
Demulsifier	An additive that promotes oil-water separation in lubricants that are exposed to water or steam	*Lubrication*
Demurrage	The charge paid to the vessel owner or operator for detention of a vessel at the port(s) beyond the time allowed, usually 72 hours, for loading and unloading.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Denaturant	Petroleum, typically pentanes plus or conventional motor gasoline, added to fuel ethanol to make it unfit for human consumption. Fuel ethanol is denatured, usually prior to transport from the ethanol production facility, by adding 2 to 5 volume percent denaturant. See Fuel Ethanol, and Fuel Ethanol Minus Denaturant.	*Energy*
Denaturants	Toxic or noxious components used in fuel ethanol to make it unfit for use as a beverage.	*Lubrication*
Denatured	Fuel ethanol that is rendered unfit for human consumption by the addition of a petroleum denaturant, typically pentanes plus or conventional motor gasoline. Fuel ethanol is usually denatured prior to transport from the ethanol production facility, by adding 2- to 5-volume-percent denaturant.	*Energy*
Denatured ethanol, and other alcohols	denatured ethanol, and other alcohols	*Energy*
Dendritic structure	A nonequilibrium microstructure from casting.	*Material Process*
Denier	1) A unit of yarn number. The number of unit weight of 0.005g per 450 meter length. 2) A yarn numbering system based on denier units. A denier is equal numerically to the number of grams per 9000 meters.	*Material Process*
Denitrification	The removal of nitrogen from a system. This may be done chemically or biologically.	*Chemical Engineering*
Denitrification	bacterial reduction of nitrite to gaseous nitrogen under anaerobic conditions.	*Chemical*
Dense Wave Division Multiplexing	The technology by which the frequencies of light carried on a single optical fiber are subdivided into discrete wavelengths, allowing for the greater transmission of data.	*Electrical Engineering*
Density	the amount of mass per unit volume.	*Chemical*
Density	The weight per unit volume of a substance.	*Electrical*
Density (Specific Gravity)	Density measures a material's weight or compactness. It changes as temperatures fluctuate. Fluids with a higher density typically transfer heat more efficiently than fluids that are less dense. Density is sometimes expressed as specific gravity, a dimensionless value that has no unit of measure. It refers to the ratio of a fluid's weight in comparison to water. For example, a material with a spec gravity of less than 1 would be considered less dense than water and would therefore float in water.	*Lubrication*
Density Mass per unit volume	Density Mass per unit volume.	*Material Process*
Dents	Small indentations is molded plastics usually caused bulges in the mold or pressing plate.	*Material Process*
Denudation	Rocks laid bare by running water or other agencies.	*Mining*
DEOAP	Diesel Engine Oil Advisory Panel (API/EMA)	*Petro-Chemical Abbreviations*
Deodorant	A product for destroying, masking or eliminating offensive odors.	*Chemistry*
Deoxyribonucleic acid (DNA)	Carrier of genetic information.	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Departing Member	A member consumer served at retail by an electric cooperative corporation that has given notice of intent to receive generation services from another source or that is otherwise in the process of changing generation suppliers. These persons shall nonetheless remain members of the electric distribution cooperative corporation for purposes of distribution service.	*Energy*
Department of Conservation and Natural Resources (DCNR)	The state agency that issues permits and enacts leasing policy for drilling on state-owned lands. The DCNR does not regulate wells. Currently close to half of all state lands are leased to drillers, including areas designated as wildlife preserves.	*Petroleum Drilling*
Department of Environmental Protection (DEP)	This state agency has permitting and primary regulatory authority over the natural gas industry in the state.	*Petroleum Drilling*
Departmental Seniority	a seniority procedure in a plant which gives employees of greater length of service in the department preference in matters of promotion.	*Industrial Relations*
Departmental Unit	a group within the plant composed of workers in a particular department.	*Industrial Relations*
Dependability	A measure of the degree to which an item is operable and capable of performing its required function at any (random) time during a specified mission profile, given item availability at the start of the mission. (This definition is significantly different from the definition of dependability used by most other US and international organizations dealing with reliability e.g., IEC and SAE. E.g. IEC 50 Chapter 191: "The collective term used to describe the availability performance and its influencing factors: reliability performance, maintainability performance and maintenance support performance." As such, its use is restricted to general descriptions in non-quantitative terms). Dependability is related to reliability; the intention was that dependability would be a more general concept then reliability.	*Reliability Engineering*
Dependable capacity	The load-carrying ability of a station or system under adverse conditions for a specified period of time.	*Energy*
Dependable Capacity	The system's ability to carry the electric power for the time interval and period specified. Dependable capacity is determined by such factors as capability, operating power factor and portion of the load the station is to supply.	*Energy*
Dependent	one who relies on someone else for his support.	*Industrial Relations*
Dependent variable	The outcome or response that results from changes to an independent variable. In a clinical trial, the outcome (over which the investigator has no direct control) is the dependent variable, and the treatment arm is the independent variable. The dependent variable is traditionally plotted on the vertical axis on graphs. Also called: Outcome variable	*Quality Engineering*
Dependent Unionism	a form of union organization described as dependent on the good will of the employer and sponsored or dominated by him.	*Industrial Relations*
Depentanizer	A fractionating column used to remove pentane and lighter fractions from hydrocarbon streams.	*Petroleum Engineering*
Depletable Energy Sources	This includes: 1) electricity purchased from a public utility and 2) energy obtained from burning coal, oil, natural gas or liquefied petroleum gasses.	*Energy*
Deplete	The depletion of additives expressed as an approximate percentage.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Depleted resources	Resources that have been mined; include coal recovered, coal lost in mining, and coal reclassified as subeconomic because of mining.	*Energy*
Depleted storage field	A sub-surface natural geological reservoir, usually a depleted gas or oil field, used for storing natural gas.	*Energy*
Depletion (coal)	The subtraction of both tonnage produced and the tonnage lost to mining from identified resources to determine the remaining tonnage as of a certain time.	*Energy*
Depletion allowance	A term for either (1) a periodic assignment to expense of recorded amounts or (2) an allowable income tax deduction that is related to the exhaustion of mineral reserves. Depletion is included as one of the elements of amortization. When used in that manner, depletion refers only to book depletion.	*Energy*
Depletion factor	The multiplier applied to the tonnage produced to compute depletion. This multiplier takes into account both the tonnage recovered and the tonnage lost due to mining. The depletion factor is the reciprocal of the recovery factor in relation to a given quantity of production.	*Energy*
Depletion	An accounting device, used primarily in tax computations. It recognizes the consumption of an ore deposit, a mine's principal asset.	*Mining*
Deposit	A body of ore distinct from a ledge.	*Mining*
Deposit Corrosion	Localized corrosion under or around a deposit or collection of material on a metal surface. (See also crevice corrosion.)	*Paint and Coatings*
Deposit	Mineral deposit or ore deposit is used to designate a natural occurrence of a useful mineral, or an ore, in sufficient extent and degree of concentration to invite exploitation.	*Mining*
Deposited Metal	Filler metal that has been added during a welding operation	*Maintenance and Repair*
Deposits	Oil-insoluble materials that result from oxidation of the oil and contamination from external sources and settle out in system components as sludge and varnish.	*Lubrication*
Depreciation	Depreciation: See definition for Amortization.	*Energy*
Depreciation and amortization of property, plant, and equipment	The monthly provision for depreciation and amortization (applicable to utility property other than electric plant, electric plant in service, and equipment).	*Energy*
Depreciation	The periodic, systematic charging to expense of plant assets reflecting the decline in economic potential of the assets.	*Mining*
Depreciation, Straight-line	Straight-line depreciation takes the cost of the asset less the estimated salvage value and allocates the cost in equal amounts over the asset's estimated useful life.	*Energy*
Depression	the period during the business cycle when unemployment is extremely high and the economy is at a low productive level.	*Industrial Relations*
Depropanizer	A fractionating column for removing propane and lighter components from liquid streams.	*Petroleum Engineering*
Depth (filter)	A filter medium which primarily retains contaminant within tortuous passages.	*Mechanical, Process, and Operations*
Depth filter	A filter medium that retains contaminants primarily within tortuous passages.	*Oil Analysis*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Depth Filter Media	Porous materials which primarily retain contaminants within a tortuous path, performing the actual process of filtration.	*Lubrication*
Depth of cut	the distance that the holing made by a coal cutter jib extends into the seam from the face. With power loading this is called the 'web'.	*Mining*
Depth of deepest production	The depth of the deepest production is the length of the well bore measured (in feet) from the surface reference point to the bottom of the open hole or the deepest perforation in the casing of a producing well.	*Energy*
Depth Of Field	The distance between the closest and farthest point at which a bar code can be scanned. DISCRETE - Symbologies in which intercharacter gaps are not treated as characters.	*Gears*
Depth of Fusion	The distance that fusion extends into the base metal from the surface melted during welding. See Fig. A1.6.	*Maintenance and Repair*
Depth	The word alone generally denotes vertical depth below the surface. In the case of incline shafts and boreholes it may mean the distance reached from the beginning of the shaft or hole, the borehole depth, or the inclined depth.	*Mining*
Deputy, Fireman or Examiner	an underground official in charge of a face or district, or of special work, and usually having certain statutory duties to perform in connection with safety. Sometimes referred to as a 'Chargehand'. Originally they were men who set timber for the safety of the workmen also put in brattice and brattice stoppings. They also draw the props in the workings from places where they were no longer required for further use.	*Mining*
Deputy's district	that part of a mine specified by the manager to be in the charge of a Deputy.	*Mining*
Derate	A decrease in the available capacity of an electric generating unit, commonly due to:	*Energy*
De-rating	Using an item in a way that applies stresses that are below the recommended stress values.	*Maintenance*
Derating Factor	A factor used to reduce a current carrying capacity of a wire when used in other environments from that for which the value was established.	*Electrical*
Deregulation	The elimination of regulation from a previously regulated industry or sector of an industry.	*Energy*
Derivative	The derivative function senses the rate of rise or fall of the system temperature and automatically adjusts the cycle time of the controller to minimize overshoot or undershoot.	*Electronic Process*
Derivative	derivative (rate) control action.	*Electrical Engineering*
Derivative Control	A mode of control using an algorithm which anticipates when a process variable will reach its de- sired control point by sensing its rate of change. This allows a control change to take place before the process variable overshoots the desired control point. See also "Control Action, Derivative (Rate)."	*Electrical Engineering*
Derivative Time	The time difference by which the output of a proportional-derivative (PD) controller leads the controller input when the input changes linearly with time.	*Electrical Engineering*
Dermatitis, Industrial	inflammation of the skin cause by fumes, vapors, irritant dusts, etc.	*Industrial Relations*
Dermatitis	Inflammation of the skin. Repeated contact with petroleum products can be a cause.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Derrick	a temporary three-legged head-frame or headgear for a shaft; or a 'Warwick' anchor prop or anchor girder, a safety girder, a bar or prop to stop a runaway on inclined haulage roads. - see also Bull props.	*Mining*
Derrick	The tower-like structure that houses most of the drilling controls.	*Petroleum Drilling*
Derrickman	The third in command after the driller & assistant driller.	*Petroleum Drilling*
Desal	Short for desalination, the removal of salts from water.	*Filtration*
Desalination	To remove salt and other chemicals from sea water or saline water.	*Petroleum Engineering*
Desalting	Removal of mineral salts (most chlorides, e.g., magnesium chloride and sodium chloride) from crude oil.	*Petroleum Engineering*
Descriptive study	A study that describes characteristics of a sample of individuals. Unlike an experimental study, the investigators do not actively intervene to test a hypothesis, but merely describe the health status or characteristics of a sample from a defined population.	*Quality Engineering*
Desiccant Breather	A device that incorporates a high capture-efficiency filter to help sustain desired cleanliness levels by removing minute particulate matter and by creating low relative humidity levels in the headspace, making condensation and absorption by the lubricant unlikely. When a system is properly fitted with a breather containing drying and filtration media, the contaminant ingression is greatly reduced.	*Reliability Engineering*
Design	to create, fashion, execute, or construct steel according to plan so that it will yield a quality hot-dip galvanized coating	*Materials Process*
Design appraisal	A procedure by which a certifying authority, appointed by the purchaser, appraises the design parameters of the equipment and/or materials they are buying. The supplier shall submit drawings, calculations, and documents as required to the C.A., in conjunction with those normally required for review and acceptance by the purchaser.	*Mechanical*
Design conditions	Defined as the hot water temperature (HWT) cold-water temperature (CWT), water flow and wet-bulb temperature (WBT) in mechanical draft towers. In natural draft towers; HWT, CWT, GPM, WBT plus either dry bulb temperature (DBT) or relative humidity (RH). Allowable noise level also applies to both.	*Facility Engineering*
Design effect	A number that describes how much larger a sample is needed in designs such as cluster randomized trials to achieve the same precision as a simple random sample. It is the ratio of the true variance of a statistic (taking the sampling design into account) to the variance of the statistic for a simple random sample with the same number of cases.	*Quality Engineering*
Design electrical rating (capacity) net	The nominal net electrical output of a nuclear unit, as specified by the utility for the purpose of plant design.	*Energy*
Design Factor	In a wire rope, it is the ratio of the nominal strength to the total working load.	*Wire Rope & Cable*
Design Failure Mode and Effects Analysis	A method for evaluating a design for robustness against potential failures.	*Electrical Engineering*
Design for the environment (DFE)	Design for the environment (DFE)	*Material Process*
Design for assembly	The practice in which ease and cost of assembly is emphasized during the product-design stage.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Design for logistics	The practice in which physical handling and distribution of a manufactured product are emphasized during the product-design stage.	*Quality*
Design for manufacturability	The practice in which ease and cost of manufacturing, as well as quality-assurance issues, are emphasized during the product-design stage.	*Quality*
Design for Manufacturing	A methodology that seeks to simplify a current or a future product design and/or manufacturing process in order to achieve cost savings.	*Reliability Engineering*
Design for procurement	A practice in which product designers work effectively with suppliers and sourcing personnel to identify and incorporate technologies or designs that can be used in multiple products, facilitating the use of standardized components to achieve economies of scale and assure continuity of supply.	*Quality*
Design for quality	The practice in which quality assurance and customer perception of product quality are emphasized as an integral part of the design process.	*Quality*
Design for recycling/ disposal	The practice in which ultimate disposal and recycling of the manufactured product are considered during the product-design stage.	*Quality*
Design for Reliability	A four-phase design process to build reliability into a part, component, or system. The phases are concept, design and development, full-scale development, and operational.	*Reliability Engineering*
Design for Six Sigma	DFSS is an approach used to design or redesign a product or service from the ground up, building in high levels of quality, reliability and performance.	*Reliability Engineering*
Design for Testability	Design For Testability (or Design for Test, or DFT) refers to design techniques that make products easier to test. Examples include the addition of test points, parametric measurement devices, self-test diagnostics, test modes, and scan design.	*Electrical Engineering*
Design Form Of Thread	The design form of an internal or external thread is the thread form in its maximum metal condition. It is the same as the basic thread profile except that the thread roots are rounded. If either the internal or external thread form exceeds the design form of the thread profile then a potential interference exists.	*Maintenance*
Design head	The achieved river, pondage, or reservoir surface height (forebay elevation) that provides the water level to produce the full flow at the gate of the turbine in order to attain the manufacturer's installed nameplate rating for generation capacity.	*Energy*
Design limit	The limit of normal operation of a system which if exceeded the system is bound to malfunction or fail.	*Reliability Engineering*
Design of experiments	An experimental design methodology that enables process designers to determine optimum product/process parameters by conducting a limited number of experiments involving combinations of variables. The usual objective is to determine which variables in a complex process are most critical for quality control - or those that can be most easily changed to reduce overall process variance.	*Quality*
Design parameter	Material property that serves as the basis for selecting a given engineering material for a given application.	*Material Process*
Design ruggedization	Design ruggedization. See Accelerated Life Testing.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Design selection	Method for corrosion prevention, for example, avoid a small area anode next to a large area cathode.	*Material Process*
Design validation	This is a process in which a series of tests are performed to verify that a design meets its specification. The test will normally include performance verification under particular environmental test conditions and usually excludes accelerated stress tests.	*Reliability Engineering*
Designated Agent	An agent that acts on behalf of a transmission provider, customer or transmission customer as required under the tariff.	*Energy*
Designated comparison method, DCM	"A fully specified method, which, in the absence of an NRSCL-credentialed reference method, serves as the common basis for the comparison of 'field' reference materials and methods, and for the development of principal assigned values (PAVs) or principal assigned characteristics (PACs)." [CLSI]	*Quality*
Designated Products	Products that are or can be made from recovered materials that have been designated in the CPG through EPA's formal rulemaking process. Also referred to as "designated items."	*Environmental Engineering*
Designer	Responsible for ensuring that the engineering design of piping	*Maintenance and Repair*
De-silting sump	The area in the cold water basin, usually at a low point, where silt can be flushed to a drain.	*Facility Engineering*
Desorption	Opposite of absorption or adsorption. In filtration, it relates to the downstream release of particles previously retained by the filter.	*Oil Analysis*
Destructive distillation	Distillation of a product at high temperatures to cause chemical changes in the original material or in its vapors so that the substances collected as a result of the distillation are decomposition products not present in the original material.	*Material Process*
Desulfurization	The removal of sulfur, as from molten metals, petroleum oil, or flue gases.	*Energy*
DETA	diethylene triamine	*Petro-Chemical Abbreviations*
Detaching hooks	devices for preventing the cage from falling when severed from the winding rope through overwinding.	*Mining*
Detection bias	Systematic difference between comparison groups in how outcomes are ascertained, diagnosed or verified. Also called: Ascertainment bias	*Quality Engineering*
Detection Limit	General concept meaning "the smalled test value that can be distinguished from zero." Depending on how this is determined experimentally, there are different estimates that can be made. See Limit of Blank (LoB), Limit of Detection (LoD), and Limit of Quantification (LoQ). Older terms that still may be seen are Lower Limit of Detection (LLD), Biological Limit of Detection (LLB), and Functional Sensitivity (FS).	*Quality*
Detection rate	See Sensitivity	*Quality Engineering*
Detectors	Specialized chemical or electronic instruments used to detect mine gases.	*Mining*
Detergent	A substance added to a fuel or lubricant to keep engine parts clean. In motor oil formulations, the most commonly used detergents are metallic soaps with a reserve of basicity to neutralize acids formed during combustion.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Detergent	Synthetic cleaning agent (other than soap) which is useful in physical removal of soils.	*Chemistry*
Detergent Oil	Is a lubricating oil possessing special sludge-dispersing properties usually conferred on the oil by the incorporation of special additives. Detergent oils hold formed sludge particles in suspension and thus promote cleanliness especially in internal-combustion engines. However detergent oils do not contain "detergents" such as those used for cleaning of laundry or dishes. Also detergent oils do not clean already "dirty" engines, but rather keep in suspension the sludge that petroleum oil forms so that the engine remains cleaner for longer period. The formed sludge particles are either filtered out by Oil Filters or drained out when oil is changed.	*Lubrication*
Detergent/Dispersant	An additive package that combines a detergent with a dispersant.	*Lubrication*
Determinant	Any definable factor that effects a change in a health condition or other characteristic.	*Analysis*
Deterministic Jitter	Reproducible jitter within a given system, under controlled conditions. Also known as bounded jitter.	*Electrical Engineering*
Deterministic vibration	A vibration whose instantaneous value at any future time can be predicted by an exact mathematical expression. Sinusoidal vibration is the classic example. Complex vibration is less simple (two or more sinusoids).	*Reliability Engineering*
Detonation	Uncontrolled burning of the last portion (end gas) of the air/fuel mixture in the cylinder of a spark-ignition engine. Also known as "knock" or "ping."	*Lubrication*
Detonation Gun	A thermal spray process in which the coating material is heated and accelerated to the work piece by a series of detonations or explosions from oxy-fuel gas mixtures.	*Paint and Coatings*
Detonator	A device containing a small detonating charge that is used for detonating an explosive, including, but not limited to, blasting caps, exploders, electric detonators, and delay electric blasting caps.	*Mining*
Developers	the team who drive the headings, (tunnels), to open out a new coalface or working area in the mine i.e. development.	*Mining*
Development	The preparation of a specific mineral deposit for commercial production; this preparation includes construction of access to the deposit and of facilities to extract the minerals. The development process is sometimes further distinguished between a preproduction stage and a current stage, with the distinction being made on the basis of whether the development work is performed before or after production from the mineral deposit has commenced on a commercial scale.	*Energy*
Development costs	Costs incurred to obtain access to proved reserves and to provide facilities for extracting, treating, gathering, and storing the oil and gas. More specifically, development costs, depreciation and applicable operating costs of support equipment and facilities, and other costs of development activities, are costs incurred to:	*Energy*
Development drilling	Drilling done to determine more precisely the size, grade, and configuration of an ore deposit subsequent to when the determination is made that the deposit can be commercially developed. Not included are:	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Development mining	Work undertaken to open up coal reserves as distinguished from the work of actual coal extraction.	*Mining*
Development Phase	The phase in which a proven oil or gas field is brought into production by drilling production (development) wells.	*Petroleum Drilling*
Development phase	The phase in which a proven oil or gas field is brought into production by drilling production (development) wells.	*Petroleum Drilling*
Development plan	a plan showing the proposed development of the mine workings, kept for operational purposes.	*Mining*
Development well	A well drilled within the proved area of an oil or gas reservoir to the depth of a stratigraphic horizon known to be productive. Also see Well.	*Energy*
Developmental	Drilling to delineate the boundaries of a known mineral deposit to enhance the productive capacity of the producing mineral property.	*Energy*
De-vent	To close the vent connection of a pressure control valve permitting the valve to function at its adjusted pressure setting.	*Mechanical, Process, and Operations*
Deviation	The difference between the value of the controlled variable and the value at which it is being controlled.	*General Engineering*
Deviation, System	Deviation, System	*Process Control*
Devil	a forked shaped iron bar that is fixed to the last tub or tram being hauled up an incline. Should the haulage rope break the 'devil' would dig into the floor and prevent the tubs from running away. (Lancs.), also called a 'drag'. –see also bar-hook and bull.	*Mining*
Devitrified	In reference to a material initially in a glassy, or vitreous, sate. Crystallized.	*Material Process*
Devon	The Devon is one of the oldest beef breeds in existence. Some authorities believe the origin of the breed to be prehistoric. These red cattle may have contributed to the Hereford and other British breeds. Originally a dual-purpose (milk and meat) breed, the Devon has evolved over the last half century as a beef-type breed. However, the American Milking Devon Cattle Association maintains the Milking Devon strain, which is unique to America . Devons originated in southwestern England where Romans noted them in 55 B.C. Devons made their way to the United States in 1623, only 131 years after Columbus . Devons are red, varying in shade from a rich deep red to a light red or chestnut.	*Agriculture*
Dew Point	Upon cooling a vapor mixture, this is the point at which droplets of liquid first appear.	*Chemical*
Dewatering	The process of removing water from a coal seam in the vicinity of a producing gas well. Dewatering is required to reduce pressure within the coal seam, which in turn allows the methane gas to be released from the coal.	*Petroleum Engineering*
Dewatering Well	A well not used or intended for use as a source of water for agriculture or human consumption and made, (a) to lower or control the level of groundwater in the area of the well, or (b) to remove materials that may be in the groundwater.	*Petroleum Engineering*
Dewaxing	The removal of wax from petroleum products (usually lubricating oils and distillate fuels) by solvent absorption, chilling, and filtering.	*Petroleum Engineering*
Dewaxing	Removal of wax from a base oil in order to reduce the pour point.	*Lubrication*

Term	Definition	*Industry*
Dexron	General Motors ATF specification	*Petro-Chemical Abbreviations*
Dezincification	A form of pitting corrosion which attacks certain zinc bearing copper-based alloys, often called "yellow brasses", when in contact with sea water or fresh water that is high in oxygen and carbon dioxide. (ASTM B61 and B62 are "red brasses" and not susceptible to dezincification.)	*General Mechanical*
Dezincification	A form of pitting corrosion which attacks certain zinc	*Mechanical*
Dezinfication	Dezinfication selective leaching or parting, was first observed on brasses. The zinc is selectively leached out of the alloy, leaving a brittle, weak, and porous mass. It consists predominantly of copper plus copper oxides.	*Material Process*
DFA	diesel fuel additive	*Petro-Chemical Abbreviations*
d-Galactonic lactone ($C_6H_{10}O_6$)	White crystals, m.p. 91 °C (195.8.°F). Soluble in water and alcohol, slightly soluble in glycerol. Derivates from galactose by partial oxidation, and uses for dentifrices, dentistry, oral preparations and organic synthesis.	*Material Process*
DHIA	Dairy Herd Improvement Association.	*Agriculture*
DHYCA	Direction des Hydrocarbures et des Carburants (French Ministry of Industry)	*Petro-Chemical Abbreviations*
DI	detergent inhibitor	*Petro-Chemical Abbreviations*
Di-(diethyl glycol monoethyl ether) phthalate (C6H4(COOCH2CH2OCH2CH2OC2H5)2)	A colorless liquid, a plasticizer, also known as Di-Carbitol phthalate.	*Material Process*
Diabase	A common basic igneous rock usually occurring in dykes or sills.	*Mining*
Diacetone alcohol	A solvent both a ketone and an alcohol.	*Material Process*
Diafiltration	A crossflow filtration process allowing for the transfer of low molecular weight species, water and/or solvents through a membrane without changing the solution volume. This process is used for purifying retained large molecular weight species, increasing the recovery of low molecular weight species, buffer exchange and simply changing the properties of a given solution.	*Pollution Engineering*
Diagnostics	Information extracted from a device or sensor that can be used to troubleshoot or diagnose a problem.	*Mechanical*
Diagonal	(See also Cross Struts for Natural Draft Tower) A framework member; a load bearing member transmitting forces at other than a right angle with reference to columns or horizontal ties. Also known as Brace.	*Facility Engineering*
Diagram	A drawing which illustrates pertinent characteristics, component positions, sizes, inter- connection, controls and actuation of components and fluid power circuits.	*Mechanical, Process, and Operations*
Diagram, Combination	A drawing utilizing a combination of graphical, cutaway and pictorial symbols showing interconnected lines.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Diagram, Cutaway	A drawing showing principle internal parts of all components, controls and actuating mechanisms, all interconnecting lines and functions of individual components.	*Mechanical, Process, and Operations*
Diagram, Graphical (schematic)	A drawing showing each piece of apparatus including all interconnecting lines by means of approved ANSI or ISO standard symbols.	*Mechanical, Process, and Operations*
Diagram, Pictorial	A drawing showing each component in its actual shape according to the manufacturer's installation drawings.	*Mechanical, Process, and Operations*
Dial	an early name of the surveyor's principal surveying tool, hence the term 'dialers' for surveyors.	*Mining*
Dialer	mine surveyor or surveyor's assistant; also called a 'Latcher' (S. Staffs.).	*Mining*
Dialing	mine surveying, also known as 'latching'.	*Mining*
Diallyl Phthalate (DP)	DAP can be made in both polymeric and monomeric form. As a polymer, it is used to produce casting resins, thermosetting molding powders, and laminates.	*Material Engineering*
diam	Diameter	*General*
Diamagnetism	Magnetic behavior associated with a relative permeability of slightly less than one.	*Material Process*
Diameter	A line segment which passes through the center of a circle and whose end points lie on the circle. As related to wire rope it would be the diameter of a circle which circumscribes the wire rope.	*Wire Rope & Cable*
Diameter at Breast Height (DBH)	The diameter of a tree measured in inches at breast height 4.5 feet above the ground.	*Forestry*
Diameter limit cutting	A selection method in which all marketable trees at or above a specified diameter are harvested.	*Forestry*
Diametral Pitch	Pitch: The ratio of the number of teeth to the number of inches of pitch diameter-equals number of gear teeth to each inch of pitch diameter. Normal Diametral Pitch is the diametral pitch as calculated in the normal plane and is equal to the diametral pitch divided by the cosine of the helix angle.	*Mechanical Engineering*
Diamond	an allotropic form, highly crystalline form of carbon that is the hardest known material. Also considered to be a girl's best friend. See 'dog' for man's best friend.	*Physics*
Diamond Concentration	the amount of diamond within a given volume of the matrix.	*Petroleum Drilling*
Diamond cubic	Important crystal structure for covalently bonded, elemental solids.	*Material Process*
Diamond drill	A rotary type of rock drill that cuts a core of rock that is recovered in long cylindrical sections, two cm or more in diameter.	*Mining*
Diamond drill	A rotary type of rock drill in which the cutting is done by abrasion rather than percussion. The cutting bit is set with diamonds and is attached to the end of long hollow rods. The drill cuts a core of rock which is recovered in long cylindrical sections, an inch or more in diameter.	*Mining*
Diamond driller	A person who operates a diamond drill.	*Mining*
Diamond Pyramid Number	(DPN) system of assigning values to metals quantifying their hardness	*Materials Process*
Diamond Size	expressed in diamond mesh sizes.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Diamond	The hardest known mineral, composed of pure carbon; low-quality diamonds are used to make bits for diamond drilling in rock.	*Mining*
Diamond-like Carbon	A thin carbon-based coating applied by either PVD or PACVD. It has high hardness and low friction.	*Paint and Coatings*
Diamyl naphthalene (C10H6(C5H11)2)	A colorless liquid, a plasticizer.	*Material Process*
Diamyl nitrosamine A solvent-amine	Diamyl nitrosamine A solvent-amine.	*Material Process*
Diamyl phthalate (C10H4(COOC5H11)2)	Diamyl phthalate (C10H4(COOC5H11)2)	*Material Process*
Diapause	Suspended development or hibernation in insects.	*Agriculture*
Diaphragm	The sensing element consisting of a membrane which is deformed by the pressure differential applied across it.	*Electronic Process*
Diaphragm	The membrane of material that remains after etching a cavity into the silicon sensing chip. changes in input pressure cause the diaphragm to deflect.	*Electrical Engineering*
Diaphragm Actuator	Is a fluid (usually pneumatic) pressure-operated, spring-opposed diaphragm assembly which positions the valve stem in response to an input signal.	*Industrial Engineering*
Diaphragm Pressure	See bench set.	*Industrial Engineering*
Diatomaceous Earth	A light-colored, soft, siliceous (a loose, soft, porous, fine-grained sediment) earth composed of the shells of diatoms, a form of algae. Some deposits are of lake origin, the largest are marine.	*Petroleum Engineering*
Diatomaceous earth (infusorial earth, kieselguhr, and tripoli)	a fine powder composed of siliceous skeletons of diatoms, apparent density 0.24 to 0.34 g/cm^3 used as filler for plastics.	*Material Process*
Diatoms	Algae with siliceous shell enclosing them, origin of diatomaceous earth.	*Material Process*
Diazinon	An organophosphate insecticide.	*Agriculture*
Dib hole	the lowest part of a pit shaft below the scaffold on which the cage rests. It forms a lodge to hold the water draining out of the mine. - see also Sump. (Lancs.).	*Mining*
Dibutoxy ethyl phthalate (C6H4(COO C2H4OC5H9)2)	A colorless liquid, a plastificizer, also known as Dibutyl Cellosolve phthalate and Kronisol.	*Material Process*
Dibutyl phthalate (CH(COOC4H9)2)	A colorless oily liquid. An important plasticizer for cellulose nitrate and other cellulose derivatives.	*Material Process*
Dibutyl succinate (C12H14O3 (OCO(CH3)8)	A colorless liquid.	*Material Process*
Dibutyl tartrate (C4H9OCO(CHOH)2 COOC4H9)	A good plasticizer for cellulose acetate.	*Material Process*
Dichlooethane or ethylene chloride	1,2 Dichlooethane or ethylene chloride (CH2ClCH2Cl) A colorless liquid, ordinary organic solvent A liquid that reacts with alkali polysulfides to form a rubberlike material (Thiokol).	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dichotomous data	Data that can take one of two possible values, such as dead/alive, smoker/non-smoker, present/not present. (Also called binary data.) Sometimes continuous data or ordinal data are simplified into dichotomous data (e.g. age in years could become <75 years or ≥75 years).Also called: Binary data	*Quality Engineering*
Dicot	Seeds that have two cotyledons.	*Agriculture*
Dictatorship of the Proletariat	the term which implies control of the means of production by the workers.	*Industrial Relations*
Division of Labor	the process whereby a production problem is broken down to its component operations.	*Industrial Relations*
Dicyanodiamide (NH2C(NH)NHCN Rhombic leaflets	A compound prepared from calcium cyanamide and water, and in the production of melamine, which in turn is used for melamine formaldehyde plastics.	*Material Process*
Dieldrin	A chlorinated hydrocarbon insecticide.	*Agriculture*
Dielectric	The term dielectric is almost synonymous with electrical insulation, which can be considered the applied form of the dielectric.	*Electrical Engineering*
Dielectric	Electrically insulating material.	*Material Process*
Dielectric strength	The voltage gradient at which a dielectric breaks down and becomes conductive. The voltage that will rupture or puncture the material in question when placed between electrodes of a given size. Expressed in volts per millimeter.	*Material Process*
Dielectric breakdown	The electric potential required to puncture the material.	*Material Process*
Dielectric breakdown	The voltage at which a dielectric material is punctured; which is divisible by thickness to give dielectric strength.	*Electrical*
Dielectric Constant	Related to the force of attraction between two opposite charges separated by a distance in a uniform medium.	*General Engineering*
Dielectric Constant	That property (K) of an insulating material which is the ratio of the parallel capacitance (C) of a given configuration of electrodes with the material as the dielectric, to the capacitance of the same electrode configuration with a vacuum as the dielectric.	*Electrical*
Dielectric Strength	The voltage which an insulating material can withstand before breakdown occurs, usually expressed as a voltage gradient (such as volts per mil).	*Electrical*
Dielectric Tests	1). Tests which consist of the application of a voltage higher than the rated voltage for a specified time for the purpose of determining the adequacy against breakdown of insulating materials and spacings under normal conditions. 2). The testing of insulating materials by application of constantly increasing voltage until failure occurs.	*Electrical*
Diesel Engine	A diesel engine uses heavier weight components than gas engines to handle higher compression ratios. Typically, diesel engines run with greater efficiency and higher torque than similar size gas engines. These attributes lead to better fuel economy and towing performance. Diesel engines do not have spark plugs or carburetors. Instead glow plugs are used to preheat air in the cylinders to ensure easy starts. Once the engine is started, compression heats the fuel in the cylinders for combustion.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Diesel fuel	A fuel composed of distillates obtained in petroleum refining operation or blends of such distillates with residual oil used in motor vehicles. The boiling point and specific gravity are higher for diesel fuels than for gasoline.	*Energy*
Diesel fuel system	Diesel engines are internal combustion engines that burn diesel oil rather than gasoline. Injectors are used to spray droplets of diesel oil into the combustion chambers, at or near the top of the compression stroke. Ignition follows due to the very high temperature of the compressed intake air, or to the use of "glow plugs," which retain heat from previous ignitions (spark plugs are not used). Diesel engines are generally more fuel-efficient than gasoline engines but must be stronger and heavier because of high compression ratios.	*Energy*
Diesel-electric plant	A generating station that uses diesel engines to drive its electric generators.	*Energy*
Dieseling	A condition in which gasoline continues to fire after the ignition has been shut off. In late-model engines, dieseling, or run-on, is caused by heat and the unusually high manifold pressure that result from retarding the spark at idle. In fuel-injected cars when the engine is turned off, fuel is automatically shut off, eliminating dieseling.	*Mechanical Engineering*
Diethanolamine	A chemical (C4H11O2N) used to remove H2S from gas streams.	*Petroleum Engineering*
Diethoxyethyl adipate	(C2H5OC2H4 OCO(CH2)4COOC2 H4OC2H5) A colorless liquid, plasticizer.	*Material Process*
Diethoxyethyl phthalate (C6H4(COOC2H4 OC2H5)2)	A plasticizer, also known as Ethox or Di Cellosolve phthalate.	*Material Process*
Diethyl adipate (CH2COOC2H5)2)	A colorless liquid, a plasticizer.	*Material Process*
Diethylene glycol propionate (CH3CH2 COOCH2CH2)2 O	A colorless liquid, plasticizer. Also, known as K P - 45.	*Material Process*
Diethylene triamine	A colorless liquid. Solvent –amine.	*Material Process*
Difference graph, difference plot	Used here to refer to the display of paired test results in which the differences between the test values and the comparison values are plotted on the y-axis versus the comparison values on the x-axis.	*Quality*
Differential	For an on/off controller, it refers to the temperature difference between the temperature at which the controller turns heat off and the temperature at which the heat is turned back on. It is expressed in degrees.	*General Engineering*
Differential	For an on/off controller, it refers to the temperature difference between the temperature at which the controller turns heat off and the temperature at which the heat is turned back on. It is expressed in degrees.	*Electronic Process*
Differential Cost	A difference in cost between any two alternatives. Also see Incremental cost.	*Procurement*
Differential current	The algebraic summation of the current in the torque motor; measured in MA (milliamperes).	*Mechanical, Process, and Operations*
Differential Curve	A curved section of roller conveyor having a conveying surface of two or more concentric rows of rollers. Also referred to as a Split Roller Design.	*Manufacturing*
Differential cylinder	Any cylinder in which the two opposed piston areas are not equal.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Differential flotation	A milling process using the flotation process, by which concentrates are made of each of the various valuable minerals in an ore.	*Mining*
Differential Input	A signal-input circuit where SIG LO and SIG HI are electrically floating with respect to ANALOG GND (METER GND, which is normally tied to DIG GND). This allows the measurement of the voltage difference between two signals tied to the same ground and provides superior common-mode noise rejection.	*General Engineering*
Differential Inputs	Two inputs, where the measured signal is the difference between them. Any voltage common to both is rejected. Differential inputs can reduce noise picked up by the signal leads.	*Reliability Engineering*
Differential Nonlinearity	A specification that appears in data-converter datasheets. In an ideal D/A converter, incrementing the digital code by 1 changes the output voltage by an amount that does not vary across the device's permitted range. Similarly, in an A/D, the digital value ramps smoothly as the input is linearly swept across its entire range. DNL measures the deviation from the ideal. An ideal converter has the code exactly the same size, and a DNL of 0 (zero).	*Electrical Engineering*
Differential Pieve-Rate Plan	a method of wage payment designed to speed up production by providing a higher rate for work performed above the standard and a lower rate of work performed below the standard.	*Industrial Relations*
Differential Pressure	The difference in static pressure between two identical pressure taps at the same elevation located in two different locations in a primary device.	*General Engineering*
Differential pressure (DP)	The difference between the pressure on the influent side of a filter (upstream pressure) and the pressure on the effluent side (downstream pressure). The differential pressure increases as the filter removes contaminants from the process fluid.	*Contamination Control*
Differential pressure indicator	An indicator which signals the difference in pressure between any two points of a system or a component.	*Oil Analysis*
Differential Pressure Indicator	An indicator which signals the difference in pressure between two points, typically between the upstream and downstream sides of a filter element.	*Lubrication*
Differential Pressure Sensor	A sensor which is designed to accept simultaneously two independent pressure sources. The output is proportional to the pressure difference between the two sources.	*Electrical Engineering*
Differential Pressure Valve	A valve whose primary function is to limit differential pressure.	*Lubrication*
Differential Revenue	The difference in revenue between any two alternatives.	*Procurement*
Differential Travel	The distance from the operating point to the release point.	*Electrical Engineering*
Differential, Locking	The same attributes of a standard differential, except that when one wheel is slipping, the most torque is supplied to the wheel with best traction. A locking differential reduces the possibility of a vehicle becoming immobile when one driving wheel loses traction.	*Mechanical Engineering*
Differentiation	Representation in terms of time rate of change. Example: differentiating velocity yields acceleration. In a computer, this is accomplished by multiplying the velocity signal by jΩ, where Ω is frequency multiplied by 2Π.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Diffraction geometry	Geometry associated with Bragg's law.	*Material Process*
Diffractometer	An electromechanical scanning device for obtaining an X-ray diffraction pattern of a powder sample.	*Material Process*
Diffuse reflection	Light reflection due to surface roughness.	*Material Process*
Diffuse Scan	A reflective scanning technique in which reflection from a near: by non: shiny surface illuminates the photosensor in the receiver. Sometimes called proximity scan because of the required nearness of the light source and photosensor to reflecting surface. Also used to detect color contrast as in registration control.	*Electrical Engineering*
Diffuser fan	A fan mounted on a continuous miner to assist and direct air delivery from the machine to the face.	*Mining*
Diffuser	The bodywork at the rear underside of the car that controls underbody airflow as it exits the back of the car. A good diffuser generates significant downforce.	*NASCAR*
Diffusion	Blending of a gas and air, resulting in a homogeneous mixture. Blending of two or more gases.	*Mining*
Diffusion	the process by which molecules in a single phase equilibrate to a zero concentration gradient by random molecular motion (Brownian motion). The flux of molecules is from regions of high concentration to low concentration and is governed by Fick's Second Law.	*Chemical*
Diffusion Coating	An alloy coating produced by applying heat to one or more coatings deposited on a basis metal.	*Paint and Coatings*
Diffusion coefficient (diffusivity)	Proportionality constant in the relationship between flux and concentration gradient.	*Material Process*
Diffusion deck	A fill deck that is located directly under the distribution basin or nozzle bank. The purpose of this deck is to receive water from the basin or nozzle and distribute it uniformly over the fill decks.	*Facility Engineering*
Diffusion layer	Fictitious layer in a fluid close to a solid surface where a chemical reaction takes place. The flux of species perpendicular to the surface in this layer is dominated by diffusion.	*Chemical*
Diffusional transformation	Phase transformation that is essentially time independent, due to a mechanism of atomic diffusion.	*Material Process*
Diffusionless transformation	Phase transformation that is essentially time independent, due to the absence of a diffusional mechanism.	*Material Process*
Diffusive transport	The process by which particles of liquids or gases move from an area of higher concentration to an area of lower concentration.	*Energy*
Dig	To form or excavate (a hole, tunnel, etc.) by removing material.	*Civil Engineering*
Dig	To form or excavate (a hole, tunnel, etc.) by removing material.	*Civil Engineering*
Digest	To soften substance by heat and moisture, sometimes under pressure, in order to remove certain substances from vegetable products.	*Material Process*
Digester	A strong closed vessel in which substances are heated under pressure, usually with water or other liquid, in order to change them physically and often chemically.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Diggings	Name applied to placers being worked.	*Mining*
Digit	A measure of the display span of a panel meter. By convention, a full digit can assume any value from 0 through 9, a 1/2-digit will display a 1 and overload at 2, a 3/4-digit will display digits up to 3 and overload at 4, etc. For example, a meter with a display span of ±3999 counts is said to be a 3-3/4 digit meter.	*General Engineering*
Digital	Digital devices transmit in bits, i.e. a series of binary numbers, to other parts of the system.	*Control Engineering*
Digital	Of or pertaining to the general class of devices or circuits whose output varies in discrete steps (i.e., pulses or "on-off" characteristics).	*Mechanical, Process, and Operations*
Digital Circuit	A circuit that has only two stable states, operating in the manner of a switch; that is, it is either On or Off.	*Electrical Engineering*
Digital Computer	An electronic machine for performing calculations on discrete quantities of data. Usually includes bulk storage devices such as disks, tape units, etc., in addition to internal memory. Also includes devices for printing and/or displaying output data.	*Electrical Engineering*
Digital Multimeter	Measuring instrument or VOM with a digital display. Example: Voltage, resistance, current	*Electrical Engineering*
Digital Multimeter	Measuring instrument or VOM with a digital display. Example—Voltage, resistance, current	*Electrical Engineering*
Digital Output	Output that is of only two stable states, appearing in the manner of a switch; that is, it is either On or Off or High or Low (i.e., high voltage or low voltage).	*Electrical Engineering*
Digital Position Sensor	A type of position sensor whose voltage output has only two states.	*Mechanical*
Digital Signal Processor	A Digital Signal Processor, or DSP, is a special-purpose digital circuit that acts on digitized signals, such as audio. DSP circuits can replace traditional analog functions, such as filtering and more complex functions that are difficult to accomplish in the analog domain.	*Electrical Engineering*
Digital Subscriber Line Access Multiplexer	A device which takes a number of ADSL subscriber lines and concentrates these to a single ATM line.	*Electrical Engineering*
Digital-to-Analog (D/A or DAC)	A device or circuit to convert a digital value to an analog signal level.	*General Engineering*
Digital-to-analog converter	A data converter, or DAC, that receives digital data (a stream of numbers) and outputs a voltage or current proportional to the value of the digital data.	*Electrical Engineering*
Di-hydroxyethyl aniline	Solvent-amine.	*Material Process*
DII	diesel ignition improver	*Petro-Chemical Abbreviations*
Di-isopropanolamine	Di-isopropanolamine A colorless liquid, solvent-amine.	*Material Process*
Dike	An embankment for controlling or holding back the waters of the sea or a river. Example: They built a temporary dike of sandbags to keep the river from flooding the town. A bank of earth formed of material being excavated. A causeway. To furnish or drain with a dike. To enclose, restrain, or protect by a dike: Example: to dike a tract of land.	*Civil Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dilatant Liquid	If the viscosity of a liquid increases as agitation is increased at constant temperature, the liquid is termed dilatant. Examples are clay slurries and candy compounds.	*Maintenance and Repair*
Dilly	a counter-balance mounted on a tram used for hauling empties up an incline; or a balance haulage incline. (N. East).	*Mining*
Dilsh	a thin seam of inferior culm (S. Wales).	*Mining*
Diluent	A substance, solid or liquid used to increase bulk of a solution.	*Material Process*
Dilute	To lower the concentration of a mixture; in this case the concentration of any hazardous gas in mine air by addition of fresh intake air.	*Mining*
Dilution	Waste of low grade rock which is unavoidably removed along with the ore in the mining process.	*Mining*
Dilution (mining)	Rock that is , by necessity, removed along with the ore in the mining process, subsequently lowering the grade of the ore.	*Mining*
Dilution (of shares)	A decrease in the value of a company's shares caused by the issue of treasury shares.	*Mining*
Dilution of Engine Oil	Contamination of crankcase oil by unburned fuel, leading to reduced viscosity and flash point. May indicate component wear or fuel system maladjustment.	*Lubrication*
Dilution	The contamination of ore with barren wall rock in stopping.	*Mining*
Diluvium	A deposit of superficial sand, loam, gravel, pebbles, etc.	*Mining*
Dimethyl furan	A solvent furan.	*Material Process*
Dimethyl phthalate (C6H4(COOCH3)2	A colorless liquid. A plasticizer for cellulose acetate and other cellulose derivatives.	*Material Process*
Dimethyl sulfate (CH3)2 SO4	A colorless heavy liquid, almost odorless and very poisonous. A reagent widely used industrially to introduce the methyl group into an organic molecule. It is used in the preparation of methyl cellulose by direct methylation of cellulose.	*Material Process*
Di-methylcyclohexil adipate (CH3C6H10 OCO (CH2)4COOC6H10CH3)	A colorless liquid, a plasticizer. Also, known as Sipalin A O M.	*Material Process*
Dimethylene urea (N(CH2)2CO)	The B-stage urea resin, the formation of which from dimethylol urea in the presence of a catalyst is characterized by a change through a viscous liquid to a gel.	*Material Process*
Dimethylol urea (NHCH2OH)2 CO)	A colorless liquid, the principal ingredient of the A-stage urea resin, formed by the condensation of one molecular proportion of urea with two of formaldehyde.	*Material Process*
Dimple	Small surface depression in plastics. Term not recommended.	*Material Process*
DIN	DIN (Deutsches Institut für Normung) is a non-governmental organization established to promote the development of standardization in Germany and related markets. Their goals are to facilitate the international exchange of goods and services, and to develop cooperation in the spheres of intellectual, scientific, technological and economic activity. Through the European standards organizations CEN and CENELEC, DIN presents the German view of European standards, which is critical to complete the single European market. Over 12,000 DIN standards cover a wide range of topics including: physical quantities and	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	units, fasteners, water analysis, building and civil engineering (including building materials, construction contract procedures (VOB), soil testing, corrosion protection of steel structures), materials testing (testing machines, plastics, rubber, petroleum products, semiconductors), steel pipes, machine tools, twist drills, roller and ball bearings, and process engineering. DIN Handbooks (covering subjects such as mechanical engineering, fasteners, steel, steel pipes, and welding), and most DIN standards are available as English versions, or English translations. (From http://www.cssinfo.com/info/din.html)	
DIN (Deutsche Industrial Norm)	A set of German standards recognized throughout the world. The 1/8 DIN standard for panel meters specifies an outer bezel dimension of 96 x 48 mm and a panel cutout of 92 x 45 mm.	*General Engineering*
DIN (Deutsche Industrial Norm)	A set of German standards recognized throughout the world. The 1/8 DIN standard for panel meters specifies an outer bezel dimension of 96 x 48 mm and a panel cutout of 92 x 45 mm.	*Electronic Process*
DIN 43760	The standard that defines the characteristics of a 100 ohm platinum RTD having a resistance vs. temperature curve specified by a = 0.00385 ohms per degree.	*General Engineering*
DIN 43760	The standard that defines the characteristics of a 100 ohm platinum RTD having a resistance vs. temperature curve specified by a = 0.00385 ohms per degree.	*Electronic Process*
Dinky prop	a small hydraulic prop, also known as a 'Bottle prop'.	*Mining*
Dint or Dinting	to take up the floor that has heaved in order to gain headroom; or to mine the fire-clay after the coal has been removed. – see Baiting, Beating, Beating-up or Blocking-up.	*Mining*
Dintheader	a machine designed to carry out dinting, usually consisting of a wide cutting boom carrying a series of cutting chains, or a continuous deck of hinged plates, incorporating multiple pick holders.	*Mining*
Dioctyl phthalate (C6H4(COOC8H17)2	A colorless liquid insoluble in water. A plasticizer.	*Material Process*
Diode	A two-terminal device that rectifies signals (passes current in only one direction). Most commonly, a semiconductor consisting of a P-N junction, but dioides can also be realized using vacuum tube, point-contact, metal-semiconductor junction (Schottky), and other technologies.	*Electrical Engineering*
Diorite	An intrusive igneous rock composed chiefly of sodic plagioclase, hornblende, biotite or pyroxene.	*Mining*
Di-o-xenyl mono phenyl phosphate (C30H23O4P)	A colorless liquid insoluble in water. A plasticizer, also known as Dow Plasticizer 6.	*Material Process*
Dioxins	General name given to 210 organic compounds containing carbon, oxygen and hydrogen with one to eight chlorine atoms.	*Chemical*
Dioxins	General name given to 210 organic compounds containing carbon, oxygen and hydrogen with one to eight chlorine atoms.	*Chemical Engineering*
Dioxolane	A colorless liquid, solvent–ether.	*Material Process*
DIP	The angle at which a vein, structure or rock bed is inclined from the horizontal, measured at right angles to the strike.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dip face	a coalface advancing downhill.	*Mining*
Dip level	the lowest drift or roadway that follows the strike of the strata. (Scot.).	*Mining*
Dip needle	A compass whose needle is mounted so as to swing in a vertical plane, used for determining the magnetic attraction of rocks.	*Mining*
Dip side	the side dipping downhill away from the point of reference; or the lowest side of a 'room' or 'wall'. Also called the 'laigh side' (Scot.).	*Mining*
Dip Stick	a stick to aid the miner when walking out up a steep roadway or dip.	*Mining*
Dip tube	Extending the blow down valve on large gate valves requires a tube which is located inside of the valve. The tube is called the "dip tube" and extends through the bonnet to the bottom of the body cavity.	*Mechanical*
Diphenyl guanidine or Melaniline (NH C(NHC6H5)2)	Monoclinic needles crystallizing from alcohol. An accelerator in rubber and plastics manufacture.	*Material Process*
Diphenyl mono -o-xenyl phosphate ((C6H5C6H4O)(C6H5O)2PO)	A plasticizer, also known as Dow Plasticizer S.	*Material Process*
Diphenyl phthalate (C6H4(COOC6H5)2)	A plasticizer.	*Material Process*
Dipole	Asymmetrical distribution of positive and negative charge, associated with secondary bonding.	*Material Process*
Dipole force	electrostatic interaction between molecules resulting from alignment of charges	*Physics*
Dipole moment	Product of charge and separation distance between centers of positive and negative charge in a dipole.	*Material Process*
Dipper	a fault that throws down the coal in front of the drift approaching it, a downthrow fault. The same fault approached from the other side would be a 'riser'. (N. East).	*Mining*
Dipropyl phthalate (C6H4(COOC3H7)2)	A colorless liquid. A plasticizer.	*Material Process*
Direct	a haulage system hauling up and lowering down an incline (S. Staffs.).	*Mining*
Direct access	The ability of a retail customer to purchase electricity or other energy sources directly from a supplier other than their traditional supplier.	*Energy*
Direct Access	The ability of a retail customer to purchase commodity electricity directly from the wholesale market rather than through a local distribution utility.	*Energy*
Direct Acting	This term has several different meanings depending upon the device it is describing. A direct-acting actuator is one in which the actuator stem extends with an increase in diaphragm pressure. A direct-acting valve is one with a push-down-to-close plug and seat orientation. A direct-acting positioner or a direct-acting controller outputs an increase in signal in response to an increase in set point.	*Industrial Engineering*
Direct Action	a procedure used by some unions to achieve their aims, rather than by negotiation or use of the machinery or the collective bargaining agreement.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Direct Actuator	Is one in which the actuator stem extends with an increase in diaphragm pressure.	*Industrial Engineering*
Direct Broadcast Satellite	A system which broadcasts directly from satellite to the subscriber (end user). Prominent examples in the US are DirecTV and Dish network.	*Electrical Engineering*
Direct Broadcast Satellite	A system which broadcasts directly from satellite to the subscriber (end user). Prominent examples in the US are DirecTV and Dish network.	*Electrical Engineering*
Direct Contact Method of Training	a procedure used in training supervisory employees.	*Industrial Relations*
Direct control load management	The magnitude of customer demand that can be interrupted at the time of the seasonal peak load by direct control of the system operator by interrupting power supply to individual appliances or equipment on customer premises. This type of control usually reduces the demand of residential customers.	*Energy*
Direct Cost	A cost that can be easily and conveniently traced to the particular cost object under consideration.	*Procurement*
Direct current (DC)	This is electrical current that does not alternate (see Alternating current), the electrons flow through the circuit in one direction. As a result, DC does not generate reactive power (see Reactive Power). This means that, in a DC system, only real (or active) power is transmitted, making better use of the system's capacity. In order to transmit electrical power as DC, the alternating current generated in the power plant must be converted into DC. At the other end of the process, the DC power must be converted back into AC, and fed into the AC-transmission or distribution network. The transmission of DC current has very low losses. In the conversion between the two forms of power, known as rectification, incurs additional power losses and so it is worth while only when these losses are less than would be incurred by AC transmission, i.e., over very long distances (~1000 km for overhead lines, ~100 km for underwater). The other situation in which DC transmission is advantageous is when connecting asynchronous grids, i.e., where adjoining electricity grids have different frequencies (e.g., 50 or 60 Hz, as happens in some parts of Brazil and the United States). (See HVDC.)	*Electrical*
Direct Current (DC)	Electric that flows continuously in the same direction.	*Energy*
Direct Digital synthesis	Is a method for digitally generating analog waveforms, such as sine waves (modulated or not) or arbitrary waveforms.	*Electrical Engineering*
Direct Digital synthesis	Is a method for digitally generating analog waveforms, such as sine waves (modulated or not) or arbitrary waveforms.	*Electrical Engineering*
Direct electricity load control	The utility installs a radio-controlled device on the HVAC equipment. During periods of particularly heavy use of electricity, the utility will send a radio signal to the building in its service territory with this device and turn off the HVAC for a certain period.	*Energy*
Direct Energy Conversion	Production of electricity from an energy source without transferring the energy to a working fluid or steam. For example, photovoltaic cells transform light directly into electricity. Direct conversion systems have no moving parts and usually produce direct current.	*Energy*
Direct Flow Filtration	Filtration in which liquid flows directly through the filter medium.	*Contamination Control*

Term	Definition	*Industry*
Direct Heating	The process of heating where the heat-source comes into direct contact with the item being heated. Conventional ovens and steam cookers are examples of direct heat transfer. See also Indirect Heating	*Industrial*
Direct Labor	an internal control or accounting device to determine or establish cost factors of labor directly involved in the production operation.	*Industrial Relations*
Direct Labor	Those factory labor costs that can be easily traced to individual units of product. Also called touch labor.	*Procurement*
Direct labor hours	Direct labor hours worked by all mining employees at a mining operation during the year. Includes hours worked by those employees engaged in production, preparation, development, maintenance, repair, shop or yard work management, and technical or engineering work. Excludes office workers. Excludes vacation and leave hours.	*Energy*
Direct Load Control	Activities that can interrupt load at the time of peak by interrupting power supply on consumer premises, usually applied to residential consumers.	*Energy*
Direct Materials	Those materials that become an integral part of a finished product and can be conveniently traced into it.	*Procurement*
Direct Memory Access	A scheme which reads or writes data directly to memory, bypassing the processor and the processor bus.	*Electrical Engineering*
Direct Memory Access	A scheme which reads or writes data directly to memory, bypassing the processor and the processor bus.	*Electrical Engineering*
Direct milling cost	Operating costs directly attributable to the processing of ores or other feed materials, including labor, supervision, engineering, power, fuel, supplies, reagents, and maintenance.	*Energy*
Direct mining cost	Operating cost directly attributable to the mining of ore, including costs for labor, supervision, engineering, power, fuel, supplies, equipment replacement, maintenance, and taxes on production.	*Energy*
Direct nonprocess end use	Those end uses that may be found on commercial, residential, or other sites, as well as at manufacturing establishments. They include heating, ventilation, and air conditioning (HVAC), facility lighting, facility support, onsite transportation, conventional electricity generation, and other nonprocess uses. "Direct" denotes that only the quantities of electricity or fossil fuel used in their original state (i.e., not transformed) are included in the estimates.	*Energy*
Direct process end use	Those end uses that are specific to the carrying out of manufacturing. They include process heating, process cooling and refrigeration, machine drive, electrochemical processes, and other process uses. "Direct" denotes that only the quantities of electricity or fossil fuel used in their original state (i.e., not transformed) are included in the estimates.	*Energy*
Direct Sales/Direct Marketing	an exchange in which the producer sells directly to the customer, as in a farmers' market or CSA model. In direct sales, the growers are able to reap 100% of the profits of their labor, and the customer is able to build a relationship with the producer.	*Agriculture*
Direct seeding	Sowing seed for broad coverage from the air or on the ground.	*Forestry*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Direct Tension Indicators	Direct Tension Indicators (DTI's) is a term sometimes used to describe load indicating washers. Projections on the face of the washer (usually on the face abuting the bolt head or nut) that deform under loading as the bolt is tensioned. An indication of the tension in the bolt can be made by measuring the gap between the washer face and the nut or bolt head. The smaller the gap - the greater the tension in the bolt. Commonly used in civil rather than mechanical engineering applications.	*Maintenance*
Direct torque control	A drive system (see Drive) that controls the speed of an electric motor, and hence the torque it can produce on a rotating shaft. The drive works by regulating the amount of power the motor draws from the grid. Torque is an angular force that causes rotation, as seen for example in a car's engine, which turns the vehicle's drive shaft.	*Electrical*
Direct use	is exclusive of station use.	*Energy*
Direct Utility Cost	A cost identified with one of the DSM categories.	*Energy*
Direction of Lay	The lateral direction, designated as left-hand or right-hand, in which the wires of a member or units of a conductor run over the top of the member or conductor as they recede from an observer looking along the axis of the member or conductor.	*Electrical*
Directional	Drilling that is deliberately made to depart significantly from the vertical.	*Energy*
Directional (deviated) well	A well purposely deviated from the vertical, using controlled angles to reach an objective location other than directly below the surface location. A directional well may be the original hole or a directional "sidetrack" hole that deviates from the original bore at some point below the surface. The new footage associated with directional "sidetrack" holes should not be confused with footage resulting from remedial sidetrack drilling. If there is a common bore from which two or more wells are drilled, the first complete bore from the surface to the original objective is classified and reported as a well drilled. Each of the deviations from the common bore is reported as a separate well.	*Energy*
Directional control performance	a subjective term or quantitative measure related to overall DLS-variance, and the "closeness" of drilling along the planned well path trajectory.	*Petroleum Drilling*
Directional Control Servo Valve	A directional control valve which modulates flow or pressure as a function of its input signal.	*Lubrication*
Directional Control Valve	A valve whose primary function is to direct or prevent flow through selected passages.	*Lubrication*
Directional Driller	These are highly trained drillers who work alongside the rig's regular drillers to direct the horizontal drilling process. An oil company brings in the directional crew, including the directional driller and MWD (measure while drilling) employees when it is time to deviate the well from vertical and build the "curve" and "lateral" portions of the well. Directional drillers are some of the highest paid service hands in the oilfield, however much is expected of them and the pressure can of the job can be great at times. Directional driller can be abbreviated "DD." If the DD does not build the curve properly or does not keep the well on target, it could cost the company thousands of dollars to correct the problem by drilling another hole.	*Petroleum Drilling*

Term	Definition	*Industry*
Directional drilling	A method of drilling involving the use of stabilizers and wedges to direct the orientation of the hole.	*Mining*
Directional plan view	a plot that displays (North/South, East/West) Cartesian coordinates of a well path projected to a horizontal surface plane; also known as map view.	*Petroleum Drilling*
Directional Stability	The ability of a vehicle to travel in a straight line with a minimum of driver control.	*Mechanical Engineering*
Directional survey	a summary of geometric information--calculated with directional survey data and a directional survey calculational method (e.g., minimum curvature method)--that pertains to spatial properties (e.g., Cartesian coordinates) of a directional well; sometimes synonymous with directional survey data or directional survey station.	*Petroleum Drilling*
Directional survey data	typically refers to the "raw" data acquired at a directional survey station, namely, well bore inclination and azimuth at specific measured depths.	*Petroleum Drilling*
Directional survey station	a reference point that corresponds to a measured depth along the (typically actual) well path where well bore inclination and azimuth are observed/measured and recorded.	*Petroleum Drilling*
Directional valve	A valve which selectively directs or prevents fluid flow to desired channels.	*Mechanical, Process, and Operations*
Directional vertical section view	a plot that displays vertical section versus true vertical depth of a well path. Vertical section is the horizontal distance (departure) of a well path projected to a vertical plane of specific azimuth. The specific azimuth typically coincides with the final target azimuth.	*Petroleum Drilling*
Directional well	a well bore created by drilling directionally.	*Petroleum Drilling*
Director- Business Services	Same as Director - Materiel Management ; Office of the President representative with facilitative, consultative, and coordinative responsibility for the Materiel Management function of the University and administrative responsibility for the Planned Purchasing and Classification and Coding programs.	*Procurement*
Direct-Reduced Iron (DRI)	metallic iron product made from iron ore pellets, lumps or fines that is reduced (by removing only the oxygen) from the ore at a temperature below the melting point of the iron. DRI is used as feedstock in electric-arc furnaces, blast furnaces and in other iron and steel making processes.	*Metallurgy*
Direct-Sequence Spread Spectrum	A transmission technology used in WLAN (wireless LAN) transmissions where a data signal at the sending station is combined with a higher data-rate bit sequence, or chipping code, that divides the user data according to a spreading ratio.	*Electrical Engineering*
Dirt band or Dirt parting	a layer of foreign material in the coal seam, often soft shaley material.	*Mining*
Dirt capacity (dust capacity) (contaminant capacity)	The weight of a specified	*Mechanical, Process, and Operations*
Dirt flinger	a 'gummer' that throws cuttings into the goaf. Also called a 'gum flinger' or 'gum stower'.	*Mining*

Term	Definition	*Industry*
Dirt ruck or Dirt tip	a spoil or waste heap on the surface (N. Staffs.). Also called a 'pit heap', 'tip', or a 'bing' in Scotland.	*Mining*
Dirt, stone or shale	Anything solid other than coal and wood, or any part of the coal measures material with an ash content exceeding 45% ash. Also called 'debris', 'muck', 'redd', 'refuse', 'rubbish', 'spoil' or 'steriles'.	*Mining*
Dirty	Term applied to a plastics piece with foreign particles molded in the surface.	*Material Process*
Dirty air	The rear wing of the car in front tends to push the air higher, creating a very turbulent low-pressure area directly behind the car. At high speeds, downforce can be disrupted by following closely behind another car. A car following closely often will suffer understeer as a result of being in this "dirty air."	*NASCAR*
Dirty coal or Inferior coal	coal with many dirt partings or a high ash content, likely to be sub-economic; or part of a coal seam with an ash content of between 15% and 45% ash.	*Mining*
Dirty locker	the locker in the pit head baths where a miner stores his working clothes between shifts. - see also Clean locker.	*Mining*
Disable	To prevent the output despite an input signal. A wiring terminal for this purpose is provided on most MICRO SWITCH control bases. The disabling circuit may receive its signal from the current sinking output of a photoelectric logic card, or modulated LED control, or from an electromechanical limit switch, etc. Disabling is used to prevent false or unwanted signals from triggering the control.	*Electrical Engineering*
Disabled Veteran	A veteran of the military, naval, or air service of the United States with a service connected disability who is a resident of the State of California . To qualify as a veteran with a service connected disability, the person must be currently declared by the United States Veterans Administration to be 10 percent (10%) or more disabled as a result of service in the armed forces. (California Military and Veterans Code, Article 6, Section 999 et seq)	*Procurement*
Disabled Veteran Business Enterprise (DVBE)	A business that is at least fifty-one percent (51%) owned by one or more disabled veterans or, in the case of any publicly owned business, at least fifty-one percent (51%) of the stock of which is owned by such individuals: and whose management and daily business operations are controlled by one or more of such individuals.	*Procurement*
Disadvantaged Business Enterprise (DBE)	A business concern which is at least fifty-one percent (51%) owned by one or more socially and economically disadvantaged individuals or, in the case of any publicly owned business, at least fifty-one percent (51%) of the stock of which is owned by such individuals and whose management and daily business operations are controlled by one or more of such individuals. Business owners who certify that they are members of named groups (Black Americans, Hispanic Americans, Native Americans, Asian-Pacific Americans, Subcontinent-Asian Americans) are to be considered socially and economically disadvantaged.	*Procurement*
Disaffiliation	the procedure whereby a local union separates from the national or international union of which it is a member.	*Industrial Relations*
Disaggregation	The functional separation of the vertically integrated utility into smaller, individually owned business units (I.e. generation, dispatch/control, transmission, distribution). The terms "deintegration", "disintegration" and "delimitation" are sometimes used to mean the same thing.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Disaster payments	Financial aid paid to farmers and livestock producers who suffer heavy economic losses from natural disasters such as floods, wind and drought. Usually refers to federal funds administered through the U.S. Department of Agriculture.	*Agriculture*
Disc	a device used on a machine to cut the coal.	*Mining*
Disc	The closure element of a globe angle or small regulator valve. The disc (sometimes referred to as "valve," "poppet" or "plug") moves to and from the seat in a direction perpendicular to the seat face. Depends on stem force for tight shutoff.	*Mechanical*
Disc Brakes	Properly called caliper disc brakes, a type of brake that consists of a rotor that rotates at wheel speed, straddled by a caliper that can squeeze the surfaces of the rotor with brake pads near its edge. Disc brakes provide a more linear response and operate more efficiently at high temperatures and during wet weather than drum brakes.	*Mechanical Engineering*
Discard Task	The Removal And Disposal Of Items Or Parts.	*Plant Engineering*
Discharge	When the water reappears above the ground surface. Volume of water that passes a given location within a given period of time.	*Petroleum Engineering*
Discharge	dismissal of an employee.	*Industrial Relations*
Discharge Area	The zone in which groundwater leaves the ground either as a spring or into a water body.	*Petroleum Engineering*
Discharge End	Location at which objects are removed from the conveyor.	*Manufacturing*
Discharge stack	(See also Fan stack) A walled enclosure extending upward above the eliminators to direct exhaust air vertically away from fans in a forced draft tower. See Fan Stack for operation in induced draft towers.	*Facility Engineering*
Discharge Time Constant	The time required for the output-voltage from a sensor or system to discharge 37% of its original value in response to a zero rise time step function input. This parameter determines a low frequency response.	*General Engineering*
Discharge Warning	a notice given to a worker that his services will be terminated if he commits infractions.	*Industrial Relations*
Discharged fuel	Irradiated fuel removed from a nuclear reactor during refueling. Also see Spent Fuel.	*Energy*
Dischargee	a worker who has been discharged.	*Industrial Relations*
Disciplinary Layoff	a temporary removal of a worker from the payroll because of infraction or violation of company rules or policies.	*Industrial Relations*
Discipline	action by an employer, short of discharge, against an employee for infraction of company or contract rules.	*Industrial Relations*
Discoloration	Any change from an initial color possessed by a plastic, a lack of uniformity in color where color should be uniform over the whole area of a plastics object. In the later sense, where they can be applied, use the more definite terms.	*Material Process*
Discontinuity	A lack of continuity or cohesion; an interruption in the normal physical structure of material or a product.	*Maintenance and Repair*
Discount	The minimum price below the par value at which treasury shares may legally be sold.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Discount/Interest Rate	The discount rate is used to determine the present value of future or past cash flows. The rate accounts for inflation and the potential earning power of money.	*Energy*
Discrete (chopped) fiber	Composite reinforcing fiber broken into segments.	*Material Process*
Discrete I/O	Senses or sends either "on or off" signals to the field. For example a discrete input would sense the position of a switch. A discrete output would turn on a pump or light.	*Process Control Engineering*
Discrete Logic	Refers to digital or "on or off" logic. For example, if the car door is open and the key is in the ignition, then the bell rings.	*Process Control Engineering*
Discrete manufacturing	Manufacturing a product by means other than a continuous process. Examples of discrete manufacturing are: 1) Mass production for high volume production of an item at minimum unit cost. Increasingly this involves the use of specialized machines for some or all parts of the manufacturing process. 2) Batch production typically employs general-purpose machines (as opposed to the special purpose machines employed for mass production). 3) Individual production for items required in low volume (typically one-offs), which results in greatly increased unit costs.	*Maintenance*
Discrete Process	A process handling distinct, separate products. The usual example is an automotive factory product line, where each car is a distinct artifact. Discrete processes are in contradistinction to continuous processes handling liquids.	*Control Engineering*
Discrete-delivery energy sources	Energy sources that must be delivered to a site.	*Energy*
Discretion	the nature and the amount of freedom possessed by an employer in the handling of his plant problems.	*Industrial Relations*
Discriminary Discharge	a discharge not based on job performance, but on discriminatory reasons.	*Industrial Relations*
Discrimination	the unequal or unfair application of policy to an individual or group.	*Industrial Relations*
Di-sec-octylamine	A colorless liquid, solvent amine.	*Material Process*
Di-sec-octylaminoeethanol	A solvent—amine.	*Material Process*
Disestablishment	the procedure used by the NLRB to divest an organization of its claim to represent the employees and its status as a labor organization.	*Industrial Relations*
Dish	the section on an underground haulage road where the sets of empties stood before being hauled inbye. (N. East).	*Mining*
Dished	Showing a symmetrical distortion of a flat or curved section of a plastic object, so that as normally viewed, it appears concave or more concave.	*Material Process*
DISI	direct injection spark ignition	*Petro-Chemical Abbreviations*
Disinfectant	An agent that destroys harmful bacteria and/or viruses on inanimate surfaces (except spores). Most common types include Quaternary Ammonium Compounds, Phenolic Compounds, Pine Oil (at least 70%). Products making disinfectant claims must be registered with the Environmental Protection Agency (EPA), and state it on the label with a registered EPA number.	*Chemistry*
Disinfecting	To remove microorganisms from a particular surface or liquid.	*Chemical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Disinfection	A cleaning process which destroys most disease-causing microorganisms (pathogens).	*Petroleum Engineering*
Disintegration	Crumbling or breaking up into the original components.	*Material Process*
Disk	to prepare the soil for planting by cutting the soil with rotating metal disks	*Agriculture*
Disk Operating System (DOS)	Program used to control the transfer of information to and from a disk, such as MS DOS.	*General Engineering*
Dislocation	Linear defect in a crystalline solid.	*Material Process*
Dislocation climb	A mechanism for creep deformation, in which the dislocation moves to an adjacent slip plane by diffusion.	*Material Process*
Dismissal	occasionally used as a synonym for discharge.	*Industrial Relations*
Dispatchability	This is the ability of a generating unit to increase or decrease generation, or to be brought on line or shut down at the request or a utility's system operator.	*Energy*
Dispatching	The operating control of an integrated electric system involving operations such as (1) the assignment of load to specific generating stations and other sources of supply to effect the most economical supply as the total or the significant area loads rise or fall (2) the control of operations and maintenance of high-voltage lines, substations, and equipment; (3) the operation of principal tie lines and switching; (4) the scheduling of energy transactions with connecting electric utilities.	*Energy*
Dispensability	The ease with which a grease can be delivered through its dispensing system to the point of application (see Pumpability and Feedability).	*Lubrication*
Dispersant	A chemical that causes particulates in a water system to remain in or be placed into suspension.	*Chemical Engineering*
Dispersant	In lubrication, a term usually used interchangeably with detergent. An additive, usually nonmetallic ("ashless"), which keeps fine particles of insoluble materials in a homogeneous solution. Hence, particles are not permitted to settle out and accumulate.	*Lubrication*
Dispersion	The spreading and mixing of chemical constituents in groundwater caused by diffusion and mixing due to microscopic variations in velocities with and between pores.	*Petroleum Engineering*
Dispersion	the process by which a substance or chemical spreads and dilutes in flowing groundwater or soil gas.	*Chemical*
Dispersion strengthened metal	An aggregate type composite in which the metal contains less than 15 vol.% oxide particles (0.01 to 0.1 micron in diameter).	*Material Process*
Displacement	A change in position. A displacement may be a translation a rotation or a combination of those.	*Engineering Physics*
Displacement	In an engine, the total volume of air or air-fuel mixture an engine is theoretically capable of drawing into all cylinders during one operating cycle. Generally expressed in liters or cubic inches. Engine displacement is equal to (bore) x (bore) x (stroke) x (number of pistons) x (.785).	*Mechanical Engineering*
Disposable	A filter element intended to be discarded and replaced after one service cycle.	*Oil Analysis*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Disposal well	A well, commonly a depleted oil or gas well, into which waste fluids can be injected for safe disposal. Disposal wells require regulatory approvals.	*Petroleum Engineering*
Disposal Well	A well that is typically drilled into a porous rock formation which is nonproductive (of oil or gas) and into which oilfield waste water, such as produced saltwater, is disposed using injection pumps. Disposal wells and facilities are regulated by the Texas Railroad Commission and are used throughout the Eagle Ford Shale to dispose of produced water.	*Petroleum Drilling*
Disposition, natural gas	The removal of natural, synthetic, and/or supplemental gas, or any components or gaseous mixtures contained therein, from the responding company's facilities within the report State by any means or for any purpose, including the transportation of such gas out of the report State.	*Energy*
Disposition, petroleum	A set of categories used to account for how crude oil and petroleum products are transferred, distributed, or removed from the supply stream. The categories include stock change, crude oil losses, refinery inputs, exports, and products supplied for domestic consumption.	*Energy*
Dispute	a controversy between an employer and a union.	*Industrial Relations*
Dispute Adjustment	a labor dispute, generally speaking, includes any controversy concerning the terms and conditions of employment.	*Industrial Relations*
Disseminated ore	Ore carrying small particles of valuable minerals spread more or less uniformly through the host rock.	*Mining*
Dissimilar metals	two or more different metals in contact; due to varying surface conductivity, one or more metals may experience accelerated corrosion; because zinc is high in the galvanic series (see Galvanic Series of Metals), it preferentially corrodes to protect most dissimilar metals	*Materials Process*
Dissipation	Unusable or lost energy, as the production of unused heat in a circuit.	*Electrical*
Dissipation Constant	The ratio for a thermistor which relates a change in internal power dissipation to a resultant change of body temperature.	*General Engineering*
Dissociation	A chemical process that causes a molecule to split into simpler groups of atoms, single atoms, or ions. For example, the water molecule breaks down spontaneously into H and OH.	*Petroleum Engineering*
Dissociation Constant (K)	A value which quantitatively expresses the extent to which a substance dissociates in solution. The smaller the value of K, the less dissociation of the species in solution. This value varies with temperature, ionic strength, and the nature of the solvent.	*General Engineering*
Dissociation Constant (K) -	A value which quantitatively expresses the extent to which a substance dissociates in solution. The smaller the value of K, the less dissociation of the species in solution. This value varies with temperature, ionic strength, and the nature of the solvent.	*Electronic Process*
Dissolution	dissolving of a substance in a liquid solvent (e.g., water).	*Chemical*
Dissolved Air	Air which is dispersed in a fluid to form a mixture.	*Lubrication*
Dissolved gases	Total gases dissolved in a liquid.	*Chemical Engineering*
Dissolved solids	Total solids that have been dissolved into a liquid. They may be ionic and/or polar in nature.	*Chemical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dissolved Water	Water which is dispersed in the fluid to form a mixture.	*Lubrication*
Distillate	The liquid obtained through distillation.	*Chemical*
Distillate	The products of distillation formed by condensing vapors.	*Petroleum Engineering*
Distillate fuel oil	A general classification for one of the petroleum fractions produced in conventional distillation operations. It includes diesel fuels and fuel oils. Products known as No. 1, No. 2, and No. 4 diesel fuel are used in on-highway diesel engines, such as those in trucks and automobiles, as well as off-highway engines, such as those in railroad locomotives and agricultural machinery. Products known as No. 1, No. 2, and No. 4 fuel oils are used primarily for space heating and electric power generation.	*Energy*
Distillate Fuel Oils	Fuel oils which are products of distillation. They include fuels used for diesel fuel and space heating.	*Petroleum Drilling*
Distillation	The process of boiling a liquid and collecting its condensed vapor. This process is used to purify liquids and to separate liquid mixtures.	*Chemical*
Distillation	The process of boiling a liquid and collecting its condensed vapor. This process is used to purify liquids and to separate liquid mixtures.	*Chemical Engineering*
Distillation method (ASTM D-95)	A method involving distilling the fluid sample in the presence of a solvent that is miscible in the sample but immiscible in water. The water distilled from the fluid is condensed and segregated in a specially-designed receiving tube or tray graduated to directly indicate the volume of water distilled.	*Oil Analysis*
Distillation Range	Distillation range is a measurement of the temperatures within which a liquid distills or boils. It's usually expressed as a percentage of the material that boils between two temperatures. A higher initial boiling point indicates a more thermally stable fluid as well as lower vapor pressures. A narrower boiling range is also more desirable.	*Lubrication*
Distillation unit (atmospheric)	The primary distillation unit that processes crude oil (including mixtures of other hydrocarbons) at approximately atmospheric conditions. It includes a pipe still for vaporizing the crude oil and a fractionation tower for separating the vaporized hydrocarbon components in the crude oil into fractions with different boiling ranges. This is done by continuously vaporizing and condensing the components to separate higher oiling point material. The selected boiling ranges are set by the processing scheme, the properties of the crude oil, and the product specifications.	*Energy*
Distortion	In systems that handle electrical signals, distortion is a generally unwanted change in the signal. Not all signal alterations are considered distortion. For instance, a uniform delay or a linear attenuation or amplification would generally not be considered distortion.	*Electrical Engineering*
Distortion	In systems that handle electrical signals, distortion is a generally unwanted change in the signal. Not all signal alterations are considered distortion. For instance, a uniform delay or a linear attenuation or amplification would generally not be considered distortion.	*Electrical Engineering*
Distortion	Change in shape in a plastics article from the original molded form. Larger forms of waviness and other defects causing the distortion of objects viewed through a transparent plastic.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Distraction or Distortion	the deviation of a coal seam from its natural level. (Yorks.).	*Mining*
Distributed Control System	Any control system in which the degradation or failure of any single element will affect only the control loop, or related loops, in which it operates.	*Electrical Engineering*
Distributed Control System (DCS)	A system customized per facility/organization and designed to meet the total measurement, control and real-time information requirements of today's process plants. A single application to connect to subsystems such as maintenance (CMMS), statistical process control (SPC), and advanced control.	*Reliability Engineering*
Distributed control system (DCS)	Distributed control system (DCS) - A control system that regulates a process (manufacturing, chemical or other) from a series of strategic positions in the processing plant, as opposed to from a single, centralized control unit. Microprocessor-based distributed control systems (DCS) originated in continuous process industries (e.g., refineries). and integrate distributed automation controllers, networks, application servers, workstations and other modules necessary to build a complete automation system.	*Electrical*
Distributed generation	This term refers to electricity generating installations that are scattered across the grid, rather than placed at a central location. They tend to be small-scale generating plants – often operating using renewable fuels. They also include domestic power generators such as roof-top wind turbines and solar panels, and microhydro installations. As more smart technologies are incorporated into the grid, enabling local distribution grids to receive as well as deliver electricity, distributed generation will become an increasingly common feature of our power systems.	*Electrical*
Distributed Generation	A distributed generation system involves small amounts of generation located on a utility's distribution system for the purpose of meeting local (substation level) peak loads and/or displacing the need to build additional (or upgrade) local distribution lines.	*Energy*
Distributed generator	A generator that is located close to the particular load that it is intended to serve. General, but non-exclusive, characteristics of these generators include: an operating strategy that supports the served load; and interconnection to a distribution or sub-transmission system (138 kV or less).	*Energy*
Distributed load	An external force which acts over a region of length, surface, or area: essentially any external force which is not a concentrated force.	*Engineering Physics*
Distributed/point-of-use water-heating system	A system for heating hot water, for other than space heating purposes, which is located at more than one space within a building. A point-of-use water heater is located at the faucet and heats water only as required for immediate use. Because water is not heated until it is required, this equipment is more energy-efficient.	*Energy*
Distribution	The delivery of energy to retail customers.	*Energy*
Distribution basin	A shallow pan-shape basin used to distribute hot water over the tower fill.	*Facility Engineering*
Distribution box	Used in conjunction with the manifold and valve assembly in a crossflow tower to disperse the hot water uniformly in all directions thereby increasing the effectiveness of the distribution nozzles.	*Facility Engineering*
Distribution header	Pipe or flume delivering water from inlet connection to lateral headers, troughs, flumes, or distribution basins.	*Facility Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Distribution line	A pipeline which distributes gas to the service lines of individual consumers. Most generally it is small in diameter (6 inch and under) and low pressure (under 150 psi).	*Mechanical*
Distribution Line	This is a line or system for distributing power from a transmission system to a customer. It is any line operating at less than 69,000 volts.	*Energy*
Distribution nozzle	(See Nozzle and next entry).	*Facility Engineering*
Distribution Power	A packaged power unit located at the point of demand. While the technology is still evolving, examples include fuel cells and photovoltaic cells.	*Energy*
Distribution provider (electric)	Provides and operates the wires between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the Distribution function at any voltage. NERC definition	*Energy*
Distribution substation	A distribution substation comprises medium-voltage switchgear, transformers and low-voltage distribution equipment. It is used to transfer power from a medium-voltage electricity distribution system to a low-voltage distribution system that serves groups of domestic or industrial consumers.	*Electrical*
Distribution system	The portion of the transmission and facilities of an electric system that is dedicated to delivering electric energy to an end-user.	*Energy*
Distribution System	That part of the electric system that delivers electric energy to consumers.	*Energy*
Distribution transformers	Distribution transformers are used to regulate the supply of power to residential premises, factories and elsewhere. (See also Transformer.)	*Electrical*
Distribution use	Natural gas used as fuel in the respondent's operations.	*Energy*
Distribution Utility (Disco)	The regulated electric utility entity that constructs and maintains the distribution wires connecting the transmission grid to the final customer. The Disco can also perform other services such as aggregating customers, purchasing power supply and transmission services for customers, billing customers and reimbursing suppliers, and offering other regulated or non-regulated energy services to retail customers. The "wires" and "customer service" functions provided by a distribution utility could be split so that two totally separate entities are used to supply these two types of distribution services.	*Energy*
Distribution	The system of wires, switches, and transformers that serve neighborhoods and business, typically lower than 69,000 volts. A distribution system reduces or downgrades power from high-voltage transmission lines to a level that can be used in homes or businesses.	*Energy*
Distributive Power	A packaged power unit located at the point of demand. While the technology is still evolving, examples include fuel cells and photovoltaic applications.	*Energy*
Distributor	A company primarily engaged in the sale and delivery of natural and/or supplemental gas directly to consumers through a system of mains.	*Energy*
Distributor	A component of the ignition system, usually driven by the camshaft that directs high-voltage surges to the spark plugs in the proper sequence.	*Mechanical Engineering*
District	one of the parts into which the mine is divided for the purpose of supervision or ventilation, an underground section of the mine.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
District chilled water	Chilled water from an outside source used as an energy source for cooling in a building. The water is chilled in a central plant and piped into the building. Chilled water may be purchased from a utility or provided by a central physical plant in a separate building that is part of the same multibuilding facility (for example, a hospital complex or university).	*Energy*
District Council	An intermediate form of labor organization between the international and local union.	*Industrial Relations*
District heat	Steam or hot water from an outside source used as an energy source in a building. The steam or hot water is produced in a central plant and piped into the building. The district heat may be purchased from a utility or provided by a physical plant in a separate building that is part of the same facility (for example, a hospital complex or university).	*Energy*
District heating	a district heating system is one that makes use of heat generated at a central location, often in a thermal power plant, to heat water that is then fed through a communal system, delivering heat to homes in the surrounding area.	*Electrical*
Ditchdigger	A power excavating machine designed to remove earth in a continuous line and to a predetermined width and depth, as by means of a rotating belt equipped with scoops.	*Civil Engineering*
Ditched top	a seam where the tops stick to the roof and have to be brought down with a pick. A collier could claim extra pay for this work. - see also Sticky coal.	*Mining*
Dither	A low amplitude, relatively high frequency periodic electrical signal, sometimes superimposed on the servo valve input to improve system resolution. Dither is expressed by the dither frequency (Hz) and the peak-to-peak dither current amplitude (ma).	*Mechanical, Process, and Operations*
Dithering	A common technique to improve digitizing when quantization noise (quantization error/noise) can no longer be treated as random. A small amount of random noise is added to the analog input signal. This added noise causes the digital output to randomly toggle between two adjacent codes, thereby avoiding thresholding effect.	*Electrical Engineering*
Dithering	A common technique to improve digitizing when quantization noise (quantization error/noise) can no longer be treated as random. A small amount of random noise is added to the analog input signal. This added noise causes the digital output to randomly toggle between two adjacent codes, thereby avoiding thresholding effect.	*Electrical Engineering*
Diverging	A section of roller or wheel conveying which makes a connection for diverting articles from a main line to a branch.	*Manufacturing*
Diversity	In radio systems, diversity is a method of improving the reliability and capacity by using multiple communication channels to carry each signal.	*Electrical Engineering*
Diversity	In radio systems, diversity is a method of improving the reliability and capacity by using multiple communication channels to carry each signal.	*Electrical Engineering*
Diversity Exchange	Exchange of capacity or energy between systems that have peak loads occurring at different times.	*Energy*
Diversity Factor	: The ratio of the sum of the non-coincident maximum demands of two or more loads to their coincident maximum demand for the same period.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Diverter	A device used to direct fluids flowing from a well away from the drilling rig.	*Petroleum Engineering*
Divestiture	The stripping off of one utility function from the others by selling (spinning-off) or in most other way changing the ownership of the assets related to that function. Most commonly associated with spinning-off generation assets so they are no longer owned by the shareholders that own the transmission and distribution assets.	*Energy*
Dividend	Cash or stock awarded to preferred and common shareholders at the discretion of the company's board of directors.	*Mining*
Dividend claim	Made when a dividend has been paid to the previous holder because stock has not yet been transferred to the name of the new owner.	*Mining*
Divinyl ether, or vinyl ether(CH2 CH)2 O)	A colorless liquid. A vinyl ether which is readily polymerized to a thermoplastic resin.	*Material Process*
DKA	Deutscher Koordinieungsausschuss	*Petro-Chemical Abbreviations*
DLS	DLS - abbreviation for dogleg severity. (degrees/100 feet or degrees/30 meters)	*Petroleum Drilling*
DLS*	DLS* - planned well bore dogleg severity (e.g., build gradient) at MD*. (degrees/100 feet or degrees/30 meters)	*Petroleum Drilling*
DMA	Acronym direct memory access. A high speed data storage mode of the IBM PC.	*General Engineering*
DMA	DMA - Acronym direct memory access. A high speed data storage mode of the IBM PC.	*Electronic Process*
DMAIC	A methodology that incorporates the following five steps: Define the project goals and customer requirements. Measure the process to determine current performance. Analyze and determine the root cause(s) of the defects. Improve the process by eliminating defect root causes. Control future process performance.	*Reliability Engineering*
DME	dimethyl ether	*Petro-Chemical Abbreviations*
DNA	DNA - Deoxyribonucleic acid.	*Agriculture*
Do It Now (DIN) Work	"Do It Now" means non-emergency work that has to be done immediately. An example is moving furniture in the executive wing.	*Maintenance*
Doak Plan	a plan designed to improve the public employment offices throughout the United States.	*Industrial Relations*
DOC	diesel oxidation catalyst	*Petro-Chemical Abbreviations*
Docket	A formal record of a Federal Energy Regulatory Commission proceeding. These records are available for inspection and copying by the public. Each individual case proceeding is identified by an assigned number.	*Energy*
Docking	deducting from the pay of a worker an amount equal to the penalty imposed.	*Industrial Relations*
Docosane (n) (CH3CH2)20CH3)	Crystals from alcohol. A solvent hydrocarbon.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
DOCP	dispersant olefin copolymer	*Petro-Chemical Abbreviations*
DOD	Department of Defense	*Petro-Chemical Abbreviations*
Doddy	the period of time which has to be worked to be able to claim a quarter of a shift overtime (Leics.).	*Mining*
DOE	DOE: Department of Energy.	*Energy*
Dog	a tool for gripping pipes; or a spring hook attached to the end of the winding rope. Before the advent of the cage, the creels would be clipped directly onto the dog for winding up the shaft. (Scot.); or an iron bar spiked at the ends; or the length of timber across the bottom of the air doors. (N. East); or an iron bar fitted to the last tub being drawn up an inclined road. Should the rope break the dog would dig into the floor and through the tub off the rail. (Lancs.). - see also Devil and Cow. A alternate term also used for 'keps'.	*Mining*
Dog	Something that is not a cat.	*Breakroom*
Dog and chain	An iron bar with a chain attached used for withdrawing props. - see also Ringer and chain.	*Mining*
Dog balls	roughly spheroidal nodules of ironstone, commonly found in the lower horizons of seatearths. (Yorks.).	*Mining*
Dog belt	a leather belt worn around the waist with a chain which passed between the legs for drawing tubs from the workings to the haulage road. (Mids.).	*Mining*
Dog Collar	Dog Collar	*Petroleum Drilling*
Dog Tracking	A condition where the rear wheels do not follow the path of the front wheels.	*Mechanical Engineering*
Dogaskin	A plastic surface with very small irregularities, usually observable only by reflected light at grazing incidence.	*Material Process*
Doggers	irregularly-shaped nodules or concretions, and sometimes a term used for inferior ironstone. (Scot.).	*Mining*
Doggin	a large specially shaped type of nail used for attaching rails to sleepers (S. Staffs.).	*Mining*
Doggy or Doggie	Originally the term was used for the man who hung the corves or creels of coal on the winding rope using a dog clip. Later, in the Midlands, it was a term used for the man who managed all the underground work of a colliery for the butty, or a chargeman responsible for a team of men on a longwall face. (Lancs.).	*Mining*
Doghouse	A small enclosure on the rig floor used as an office or a storehouse for small objects. Also, any small building used as an office or for storage.	*Petroleum Drilling*
Dog-Leg	Permanent bend or kink, in a wire rope, caused by improper use or handling.	*Wire Rope & Cable*
Dogleg severity	a normalized estimate (e.g., degrees/100 feet) of the overall curvature of an actual well path between two consecutive directional survey stations, according to the minimum curvature survey calculational method. With respect to a planned well path, dogleg severity may at times be synonymous with build gradient and/or turn gradient. (degrees/100 feet or degrees/30 meters)	*Petroleum Drilling*
Dogs	another name for 'keps'.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dole	The term used in England for public unemployment relief.	*Industrial Relations*
Doll dirt	the soft material found underlying the coal. It was sometimes used for stemming. (Lancs.). - see Dolls.	*Mining*
Dolls	pieces of stemming usually made from brick clay and molded by hand to the same size and shape as a cartridge of explosive.	*Mining*
Dolman	A Turkish woman's cloak or mantle with capelike sleeves	*Breakroom*
Domain	Microscopic region of common electrical dipole alignment, in a ferroelectrical material, or common magnetic moment alignment, in a ferromagnetic material.	*Material Process*
Domain structure	Microstructural arrangement of magnetic domains.	*Material Process*
Dome	In a dam, a semidome having its convex surface toward the impounded water.	*Civil Engineering*
Domed	Showing a symmetrical distortion on a flat or curved section of a plastics object, so that as normally viewed, it appears convex or more convex.	*Material Process*
Domestic	Domestic: See United States.	*Energy*
Domestic crude oil	Crude oil produced in the United States including the Outer Continental Shelf (OCS).	*Energy*
Domestic inland consumption	Domestic inland consumption is the sum of all refined petroleum products supplied for domestic use (excludes international marine bunkers). Consumption is calculated by product by adding production, imports, crude oil burned directly, and refinery fuel and losses, and then subtracting exports and charges in primary stocks (net withdrawals is a plus quantity and net additions is a minus quantity).	*Energy*
Domestic System	generally referred to the putting-out system, which featured work at home.	*Industrial Relations*
Domestic uranium industry	Collectively, those businesses (whether U.S. or foreign-based) that operate under the laws and regulations pertaining to the conduct of commerce within the United States and its territories and possessions and that engage in activities within the United States, its territories, and possessions specifically directed toward uranium exploration, development, mining, and milling; marketing of uranium materials; enrichment; fabrication; or acquisition and management of uranium materials for use in commercial nuclear power plants.	*Energy*
Domestic vehicle producer	An Original Vehicle Manufacturer that assembles vehicles in the United States for domestic use. The term "domestic" pertains to the fifty states, the District of Columbia, common wealths, territories, and possessions of the United States.	*Energy*
Domesticate	to tame and breed for human use	*Agriculture*
Dominant Dead Time Process	If the dead time is larger than the lag time the process is a dominant dead time process.	*Process Control Engineering*
Dominant Lag Process	Most processes consist of both dead time and lag. If the lag time is larger than the dead time, the process is a dominant lag process. Most process plant loops are dominant lag types. This includes most temperature, level, flow and pressure loops.	*Process Control Engineering*
Donkey	a clog sole with the heel removed or a piece of wood with a small metal plate tacked to the bottom. Used by miners as a kind of ski to slide down the tub rail when going down an incline. The men became very adept in their use and could often travel at great speed while squatting down and balancing on one leg. (Lancs.).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Donkey	A small domestic mammal classified with the asses.	*Agriculture*
Donor level	Energy level near the conduction band in an n-type semiconductor.	*Material Process*
Dooby wagon	a wagon for carting dirt to the colliery tip. (Yorks.).	*Mining*
Dook	a mine or roadway driven to the dip side. Usually the main road going to the dip. (Scot.). - see also Steeps and Crut.	*Mining*
Doors	usually a boy who opens and closes ventilation doors in a haulage road.	*Mining*
Doors, Double shift working or Double shifting	coal getting on two shifts per day; or a 'double un', working two shifts back to back (S. Staffs.).	*Mining*
Doors, Landings	the entrance to the workings from the shaft. The first landing going down the shaft was the 'high-door'. The next, the, 'middle-landing' in the shaft was the 'mid-door' and the lowest or the bottom of the shaft was the 'low door' or 'laigh doors'. (Scot.). –see also Inset. Also wooden or steel doors erected across the roadways to separate the ventilation circuits, also called 'Air doors'.	*Mining*
Doors, Door stoop	the pillar of coal left unworked around the base of a shaft to support the shaft and the buildings on the surface (Scot.)—see also Shaft pillar.	*Mining*
Doors, Dosco	Doors. Dosco—see Road Headers.	*Mining*
Doors, Double bond	when two cages were in use in a shaft as opposed to the 'single bond' when a shaft had only one cage.	*Mining*
Doors, Double buttocking	Doors. Double buttocking—see Buttocking.	*Mining*
Doors, Double stall	a modification of the pillar and stall method of working coal, applied extensively in S. Wales for working shallow inclined seams.	*Mining*
Dopant	an impurity deliberately added to a material to enhance the conductivity of the material	*Physics*
Dope	A name commonly applied to a viscous cellulose ester or ether solution, for use upon aircraft fabric, leather, and like surfaces, and for making film.	*Material Process*
Dor bar	The final saleable product of a gold mine. Usually consisting of gold and silver.	*Mining*
Dormant	Seeds that fail to germinate even though environmental conditions for germination are adequate.	*Agriculture*
Dorsal	Of or belonging to the upper surface; top.	*Forestry*
Dorset	A breed of sheep that originated in Southwest England when Spanish Merino sheep crossed with the Horned Sheep of Wales. Apparently first came to the United States in 1860. There are both horned and polled Dorsets .	*Agriculture*
Dorsoventral	From top to bottom; from the upper surface to the lower surface.[1]	*Forestry*
Dorsum	The upper surface; top.	*Forestry*
Dose	A measured concentration of a toxicant for a known duration of time (concentration per unit time).[1]	*Forestry*
Dose dependent	A response to a drug which may be related to the amount received (i.e. the dose). Sometimes trials are done to test the effect of different dosages of the same drug. This may be true for both benefits and harms.	*Quality Engineering*

Please see the Appendix for further illustration

Term	Definition	Industry
Dose response relationship	The relationship between the quantity of treatment given and its effect on outcome. In meta-analysis, dose-response relationships can be investigated using meta-regression.	*Quality Engineering*
Dose-response relationship	A relationship in which change in amount, intensity, or duration of exposure is associated with a change-either an increase or decrease-in risk of a specified outcome.	*Analysis*
DOT	Department of Transport	*Petro-Chemical Abbreviations*
Dot Matrix Printer	Printer which forms characters when an array of pins hits an inked ribbon which transfers the image to the media.	*Gears*
Double Submerged Arc-Welded Pipe	Pipe having a longitudinal butt joint produced by at least two passes, one of which is on the inside of the pipe. Coalescence is produced by heating with an electric arc or arcs between the bare metal electrode or electrodes and the work. The welding is shielded by a blanket of granular, fusible material on the work. Pressure is not used, and filler metal for the inside and outside welds is obtained from the electrode or electrodes.	*Maintenance and Repair*
Double acting cylinder	A cylinder in which fluid force can be applied to the movable element in either direction.	*Mechanical, Process, and Operations*
Double band	Covalent sharing of two pairs of valence electrons.	*Material Process*
Double blind	See Blinding	*Quality Engineering*
Double block and bleed	The capability of a valve under pressure to obtain a seal across both the upstream and downstream seat rings and to have its body cavity bled down to atmospheric pressure.	*General Mechanical*
Double Break Contacts	(Twin break) breaks the circuit in two places. Also referred to as form Z circuitry.	*Electrical Engineering*
Double circuit line	A transmission line having two separate circuits. Because each carries three-phase power, at least six conductors, three per circuit, are required.	*Energy*
Double Employment	the practice of holding down two jobs at the same time.	*Industrial Relations*
Double Extra Strong	(XXS) also referred to as Double Extra Heavy (XXH); A designation of pipe with a wall thickness twice that of Extra Strong Pipe.	*Petroleum Engineering*
Double piston effect principal (DPE)	The sealing principal of a ball valve whereby line pressure is used on both the upstream and downstream floating seats to effect a dead-tight seal simultaneously on both sides of the ball. With the DPE seat configuration when the upstream seat leaks, the pressure entering into the body cavity acts on the down stream seat, which being of the PPE design, is then pushed against the ball and the valve seals in both directions.	*Mechanical*
Double Pitch Chain	A roller chain using the same joint members as standard pitch chain and having the same dimensions except for the pitch which is twice standard.	*Equipment*
Double Precision	The degree of accuracy that requires two computer words to represent a number. Numbers are stored with 17 digits of accuracy and printed with up to 16 digits.	*General Engineering*
Double Seal	Two mechanical seals designed to permit a liquid or gas barrier fluid between the seals mounted back-to-back or face-to-face.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Double Studded Adaptor	(DSA) A flange with a through bore and a ring groove on each side, drilled and tapped bolt hole sets on both sides and tapped end studs complete with nuts fitted on both sides. The two sides are different in size and/or pressure rating. (If they are the same it is just a 'spacer'). Utilized to adapt between different flange end connections.	*Petroleum Engineering*
Double timbering	Double timbering, -see Street timbering.	*Mining*
Double unit face	a longwall face with three gates, one in the centre, the 'mothergate', and two tailgates. – see also Single unit.	*Mining*
Double Wishbone Suspension (A Arm Suspension)	A system of independent suspension in which each wheel is located on a "knuckle" that is connected by ball joints to an upper A arm and a lower A arm. Usually, the lower A arms are longer. This system provides minimal changes in track and camber when the suspension is under load, as when going over bumps or in hard cornering.	*Mechanical Engineering*
Double Wishbone Suspension (A Arm Suspension)	A system of independent suspension in which each wheel is located on a "knuckle" that is connected by ball joints to an upper A arm and a lower A arm. Usually, the lower A arms are longer. This system provides minimal changes in track and camber when the suspension is under load, as when going over bumps or in hard cornering.	*Mechanical Engineering*
Double Pole Double Throw (DPDT)	Switches which make and break two separate circuits. This circuit provides a normally open and normally closed contact for each pole.	*Electrical Engineering*
Double-acting	A type of actuation that uses air on both sides of a piston to drive a control valve open or closed.	*Mechanical*
Double-Acting Cylinder	A cylinder in which fluid force can be applied to the movable element in either direction.	*Mechanical, Process, and Operations*
Double-deck	To add a second deck to (a bridge) or a second level to (a road).	*Civil Engineering*
Double-deck	To add a second deck to (a bridge) or a second level to (a road).	*Civil Engineering*
Double-dipping (see progressive-dipping)	the act of dipping steel, too large in one dimension to completely fit into the galvanizing kettle, more than once in cleaning solutions and molten zinc metal in order to produce a coating that covers the entire surface of the steel	*Materials Process*
Double-flow water-cooling tower	A crossflow tower with two fill sections and one plenum chamber, which is common to both.	*Facility Engineering*
Double heading Pay	extra pay to railroad engineers who are required to use more than one engine in running over steep grades for any length of time.	*Industrial Relations*
Double-Rod Cylinder	A cylinder with a single piston and a piston rod extending from each end.	*Mechanical, Process, and Operations*
Doubles	a medium size of coal, around 1-2 inches in dimensions.	*Mining*
Doup-out	in 'stoop and room' working, where a miner connected his drift into another one. (Scot.).	*Mining*
Dour holing	under-cutting with difficulty in hard coal or stone. (Scot.). Downcast (shaft), the shaft down which the clean air descends to ventilate the underground workings. - see also 'Air pit' and 'Upcast shaft'.	*Mining*
Dowel pin	A pin, usually of circular section, fitting into a corresponding hole in an abutting piece, as of two parts of mold.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	Industry
Down Converters	A device which provides frequency conversion to a lower frequency. Example: In digital broadcast satellite applications.	*Electrical Engineering*
Down Converters	A device which provides frequency conversion to a lower frequency. Example -	*Electrical Engineering*
Down time	The amount of time a repairable unit is not operating. This can be due to being in a failed state, administrative delay, waiting for replacement parts to be shipped or undergoing active repair.	*Reliability Engineering*
Downer	a rest taken during the shift usually for a meal. (Som.).	*Mining*
Downflow	Process in which the hydrocarbon stream flows from top to bottom.	*Petroleum Engineering*
Downforce	Wings on a racing car are upside down compared to an airplane wing. Instead of lifting the car, they press the car harder onto the track, providing increased traction for braking, acceleration and cornering. Downforce is also provided by the ground-effects tunnels underneath the car, creating a vacuum that sucks the car to the track. A modern open wheeled car provides so much downforce that it could actually stick to the ceiling at just over 100 miles per hour. Increased downforce also results in increased drag, which slows a car down, so it's a tradeoff.	*NASCAR*
Downgradient	in the direction of decreasing static head (potential).	*Chemical*
Downhole	Term used pertaining to the wellbore	*Petroleum Drilling*
Down-hole disposal	The disposal of formation water and drilling and waste fluids down a wellbore in a deep formation not in communication with an aquifer.	*Petroleum Engineering*
Downsizing	A reduction in the number of employees that occurs due to management decision, not associated with natural attrition.	*Maintenance*
Downspacing	Refers reducing the number of acres required for oil or gas wells so that more wells are drilled in a given space. Downspacing is being researched by several oil and gas companies in the Eagle Ford Shale as a means of boosting the overall oil and gas recovery factor.	*Petroleum Drilling*
Downspout	A short vertically placed pipe or nozzle used in a gravity distribution system to divert water from a flume or lateral to a splasher.	*Facility Engineering*
Downstream	The oil industry term "downstream" refers to all petroleum activities from the processing of refining crude oil into petroleum products to the distribution, marketing, and shipping of those products. See also Upstream.	*Electrical*
Downstream	Those activities in the oil and gas industry which take place away from the source of the supply. Downstream operations commonly include refining and marketing endeavors.	*Petroleum Drilling*
Down-throw fault	a fault in the strata which causes the coal seam to be cut off and be carried to a lower level. - see Faults. Also known as 'down fall' and 'down leap'.	*Mining*
Downtime	The time that an item of equipment is out of service, for example as a result of equipment failure. The time that an item of equipment is available but not utilized is generally not included in the calculation of downtime. In other words, downtime is the time that the asset is not in a condition to perform its required function. The downtime of an item includes active maintenance time and delays due to awaiting spares, labor, facilities, movement, etc. Unless otherwise stated, downtime due to failure is considered to commence at the instant the item is deemed to have failed and to persist until the equipment is again available.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dowty or Dowty prop	the first British made hand operated hydraulic prop developed by Dowty Mining Equipment in 1946. By 1956 there were 400,000 hydraulic props and 200,000 yielding props in use. These were of tubular steel construction designed to be erected single handed and set by a pumping action using a pump handle. They were generally set to yield at about 15-20 tons bearing pressure.	*Mining*
DPF	diesel particulate filter	*Petro-Chemical Abbreviations*
DPMA	dispersant polymethacrylate	*Petro-Chemical Abbreviations*
DPNA	Diesel Particulate NOx Reduction (Toyota)	*Petro-Chemical Abbreviations*
DPST	Double-pole single-throw, as related to electrical switches. See definition of "SPST."	*Mechanical*
Draft	Taper or slope of vertical surfaces of mold required to facilitate removal of casting or molding.	*Material Process*
Drafting	A fast-moving car creates a low-pressure area behind it, causing the air to try to move with the car. A car following behind can take advantage of this low pressure as it actually sucks the car along faster, known as "being in the slipstream." A savvy driver can either use the draft to pass, or to lift off the gas slightly and conserve fuel.	*NASCAR*
Drag	a brake, a device attached to the rear vehicle of a train of tubs on an inclined system to arrest or derail the train in the event of a runaway; also called a 'snibble' or a, 'spragg'. (Scot.).	*Mining*
Drag	The resistance to movement caused by oil viscosity.	*Lubrication*
Drag Chain Conveyor	A type of conveyor having one or more endless chains which drag bulk materials through a trough.	*Equipment*
Drag Coefficient	A measure of the aerodynamic sleekness of an object. Drag coefficient is signified by "dc.: The lower the number, the greater the aerodynamic efficiency. The higher the drag coefficient, the more a car's engine must work to keep a given road speed. Also known as "CD" for coefficient of drag."	*Mechanical Engineering*
Drag fold	Rock that has been folded or bent back on itself.	*Mining*
Drag fold	The result of the plastic deformation of a rock unit where it has been folded or bent back on itself.	*Mining*
Dragline	a) Wire rope used for pulling excavating or drag buckets, and b) name applied to a specific type of excavator.	*Wire Rope & Cable*
Dragline crane	An excavating crane having a bucket that is dropped from a boom and dragged toward the crane base by a cable. Also called "dragline."	*Civil Engineering*
Dragline excavator	removes overburden to expose the coal by means of a scoop bucket that is suspended from a long boom. The dragline digs by pulling the bucket toward the machine by means of a wire rope.	*Energy*

Term	Definition	*Industry*
Dragline	A large excavation machine used in surface mining to remove overburden (layers of rock and soil) covering a coal seam. The dragline casts a wire rope-hung bucket a considerable distance, collects the dug material by pulling the bucket toward itself on the ground with a second wire rope (or chain), elevates the bucket, and dumps the material on a spoil bank, in a hopper, or on a pile.	*Mining*
Dragon	a barrel used to raise water from a 'gin-pit' (S. Staffs.).	*Mining*
Drags-man	a man employed as a putter or pusher in the working places. (N. East).	*Mining*
Drain	One of the three terminals that comprise a FET. A voltage on the gate controls the current flow between the source and drain.	*Electrical Engineering*
Drain Region	in a field effect transistor that receives charge carriers.	*Material Process*
Drain Cleaner	A chemically strong product formulated to clean plugs of solid grease and other varied materials embedded in drains.	*Chemistry*
Drain plug	A fitting at the bottom of a valve, the removal of which permits draining and flushing the body cavity.	*Mechanical*
Drain plug	A fitting at the bottom of a valve, the removal of which permits draining and flushing the body cavity.	*General Mechanical*
Drain Wire	An uninsulated wire, usually placed directly beneath and in electrical contact with a grounded shield, which is used for making ground connections.	*Electrical*
Drain, -see Water gate	Drain, -see Water gate.	*Mining*
Drainage	A system of drains, artificial or natural.	*Civil Engineering*
Drainage basin	The land drained by a river system.	*Energy*
Drainage	The process of removing surplus ground or surface water either by artificial means or by gravity flow.	*Mining*
Drainageway	A conduit, ditch, or the like, for draining water from an area.	*Civil Engineering*
Drainfield	An open area, the soil of which absorbs the contents of a septic tank.	*Civil Engineering*
Draught	the quantity of coal raised to the bank in any given time, e.g. one day's production (S. Staffs.).	*Mining*
Draulic component	draulic component.	*Mechanical, Process, and Operations*
Draw slate	A soft slate, shale, or rock from approximately 1 cm to 10 cm thick and located immediately above certain coal seams, which falls quite easily when the coal support is withdrawn.	*Mining*
Draw the Jud	means to take out or withdraw the timber supports.	*Mining*
Draw, to wind	the act of hoisting or winding; or to haul; or the break in the strata from the coalface to the surface. The angle between this break and the vertical; or to remove props which are no longer required.	*Mining*
Drawbridge	A bridge of which the whole or a section may be drawn up, let down, or drawn aside, to prevent access or to leave a passage open for boats, barges, etc.	*Civil Engineering*
Drawdown	lowering the water table due to withdrawal of groundwater as from a well.	*Chemical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Drawdown (maximum)	The distance that the water surface of the reservoir is lowered from the normal full elevation to the lowest allowable elevation as the result of the withdrawal of water for the purposes of generating electricity.	*Energy*
Drawing	the knocking away of spraggs beneath the coal after holing; or to raise coal up the pit shaft or out of a drift; or the withdrawing of props, bars and chocks out of the waste or goaf for re-use and to allow the roof to fall, also called 'drawing off'.	*Mining*
Drawing	In the manufacture of wire, pulling the metal through a die or series of dies for reduction of diameter to specified size.	*Electrical*
Drawing-off, -see Drawing	Drawing-off, -see Drawing.	*Mining*
Drawpoint	An underground opening at the bottom of a stope through which broken ore from the stope is extracted.	*Mining*
DRB	DRB: Demonstrated Reserve Base	*Energy*
Dredge	Any of various powerful machines for dredging up or removing earth, as from the bottom of a river, by means of a scoop, a series of buckets, a suction pipe, or the like.	*Civil Engineering*
Dredge mining	A method of recovering coal from rivers or streams.	*Energy*
Dreel	a hand operated or power driven machine for boring shotholes (Scot.).	*Mining*
Dregs, -see 'Lockers'	Dregs, -see 'Lockers'.	*Mining*
Dress	to trim loose material from the face.	*Mining*
Dresser	a large pick used for preparing large coal for loading into skips. (Derbys.), (S. Staffs.), or breaking down oversized pieces of coal or rock. Also known as a 'loading pick or 'Poll tomahawk'. One side of the head is in the form of a hammer, the other a curved pick.	*Mining*
Dressing	that portion of a coal seam prepared by holing and cutting for detachment from its position in situ.	*Mining*
Drier	A composition that accelerates the drying of oil, paint or varnish. Driers are usually organo-metallic compositions and are available in both solid and liquid form.	*Material Process*
Drift	Water lost from a cooling tower as liquid droplets entrained in the exhaust air. It is independent of water lost by evaporation. Units may be in lbs./hr. or percentage of circulating water flow. Drift eliminators control this loss from the tower.	*Chemical Engineering*
Drift (drive)	A horizontal passage underground that follow along the length of a vein or rock formation as opposed to a crosscut which crosses the rock formation.	*Mining*
Drift and pillar	a system of working the coal similar to the 'bankwork' system of Yorkshire (N. Staffs.).	*Mining*
Drift eliminators	An assembly constructed of wood, plastic, cement board, or other material that serves to remove entrained moisture from the discharged air.	*Facility Engineering*
Drift mine	is driven horizontally into coal that is exposed or accessible in a hillside. In a hydraulic mine, high-pressure water jets break the coal from a steeply inclined, thick coalbed that would be difficult to mine with the usual underground methods. The coal is then transported to the surface by a system of flumes or by pipeline. Although currently not in commercial use in the United States, hydraulic mining is used in western Canada.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Drift mine	An underground coal mine in which the entry or access is above water level and generally on the slope of a hill, driven horizontally into a coal seam.	*Mining*
Drift of an Operating Characteristic	An inexact term referring in a general way to the degree of instability of a plunger force or travel characteristic under specified conditions and during a specified number of cycles of switch operation.	*Electrical Engineering*
Drift velocity	Average velocity of the charge carrier in an electrically conducting material.	*Material Process*
Drift	A horizontal underground opening that follows along the length of a vein or rock formation as opposed to a crosscut which crosses the rock formation.	*Mining*
Drifter	person employed in driving underground roadways (tunnels) in stone. Also called a 'stoneman'.	*Mining*
Drifter	A rock drill used for boring horizontal holes for blasting.	*Mining*
Drifter	A hydraulic rock drill used to drill small-diameter holes for blasting or for installing rock bolts.	*Mining*
Drifting back	the operation of working away the pillars towards the shaft in rearing seams (N. Staffs.).	*Mining*
Drill and equip development wells	development-type stratigraphic test wells, and service wells, including the costs of platforms and of well equipment such as casing, tubing, pumping equipment, and the well head assembly.	*Energy*
Drill bit	Interchangeable diamond tipped drill bit.	*Petroleum Engineering*
Drill Collar	A length of extremely heavy steel tube. It is placed in the drill string immediately above the drill bit to minimize bending caused by the weight of the drill pipe.	*Petroleum Engineering*
Drill pipe	Steel pipe, in approximately 9-metre lengths, screwed together to form a continuous pipe extending from the drilling rig's derrick to the drilling bit in the bottom of the hole.	*Petroleum Drilling*
Drill Rig	Any power-driven percussion, rotary, boring, coring, digging, jetting, or augering machine used in the construction of a well or borehole.	*Petroleum Engineering*
Drill string	A column, or string, of pipe that transmits drilling fluid (via the mud pumps) and torque (via the Kelly drive or top drive) to the drill bit.	*Petroleum Drilling*
Drill	A machine utilizing rotation, percussion (hammering), or a combination of both to make holes. If the hole is much over 0.4m in diameter, the machine is called a borer.	*Mining*
Drill	(1) To bore a hole, Also see Drilling (2) An implement with cutting edges used to bore holes.	*Petroleum Drilling*
Driller	The crew supervisor on a drilling rig, working under the toolpusher.	*Petroleum Drilling*
Drill-indicated reserves	The size and quality of a potential orebody as suggested by widely spaced drillholes; more work is required before reserves can be classified as probable or proven.	*Mining*
Drilling	The act of boring a hole (1) to determine whether minerals are present in commercially recoverable quantities and (2) to accomplish production of the minerals (including drilling to inject fluids).	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Drilling	The using of a rig and crew for the drilling, suspension, completion, production testing, capping, plugging and abandoning, deepening, plugging back, sidetracking, redrilling or reconditioning of a well (except routine cleanout and pump or rod pulling operations) or the converting of a well to a source, injection, observation, or producing well, and including stratigraphic tests. Also includes any related environmental studies. Associated costs include completion costs but do not include equipping costs	*Petroleum Drilling*
Drilling and equipping of wells	The drilling and equipping of wells through completion of the "Christmas tree."	*Energy*
Drilling arrangement	A contractual agreement under which a working interest owner (assignor) assigns a part of a working interest in a property to another party (the assignee) in exchange for which the assignee agrees to develop the property. The term may also be applied to an agreement under which an operator assigns fractional shares in production from a property to participants for cash considerations as a means of acquiring cash for developing the property. Under a "disproportionate cost" drilling arrangement, the participants normally pay a greater total share of costs than the total value of the fractional shares of the property received in the arrangement.	*Energy*
Drilling Choke	A Choke designated by its manufacturer as suitable for drilling service, (utilized as part of Choke Manifold).	*Petroleum Engineering*
Drilling directionally	the process of drilling a well bore with sustained and proactive attention to a preferred path; such preferred trajectory comprising non-vertical hole sections.	*Petroleum Drilling*
Drilling Fluid	A water or air-based fluid used in the water well drilling operation to remove cuttings from the hole, to clean and cool the bit, to reduce friction between the drill string and the sides of the hole, and to seal the borehole.	*Petroleum Engineering*
Drilling fluid (Mud)	The circulating fluid used to bring drilling cuttings out of the well bore, cool the drill bit and provide hole stability and pressure control.	*Petroleum Engineering*
Drilling Fluids	Special chemical fluids, usually called mud, introduced into the hole to lubricate the action of a rotary bit, to remove the cuttings and to prevent blowouts.	*Petroleum Drilling*
Drilling rig	The machine used to drill a wellbore. It includes virtually everything except living quarters. Major components of the rig include the mud tanks, the mud pumps, the derrick or mast, the drawworks, the rotary table or topdrive, the drillstring, the power generation equipment and auxiliary equipment.	*Petroleum Drilling*
Drilling rig	A drilling rig is used to determine the amount and type of overburden overlying a coal deposit and the extent of the deposit, to delineate major geologic features, and to drill holes for explosives to fragment the overburden for easier removal.	*Energy*
Drilling rig	A drilling unit that is not permanently fixed to the seabed, e.g. a drillship, a semi-submersible or a jack-up unit. Also means the derrick and its associated machinery.	*Petroleum Drilling*
Drilling Spool	Equipment used with Blowout Preventers to space pieces of equipment apart. Is fitted with outlets to attach lines extending to Choke and Kill Manifolds. Also referred to as a 'Mud Cross'.	*Petroleum Engineering*
Drilling	The use of such a machine to create holes for exploration or for loading with explosives.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Drilling	The using of a rig and crew for the drilling, suspension, completion, production testing, capping, plugging and abandoning, deepening, plugging back, sidetracking, redrilling or reconditioning of a well (except routine cleanout and pump or rod pulling operations) or the converting of a well to a source, injection, observation, or producing well, and including stratigraphic tests. Also includes any related environmental studies. Associated costs include completion costs but do not include equipping costs.	*Petroleum Drilling*
Drill-stem test	A method of gathering data on the potential productivity of a geological formation before installing casing in a well. A drill stem test records pressure and fluid recovery data from which formation characteristics can be inferred.	*Petroleum Engineering*
Drip irrigation	A system for irrigating crops by delivering water to the root zone through small, plastic pipes equipped with emitters. This technology conserves water and eliminates soil erosion from irrigation water runoff. Also called trickle irrigation.	*Agriculture*
Drip oil	A by product in the manufacture of illuminating gas, providing a new source of supply for styrene and several other hydrocarbons.	*Material Process*
Drivage	a roadway or tunnel.	*Mining*
Drive	An assembly of the necessary structural, mechanical and electrical parts which provide the motive power for a conveyor. Usually consisting of motor/reducer, chain, sprockets, guards, mounting base and hardware.	*Manufacturing*
Drive	A drive is an electronic device used to regulate the performance of an electric motor. It works by controlling the power, frequency and current the motor draws from the grid. Drives (also referred to as a variable-speed motor drive) can lead to considerable energy savings as most motors are fixed-speed devices that run at full speed, even when a lower speed would suffice. Many motors are controlled by "throttling down," which is equivalent to slowing a car by using the brake, rather than taking your foot off the accelerator, and does not save energy. Reducing a motor's speed by half using a drive can reduce the energy it consumes to one-eighth of its consumption at full speed.	*Electrical*
Drive Belt	A belt which is used to transmit power or motion from one part to another.	*Equipment*
Drive Chain	A chain used to transmit power.	*Equipment*
Drive pins	The two pins which fit into the bottom of a ball valve stem and engage corresponding holes in the ball. As the operator turns the stem, the drive pins turn the ball.	*Mechanical*
Drive Pulley	A pulley mounted on the drive shaft that transmits power to the belt with which it is in contact. Pulley is normally positive crowned and lagged.	*Manufacturing*
Drive Shaft	(1) A main driving shaft on a which conveyor sprockets, gears, or pulleys are mounted. This shaft is connected to the drive unit through a coupling, sprocket, gear, or other form of mechanical power transmission; (2) A shaft used to support t	*Equipment*
Driven Roller	Any carrying roller driven by belting, chain or other propelling medium.	*Equipment*
Driver	Primary drive for the fan drive assembly. It may be an electric motor, gas engine, steam turbine, hydraulic motor, or other power source.	*Facility Engineering*
Drivetrain	The power-transmitting components in a vehicle, including clutch, gearbox (or automatic transmission), driveshaft, universal joints, differential and axle shafts.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Droop	A common occurrence in time-proportional controllers. It refers to the difference in temperature between the set point and where the system temperature actually stabilizes due to the time-proportioning action of the controller.	*General Engineering*
Drop	drilling directionally with the intent to decrease well bore inclination; also refers to increasing and orienting lateral bit force magnitude to or towards the low side of the drill hole.	*Petroleum Drilling*
Drop cages	small cages operating between decking levels in multi decking.	*Mining*
Drop fault	Drop fault, -see 'downthrow fault'.	*Mining*
Drop Pipe	The pipe that carries water from a pump in a well up to the surface.	*Petroleum Engineering*
Drop post or Drop Warwick	Drop post or Drop Warwick, another name for a 'Warwick'.	*Mining*
Drop shaft, Drop staple or Drop pit	a shaft underground between two seams that does not come to the surface. The shafts were used to lower coal to the level of the base of the winding shaft. This allowed all the coal produced in the mine to be wound up the shaft from a single loading point, also known as a 'blind pit', - see also Cut and Staple, Blind Pit, Jacky Pit. Usually a shaft with a single cage and balance weight.	*Mining*
Drop-Out Voltage	Refers to the power level at which the internal forces in the solenoid valve (spring and friction) overcome the magnetic field and can no longer maintain a latched condition. Drop-out voltage is one of the measurements used to determine solenoid limits.	*General Mechanical*
Dropouts	See Attrition	*Quality Engineering*
Dropping Point	The temperature at which grease becomes soft enough to form a drop and fall from the orifice of the test apparatus of ASTM D566 (IP 132) and ASTM D 2265.	*Lubrication*
Dropping Point	In general, the dropping point is the temperature at which the grease passes from a semisolid to a liquid state. This change in state is typical of greases containing conventional soap thickeners. Greases containing thickeners other than conventional soaps may, without change in state, separate oil.	*Lubrication*
Dross	byproduct of the galvanizing process that forms by reactions between zinc and loose particles of iron; dross may exist at all depths of the kettle, but usually sinks to the bottom	*Materials Process*
Dross coal	small coal, also a term often used to distinguish ordinary coal from cannel coal in compound seams. (Scot.); or useless coal. (Lancs.).	*Mining*
Dross inclusions	dross that is carried out on the work upon removal from the galvanizing kettle	*Materials Process*
Drossing	removing dross buildup from the bottom of the kettle	*Materials Process*
Drub or Drug	a kind of seatearth; or sometimes a carbonaceous or bituminous shale. (Yorks.); or dirt.	*Mining*
Druggon	a square wrought-iron or wooden box, used for taking clean water into the mine for the horses, or for watering down dust before shot firing, sometimes hung beneath the cage (S. Staffs.).	*Mining*

Term	Definition	*Industry*
Drum	the drum of a winding engine upon which the winding rope is coiled or wound, often conical scroll or spiral shaped; or the barrel or 'roll' at the top of a self-acting incline around which the rope passes; or a brick, iron or wooden cylinder used for sinking through beds of sand or soft ground. (Lancs.).	*Mining*
Drum chopping	A site preparation technique in which logging debris is leveled by a bulldozer pulling a large drum filled with water.	*Forestry*
Drum head	a short heading at the top of a self-acting incline made to house the 'drum'. (N. East).	*Mining*
Drum Or Formed	Images formed from hammer striking ribbon and media against reversed image on a rotating drum.	*Gears*
Dry (coal) basis	Coal quality data calculated to a theoretical basis in which no moisture is associated with the sample. This basis is determined by measuring the weight loss of a sample when its inherent moisture is driven off under controlled conditions of low temperature air-drying followed by heating to just above the boiling point of water (104 to 110 degrees Centigrade).	*Energy*
Dry area	An unified surface caused by lack of fusion.	*Material Process*
Dry bottom boiler	No slag tanks at furnace throat area. The throat area is clear. Bottom ash drops through the throat to the bottom ash water hoppers. This design is used where the ash melting temperature is greater than the temperature on the furnace wall, allowing for relatively dry furnace wall conditions.	*Energy*
Dry bulb temperature	Temperature of the air as indicated by a standard thermometer.	*Material Process*
Dry Circuit	A slang expression meaning a low energy circuit. Although many individuals and groups have assigned current and voltage values to "dry circuits" there is at present no general agreement as to what the values should be.	*Electrical Engineering*
Dry Diggings	Earth excavated in the summer and held to be washed in winter, when water was more plentiful.	*Mining*
Dry Film Lubricant	Low shear-strength lubricants that shear in one particular plane within its crystal structure (such as graphite, molybdenum disulfide and certain soaps).	*Lubrication*
Dry galvanizing	dipping steel in an aqueous zinc ammonium chloride solution and then thoroughly drying before immersing in the molten zinc bath	*Materials Process*
Dry gas	Dry gas: See Dry natural gas.	*Energy*
Dry Gas	Natural gas composed mainly of methane with only minor amounts of ethane, propane and butane and little or no heavier hydrocarbons in the gasoline range.	*Petroleum Drilling*
Dry Gas	Natural gas composed mainly of methane with only minor amounts of ethane, propane and butane and little or no heavier hydrocarbons in the gasoline range.	*Petroleum Drilling*
Dry hole	An exploratory or development well found to be incapable of producing either oil or gas in sufficient quantities to justify completion as an oil or gas well. Also see Well.	*Energy*
Dry hole charge	The charge-off to expense of a previously capitalized cost upon the conclusion of an unsuccessful drilling effort.	*Energy*
Dry hole contribution	A payment (either in cash or acreage) that is required by agreement only if a test well is unsuccessful and that is made in exchange for well test and evaluation data.	*Energy*
Dry hole	A well which has proved to be non-productive.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dry house	A building where the miner changes to his working clothes.	*Mining*
Dry Lubrication	The situation when moving surfaces have no liquid lubricant between them.	*Lubrication*
Dry natural gas	Natural gas which remains after: 1) the liquefiable hydrocarbon portion has been removed from the gas stream (i.e., gas after lease, field, and/or plant separation); and 2) any volumes of nonhydrocarbon gases have been removed where they occur in sufficient quantity to render the gas unmarketable. Note: Dry natural gas is also known as consumer-grade natural gas. The parameters for measurement are cubic feet at 60 degrees Fahrenheit and 14.73 pounds per square inch absolute. Also see Natural gas.	*Energy*
Dry natural gas production	The process of producing consumer-grade natural gas. Natural gas withdrawn from reservoirs is reduced by volumes used at the production (lease) site and by processing losses. Volumes used at the production site include (1) the volume returned to reservoirs in cycling, repressuring of oil reservoirs, and conservation operations; and (2) gas vented and flared. Processing losses include (1) nonhydrocarbon gases (e.g., water vapor, carbon dioxide, helium, hydrogen sulfide, and nitrogen) removed from the gas stream; and (2) gas converted to liquid form, such as lease condensate and plant liquids. Volumes of dry gas withdrawn from gas storage reservoirs are not considered part of production. Dry natural gas production equals marketed production less extraction loss.	*Energy*
Dry process	Preparation of a material in the absence of enough water to product a solution or slurry, for example, making phenol formaldehyde resin using solid aldehyde-yielding agents in place of the more common aqueous formaldehyde.	*Material Process*
Dry production	Dry production: See Dry natural gas production.	*Energy*
Dry spot	Area of incomplete surface film on laminated plastics, in laminated glass, an area over which the interlayer and the glass have not become bonded.	*Material Process*
Dry Sump	An engine design in which oil is not retained in a pan beneath the crankshaft thus permitting splash lubrication. There may be a remote sump from which oil is recirculated, or there may be a total loss system.	*Lubrication*
Dry Washing	Fine soil blown away, leaving the gold.	*Mining*
Dry well	A drainage pit lined with loose stonework for the leaching of liquid wastes.	*Civil Engineering*
Dry	A building where the miner changes into working clothes.	*Mining*
Dry-bulb temperature (DBT)	The temperature of the inlet or ambient air adjacent to the cooling tower as measured by a dry-bulb thermometer.	*Facility Engineering*
Dryer	Steam used to create heat can be channeled through heat exchange coils for the purpose of drying. Industries which use dryers may include timber mills, dried fruit and food manufacturers, tobacco producers, etc.	*Industrial*
Drying agents (Dryers catalysts)	Metallic soaps of higher organic acids used to hasten the film formation of reins modified with drying oils.	*Material Process*
Drying oils	Oils which dry or oxidize to a varnish like film on exposure to air and sun light. Linseed oil, Chine wood oil, and perilla oil are examples.	*Material Process*
Drywasher	A common desert mining tool similar to a highbanker but does not need water. It operates by the use of wind. The light junk material is blown off the top of the sluice in the drywasher and the gold stays on the bottom.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
DSA	See Double Studded Adaptor.	*Petroleum Engineering*
DSL	A mechanism for providing high-speed digital communications over a standard phone line. Example: Internet access	*Electrical Engineering*
DSL	A mechanism for providing high-speed digital communications over a standard phone line.	*Electrical Engineering*
DSM	DSM: Demand-Side Management	*Energy*
DSM Measure Technology Program	Single devices, equipment, or rates as listed in the Reference Data. A demand-side management program is usually a group of DSM measures or technologies. However, a DSM program could in some cases be a single measure.	*Energy*
DSP	dual spark engine	*Petro-Chemical Abbreviations*
DSP	Digital Signal Processor. A microprocessor optimized for digital signal manipulations.	*Reliability Engineering*
DTBP	di-tert-butyl phenol	*Petro-Chemical Abbreviations*
DTW	DTW: Dealer Tank Wagon	*Energy*
"DU" BEARING	A bearing consisting of bonze, impregnated with TFE (Teflon) resin and lead powder – bonded to a low carbon steel backing	*Mechanical*
Dual Element Sensor	A sensor assembly with two independent sensing elements.	*General Engineering*
Dual Front Airbags	Designed to protect the driver and front passenger in a frontal collision. Mounted in the steering wheel hub and in the right side of the dashboard, they inflate and deflate within a fraction of a second. Most systems can judge the severity of an impact and determine whether a front-seat occupant is wearing a safety belt or is out of position. This allows them to adjust the rate of deployment to minimize injuries from the airbags themselves. Dual front airbags are required by law on all new passenger vehicles.	*Mechanical Engineering*
Dual fuel vehicle (1)	A motor vehicle that is capable of operating on an alternative fuel and on gasoline or diesel fuel. These vehicles have at least two separate fuel systems which inject each fuel simultaneously into the engine combustion chamber.	*Energy*
Dual fuel vehicle (2)	A motor vehicle that is capable of operating on an alternative fuel and on gasoline or diesel fuel. This term is meant to represent all such vehicles whether they operate on the alternative fuel and gasoline/diesel simultaneously (e.g., flexible-fuel vehicles) or can be switched to operate on gasoline/diesel or an alternative fuel (e.g., bi-fuel vehicles).	*Energy*
Dual Inline Package	Dual Inline Package is an integrated circuit package with two rows of pins.	*Electrical Engineering*
Dual Overhead Camshafts (DOHC)	A DOHC engine has two camshafts in each cylinder head; one camshaft actuates intake valves and the other actuates exhaust valves. The camshafts act directly on the valves, eliminating pushrods and rocker arms. This reduced reciprocating mass of the valve train enables the engine to build RPM more quickly. DOHC designs are typically high-performance, four valve per cylinder engines. (A four valve per cylinder two intake and two exhaust design helps the engine "breathe" more freely for increased performance.)	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dual Phase Controller	Switching regulator that employs dual-phase technique to reduce output noise and boost output current capability.	*Electrical Engineering*
Dual Ratings	the piping system may be subjected to full-vacuum conditions or sub- merged in water and thus experience external pressure, in addition to withstanding the internal pressure of the flow medium. Such piping systems must be rated for both internal and external pressures at the given temperatures. In addition, a piping system may handle more than one flow medium during its different modes of operation. Therefore, such a piping system may be assigned a dual rating for two different flow media. For example, a piping system may have condensate flowing through it at some lower temperature during one mode of operation while steam may flow through it at some higher temperature during another mode of operation. It may be assigned two pressure ratings at two different temperatures.	*Maintenance and Repair*
Dual Unionism	a term generally applied to any union or organization which is seeking to represent workers in the same trade or industry in which a union already exists.	*Industrial Relations*
Dual-Band	Dual-band refers to the capability of GSM network infrastructure and handsets to operate across two frequency bands.	*Electrical Engineering*
Dual-fired unit	A generating unit that can produce electricity using two or more input fuels. In some of these units, only the primary fuel can be used continuously; the alternate fuel(s) can be used only as a start-up fuel or in emergencies.	*Energy*
Dual-Line System	A positive displacement terminating (oil, or grease) lubrication system that employs two main lines supplied from a pump connected to a 4-way (reverser) valve. Pressure in one main line (while the other is open to tank) causes the measuring piston(s) in the dual-line valve(s) to stroke in one direction dispensing lubricant to one group of lube points. Switching the 4-way (reverser) valve directs pump flow to the second main line and opens the first main line to tank. This allows pressure to build in the second main line causing the dual-line valve(s) measuring piston(s) to stroke back to their original position dispensing lubricant to a second group of lube points. The system is a parallel type and each dual-line valves operates independently of any other in the system.	*Lubrication*
Dual-Modulus Prescaler	A Dual-Modulus Prescaler (DMP) is an important circuit block used in frequency synthesizers to divide the high-frequency signal from the voltage controlled oscillator (VCO) to a low-frequency signal by a predetermined divide ratio, either (N+1) or N, which is controlled by a swallow counter.	*Electrical Engineering*
Dual-Pay System	a method of wage payment whereby compensation is paid on the basis of hours work and miles travelled.	*Industrial Relations*
Duals	Two tire and wheel assemblies, mounted on one side of an axle.	*Mechanical Engineering*
Dual-slope A/D Converter	An analog-to-digital converter which integrates the signal for a specific time, then counts time intervals for a reference voltage to bring the integrated signal back to zero. Such converters provide high resolution at low cost, excellent normal-mode noise rejection, and minimal dependence on circuit elements.	*General Engineering*
Dual-Stage Airbags	Front airbags that can deploy at either of two levels, depending on the severity of a collision.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	Industry
Dual-Stroke Cylinder	A cylinder combination which provides two working strokes.	*Mechanical, Process, and Operations*
Dual-Zone Climate Control	Allows individualized control of heating and air conditioning. Most systems are adjustable for the driver and front passenger; others feature a third adjustment for rear passengers.	*Mechanical Engineering*
Duane model	A reliability growth model similar to the AMSAA model that uses a relationship between cumulative test time and cumulative failures to develop a reliability growth profile.	*Reliability Engineering*
Duck tin, -see Dan tin	Duck tin, -see Dan tin.	*Mining*
Duck-bill props	a miners' name for the 'Bathgate' prop, an adjustable steel prop with duckbill shaped wedges, which locked it when it was set. Also generally known as 'key-props'. To the men, they were known as 'finger trappers' or 'thumb busters'.	*Mining*
Ductile	to brittle transition temperature Narrow temperature region in which the fracture of alloys changes from brittle at lower temperature to ductile at higher temperatures.	*Material Process*
Ductile Deformable	Ductile Deformable.	*Material Process*
Ductile Iron	A cast ferrous material in which the free graphite is in a spheroidal form rather than a fluke form. The desirable properties of ductile iron are achieved by means of chemistry and a ferritizing heat treatment of the castings.	*Maintenance and Repair*
Ductile iron	A form of cast iron is relatively ductile due to spheroidal graphite precipitates, rather than flakes.	*Material Process*
Ductile iron	molten iron treated with an element such as magnesium or cerium to induce a measurable degree of ductility to the metal; these additives do not affect galvanizability	*Materials Process*
Ductility	Ductility generally refers to the amount of inelastic deformation which a material or structure experiences before complete failure. Quantitatively, ductility can be defined as the ratio of the total displacement or strain at failure, divided by the displacement or strain at the elastic limit.	*Engineering Physics*
Ductility	the ability of a material to be formed without fracturing; galvanized steel is ductile within certain recommended bending radii	*Materials Process*
Ductility Deformability	Percent elongation at failure is a quantitative measure. Extent to which a solid can be drawn out into a fine thread.	*Material Process*
Dudley	a large capacity, circular water bottle used underground.	*Mining*
Duds	underground clothes.	*Mining*
Due diligence	The degree of care and caution required before making a decision; loosely, a financial and technical investigation to determine whether an investment is sound.	*Mining*
Due Process of Law	provisions in the U.S. Constitution in the 5th and 14th amendments.	*Industrial Relations*
Dues ion	periodic payments paid by members to the union.	*Industrial Relations*
Dufaylite	Honeycomb structure bonded with a synthetic resin.	*Material Process*
Duff	very small size of coal, fine coal, also called 'pease', generally less than ? inch.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dug Wells	Large-diameter wells dug by backhoe or by hand. Usually shallow with large-diameter casing, 60 to 120 cm (24 to 48 in.). Advantages are: easy to construct; inexpensive initial cost; large casing provides storage; may be used in poor-yielding aquifer. Disadvantages: if shallow, water shortages are possible in dry periods; easy to seal properly, but require large volumes of material; vulnerable to near surface contamination.	*Petroleum Engineering*
Dukey	an inclined haulage road worked by an engine (S. Wales).	*Mining*
Dull surface	Lack of gloss or luster in the surface of plastic, approaching a matte or sand blasted finish.	*Material Process*
Dumb drift	a drift for return air to avoid the furnace or by-pass an inset where cages or skips are loaded and reach the Upcast Shaft.	*Mining*
Dumb fault	Dumb fault, -see Washout.	*Mining*
Dummocky	where the roof stratum of a road is tender but not 'heavy' or 'weighted' (N. Staffs.).	*Mining*
Dummy	A bag filled with sand, clay, etc., used for stemming a charged hole.	*Mining*
Dummy gate	a road that is formed but not maintained or used behind a longwall face (which can sometimes provide material for building packs). Also called a 'Dummy road'.	*Mining*
Dump	A pile or heap of rock or ore on the surface.	*Mining*
Dump energy	Energy generated in a hydroelectric plant by water that cannot be stored or conserved and which energy is in excess of the needs of the system producing the energy.	*Energy*
Dumpy level	underground surveying instrument.	*Mining*
Dundy	inferior coal or coal affected by 'trap-rock'. (Scot.).	*Mining*
Duns	carbonaceous dirt partings. (Yorks.).	*Mining*
Duplex	Pertaining to simultaneous two-way independent data communication transmission in both direction. Same as "full duplex".	*Electronic Process*
Duplex Filter	An assembly of two filters with valving for selection of either or both filters.	*Lubrication*
Duplex systems	galvanized steel that has been coated with an additional corrosion-inhibiting product, typically liquid or powder paint; the two separate coating systems work synergistically to provide enhanced corrosion protection	*Materials Process*
Duplex Wire	A pair of wires insulated from each other and with an outer jacket of insulation around the inner insulated pair.	*General Engineering*
Duplex Wire	A pair of wires insulated from each other and with an outer jacket of insulation around the inner insulated pair.	*Electronic Process*
Duplicating	Milling operation in which the contour or outline to be milled is followed by a tracer on stylus that governs the motion of one or more cutting spindles.	*Material Process*
Durability	A measure of useful life (a special case of reliability).	*Reliability Engineering*
Duration	Duration of a shock pulse is how long it lasts. For "classical" pulses (not found in the real world), time is usually measured between instants when the amplitude is greater than 10% of the peak value.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Duress	physical force or threat of force or intimidation to make a person do something against his will or better judgment.	*Industrial Relations*
Durham	Durham—see Pit pan.	*Mining*
Durometer	A standard for quantifying the hardness of rubber, plastic, and other non-metallic materials. Typical hardness of flexible tubing ranges from 50 to 70 Durometer on the "A" scale.	*Mechanical*
Durometer	A measurement used to denote the hardness of a substance (usually of thermo-setting and thermoplastic materials).	*Electrical*
Durometer hardness	An arbitrary indication of hardness of rubber or plastic determined by an indenter.	*Mechanical, Process, and Operations*
Dusting Product (Furniture)	An aerosol or pump spray that dispenses ingredients in a fine spray onto surface of dusting cloth. Some cloths come already impregnated with active ingredients. These products attract, pick up and retain light dust and soil.	*Chemistry*
DUT	Acronym for Device Under Test used to describe a unit, component, sub-system or system being tested	*Reliability Engineering*
Dutchman	A short section of belt, provided with lacing, in a conveyor belt which can be removed when take-up provision has been exceeded.	*Manufacturing*
Duty Cycle	The total time to one on/off cycle. Usually refers to the on/off cycle time of a temperature controller.	*General Engineering*
Dye Soluble	organic colorant for polymers.	*Material Process*
Dyestuffs	specially prepared for dyeing of viscose rayon. They tend to cover the irregularities occasioned by varying batches of rayon.	*Material Process*
Dyke	see Fault and Slip Dyke.	*Mining*
Dyke	A long and relatively thin body of igneous rock that, while in the molten state, intruded a fissure in older rocks.	*Mining*
Dynamic (Two-Plane) Balancing Machine	A dynamic balancing machine is a centrifugal balancing machine that furnishes information for performing two-plane balancing.	*General Engineering*
Dynamic Balance	Balance in Motion. The balance of a tire and wheel while it is rotating. A condition in which a tire and wheel assembly has weight distributed equally on both sides of the wheel's axis of rotation.	*Mechanical Engineering*
Dynamic Calibration	Calibration in which the input varies over a specific length of time and the output is recorded vs. time.	*General Engineering*
Dynamic equilibrium	Equilibrium which includes inertial forces.	*Engineering Physics*
Dynamic Friction	Resistance to relative movement of two bodies that are already in motion.	*Maintenance*
Dynamic modulus of elasticity	Parameter representing the stiffness of a polymeric material under an oscillating load.	*Material Process*
Dynamic motion	Movement, as compared with nonmoving or static position. Dynamic motion is sensed with displacement or velocity pickups or with accelerometers.	*Reliability Engineering*
Dynamic Pressure	The difference in pressure levels from static pressure to stagnation pressure caused by an increase in velocity. Dynamic pressure increases by the square of the velocity.	*Electronic Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Dynamic RAM	Random-Access Memory that uses a continuous clock. Unlike SRAM, when DRAM is no longer clocked, its data is lost.	*Electrical Engineering*
Dynamic Range	The range, in dB, between the noise floor of a device and its defined maximum output level.	*Electrical Engineering*
Dynamic Seal	A seal that moves due to axial or radial movement of the unit.	*Lubrication*
Dynamic shunt compensation	A technology used to stabilize voltage by introducing or absorbing reactive power at specific points of a power transmission grid. The system helps to improve power transmission capacity as well as the overall stability of the grid. Dynamic shunt compensation is one of the three main FACTS (Flexible Alternating Current Transmission Systems) technologies, the others being series compensation and dynamic energy storage. (See also Series and Shunt.)	*Electrical*
Dynamic signal analyzer DSA	Vibration analyzer using digital signal processing and the Fast Fourier Transform (FFT) to display vibration frequency components. May also display the time domain and the phase spectrum. Usually interfaced to a computer.	*Reliability Engineering*
Dynamic Unbalance	Dynamic unbalance is that condition in which the central principal axis is not coincident with the shaft axis.	*General Engineering*
dynamic viscosity	a measure of a fluid's resistance to tangential or shear stress.	*Chemical*
Dynamometer	A device which absorbs and measures the power derived by an internal combustion engine.	*Mechanical Engineering*
Dyno	A contraction of "Dynamometer," an engine-testing device used in the shop that measures power and simulates the loads and environment of a racing engine.	*NASCAR*
Dysodil—see Lignite	Dysodil—see Lignite.	*Mining*
E	E	*Forestry*
--E--	--E--	*Petroleum Drilling*
E&A	Abbreviation for exploration and appraisal.	*Petroleum Drilling*
E&A	Abbreviation for exploration and appraisal.	*Petroleum Drilling*
E&P	Abbreviation for exploration and production.	*Petroleum Drilling*
E&P	Abbreviation for exploration and production.	*Petroleum Drilling*
E*	planned well bore East (+) / West (-) Cartesian coordinate at MD*. (feet or meters)	*Petroleum Drilling*
E.B.G., or Elsewhere below ground	a statistical term applied to all personnel working underground other than at the coalface.	*Mining*
E.P.A.	Environmental Protection Agency of the United States Government. Has responsibility to regulate the environment.	*Chemistry*
E/P	Voltage to pneumatic converter.	*Industrial Engineering*
E85	A fuel containing a mixture of 85 percent ethanol and 15 percent gasoline. See Motor gasoline (finished).	*Energy*
E85	A mixture of base gasoline and fuel ethanol, containing 85% by volume of ethanol.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
E95	A fuel containing a mixture of 95 percent ethanol and 5 percent gasoline	*Energy*
Eaglebine Play	Refers to areas where oil companies can produce from both Eagle Ford Shale and Woodbine formation in a single well.	*Petroleum Drilling*
EAN	European Article Number	*Gears*
EAR	Estimated Additional Resources	*Energy*
Early Retirement Date	a date preceding the expected retirement date set by agreement or practice.	*Industrial Relations*
Earning Power	a worker's potential capacity on his job to earn wages over a period of time.	*Industrial Relations*
Earnings	the total amount of remuneration received as compensation for work performed or services rendered.	*Industrial Relations*
Earth or Earthy coal	an early term for coal to differentiate it from charcoal, or a term used for lignite, an earthy brown coal; or shale or clay, generally in association with a coal seam. (Lancs.).	*Mining*
East Central Area Reliability Coordination Agreement	One of the ten regional reliability councils that make up the North American Electric Reliability Council (NERC).	*Energy*
East North Central	Illinois, Indiana, Michigan, Ohio, and Wisconsin;	*Energy*
East South Central	Alabama, Kentucky, Mississippi, and Tennessee;	*Energy*
Eastern	Bridgeport, CT, Washington, DC, Boston, MA, Baltimore, MD, Portland, ME, Buffalo, NY, New York City, NY, Ogdensburg, NY, Philadelphia, PA, Providence, RI, Norfolk, VA, St. Albans, VT.	*Energy*
Eastern Region	Consists of the Appalachian Coal Basin. The following comprise the Eastern Region: Alabama, eastern Kentucky, Georgia, Maryland, Mississippi, Ohio, Pennsylvania, Virginia, Tennessee, North Carolina, and West Virginia.	*Energy*
Eat out	an expression used when a level coal drift is turned to the dip, in order to take advantage of (or "eat out") an up throw fault, (N. East).	*Mining*
Ebb pit	a pit or shaft sunk to a shallow seam. (Scot.).	*Mining*
EC	Environment Canada	*Petro-Chemical Abbreviations*
ECAR	ECAR: East Central Area Reliability Council	*Energy*
ECCC	electronically controlled converter clutch	*Petro-Chemical Abbreviations*
Eccentric	- Not having the same center.	*Mechanical*
Eccentricity	A measure of the lack of coincidence of longitudinal axes of a circular cross-sectional wire and its surrounding circular cross-sectional insulation. It is expressed as the percentage ratio of the distance between wire and insulation centers to the difference between wire and insulation radii.	*Electrical*
Eccentricity, mechanical	Variation of shaft surface radius when referenced to the shaft's true geometric centerline. Out-of-roundness.	*Reliability Engineering*
ECE	Economic Commission for Europe	*Petro-Chemical Abbreviations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Echo	To reflect received data to the sender. For example, keys depressed on a keyboard are usually echoed as characters displayed on the screen.	*General Engineering*
Echo	- To reflect received data to the sender. For example, keys depressed on a keyboard are usually echoed as characters displayed on the screen.	*Electronic Process*
EC-II	Energy Conserving-II (engine oil designation)	*Petro-Chemical Abbreviations*
ECM	electronic control module	*Petro-Chemical Abbreviations*
Eco-efficiency	- Combining efficiency and ecological aspects in the pursuit of sustainable development.	*Electrical*
Ecology	the study of the environment and how living things interact with it	*Agriculture*
Economic Action	steps taken by labor organizations to achieve their goals, generally in the form of strikes, picketing, boycotts, or other means at their disposal.	*Industrial Relations*
Economic analysis (economic evaluation)	Comparison of the relationship between costs and outcomes of alternative healthcare interventions. See also: Cost-benefit analysis, Cost-effectiveness analysis, Cost-utility analysis	*Quality Engineering*
Economic Dispatch	The distribution of total generation requirements among alternative sources for optimum system economy with consideration to both incremental generating costs and incremental transmission losses.	*Energy*
Economic Efficiency	A term that refers to the optimal production and consumption of goods and services. This generally occurs when prices of products and services reflect their marginal costs. Economic efficiency gains can be achieved through cost reduction, but it is better to think of the concept as actions that promote an increase in overall net value (which includes, but is not limited to, cost reductions).	*Energy*
Economic Life	The Total Length Of Time That An Asset Is Expected To Remain Actively In Service Before It Is Expected That It Would Be Cheaper To Replace The Equipment Rather Than Continuing To Maintain It. In Practice, Equipment Is More Often Replaced For Other Reasons, Including: Because It No Longer Meets Operational Requirements For Efficiency, Product Quality, Comfort Etc., Or Because Newer Equipment Can Provide The Same Quality And Quantity Of Output More Efficiently.	*Management*
Economic Report	the Report of Congress required of the President by the Employment Act of 1946.	*Industrial Relations*
Economic Sanctions	actions intended to penalize an employer for violating the provisions of an agreement or other understanding with a union.	*Industrial Relations*
Economic Strike	a work stoppage which results from inability of an employer and a union to agree on wages, hours, or other conditions of employment.	*Industrial Relations*
Economic Value Added (EVA)	A measurement of shareholder wealth created by an investment center. A trademark of Stern Stewart & Company, calculating EVA can be very complex but is basically net operating profit after taxes (NOPAT) minus an appropriate charge for the opportunity cost of all capital invested in an enterprise.	*Quality*
Economy Energy	Energy produced and substituted for the traditional but less economical source of energy. Economic energy is usually sold without capacity and is priced at variable costs plus administration costs.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Economy of scale	The principle that larger production facilities have lower unit costs than smaller facilities.	*Energy*
EconoReset	The simplest form of microprocessor supervisory circuit, it monitors the power supply for the microprocessor and provides only a power-on reset function.	*Electrical Engineering*
EconoReset	The simplest form of microprocessor supervisory circuit, it monitors the power supply for the microprocessor and provides only a power-on reset function.	*Electrical Engineering*
EconOscillator	Low-cost, surface-mount, CMOS oscillator family from Maximum EconOscillators replace crystal-based oscillators. They need no external crystals or timing components.	*Electrical Engineering*
Ecosystem	a community of living and non-living things that interact by exchanging matter and energy	*Agriculture*
Ecosystem	The components of a particular habitat, such as a pond or forest, together with the physical environment in which they live.	*Forestry*
Ecosystem services	Indirect benefits provided by the forest ecosystem that help ensure the integrity of critical structure, functions and processes.	*Forestry*
ECU	electronic control units	*Petro-Chemical Abbreviations*
Ecuador (1973-1992 and 2007-present)	Ecuador (1973-1992 and 2007-present)	*Energy*
Eddy current	Fluctuating electrical current in a conductor. A source of energy loss in applications of magnet.	*Material Process*
Eddy current	Electrical current generated (and dissipated) in a conductive material (often a rotor shaft) when it intercepts the electromagnetic field of a displacement or proximity probe.	*Reliability Engineering*
Eddy Current Testing	This is a nondestructive testing method in which eddy current flow is induced in the test object. Changes in the flow caused by variations in the object are reflected into a nearby coil or coils for subsequent analysis by suitable instrumentation and techniques.	*Maintenance and Repair*
Eddy current testing	A type of non destructive testing in which defects are monitored as a result of changes in the impedance of an inspection coil, as the coil carriers an alternating current and passes through the vicinity of the flawed material.	*Material Process*
Edge	The transition between two different types or ages of vegetation.	*Forestry*
Edge (filter)	A filter medium whose passages are formed by the adjacent surfaces of stacked discs, edgewound ribbons, or single-layer filaments.	*Mechanical, Process, and Operations*
Edge coal or edge seams	Edge coal or edge seams, highly inclined seams, which are set at an almost vertical angle.	*Mining*
Edge dislocation	Linear defect with the Burgers vector perpendicular to the dislocation line.	*Material Process*
Edge Joint	A joint between the edges of two or more parallel or nearly parallel members.	*Maintenance and Repair*
Edge Preparation	The contour pre- pared on the edge of a member for welding. See Fig. A1.7.	*Maintenance and Repair*
Edge sealing	The process of sealing the edges of a laminate. It is necessary with certain plastics which absorb moisture from the air.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
EDI	EDI: Electronic Data Interchange	*Energy*
Editor (of a Cochrane Review Group)	A member of the CRG's editorial team, often not located at the editorial base, who not only prepares and maintains one or more Cochrane Reviews as a member of a CRG, but also has responsibilities to support the Co-ordinating Editor in editing Cochrane Reviews prepared by others, and in fostering the smooth running of the CRG.	*Quality Engineering*
Editorial base	Cochrane Review Groups have an editorial base at which their work is coordinated. Usually the Co-ordinating Editor, the Managing Editor, the Trials Search Co-ordinator, secretarial support, and the CRG's trials register are located there. Reviewers/Authors are encouraged to come there to work on their Cochrane Reviews.	*Quality Engineering*
Editorial Management Advisory Group (EMAG)	Formerly called the ModMan Advisory Group (MAG). Advises on the development of software that supports the editorial process of Collaborative Review Groups. Also called: EMAG, MAG, ModMan Advisory Group	*Quality Engineering*
Editorial process	The process by which each individual CRG decides on the criteria for editing and including Cochrane Reviews in its edited module for inclusion in the Cochrane Database of Systematic Reviews. See also: Referee process	*Quality Engineering*
Editorial team (of a Cochrane Review Group)	Normally consists of a Co-ordinating Editor, a Managing Editor, several editors, in most cases a Trials Search Co-ordinator, and in some cases a secretary.	*Quality Engineering*
EEB	European Environmental Bureau	*Petro-Chemical Abbreviations*
EEC	European Economic Community	*Petro-Chemical Abbreviations*
EECS	The Electrical Equipment Certification Service (EECS) is based at the UK Health and Safety Laboratory's Buxton research center. It provides a range of testing and certification services primarily related to equipment and systems intended for use in potentially explosive atmospheres.	*Maintenance*
EELQMS	European Engine Lubricant Quality Management System	*Petro-Chemical Abbreviations*
Eenie coal	coal that is slightly altered in appearance due to the presence of a 'whin'. The broken edge of the coal has bright circular spots, which look like eyes. Also known as 'peacock coal'. (Scot.).	*Mining*
Effect size	1. A generic term for the estimate of effect of treatment for a study .2. A dimensionless measure of effect that is typically used for continuous data when different scales (e.g. for measuring pain) are used to measure an outcome and is usually defined as the difference in means between the intervention and control groups divided by the standard deviation of the control or both groups. See also: Standardized mean difference	*Quality Engineering*
Effective Area	For a diaphragm actuator, the effective area is that part of the diaphragm area that is effective in producing a stem force. Usually the effective area will change as the valve is stroked – being at a maximum at the start and a minimum at the end of the travel range. Flat sheet diaphragms are most affected by this; while molded diaphragms will improve the actuator performance, and a rolling diaphragm will provide a constant stem force throughout the entire stroke of the valve.	*Industrial Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Effective Diameter	This is the diameter of an imaginary cylinder coaxial with the thread, which has equal metal and space widths. It is often referred to as pitch diameter. Sometimes referred to as the simple effective diameter to differentiate from the virtual effective diameter.	*Maintenance*
Effective Face Width	Face Width: That portion of the face width that actually comes into contact with mating teeth, as occasionally one member of a pair of gears may have a greater face width than the other.	*Mechanical Engineering*
Effective Filtration Area (device size)	Filter media and devices are available in a wide range of sizes with different Effective Filtration Areas (EFA). EFA is the filter area that is available for filtration—the larger the filter area, the higher the flow rate at a given differential pressure.	*Contamination Control*
Effective full-power days	The number of effective full-power days produced by a unit is a measure of the unit's energy generation. It is determined using the following ratio Heat generation (planned or actual) in megawatt days thermal (MWdt) (divided by) Licensed thermal power in megawatts thermal (MWt).	*Energy*
Effective Hydraulic Diameter	The area in which water from the aquifer can move freely into a well. If a borehole is completed with a well casing plus surrounded by a filter pack material, the effective hydraulic diameter is equal to the diameter of the borehole.	*Petroleum Engineering*
Effective Number of Bits	An indication of the quality of an analog-to-digital converter (ADC). The measurement is related to the test frequency and the signal-to-noise ratio.	*Electrical Engineering*
Effective Nut Diameter	Twice the effective nut radius.	*Maintenance*
Effective Nut Radius	The radius from the centre of the nut to the point where the contact forces, generated when the nut is turned, can be considered to act.	*Maintenance*
Effective porosity	the amount of interconnected pore space in a soil or rock through which fluids can pass, expressed as a percent of bulk volume. Some of the voids and pores in a rock or soil will be filled with static fluid or other material, so that effective porosity is always less than total porosity.	*Chemical*
Effective Sensing Distance	The difference between nominal sensing distance and the % manufacturing tolerance.	*Electrical Engineering*
Effective Series Resistance	The resistive component of a capacitor's equivalent circuit. A capacitor can be modeled as an ideal capacitor in series with a resistor and an inductor. The resistor's value is the ESR.	*Electrical Engineering*
Effective Series Resistance	is the resistive component of a capacitor's equivalent circuit. A capacitor can be modeled as an ideal capacitor in series with a resistor and an inductor. The resistor's value is the ESR.	*Electrical Engineering*
Effective Size	The 90% retained size of a sediment as determined from a grain-size analysis; therefore, 10% of the sediment is finer and 90% is coarser.	*Petroleum Engineering*
Effective volume	(See Net Effective Volume).	*Facility Engineering*
Effectiveness	A measure of the benefit resulting from an intervention for a given health problem under usual conditions of clinical care for a particular group; this form of evaluation considers both the efficacy of an intervention and its acceptance by those to whom it is offered, answering the question, "Does the practice do more good than harm to people to whom it is offered?" See Intention to treat.	*Analysis*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Efficacy	A measure of the benefit resulting from an intervention for a given health problem under the ideal conditions of an investigation; it answers the question, "Does the practice do more good than harm to people who fully comply with the recommendations?"	*Analysis*
Efficiency	The actual torque ratio of a gear set divided by its gear ratio.	*Gears*
Efficiency (filter)	The ability, expressed as a percent, of a filter to remove specified artificial contaminant at a given contaminant concentration under specified test conditions.	*Mechanical, Process, and Operations*
Efficiency Expert	an individual assigned to review the operations of a plant, department, or other production unit to determine the most effective way to perform job duties.	*Industrial Relations*
Efficiency of Labor	the productivity of a worker as measured by his output during a definite time span.	*Industrial Relations*
Efficiency Rating	the periodic appraisal of an employee's work performance.	*Industrial Relations*
Efficiency Service Company	A company that offers to reduce a client's electricity consumption with the cost savings being split with the client.	*Energy*
Effluent	Filtered liquid leaving the filter.	*Filtration*
effluent	something that flows out, especially a liquid or gaseous waste stream.	*Chemical*
Effusion cell	Resistance heated furnace providing a source of atoms or molecule for a deposition process.	*Material Process*
EFTC	Engine Fuels Technical Committee (CEC)	*Petro-Chemical Abbreviations*
Egg gallery	A long, narrow tunnel along the sides of which eggs are deposited in small niches; the pattern of construction is often diagnostic of a particular species of insect. [1] Fin.Swe.	*Forestry*
Egg mass	Cluster of eggs, usually in a matrix of body hairs or wing scales from the female adult and/or a mucilaginous cementing secretion. [1]	*Forestry*
Egg	Female gamete.	*Agriculture*
E-glass	Most generally used glass fiber composition for composite applications.	*Material Process*
EGR	exhaust gas recirculation	*Petro-Chemical Abbreviations*
EHS	extremely hazardous substance	*Petro-Chemical Abbreviations*
EIA	The Energy Information Administration. An independent agency within the U.S. Department of Energy that develops surveys, collects energy data, and analyzes and models energy issues. The Agency must meet the requests of Congress, other elements within the Department of Energy, Federal Energy Regulatory Commission, the Executive Branch, its own independent needs, and assist the general public, or other interest groups, without taking a policy position. See more information about EIA at http://www.eia.gov/about/	*Energy*
Eight-Hour Leagues	organizations formed in 1865 in Massachusetts to get support for the eight-hour day.	*Industrial Relations*
Eight-Hour Movement	the efforts during various periods, particularly in the 1800's, to obtain public support for the eight-hour day.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Eimco	a small tracked bucket loader, often used in headings.	*Mining*
EIS	EIS: Environmental Impact Statement	*Energy*
Ejector Device	from removing a molded piece from the mold.	*Material Process*
Ejector pin	assembly All the parts that help	*Material Process*
Ejector pin	Pin for removing finished piece from mold.	*Material Process*
el	Elevation	*General*
Elastic	A material or structure is said to behave elastically if it returns to its original geometry upon unloading.	*Engineering Physics*
Elastic Deformation	A change in a substance whereby it reverts to its original dimensions on release of an applied stress.	*Electrical*
Elastic deformation	Temporary deformation associated with the stretching of atomic bonds. A deformation in which a substance reverts to its original dimensions on release of the deforming stress.	*Material Process*
Elastic energy	The energy stored in deformed elastic material (e.g., a watch spring). Elastic energy equals where k is the stiffness, and is the associated deflection. Elastic energy is sometimes called elastic potential energy because it can be recovered when the object returns to its original shape; see potential energy.	*Engineering Physics*
Elastic limit	The point beyond which the deformations of a structure or material are no longer purely elastic. E-Modulus: see modulus of elasticity.	*Engineering Physics*
Elastic limit	For a given material, that stress beyond which any increment of stress produces a permanent strain.	*Material Process*
Elasticity	Ability of material to resume its original form after the removal of the force which has produced a change in form.	*Material Process*
Elasticity	The property of certain materials that enables them to return to their original dimensions after an applied stress.	*Paint and Coatings*
Elasticity of Demand	The ratio of the percentage change in the quantity demanded of a good to the percentage change in price.	*Energy*
Elastohydrodynamic Lubrication	In rolling element bearings, the elastic deformation of the bearing (flattening) as it rolls, under load, in the bearing race. This momentary flattening improves the hydrodynamic lubrication properties by converting point or line contact to surface-to-surface contact.	*Lubrication*
Elastohydrodynamic Lubrication (EHD)	A lubricant regime characterized by high unit loads and high speeds in rolling elements where the mating parts deform elastically due to the incompressibility of the lubricant film under very high pressure.	*Lubrication*
Elastomer	A natural or synthetic elastic material, often used for o-ring seals. Typical materials are viton, buna-n, EPDM (ethylene propylene dimonomer),	*General Mechanical*
Elastomer	A material that at room temperature returns rapidly to approximately its initial dimensions and shape after substantial deformation by a weak stress and release of the stress.	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Elbow	A pipe fitting installed between two lengths of pipe or tube allowing a change of direction, usually 90° or 45°. The ends may be machined for butt welding, threaded (usually female), or socketed, etc. When the two ends differ in size, it is called a reducing or reducer elbow. Most elbows are available in short radius or long radius of types. The short radius elbows have a center to end distance equal to the NPS in inches, while the long radius is 1.5 times the NPS in inches. Short elbows are universally available; long elbows are readily available in ABS plastic, PVC, CPVC and copper. See also Pipe Fittings	*Industrial*
Elbow	A female threaded or socket fitting used for changing direction in a run of pipe or tubing. See "Ell," "Street Ell."	*Mechanical*
Electioneering	activity designed to influence voting.	*Industrial Relations*
Elections	procedures established by federal and state statutes to determine the organizations properly representative of employees for the purpose of collective bargaining.	*Industrial Relations*
Electric Fusion-Welded Pipe	Pipe having a longitudinal or spiral butt joint in which coalescence is produced in the preformed tube by manual or automatic electric arc welding. The weld may be single or double and may be made with or without the use of filler metal.4	*Maintenance and Repair*
Electric Actuator	Also known as an Electro-Mechanical Actuator uses an electrically operated motor-driven gear train or screw to position the actuator stem. The actuator may respond to either a digital or analogue electrical signal.	*Industrial Engineering*
Electric baseboard	An individual space heater with electric resistance coils mounted behind shallow panels along baseboards. Electric baseboards rely on passive convection to distribute heated air to the space.	*Energy*
Electric Capacity	This refers to the ability of a power plant to produce a given output of electric energy at an instant in time, measured in kilowatts or megawatts (1,000 kilowatts).	*Energy*
Electric current	The flow of electric charge. The preferred unit of measure is the ampere.	*Energy*
Electric Distribution Company	The company that owns the power lines and equipment necessary to deliver purchased electricity to the customer.	*Energy*
Electric energy	The ability of an electric current to produce work, heat, light, or other forms of energy. It is measured in kilowatt hours.	*Energy*
Electric Erosion	Electric erosion is damage to contact steel surfaces caused by the passage of electric current. Small current leakage typically results in small craters, and possibly flutes or discoloration. Large craters can result from excessive voltage leaks.	*Reliability Engineering*
Electric expenses	The cost of labor, material, and expenses incurred in operating a facility's prime movers, generators, auxiliary apparatus, switching gear, and other electric equipment for each of the points where electricity enters the transmission or distribution grid.	*Energy*
Electric generation	See Gross generation and Net generation.	*Energy*

Term	Definition	*Industry*
Electric generation industry	Stationary and mobile generating units that are connected to the electric power grid and can generate electricity. The electric generation industry includes the "electric power sector" (utility generators and independent power producers) and industrial and commercial power generators, including combined-heat-and-power producers, but excludes units at single-family dwellings.	*Energy*
Electric generator	A facility that produces only electricity, commonly expressed in kilowatt hours (kWh) or megawatt hours (MWh). Electric generators include electric utilities and independent power producers.	*Energy*
Electric hot water boiler	Electrical appliances which produce hot water. They are available in the form of instantaneous water heaters or storage tanks.	*Thermal Management*
Electric hybrid vehicle	An electric vehicle that either (1) operates solely on electricity, but contains an internal combustion motor that generates additional electricity (series hybrid); or (2) contains an electric system and an internal combustion system and is capable of operating on either system (parallel hybrid).	*Energy*
Electric industry reregulation	The design and implementation of regulatory practices to be applied to the remaining traditional utilities after the electric power industry has been restructured. Reregulation applies to those entities that continue to exhibit characteristics of a natural monopoly. Reregulation could employ the same or different regulatory practices as those used before restructuring.	*Energy*
Electric industry restructuring	The process of replacing a monopolistic system of electric utility suppliers with competing sellers, allowing individual retail customers to choose their supplier but still receive delivery over the power lines of the local utility. It includes the reconfiguration of vertically-integrated electric utilities.	*Energy*
Electric motor	A device that converts electrical energy into mechanical energy that can be used to drive mechanical equipment.	*Electrical*
Electric motor vehicle	A motor vehicle powered by an electric motor that draws current from rechargeable storage batteries, fuel cells, photovoltaic arrays, or other sources of electric current.	*Energy*
Electric non-utility	Any entity that generates, transmits, or sells electricity, or sells or trades electricity services and products, where costs are not established and recovered by regulatory authority. Examples of these entities include, but are not limited to, independent power producers, power marketers and aggregators (both wholesale and retail), merchant transmission service providers, self-generation entities, and cogeneration firms with Qualifying Facility Status.	*Energy*
Electric operating expenses	Summation of electric operation-related expenses, such as operation expenses, maintenance expenses, depreciation expenses, amortization, taxes other than income taxes, Federal income taxes, other income taxes, provision for deferred income taxes, provision for deferred income-credit, and investment tax credit adjustment.	*Energy*
Electric permittivity	Proportionality constant in the relationship between charge density and electrical field strength.	*Material Process*
Electric Plant (Physical)	A facility that contains all necessary equipment for converting energy into electricity.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Electric plant acquisition adjustment	The difference between (a) the cost to the respondent utility of an electric plant acquired as an operating unit or system by purchase and (b) the depreciated original cost, estimated if not known, of such property.	*Energy*
Electric power	The rate at which electric energy is transferred. Electric power is measured by capacity and is commonly expressed in megawatts (MW).	*Energy*
Electric power grid	A system of synchronized power providers and consumers connected by transmission and distribution lines and operated by one or more control centers. In the continental United States, the electric power grid consists of three systems the Eastern Interconnect, the Western Interconnect, and the Texas Interconnect. In Alaska and Hawaii, several systems encompass areas smaller than the State (e.g., the interconnect serving Anchorage, Fairbanks, and the Kenai Peninsula; individual islands).	*Energy*
Electric power plant	A station containing prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or fission energy into electric energy.	*Energy*
Electric power sector	An energy-consuming sector that consists of electricity only and combined heat and power(CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public--i.e., North American Industry Classification System 22 plants. See also Combined heat and power (CHP) plant and Electricity only plant.	*Energy*
Electric Power Supplier	Non-utility provider of electricity to a competitive marketplace.	*Energy*
Electric power system	An individual electric power entity--a company; an electric cooperative; a public electric supply corporation as the Tennessee Valley Authority; a similar Federal department or agency such as the Bonneville Power Administration; the Bureau of Reclamation or the Corps of Engineers; a municipally owned electric department offering service to the public; or an electric public utility district (a "PUD"); also a jointly owned electric supply project such as the Keystone.	*Energy*
Electric pump for well water	This pump forces the water from a well below ground level up into the water pipes that circulate through the house. When this pump is not working, there is a limited supply of running water in the house.	*Energy*
Electric Rate	The price set for a specified amount and type of electricity by class of service in an electric rate schedule or sales contract.	*Energy*
Electric Rate Schedule	An electric rate and its contract terms accepted by a regulatory agency.	*Energy*
Electric Reliability Council of Texas (ERCOT)	One of the ten regional reliability councils that make up the North American Electric Reliability Council (NERC).	*Energy*
Electric Resistance-Welded Pipe	Pipe produced in individual lengths or in continuous lengths from coiled skelp and subsequently cut into individual lengths having a longitudinal butt joint in which coalescence is produced by the heat obtained from resistance of the pipe to the flow of electric current in a circuit of which the pipe is a part and by the application of pressure.3	*Maintenance and Repair*
Electric Service Provider	An entity that provides electric service to a retail or end-use customer.	*Energy*

Term	Definition	*Industry*
Electric Supplier	An entity (including an energy marketer or energy services company – or ESCO) licensed or approved by a state utility regulatory agency to provide electricity supply to consumers. With energy choice, consumers can choose their electric supplier. The energy is then delivered by the consumer's utility distribution company	*Energy*
Electric System	This term refers to all of the elements needed to distribute electrical power. It includes overhead and underground lines, poles, transformers, and other equipment.	*Energy*
Electric system loss	Total energy loss from all causes for an electric utility.	*Energy*
Electric system reliability	The degree to which the performance of the elements of the electrical system results in power being delivered to consumers within accepted standards and in the amount desired. Reliability encompasses two concepts, adequacy and security. Adequacy implies that there are sufficient generation and transmission resources installed and available to meet projected electrical demand plus reserves for contingencies. Security implies that the system will remain intact operationally (i.e., will have sufficient available operating capacity) even after outages or other equipment failure. The degree of reliability may be measured by the frequency, duration, and magnitude of adverse effects on consumer service.	*Energy*
Electric Utility	A legal entity that owns and/or operates facilities for the generation, transmission, distribution, or sale of electric energy.	*Energy*
Electric Utility Affiliate	This refers to a subsidiary or affiliate of an electric utility. Many utilities form affiliates to develop, own, and operate independent power facilities.	*Energy*
Electric utility company	Electric utility company: See Electric utility.	*Energy*
Electric utility divestiture	The separation of one electric utility function from others through the selling of the management and ownership of the assets related to that function. It is most commonly associated with selling generation assets so they are no longer owned or controlled by the shareholders that own the company's transmission and distribution assets.	*Energy*
Electric utility generator	A generator that is owned by an electric utility, (see definition of electric utility) or a jointly owned generator with the greatest share of the generator being electric utility owned. Note: If two or more owners have equal shares of ownership in a generator, it is considered to be an electric utility generator if any one of the owners meets the definition of electric utility.	*Energy*
Electric utility restructuring	The introduction of competition into at least the generation phase of electricity production, with a corresponding decrease in regulatory control.	*Energy*
Electric utility sector	The electric utility sector consists of privately and publicly owned establishments that generate, transmit, distribute, or sell electricity primarily for use by the public and that meet the definition of an electric utility. Non utility power producers are not included in the electric sector.	*Energy*
Electric Water Heating	Electric water heating is often done by an immersion heater fitted near the bottom of the hot water tank. The immersion heater is a metal tube containing an insulated electric resistance heater.	*Industrial*
Electric Wholesale Generator	A power producer who sells power at cost to a customer.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Electric zone	A portion of the grid controlled by the independent system operator.	*Energy*
Electrical balance of plant (eBoP)	The sum of all electrical equipment required for safe and coordinated operation of various parts of a power plant.	*Electrical*
Electrical Conductance	A measure of the ease with which a conducting current can be caused to flow through a material under the influence of an applied electric field. It is the reciprocal of resistivity and is measured in mhos (unit of conductance equal to the reciprocal of the ohm) per foot (meter). The ohm is the SI unit of electrical impedance or, in the direct current case, electrical resistance, named after Georg Simon Ohm. It is defined as the resistance between two points of a conductor when a constant potential difference of one volt, applied to these points, produces in the conductor a current of one ampere. The International System of Units (SI) is the modern form of the metric system and is generally a system devised around the convenience of the number ten.	*Petroleum Engineering*
Electrical conduction	having a measurable conductivity due to the movement of any type of charge carrier.	*Material Process*
Electrical Current Analysis	An investigation of the electric current (spectrum) of electric motors or generators. Through this analysis, irregularities (e.g. broken rotor bars, cracked end-rings, high resistance joints) are detected. Specialized tools and personnel exist for doing these investigations.	*Maintenance*
Electrical drivetrain	In the wind power industry, this term refers to the combination of the a wind turbine's generator, converter and transformer.	*Electrical*
Electrical field strength	Voltage per unit distance.	*Material Process*
Electrical grounding	To connect with the ground to make the earth part of the circuit.	*Mining*
Electrical Insulating Oil	A high-quality oxidation-resistant oil refined to give long service as a dielectric and coolant for electrical equipment, most commonly transformers. An insulating oil must resist the effects of elevated temperatures, electrical stress, and contact with air, which can lead to sludge formation and loss of insulation properties. It must be kept dry, as water is detrimental to dielectric strength – the minimum voltage required to produce an electric arc through an oil sample, as measured by test method ASTM D 877.	*Lubrication*
Electrical Interference	Electrical noise induced upon the signal wires that obscures the wanted information signal.	*Electrical*
Electrical isolation	separating two conductive materials from electrical contact; galvanized steel is sometimes electrically isolated in order to prevent rapid consumption of the zinc coating	*Materials Process*
Electrical Life	The life of a switch under a specified combination of electrical load, actuation, environment and criterion of failure. Synonymous with switch life.	*Electrical Engineering*
Electrical quiescent power	The power required for differential operation of the servovalve when the current through each coil is equal and opposite in polarity.	*Mechanical, Process, and Operations*
Electrical Resistivity	The property of material which resists the flow of electrical current measured per unit length through a cross-sectional area.	*Petroleum Engineering*
Electrical Steel	Steel that includes silicon. The silicon content allows the steel to minimize energy loss during electrical applications.	*Metallurgy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Electrical system energy losses	The amount of energy lost during generation, transmission, and distribution of electricity, including plant and unaccounted for use.	*Energy*
Electrical units -	Electrical Units - Watt = Ampere x Volt; 1,000 A = 1 Kiloampere (=kA); 1,000 V = 1 Kilovolt (= kV); 1,000 W = 1 Kilowatt (= kW); 1,000,000 W = 1,000 kW = 1Megawatt (= MW). Some examples – Voltage In a home the voltage in the outlets is normally 220 or 110 Volt. Large power transmission lines have voltages in the range of 220 - 800 kV. Power - A typical incandescent (not fluorescent) light bulb consumes 40 - 100 Watt. A normal home in North America or Europe consumes power in the range of 1 - 10 kW. A large wind power unit can generate 3,000 kW (= 3 MW). A large coal or nuclear power station can generate 500 - 4,000 MW. (Individual nuclear generating units have a capacity of 1 - 1.3 GW).	*Electrical*
Electrically poled	Polycrystalline material having a single, crystalline orientation due to the alignment of the starting powder under a strong electrical field.	*Material Process*
Electric-Arc Furnace (EAF Or EF)	An economical method of steelmaking that is energized by an electric arc flowing between two bottom electrodes. Furnace charges consist of purchased scrap.	*Metallurgy*
Electricity	A form of energy characterized by the presence and motion of elementary charged particles generated by friction, induction, or chemical change.	*Energy*
electricity (including electricity from solar energy)	electricity (including electricity from solar energy)	*Energy*
Electricity broker	An entity that arranges the sale and purchase of electric energy, the transmission of electricity, and/or other related services between buyers and sellers but does not take title to any of the power sold.	*Energy*
Electricity congestion	A condition that occurs when insufficient transmission capacity is available to implement all of the desired transactions simultaneously.	*Energy*
Electricity demand	The rate at which energy is delivered to loads and scheduling points by generation, transmission, and distribution facilities.	*Energy*
Electricity generation	The process of producing electric energy or the amount of electric energy produced by transforming other forms of energy, commonly expressed in kilowatt hours(kWh) or megawatt hours (MWh).	*Energy*
Electricity generation, gross	Electricity generation, gross: See Gross generation.	*Energy*
Electricity generation, net	Electricity generation, net: See Net generation.	*Energy*
Electricity only plant	A plant designed to produce electricity only. See also Combined heat and power (CHP) plant.	*Energy*
Electricity paid by household	The household paid the electric utility company directly for all household uses of electricity (such as water heating, space heating, air-conditioning, cooking, lighting, and operating appliances.) Bills paid by a third party are not counted as paid by the household.	*Energy*
Electricity sales	The amount of kilowatt hours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. "Other" sales include sales for public street and highway lighting and other sales to public authorities, sales to railroads and railways, and interdepartmental sales.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Electricity storage	Electricity is difficult to store. The most effective way to store surplus electricity in terms of cost and environmental impact is to use it to pump water uphill into the reservoirs of hydropower plants, a process known as pumped storage. Alternatives include large-scale batteries.	*Electrical*
Electrochemical cell	System providing for connected anodic and cathodic electrode reactions.	*Material Process*
Electrochemical Cell	An electrochemical system consisting of an anode and a cathode in metallic contact and immersed in an electrolyte. (The anode and cathode may be different metals or dissimilar areas on the same metal surface.	*Paint and Coatings*
Electrochemical process	The direct process end use in which electricity is used to cause a chemical transformation. Major uses of electrochemical process occur in the aluminum industry in which alumina is reduced to molten aluminum metal and oxygen, and in the alkalies and chlorine industry, in which brine is separated into caustic soda, chlorine, and hydrogen.	*Energy*
Electrode	Conductor that carries an electrical charge.	*Chemical Engineering*
Electrode	Electrode—See Isopotential point.	*Electronic Process*
Electrode Potential (E)	The difference in potential established between an electrode and a solution when the electrode is immersed in the solution.	*General Engineering*
Electro-hydraulic servo valve	A directional type valve which receives a variable or controlled electrical signal and which controls or meters hydraulic flow.	*Mechanical, Process, and Operations*
Electroless Nickel	A relatively thin, hard coating that can be applied to threads and deposited uniformly. Bright metallic in appearance this coating has excellent resistance to wear and corrosion.	*Maintenance*
Electroless Nickel	The autocatalytic deposition of nickel/phosphorous and nickel/boron have many useful corrosion and tribo/corrosion applications. Unlike the electrolytic processes, they produce a deposit with completely uniform coverage. In the case of Ni P, deposits around 25 to 50 microns thick with a hardness of about 500Hv is obtained, but thermal ageing at temperatures around 400°C can develop hardness values in excess of 1000Hv.	*Paint and Coatings*
Electroless nickel plating	A plating process which requires no external electrical power and is the result of a chemical reaction between the part and the plating solution. A uniform consistent deposit and plating rate can be produced by controlling and adjusting the chemistry of the plating bath.	*Mechanical*
Electroluminescence	Luminescence caused by electrons.	*Material Process*
Electrolysis	Production of chemical changes of the electrolyte by the passage of current through an electrochemical cell.	*Paint and Coatings*
Electrolysis	An electric current is passed through a solution containing dissolved metals, causing the metals to be deposited onto a cathode.	*Mining*
Electrolyte	A chemical compound that dissociates or ionizes in water to produce a solution that will conduct an electric current; an acid, base, or salt.	*Chemical Engineering*
Electrolyte	A conducting medium in which the flow of current is accompanied by movement of matter. A substance that is capable of forming a conducting liquid medium when dissolved or melted.	*Paint and Coatings*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Electrolytic refining	The process of purifying metal ingots that are suspended as anodes in an electrolytic bath, alternated with refined sheets of the same metal which act as starters or cathodes.	*Mining*
Electromagnetic Compatibility	The ability of electronic equipment to be a "good electromagnetic neighbor": It neither causes, nor is susceptible to, electromagnetic interference (within the limits of applicable standards).	*Electrical Engineering*
Electromagnetic fields	All stationary charged particles are surrounded by an electric field (measured in volts/meter). Charged particles in motion (e.g., electrons in an electrical current) are also surrounded by a magnetic field (measured in amps/meter). The combination of an electric field (around the charged particles) and the magnetic field (generated when the charged particles flow) is known as an electromagnetic field (sometimes abbreviated to EMF). Radio waves are a form of electromagnetic radiation. Note - the terms "electric field" and "magnetic field" are not interchangeable.	*Electrical*
Electromagnetic Interference	Unwanted noise from electromagnetic radiation.	*Electrical Engineering*
Electromotive Force (emf)	The potential difference between the two electrodes in a cell. The cell emf is the cell voltage measured when no current is flowing through the cell. It can be measured by means of a pH meter with high input impedance.	*Electrical*
Electromotive force series	Systematic listing of half cell reaction voltages.	*Material Process*
Electromotive Force Series (EMF Series)	A list of elements arranged according to their standard electrode potentials, with "noble" metals such as gold being positive and "active" metals such as zinc being negative.	*Paint and Coatings*
Electron	Negatively charged subatomic particle located in an orbital about a positively charged nucleus.	*Material Process*
Electron acceptor	a chemical entity that accepts electrons transferred to it from another compound. It is an oxidizing agent that, by virtue of its accepting electrons, is itself reduced in the process. See also terminal electron acceptor and oxidation-reduction.	*Chemical*
Electron cloud	Assembly of delocalized electrons in a metallic solid. Electron gas.	*Material Process*
Electron density	Concentration of negative charge in an electron orbital.	*Material Process*
Electron donor	a chemical entity that donates electrons to another compound. It is a reducing agent that, by virtue of its donating electrons, is itself oxidized in the process. (see also electron acceptor and oxidation-reduction.)	*Chemical*
Electron hole	Missing electron in an electron cloud. a charge carrier with an effective positive charge.	*Material Process*
Electron hole pair	Two charge carriers produced when an electron is promoted to the conduction band, leaving behind an electron hole in the valence band.	*Material Process*
Electron orbital	Location of negative charge about a positive nucleus in an atom.	*Material Process*
Electron sharing	Basis of the covalent bond.	*Material Process*
Electron spectroscopy for chemical analysis (ESCA)	X-ray photoelectron spectroscopy (XPS). Chemical analysis by the use of characteristic energy photoelectrons produced by exposure to X-ray photons.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Electron spin	Relativistic effect associated with the intrinsic angular momentum of an electron. For simplicity, can be likened to the motion of a spinning planet.	*Material Process*
Electron transfer	Basis of the ionic bond.	*Material Process*
Electronegative material	is one or more electrons short of filling its outermost sublevel	*Physics*
Electronegativity	the ability of an atom in a covalent bond to attract electrons to itself	*Physics*
Electronegativity	The ability of an atom to attract electrons to itself.	*Material Process*
Electroneutrality condition	Condition that states that the sum of charges in a control volume in an electrolyte should be zero.	*Chemical*
Electronic	Industrial application of high frequency electric current.	*Material Process*
Electronic Brake-Force Distribution	Operates in conjunction with ABS to balance the force applied to brakes at front and rear wheels. Can prevent over-braking, improve brake-pad life, reduce "brake fade" caused by excessive heat, and ensure peak braking efficiency in all conditions.	*Mechanical Engineering*
Electronic ceramic	Ceramic material with an engineering application predominantly based on its electronic properties.	*Material Process*
Electronic conduction	Having a measurable conductivity due specifically to the movement of electrons.	*Material Process*
Electronic Data Interchange (EDI)	(EDI) links-Information-system linkages, based on communication protocols and document formats, which permit inter-company computer-to-computer communications. EDI links not only speed communication, but also eliminate re-keying of information and reduces the opportunity to introduce errors. A typical EDI application might speed information exchange between a customer and supplier company for purchase orders, invoices, or other transactions. EDI communications are often facilitated through "electronic mailbox" systems on third-party value-added networks.	*Maintenance*
Electronic Fuel Injection System	A system that injects fuel into the engine and includes an electronic control unit to time and meter the fuel flow.	*Mechanical Engineering*
Electronic Ignition System	An ignition system that uses transistors and other semiconductor devices as an electronic switch to turn the primary current on and off.	*Mechanical Engineering*
Electronic Industries Association (EIA)	A standards organization specializing in the electrical and functional characteristics of interface equipment.	*General Engineering*
Electronic Materials	materials that possess the ability to conduct electrons, such as semiconductors	*Physics*
Electronic optical and magnetic materials	Those engineering materials used primarily for their electronic, optical, or magnetic properties.	*Material Process*
Electronic polymer	A linear polymer with alternating single and double bonds. The extra electrons associated with the double bonds are relatively conductive.	*Material Process*
Electrons in covalent bonds are most likely to be found....	between the two nuclei	*Physics*
Electroosmosis	Onset of a flow due to the application of an external electric field or due to the formation of an electric field created by ion transport in membranes.	*Chemical*

Term	Definition	*Industry*
Electroosmosis	Onset of a flow due to the application of an external electric field or due to the formation of an electric field created by ion transport in membranes.	*Chemical Engineering*
Electrophoresis	Migration of charged electrolyte ions in an electric field.	*Chemical*
Electroplating	Metal build up at the cathode of an electrochemical cell.	*Material Process*
Electroplating	The electrodeposition of an adherent metallic coating upon an electrode for the purpose of securing a surface with properties or dimensions different from those of the substrate material.	*Paint and Coatings*
Electropneumatic	A type of digital valve positioner that receives an analog signal and converts it to a pneumatic output. That output is used to drive an actuator, which in turn opens or closes a control valve.	*Mechanical*
Electropositive Material	has one or more extra electrons beyond its last completed sublevel	*Physics*
Electrostatic Discharge	Release of stored static electricity. Most commonly the potentially damaging discharge of many thousands of volts that occurs when an electronic device is touched by a charged body.	*Electrical Engineering*
Electrostatic Discharge	Release of stored static electricity. Most commonly the potentially damaging discharge of many thousands of volts that occurs when an electronic device is touched by a charged body.	*Electrical Engineering*
Electrostatic Printer	Sensitized drum attracts toner which is transferred to media.	*Gears*
Electrostatic separator	A separator that removes contaminant from dielectric fluids by applying an electrical charge to the contaminant that is then attracted to a collection device of different electrical charge.	*Oil Analysis*
Element	The device that performs the filtration.	*Filtration*
Element	A component of a device or system.	*Process Control*
Element (Cartridge)	The porous device that performs the actual process of filtration.	*Oil Analysis*
Element (cartridge)	The porous device which performs the actual process of filtration.	*Mechanical, Process, and Operations*
Elements	Substances that cannot be divided into smaller units without nuclear destruction.	*Chemical Engineering*
Elemi	An aromatic balsamic, resinous gum used in some lacquers because of its elasticity and adhesive properties.	*Material Process*
Elevator	A hinged mechanism that is closed around the drill pipe, or other drill string components, to facilitate lowering them into or lifting them out of the wellbore.	*Petroleum Drilling*
Eligibility Date	the date used by the NLRB to determine the eligibility of employees to vote in a representation election.	*Industrial Relations*
Eligibility for Union Membership	most unions permit membership to those employees in the trade, occupation, or plant who pay their initiation fees and dues and live up to the union constitution and bylaws.	*Industrial Relations*
Eligibility List	a list generally used by civil service agencies to determine, after written or oral examination, those eligible to be hired in certain categories.	*Industrial Relations*
Eligibility Stickers to Vote	the Wagner Act was silent on this matter. The Taft-Hartley Act, however, provided that employees on strike who are not entitled to reinstatement "shall not be eligible to vote".	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Eliminator	(See Drift Eliminator).	*Facility Engineering*
Eliminator baffle	(See Eliminator Board).	*Facility Engineering*
Eliminator board	The smallest component in a wood drift eliminator assembly which is usually installed in a fixed position at an angle to the direction of air flow. Also known as Eliminator Baffle (Blade).	*Facility Engineering*
ELL	A pipe or tubing fitting that has the shape of an "L." See "Elbow."	*Mechanical*
Elliott	a hand operated drilling machine for drilling shot holes in hard coal or rock.	*Mining*
Elongation	The fractional increase in length of a material stressed in tension.	*Electrical*
ELTC	Engine Lubricant Technical Committee (CEC)	*Petro-Chemical Abbreviations*
Elution	The process of using a solvent (eluent) to remove select ions (e.g., uranium) from an adsorbent such as ion-exchange resins.	*Energy*
Elytra	The anterior leathery or chitinous wings of beetles and leafhoppers; serve as coverings to the hind wings and commonly meet at rest in a straight line down the middle of the dorsum.	*Forestry*
EM survey	A geophysical survey method which measures the electromagnetic properties of rocks.	*Mining*
EMA	Engine Manufacturers Association	*Petro-Chemical Abbreviations*
EMAG	See Editorial Management Advisory Group (EMAG)	*Quality Engineering*
EMBASE	Excerpta Medica database. A major European database of medical and health research.	*Quality Engineering*
Embedded Cost	A utility's average cost of doing business, which includes the costs of fuel, personnel, plants, poles, and wires.	*Energy*
Embedded System	A system in which the computer (generally a microcontroller or microprocessor) is included as an integral part of the system.	*Electrical Engineering*
Embedment	Localized plastic deformation which occurs in the vicinity of clamped fasteners or in the fastener threads. Embedding is local plastic deformations that occur under the nut face, in the joint faces and in the threads as a result of plastic flattening of the surface roughness. This occurs even when the loading is below the yield point of the bolt or limiting surface pressure of the joint material and is the result of the real area of contact between surfaces being less than the apparent area.	*Maintenance*
Embossing	A means of marker identification by means of thermal indentation leaving raised lettering on the sheath material of cable.	*Electrical*
Embrittlement	reduction in the normal ductility of a metal due to a physical or chemical change that may occur when cold-worked steel is immersed in molten zinc in the galvanizing kettle	*Materials Process*
Emergency	The failure of an electric power system to generate or deliver electric power as normally intended, resulting in the cut-off or curtailment of service.	*Energy*
Emergency backup generation	The use of electric generators only during interruptions of normal power supply.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Emergency Board	a board established under Section 10 of the Railway Labor Act after the procedures of the Act have been followed without agreement between the carrier and the employees.	*Industrial Relations*
Emergency energy	Electric energy provided for a limited duration, intended only for use during emergency conditions.	*Energy*
Emergency Maintenance Task	A Maintenance Task Carried Out In Order To Avert An Immediate Safety Or Environmental Hazard, Or To Correct A Failure With Significant Economic Impact.	*Plant Engineering*
Emergency Pull Cord	Vinyl coated cord that runs along the side of the conveyor that can be pulled at any time to stop the conveyor. Used with an Emergency Stop Switch.	*Manufacturing*
Emergency response plan (ERP)	ERPs are pre-planned responses to incidents to ensure protection of public health, safety, property and the environment and quick and effective responses.	*Petroleum Engineering*
Emergency seat seal	A fitting on the valve body through which sealant can be injected to effect a seat seal in an emergency situation.	*General Mechanical*
Emergency Shut Down Valve (ESD)	A valve that uses energy which is stored in the actuator to close rapidly in an emergency.	*Industrial Engineering*
Emergency Stop Switch	Electrical device used to stop the conveyor in an emergency. Used with an Emergency Pull Cord.	*Manufacturing*
Emergency Work	occasionally has reference to work provided during serious periods of unemployment in order to meet the needs of the community.	*Industrial Relations*
Emerson Efficiency Plan	a wage incentive system developed by Harrington Emerson which pays the day rate to the worker until he reaches the standard.	*Industrial Relations*
EMF	A rise in (electrical) potential energy. The principal unit is the volt.	*Electrical*
EMI	Electromagnetic interference.	*Electrical*
EMI	EMI - Electromagnetic interference.	*Electronic Process*
Emission	The emissions of a heating system are products of combustion that are discharged into the atmosphere through the chimney together with the flue gas.	*Thermal Management*
Emission spectrometer	Works on the basis that atoms of metallic and other particular elements emit light at characteristic wavelengths when they are excited in a flame, arc, or spark. Excited light is directed through an entrance slit in the spectrometer. This light penetrates the slit, falls on a grate, and is dispersed and reflected. The spectrometer is calibrated by a series of standard samples containing known amounts of the elements of interest. By exciting these standard samples, an analytical curve can be established which gives the relationship between the light intensity and its concentration in the fluid.	*Oil Analysis*
Emissions	The release or discharge of substances, effluents or pollutants into the environment.	*Electrical*
Emissions (Mobile Sources)	The combustion of fuel leads to the emission of exhaust gases that may be regarded as pollutants. Water and CO2 are not included in this category but CO, NOx and hydrocarbons are subject to legislative control. All three are emitted by gasoline engines; diesel engines also emit particulates that are controlled.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Emissions (Stationary Sources)	Fuel composition can influence emissions of sulfur oxides and particulates from power stations. Local authorities control the sulfur content of heavy fuel oils used in such applications.	*Lubrication*
Emissions coefficient	A unique value for scaling emissions to activity data in terms of a standard rate of emissions per unit of activity (e.g., pounds of carbon dioxide emitted per Btu of fossil fuel consumed).	*Energy*
Emissivity	The ratio of energy emitted by an object to the energy emitted by a blackbody at the same temperature. The emissivity of an object depends upon its material and surface texture; a polished metal surface can have an emissivity around 0.2 and a piece of wood can have an emissivity around 0.95.	*General Engineering*
Emitter	Region in a transistor that serves as the source of charge carriers.	*Material Process*
EMO –	Electric Motor Operated—The acuation of a valve by electric motor. See "Power Operator."	*Mechanical*
Empirical	Empirical results are based on observation rather than on reasoning alone.	*Quality Engineering*
Empirical	relying upon or gained from experiment or observation.	*Chemical*
Employ	to hire or make use of someone's service.	*Industrial Relations*
Employable	those persons in the population who are able to work and are within certain age limits.	*Industrial Relations*
Employee	a person in a gainful occupation who performs any work during the week when a census or other check is made.	*Industrial Relations*
Employee Associations	groups of workers organized in a single plant or establishment for the purpose of meeting common objectives.	*Industrial Relations*
Employee Benefits	nonwage aids instituted to meet some of the problems of insecurity of workers and at the same time to build better morale in the plant.	*Industrial Relations*
Employee Evaluation	the procedure used to determine an individual's fitness and qualifications for a particular job.	*Industrial Relations*
Employee Handbook	a booklet provided by employers to new employees as part of the orientation program.	*Industrial Relations*
Employee Magazine	a general medium for communication with employees in the plant.	*Industrial Relations*
Employee Representation Plan	programs designed to provide some sense of participation by employees in a particular company.	*Industrial Relations*
Employee Requisition	a procedure used in some companies whereby departments request the personnel office or Division to supply the personnel needs of the operating system.	*Industrial Relations*
Employee Rule Book	a booklet setting forth company rules or detailed information on company procedures.	*Industrial Relations*
Employee Stock Ownership Plan	plan designed to give workers a sense of participation in management of a company.	*Industrial Relations*
Employee Unit	the group of employees determined by the NLRB or a state board.	*Industrial Relations*
Employee Wage Suit	action by a worker against an employer for the recovery of unpaid wages, usually under the Fair Labor Standards Act.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Employees' Annual Report Company	a report directed primarily to the worker in the plant, in language which he can comprehend and which avoids the technical language of finance or accounting, intended to give him some understanding of the operations of the company.	*Industrial Relations*
Employees' Club	a group or association set up within a company or plant whose functions are primarily social and recreational, and generally open to all employees.	*Industrial Relations*
Employer	generally a person, association, or corporation having workers in its employ.	*Industrial Relations*
Employer Association	a group or organization sponsored or supported by employers primarily for the purpose of presenting a united front in dealing with organized employees.	*Industrial Relations*
Employer Petition	a formal request by an employer to the NLRB or a state board requesting the holding of an election to determine the representative, if any, to be recognized for collective bargaining purposes in the plant, or for a smaller unit within the plant.	*Industrial Relations*
Employer Reserve Plan	unemployment tax payments based on the merit rating of the employer.	*Industrial Relations*
Employer Rights	those prerogatives and activities relating to the operation and management of a business which the employer feels are not subject to collective bargaining.	*Industrial Relations*
Employer-Employee Relations	refers to the entire gamut of relationships that exist in, or arise out of, employment of workers by an employer.	*Industrial Relations*
Employer's Final Offer	a procedure set forth in the Taft-Hartley Act as part of the handling of national emergency disputes which assumes that if employees are familiar with the employer's last offer, and have an opportunity to vote by secret ballot in an election conducted, they are likely to accept the offer.	*Industrial Relations*
Employer's Liability	statutes which determine the circumstances under which employers are subject or liable for damages for injuries received by their employees.	*Industrial Relations*
Employer's Liability Insurance	policies taken out by employers to cover industrial accidents which might occur to employees or to outsiders during employment.	*Industrial Relations*
Employment Act of 1946	a federal statute declaring that the government has the responsibility to promote employment opportunities.	*Industrial Relations*
Employment Agencies	organizations established for the purpose of bringing together employers having employment opportunities and workers in need of employment.	*Industrial Relations*
Employment Application	a form used by most companies to determine the qualifications and background of the applicant's employment.	*Industrial Relations*
Employment Contract	the relationship created when an employer hires an employee to perform work.	*Industrial Relations*
Employment Controls	generally applies to those regulations issued during periods of war emergency when the government is seeking to mobilize its manpower into channels producing goods and services for the war effort.	*Industrial Relations*
Employment Division	that section of the personnel department of a large company which handles recruitment and placement.	*Industrial Relations*
Employment Forecasting	projecting for either short or long periods estimates of total employment in a particular industry, region, state, or country.	*Industrial Relations*
Employment Guarantee	a system or plan designed to provide steady employment during the year by assuring a certain number of weeks of work.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Employment History	the individual personnel record of each employee which contains the most important information about the worker.	*Industrial Relations*
Employment Interview	one of the most used techniques in th selection of employees.	*Industrial Relations*
Employment Manager	sometimes used interchangeably with personnel director or personnel manager.	*Industrial Relations*
Employment Stabilization	refers to efforts on the part of employers, employees, and government to achieve greater regularity or stability in employment.	*Industrial Relations*
Employment Statistics	data published by government and private agencies embodying attempts to estimate the total labor force, employment, and unemployment.	*Industrial Relations*
Empowered natural work teams	Teams that share a common workspace and/or responsibility for a particular process or process segment. Typically such teams have clearly defined goals and objectives related to day-to-day production activities, such as quality assurance and meeting production schedules, as well as authority to plan and implement process improvements. Unlike self-directed teams, empowered work teams typically do not assume traditional "supervisory" roles.	*Quality*
EMS Energy Management System	EMS: Energy Management System	*Energy*
Emulsibility	The ability of a non-water-soluble fluid to form an emulsion with water.	*Oil Analysis*
Emulsifier	An emulsifier (or emulsifying agent) is a substance which can be used to produce an emulsion out of two liquids that normally cannot be mixed together (such as oil and water). Emulsifiers are common in foods to maintain consistency within puddings, powders, etc.	*Chemical*
Emulsifier	An emulsifier (or emulsifying agent) is a substance which can be used to produce an emulsion out of two liquids that normally cannot be mixed together (such as oil and water). Emulsifiers are common in foods to maintain consistency within puddings, powders, etc.	*Chemical Engineering*
Emulsifier or emulsifying agent	A substance used to produce an emulsion of two or more immiscible liquids.	*Material Process*
Emulsion	A dispersion of one liquid in another with which it is not miscible. The particles are larger than colloidal size and an emulsifying agent must be added to keep them in suspension.	*Material Process*
Emulsion	A dispersion of small oil particles in a solution.	*Chemistry*
Emulsion, Oil in water	A dispersion of oil in a continuous phase of water. EMULSION, WATER IN OIL - A dispersion of water in a continuous phase of oil.	*Mechanical, Process, and Operations*
En echelon	Roughly parallel but staggered structures.	*Mining*
Enable	The opposite of disable. To allow output in response to an input signal. We often speak of one light source - photoreceiver pair (the "gating" pair) enabling a second pair (the "inspect" pair).	*Electrical Engineering*
Enabling Legislation	a statute passed by a State legislature which makes is possible to receive certain benefits under a federal law, or generally, any act which removes a restriction or disability.	*Industrial Relations*
Enamel	Glass coating on a metal substrate.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	Industry
Enclosed Switch	A basic switch unit (contact block) enclosed in a durable metal housing. The enclosure protects the switching unit, provides mounting means, and fitting for conduit connection.	*Electrical Engineering*
Enclosure	A housing for components. ENERGY - The capacity for doing work. (See Joule.)	*Mechanical, Process, and Operations*
Enclosure	A rectangle drawn around a graphical component or components to indicate the limits of an assembly.	*Mechanical, Process, and Operations*
End (of the coal)	In driving roads parallel to the 'cleat' or 'grain' of the coal, they are said to be 'on the end of the coal'.	*Mining*
End bevel	Weld end preparations for butt welding. Governed by ANSI B31.4 & B16.25.	*Mechanical*
End cap	A ported or closed cover for the end of a filter element.	*Oil Analysis*
End Connection	The configuration provided to make a pressure-tight joint to the pipe carrying the fluid being controlled. The most common of these connections are threaded, flanged, or welded.	*Industrial Engineering*
End connection	The type of connection supplied on the ends of a valve which allows it to be connected to piping—may be weld end, flanged end, threaded or socket weld.	*General Mechanical*
End face	a face advancing in approximately the same direction as the line of the main cleat. Also called a 'headways face'	*Mining*
End Lines	The lines bounding the ends of a claim.	*Mining*
End Point	Highest vapor temperature recorded during a distillation test of a petroleum stock.	*Lubrication*
End Point (Potentiometric)	The apparent equivalence point of a titration at which a relatively large potential change is observed.	*Electronic Process*
End Points	The end points of a full scale calibration curve.	*General Engineering*
End Points	Outputs at the specified upper and lower limits of the Range.	*Electrical Engineering*
End Preparation	The treatment of the end of a length of wire rope designed primarily as an aid for pulling the rope through a reeving system or tight drum opening. Unlike END TERMINATIONS, these are not designed for use as a method for making a permanent connection.	*Wire Rope & Cable*
End Preparation	End Preparation. The contour prepared on the end of a pipe, fitting, or nozzle for welding. The particular preparation is prescribed by the governing code.	*Maintenance and Repair*
End Termination	The treatment at the end or ends of a length of wire rope, usually made by forming an eye or attaching a fitting and designed to be the permanent end termination on the wire rope that connects it to the load.	*Wire Rope & Cable*
End user	A firm or individual that purchases products for its own consumption and not for resale (i.e., an ultimate consumer).	*Energy*
End wall	The wall on the end of the tower structure.	*Facility Engineering*
Endangered species	Condition that occurs when the total number of a species may not be sufficient to reproduce enough offspring to ensure its survival.	*Forestry*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ending stocks	Primary stocks of crude oil and petroleum products held in storage as of 12 midnight on the last day of the month. Primary stocks include crude oil or petroleum products held in storage at (or in) leases, refineries, natural gas processing plants, pipelines, tank farms, and bulk terminals that can store at least 50,000 barrels of petroleum products or that can receive petroleum products by tanker, barge, or pipeline. Crude oil that is in-transit by water from Alaska or that is stored on Federal leases or in the Strategic Petroleum Reserve is included. Primary Stocks exclude stocks of foreign origin that are held in bonded warehouse storage.	*Energy*
Endings	narrow strike roadways in coal in the 'Narrow' system of working; or the extreme boundaries of a mine. (Yorks.).	*Mining*
Endless Loop	see Loop, Endless	*General*
Endless Rope	Rope with ends spliced together to form a single continuous loop.	*Wire Rope & Cable*
Endless rope haulage	a system of haulage, normally double track, employing a moving endless rope to which the tubs are clipped either individually or in sets.	*Mining*
Endosperm	Triploid tissue of seeds composed mostly of starch-containing cells, that arises from the fusion of a sperm nucleus with two polar nuclei of the embryo sac. In some seeds, the endosperm persists as a storage tissue and is used to nourish the germinating seedling.	*Agriculture*
Endothermic	A process is said to be endothermic when it absorbs heat.	*Electrical*
Endpoint	See Outcome	*Quality Engineering*
End-Use	The specific purpose for which electric is consumed (I.e. heating, cooling, cooking, etc.).	*Energy*
Endways, Ends or Headways	headings driven in the direction of the cleat, or driving 'on the end'.	*Mining*
Energy	The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic energy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatt hours, while heat energy is usually measured in British thermal units (Btu).	*Energy*
Energy	Three types of energy are available in modern hydraulics (of the normal hydrostatic pipe). 1. Potential Energy - Pressure energy. The static energy of oil which is standing but is pressurized and ready to do work. Example: oil in a loaded accumulator. 2. Heat Energy - Friction or resistance to flow. (An energy loss in terms of output.) Example: friction between moving oil and the confines of lines or passages produces heat energy. 3. Kinetic Energy - The energy of the moving liquid. Varies with the velocity (speed) of the liquid.	*Mechanical, Process, and Operations*
Energy assistance program	See Low Income Home Energy Assistance Program.	*Energy*
Energy audit	A program carried out by a utility company in which an auditor inspects a home and suggests ways energy can be saved.	*Energy*

Term	Definition	*Industry*
Energy band	A range of electron energies in a solid associated with an energy level in an isolated atom.	*Material Process*
Energy band gap	Range of electron energies above the valence band and below the conduction band.	*Material Process*
Energy broker system	Introduced into Florida by the Public Service Commission, the energy broker system is a system for exchanging information that allows utilities to efficiently exchange hourly quotations of prices at which each is willing to buy and sell electric energy. For the broker system to operate, utility systems must have in place bilateral agreements between all potential parties, must have transmission arrangements between all potential parties, and must have transmission arrangements that allow the exchanges to take place.	*Energy*
Energy charge	That portion of the charge for electric service based upon the electric energy (kWh) consumed or billed.	*Energy*
Energy Charge	The amount of money owed by an electric customer for kilowatt-hours consumed.	*Energy*
Energy conservation features	This includes building shell conservation features, HVAC conservation features, lighting conservation features, any conservation features, and other conservation features incorporated by the building. However, this category does not include any demand-side management (DSM) program participation by the building. Any DSM program participation is included in the DSM Programs.	*Energy*
Energy Conservation	Actions that are taken to reduce or manage energy consumption in a cost-effective and efficient manner. Methods of reducing energy include using insulation, increasing energy efficiency and changing patterns of use.	*Energy*
Energy consumption	The use of energy as a source of heat or power or as a raw material input to a manufacturing process.	*Energy*
Energy Consumption	The amount of energy consumed in the form in which it is acquired by the user. The term excludes electrical generation and distribution losses.	*Energy*
Energy cost effectiveness	This is a key performance indicator used to judge the productivity of a proves in terms of financial gain per unit of energy consumed.	*Electrical*
Energy Costs	Costs, such as for fuel, that are related to and vary with energy production or consumption.	*Energy*
Energy Deliveries	Energy generated by one system delivered to another system.	*Energy*
Energy demand	The requirement for energy as an input to provide products and/or services.	*Energy*
Energy dispersive	X-ray spectrometry (EDX) Chemical analysis by the use of characteristic x-ray photon produced by exposure to high energy electrons.	*Material Process*
Energy Effects	: Changes at the consumer meter that reflect activities undertaken in response to utility-administered programs.	*Energy*
Energy efficiency	Defined as output energy divided by input energy, and, if necessary, averaged over time. The electrical efficiency of an appliance is defined as the amount of that energy that is converted into a useful form, divided by the total energy it draws. For example, an incandescent light bulb (one with a filament inside the bulb) is said to be inefficient because much of the energy it uses (around 95 percent) is converted into heat rather than light. A fluorescent lamp that works on a different principle is somewhat more efficient because more of the energy it uses is converted into light and less is lost as heat (around 80 percent).	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Energy Efficiency Programs	Refers to programs that are aimed at reducing the energy used by specific end-use devices and systems, typically without affecting the services provided. These programs reduce overall electricity consumption (reported in megawatt or kilowatt hours), often without explicit consideration for the timing of program-induced savings. Such savings are generally achieved by substituting technically more advanced equipment to produce the same level of end-use services (e.g. lighting, heating, motor drive) with less electricity. Examples include high-efficiency appliances, efficient lighting programs, high-efficiency heating, ventilating and air conditioning (HVAC) systems or control modifications, efficient building design, advanced electric motor drives, and heat recovery systems.	*Energy*
Energy Efficiency	Programs that reduce consumption.	*Energy*
Energy efficiency, Electricity	Refers to programs that are aimed at reducing the energy used by specific end-use devices and systems, typically without affecting the services provided. These programs reduce overall electricity consumption (reported in megawatt hours), often without explicit consideration for the timing of program-induced savings. Such savings are generally achieved by substituting technologically more advanced equipment to produce the same level of end-use services (e.g. lighting, heating, motor drive) with less electricity. Examples include high-efficiency appliances, efficient lighting programs, high-efficiency heating, ventilating and air conditioning (HVAC) systems or control modifications, efficient building design, advanced electric motor drives, and heat recovery systems.	*Energy*
Energy efficient motors	Are also known as "high-efficiency motors" and "premium motors." They are virtually interchangeable with standard motors, but differences in construction make them more energy efficient.	*Energy*
Energy exchange	Any transaction in which quantities of energy are received or given up in return for similar energy products. See exchange, electricity; exchange, petroleum; and exchange, natural gas.	*Energy*
Energy expenditures	The money directly spent by consumers to purchase energy. Expenditures equal the amount of energy used by the consumer multiplied by the price per unit paid by the consumer.	*Energy*
Energy Harvesting	Energy harvesting (also known as power harvesting or energy scavenging) is the process in which energy is captured from a system's environment and converted into usable electric power. Energy harvesting allows electronics to operate where there's no conventional power source, eliminating the need to run wires or make frequent visits to replace batteries. An energy harvesting system generally includes circuitry to charge an energy storage cell, and manage the power, providing regulation and protection.	*Electrical Engineering*
Energy information	Includes (A) all information in whatever form on fuel reserves, extraction, and energy resources (including petrochemical feedstocks) wherever located; production, distribution, and consumption of energy and fuels wherever carried on; and (B) matters relating to energy and fuels, such as corporate structure and proprietary relationships, costs, prices, capital investment, and assets, and other matters directly related there to, wherever they exist.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Energy Information Administration (EIA)	An independent agency within the U.S. Department of Energy that develops surveys, collects energy data, and does analytical and modeling analyses of energy issues. The Agency must satisfy the requests of Congress, other elements within the Department of Energy, Federal Energy Regulatory Commission, the Executive Branch, its own independent needs, and assist the general public, or other interest groups, without taking a policy position.	*Energy*
Energy Intensity	A ratio of energy consumption to another metric, typically national gross domestic product in the case of a country's energy intensity. Sector-specific intensities may refer to energy consumption per household, per unit of commercial floorspace, per dollar value industrial shipment, or another metric indicative of a sector. Improvements in energy intensity include energy efficiency and conservation as well as structural factors not related to technology or behavior.	*Energy*
Energy intensity (Commercial Buildings Energy Consumption Survey)	The ratio of consumption to floor space.	*Energy*
Energy level	Fixed binding energy between an electron and its nucleus.	*Material Process*
Energy loss	Deleted because there is no need for a general term to encompass all forms of energy loss. Terms referring to losses specific to particular energy sources are defined separately.	*Energy*
Energy loss	Area contained within the hysteresis loop of a ferromagnetic material.	*Material Process*
Energy loss (power)	Energy loss (power): See Power loss.	*Energy*
Energy management and control system (EMCS)	An energy conservation feature that uses mini/microcomputers, instrumentation, control equipment, and software to manage a building's use of energy for heating, ventilation, air conditioning, lighting, and/or business-related processes. These systems can also manage fire control, safety, and security. Not included as EMCS are time-clock thermostats.	*Energy*
Energy management practices	Involvement, as a part of the building's normal operations, in energy efficiency programs that are designed to reduce the energy used by specific end-use systems. This includes the following EMCS, DSM Program Participation, Energy Audit, and a Building Energy Manager.	*Energy*
Energy performance certificate	The energy performance certificate shows the energy efficiency of a building. It contains all relevant energy data of a building.	*Thermal Management*
Energy Policy Act of 1992	This act which was the first comprehensive federal energy law promulgated in more than a decade will help create a more competitive U.S. electric power marketplace by removing barriers to competition. By doing so, this act allows a broad spectrum of independent energy producers to compete in wholesale electric power markets. The act also made significant changes in the way power transmission grids are regulated. Specifically, the law gives the Federal Energy Regulatory Commission the authority to order electric utilities to provide access to their transmission facilities to other power suppliers.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Energy Policy Act of 1992 (EPACT)	This legislation creates a new class of power generators, exempt wholesale generators, that are exempt from the provisions of the Public Holding Company Act of 1935 and grants the authority to the Federal Energy Regulatory Commission to order and condition access by eligible parties to the interconnected transmission grid.	*Energy*
Energy production	See production terms associated with specific energy types.	*Energy*
Energy Receipts	Energy generated by one utility system that is received by another through transmission lines.	*Energy*
Energy reserves	Estimated quantities of energy sources that are demonstrated to exist with reasonable certainty on the basis of geologic and engineering data (proved reserves) or that can reasonably be expected to exist on the basis of geologic evidence that supports projections from proved reserves (probable/indicated reserves). Knowledge of the location, quantity, and grade of probable/indicated reserves is generally incomplete or much less certain than it is for proved energy reserves. Note: This term is equivalent to "Demonstrated Reserves" as defined in the resource/reserve classification contained in the U.S. Geological Survey Circular 831,1980. Demonstrated reserves include measured and indicated reserves but exclude inferred reserves.	*Energy*
Energy Reserves	The portion of total energy resources that is known and can be recovered with presently available technology at an affordable cost.	*Energy*
Energy Resources	Everything that could be used by society as a source of energy.	*Energy*
Energy sale(s)	The transfer of title to an energy commodity from a seller to a buyer for a price or the quantity transferred during a specified period.	*Energy*
Energy savings	A reduction in the amount of electricity used by end users as a result of participation in energy efficiency programs and load management programs.	*Energy*
Energy service provider	An energy entity that provides service to a retail or end-use customer.	*Energy*
Energy Services Companies (ESCOs)	ESCOs would be created in a deregulated, openly competitive electric marketplace. The Energy Services industry would be made up of power aggregators, power marketers and brokers, whose job is to match buyers and sellers, tailor both physical and financial instruments to suit the needs of particular customers, and to allow even the smallest residential customers to form buying groups or cooperatives that will give them the same bargaining power as large industrial customers.	*Energy*
Energy Services Company (ESCO)	A company offering electricity, specialized or customized energy services by providing advice and products to customers.	*Energy*
Energy source	Any substance or natural phenomenon that can be consumed or transformed to supply heat or power. Examples include petroleum, coal, natural gas, nuclear, biomass, electricity, wind, sunlight, geothermal, water movement, and hydrogen in fuel cells.	*Energy*
Energy Source	A source that provides the power to be converted to electricity.	*Energy*
Energy supplier	Fuel companies supplying electricity, natural gas, fuel oil, kerosene, or LPG (liquefied petroleum gas) to the household.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Energy supply	Energy made available for future disposition. Supply can be considered and measured from the point of view of the energy provider or the receiver.	*Energy*
Energy through Energy well	The region around the energy minimum in a bonding energy curve.	*Material Process*
Energy Use	Energy consumed during a specified time period for a specific purpose (usually expressed in kWh).	*Energy*
Energy used in the home	For electricity or natural gas, the quantity is the amount used by the household during the365- or 366-day period. For fuel oil, kerosene, and liquefied petroleum gas (LPG), the quantity consists of fuel purchased, not fuel consumed. If the level of fuel in the storage tank was the same at the beginning and end of the annual period, then the quantity consumed would be the same as the quantity purchased.	*Energy*
Energy	This is broadly defined as the capability of doing work. In the electric power industry, energy is more narrowly defined as electricity supplied over time, express in kilowatt-hours.	*Energy*
Energy-use sectors	A group of major energy-consuming components of U.S. society developed to measure and analyze energy use. The sectors most commonly referred to in EIA are: residential, commercial, industrial, transportation, and electric power.	*Energy*
Energy-weighted industrial output	The weighted sum of real output for all two-digit Standard Industrial Classification(SIC) manufacturing industries plus agriculture, construction, and mining. The weight for each industry is the ratio between the quantity of end-use energy consumption to the value of real output.	*Energy*
Enforced Membership	a procedure usually under the provisions of the collective bargaining agreement whereby all new employees were required to be or to become members of the union.	*Industrial Relations*
Enforcement of Agreement	collective bargaining agreements are generally self-enforceable.	*Industrial Relations*
Enforcement of Arbitration Agreement	the procedure available to the parties to carry out their agreement for final and binding determination of various types of labor disputes.	*Industrial Relations*
Enforcement Strike	a concerted stoppage of work for the purpose of maintaining existing conditions of employment.	*Industrial Relations*
Engel's Law	a generalization arrived at by Fredrich Engels, German economist and statistician, based on studies of Prussian family budgets.	*Industrial Relations*
Engine Deposits	Hard or persistent accumulation of sludge, varnish and carbonaceous residues due to blow-by of unburned and partially burned fuel, or the partial breakdown of the crankcase lubricant. Water from the condensation of combustion products, carbon, residues from fuel or lubricating oil additives, dust and metal particles also contribute.	*Lubrication*
Engine deposits	Hard or persistent accumulation of sludge, varnish, lacquer and carbonaceous residues due to blow-by of unburned and partially burned fuel, or the partial breakdown of the crankcase lubricant. Water from the condensation of combustion products, carbon, residues from fuel or lubricating oil additives, dust and metal particles also contribute.	*Mechanical, Process, and Operations*
Engine pit/shaft or Pumping pit	a pit or shaft, the whole or part of which was used for pumping, in which a pumping engine was placed.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Engine size	The total volume within all cylinders of an engine when pistons are at their lowest positions. The engine is usually measured in "liters" or "cubic inches of displacement (CID)." Generally, larger engines result in greater engine power, but less fuel efficiency. There are 61.024 cubic inches in a liter.	*Energy*
Engineering Design	The detailed design developed from process requirements and conforming to established design criteria, including all necessary drawings and specifications, governing a piping installation.5	*Maintenance and Repair*
Engineering polymer	Polymer with sufficient strength at a given load divided by the original stress free length.	*Material Process*
Engineering Procurement and Construction (EPC)	Term used to describe contracts in which a company assumes full responsibility for project engineering, material procurement and construction. The term is also used for companies contracted to perform these services.	*Electrical*
Engineering strain	Increase in sample length at a given load divided by the stress free length.	*Material Process*
Engineering stress	Load on a sample divided by the original stress free area.	*Material Process*
Engineering units	Units that are decided upon by an individual user or by agreement among users. Examples include inches/second, mm/s, g, Hz, Tu, etc.	*Reliability Engineering*
Engineering Work Order	The Prime Document Used To Initiate An Engineering Investigation, Engineering Design Activity Or Engineering Modifications To An Item Of Equipment.	*Plant Engineering*
Engineman	the person who operates a haulage system, i.e. operates the engine/motor.	*Mining*
English units	it is expressed in pounds per cubic foot (lb/ft3).	*Maintenance and Repair*
English Workweek	the term applied to the working practice in England in the 1920's which set the workweek at eight hours for Monday through Friday and four hours on Saturday morning.	*Industrial Relations*
Engraver	Beetle which feeds in the phloem-cambium region of woody plants, often scoring or engraving adjacent sapwood tissues.[1]	*Forestry*
Enhanced Data Rates for GSM Evolution	An enhanced modulation technique designed to increase network capacity and data rates in GSM networks. EDGE should provide data rates up to 384Kbps.	*Electrical Engineering*
Enhanced Oil Recovery	A process whereby oil is recovered other than by the natural pressure in a reservoir.	*Petroleum Drilling*
Enhanced oil recovery	A process whereby oil is recovered other than by the natural pressure in a reservoir.	*Petroleum Drilling*
Enhanced Recovery	The increased recovery from an oil pool achieved by artificial means or by the application of outside energy sources to the pool.	*Petroleum Drilling*
Enjoin	a court action designed to prevent a union from engaging in economic or strike action.	*Industrial Relations*
Enriched uranium	Uranium in which the U-235 isotope concentration has been increased to greater than the 0.711 percent U-235 (by weight) present in natural uranium.	*Energy*
Enrichment feed deliveries	Uranium that is shipped under contract to a supplier of enrichment services for use in preparing enriched uranium product to a specified U-235 concentration and that ultimately will be used as fuel in a nuclear reactor.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Enrichment tails assay	A measure of the amount of fissile uranium (U-235) remaining in the waste stream from the uranium enrichment process. The natural uranium "feed" that enters the enrichment process generally contains 0.711 percent (by weight) U-235. The "product stream" contains enriched uranium (more than 0.711 percentU-235) and the "waste" or "tails" stream contains depleted uranium (less than 0.711 percent U-235). At the historical enrichment tails assay of 0.2 percent, the waste stream would contain 0.2 percent U-235. A higher enrichment tails assay requires more uranium feed (thus permitting natural uranium stockpiles to be decreased), while increasing the output of enriched material for the same energy expenditure.	*Energy*
Entering air	Air from the atmosphere surrounding the cooling tower which enters through the louvers on an Induced draft tower or is discharged into the tower by a fan on a Forced Draft Tower.	*Facility Engineering*
Entering wet-bulb temperature	Average wet-bulb temperature of the entering air. Includes any effects of recirculation.	*Facility Engineering*
Enterprise Asset Management (EAM) Systems	Software application to support enterprise wide asset management philosophy. A computerized maintenance management system with extended functionality which typically includes timekeeping, project management, human resources issues, payroll, core financial data, etc.	*Maintenance*
Enterprise integration (EI)	A broad implementation of information technology to link various functional units within a business enterprise; on a wider scale, it may also integrate strategic partners in an inter-enterprise configuration. In a manufacturing enterprise, EI may be regarded as an extension of CIM that integrates financial or executive decision-support systems with manufacturing tracking and inventory systems, product-data management, and other information systems.	*Quality*
Enterprise resource planning (ERP)	An extension of MRP II software designed to operate on enterprise-wide computing platforms. ERP systems typically claim the ability to achieve tighter (or "seamless") integration between a greater variety of functional areas, including materials management, supply-chain management, production, sales and marketing, distribution, finance, field service, and human resources. They also provide information linkages to help companies monitor and control activities in geographically dispersed operations.	*Quality*
Enterprise Resource Planning (ERP) system	An Enterprise Resource Planning system refers to a system comprised of a single or integrated suite of applications to manage enterprise business functions, including finance, human resources, and order fulfillment.	*Maintenance*
Enthalpy	The sum of the internal energy of a body and the product of its volume multiplied by the pressure.	*General Engineering*
Entities	The term used for registered groups in The Cochrane Collaboration (Review Groups, Centers, Fields, and Methods Groups. Also called: Cochrane Groups	*Quality Engineering*
Entitlement	Electric energy or generating capacity that a utility has a right to access under power exchange or sales agreements.	*Energy*
Entrained	particulates or vapor transported along with flowing gas or liquid.	*Chemical*
Entrained Air	A mechanical mixture of air bubbles having a tendency to separate from the liquid phase.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Entrance Cable/Service Entrance Conductor	This is the cable running down the side of a customer's house into the meter. This cable is owned by the customer and its maintenance is the customer's responsibility. Work on this cable should be performed only by a licensed electrician.	*Energy*
Entrance Rate	the hourly rate of pay an employee receives when first hired by the company.	*Industrial Relations*
Entrepreneur	technically an undertaker or enterpriser, the person, group, or organization which brings together the other factors in production in order to provide goods or services.	*Industrial Relations*
Entropy	Entropy is a thermodynamic quantity that represents the amount of energy in a system that is no longer available for mechanical output.	*Industrial*
Entry	An underground horizontal or near-horizontal passage used for haulage, ventilation, or as a mainway; a coal heading; a working place where the coal is extracted from the seam in the initial mining; same as "gate" and "roadway," both British terms.	*Mining*
Environment	physical surroundings; all that is around you	*Agriculture*
Environment	The interaction of climate, soil, topography, and other plants and animals in any given area.	*Forestry*
Environment protection	Environment protection means pollution control. Environmental protection engineering develops methods for pollution removal.	*Material Process*
Environmental Attributes	Environmental attributes quantity the impact of various options on the environment. These attributes include particulate emissions, SO2 or Nox, and thermal discharge (air and water).	*Energy*
Environmental Conditions	All conditions in which a transducer may be exposed during shipping, storage, handling, and operation.	*Electronic Process*
Environmental Consequences	A Failure Has Environmental Consequences If It Could Cause A Breach Of Any Known Environmental Standard Or Regulation.	*Plant Engineering*
Environmental contaminant	All material and energy present in and around an operating system, such as dust, air moisture, chemicals, and thermal energy.	*Oil Analysis*
Environmental engineering specialist	One whose principal work assignment lies in the technical area of natural and induced environments and their relation to military equipment. A person who has expertise in measuring and analyzing field environmental conditions, formulating environmental test criteria, specifying laboratory simulation of environments, and evaluating the effects of environments on equipment.	*Reliability Engineering*
Environmental impact assessment (EIA)	An evaluation of the potential impact of emission associated with an engineering process for the purpose of identifying major problem.	*Material Process*
Environmental impact statement	A report that documents the information required to evaluate the environmental impact of a project. It informs decision makers and the public of the reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the environment.	*Energy*
Environmental impact study	A written report, compiled prior to a production decision, that examines the effects proposed mining activities will have on the natural surroundings.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Environmental Protection Agency (EPA)	Federal agency that regulates industrial impacts on the environment. Despite its environmental mandate, the EPA has shown little activity in Pennsylvania since Marcellus shale drilling began in 2005. The federal agency began a two-year study this summer aimed at considering new rules for the industry after 2012.	*Petroleum Drilling*
Environmental protection agency (EPA) certification files	Computer files produced by EPA for analysis purposes. For each vehicle make, model and year, the files contain the EPA test MPGs (city, highway, and 55/45 composite). These MPG's are associated with various combinations of engine and drive-train technologies (e.g., number of cylinders, engine size, gasoline or diesel fuel, and automatic or manual transmission). These files also contain information similar to that in the DOE/EPA Gas Mileage Guide, although the MPGs in that publication are adjusted for shortfall.	*Energy*
Environmental restoration	Although usually described as "cleanup," this function encompasses a wide range of activities, such as stabilizing contaminated soil; treating groundwater; decommissioning process buildings, nuclear reactors, chemical separations plants, and many other facilities; and exhuming sludge and buried drums of waste.	*Energy*
Environmental restrictions	In reference to coal accessibility, land-use restrictions that constrain, postpone, or prohibit mining in order to protect environmental resources of an area; for example, surface- or ground water quality, air quality affected by mining, or plants or animals or their habitats.	*Energy*
Environmental Stress Cracking Resistance	he ability of a material to resist crack formation and crack propagation when subjected to stress within a contaminating environment.	*Electrical*
Environmental stress screening (ESS)	A post-production process in which produced units are subjected to stresses more severe than anticipated in service. The object is to precipitate latent defects into recognizable failures, so that that particular unit does not proceed further in production nor reach the customer.	*Reliability Engineering*
Environmental testing	Subjecting a sample of products to a simulation of anticipated storage, transport and service environments (such as vibration, shock, temperature, altitude, humidity, etc.)	*Reliability Engineering*
Environmentally Assisted Cracking (EAC)	A process that can occur with the use of high strength steel fasteners in which crack initiation and growth occurs in the fastener at a comparatively low stress level as a result of interactions that occur with the environment. Hydrogen is suspected of causing EAC in high strength steel fasteners, the hydrogen being produced as a result of chemical reactions (galvanic corrosion in a moist environment) or being present from a plating process that may have been applied to the fastener.	*Maintenance*
Environment-Proof Switch	A switch which is completely sealed to ensure constant operating characteristics. Sealing normally includes and "O" ring on actuator shaft and fused glass-to-metal terminal seals or complete potting and an elastomer plunger-case seal.	*Electrical Engineering*
Enzyme	(a) any of numerous proteins or conjugated proteins produced by living organisms and functioning as biochemical catalysts. (b) a protein that a living organism uses in the process of degrading a specific compound. The protein serves as a catalyst in the compound's biochemical transformation.	*Chemical*
Enzyme	A protein or combination of individual proteins that catalyzes a biochemical reaction.	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Enzymes	proteins that start a chemical reaction	*Agriculture*
EO-L/M	Mack heavy-duty diesel engine oil specifications	*Petro-Chemical Abbreviations*
EOLCS	Engine Oil Licensing and Certification System (EOLCS) - API's system that permits engine oil marketers that meet specified requirements to use the API Engine Oil Quality Marks.	*Mechanical, Process, and Operations*
EOR	**EOR:** Enhanced Oil Recovery	*Energy*
EP	end point	*Petro-Chemical Abbreviations*
EP (Extreme Pressure) Lubricants	Lubricants that impart to rubbing surfaces the ability to carry appreciably greater loads than would be possible with ordinary lubricants without excessive wear or damage.	*Lubrication*
EP Additive (Extreme Pressure Agent)	Lubricant additive that prevents sliding metal surfaces from seizing under extreme pressure conditions.	*Lubrication*
EP Energy Provider	EP: Energy Provider	*Energy*
EPA	**EPA:** Environmental Protection Agency	*Energy*
EPA	US Environmental Protection Agency - one function is measurement of vehicle fuel efficiency and exhaust gas discharge.	*Mechanical, Process, and Operations*
EPA certification	A permanent label on fireplace inserts and freestanding wood stoves manufactured after July1, 1988, indicating that the equipment meets EPA standards for clean burning.	*Energy*
EPA Complex Model	Scheduled for implementation January 1, 1997. The model is more restrictive than the simple model, and contains limits on RVP, oxygen, olefins, benzene, sulfur, and T-90. In addition, it will include requirements on aromatic content and T-50 temperatures.	*Lubrication*
EPA composite MPG	The harmonic mean of the EPA city and highway MPG (miles per gallon), weighted under the assumption of 55 percent city driving and 45 percent highway driving.	*Energy*
EPA Simple Model	Used to define reformulated gasoline effective January 1, 1995. The model includes RVP and oxygen content requirements to reduce volatile organic compound emissions. It caps oxygen, benzene, sulfur, olefins, and T-90 content at levels equal to or lower than a refiner's 1990 baseline.	*Lubrication*
EPACT	EPACT: Energy Policy Act of 1992	*Energy*
EPEFE	European Programme on Emissions, Fuels	*Petro-Chemical Abbreviations*
Ephemeral stream	Water that flows in natural channels only during significant rainfall.	*Forestry*
Ephemeral Union	a labor organization which has only a brief period of existence.	*Industrial Relations*
Epicormic branching	Branches arising from buds in bark along mainstem, most commonly occurring in trees under crown stress; also called water sprouts.	*Forestry*
Epidemic	A change, usually a sudden increase, in a disease within a population.[1] Fin. Swe.	*Forestry*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Epidemiology	The study of the health of populations and communities, not just particular individuals.	*Quality Engineering*
Epigenetic	Ore bodies formed by hydrothermal fluids and gases that were introduced into the host rocks from elsewhere, filling cavities in the host rock.	*Mining*
Epitaxy	A vapor deposition technique involving the buildup of thin film layers of one semiconductor on another while maintaining some particular crystallographic relationship between the layer and the substrate.	*Material Process*
Epithermal deposit	A mineral deposit consisting of veins and replacement bodies, usually in volcanic or sedimentary rocks, containing precious metals or, more rarely, base metals.	*Mining*
Epoxy	Epoxies are used in numerous ways. In combination with glass fibers, it is capable of producing composites that are of high strength and that are heat resistant. This composite is typically used for filament wound rocket motor casings in missiles, in aircraft components, and in tanks, pipes, tooling jigs, pressure vessels, and fixtures. Epoxies are also found in gymnasium floors, industrial equipment, sealants, and protective coatings in appliances.	*Material Engineering*
EPRI	Electric Power Research Institute	*Petro-Chemical Abbreviations*
Eprom	Erasable Programmable Read-Only Memory. The PROM can be erased by ultraviolet light or electricity.	*General Engineering*
EPROM (Erasable Programmable Read-Only Memory)	A memory device with information placed into it during manufacture that cannot be altered by the computer. It can only be erased and reprogrammed with special equipment.	*Electrical Engineering*
Equal Distribution of Work	procedures designed to provide an opportunity for all employees to share equally in the work that is available.	*Industrial Relations*
Equal Loudness Curves	Graphs of pure tone (constant or steady) sound pressure levels (labeled as to loudness level in phons) vs. frequency, with each graph representing equal loudness.	*Reliability Engineering*
Equal Pay Act of 1963	a law enacted June 10, 1963, aimed at the elimination of differentials in pay based solely on sex.	*Industrial Relations*
Equal Pay for Equal Work	a principle which seeks to establish job rates which are not dependent upon factors unrelated to quality of work.	*Industrial Relations*
Equal Percentage	A term used to describe a type of valve flow characteristic where for equal increments of valve plug travel the change in flow rate with respect to travel may be expressed as a constant percent of the flow rate at the time of the change. The change in flow rate observed with respect to travel will be relatively small when the valve plug is near its seat and relatively high when the valve plug is nearly wide open.	*Industrial Engineering*
Equalizing Sheave	The sheave at the center of a rope system over which no rope movement occurs other than equalizing movement. It is frequently overlooked during crane inspections, with disastrous consequences. It can be a source of severe degradation.	*Wire Rope & Cable*
Equalizing Thimble	Special type of fitting used as a component part of some wire rope slings.	*Wire Rope & Cable*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Equilay conductor	Conductor constructed with a central core surrounded by more than one layer of helically laid wires, all layers having a common length of lay, direction of lay being reversed successive layers.	*Electrical*
Equilibrium	An object is in equilibrium if the resultant of the system of forces acting on it has zero magnitude. See static equilibrium and dynamic equilibrium.	*Engineering Physics*
Equilibrium Constant	The product of the concentrations (or activities) of the substances produced at equilibrium in a chemical reaction divided by the product of concentrations of the reacting substances, each concentration raised to that power which is the coefficient of the substance in the chemical equation.	*General Engineering*
Equilibrium cycle	An analytical term that refers to fuel cycles that occur after the initial one or two cycles of a reactor's operation. For a given type of reactor, equilibrium cycles have similar fuel characteristics.	*Energy*
Equipment Connection	An integral part of such equipment as pressure vessels, heat exchangers, pumps, etc., designed for attachment of pipe or piping components.	*Maintenance and Repair*
Equipment Life	This Term Often Is not Very Useful, In A Practical Sense. For Example, If I Was To Tell You That My Aunt Has An Axe That She Uses For Chopping Firewood, And In The Last 40 Years It Has Had 2 New Axeheads And 5 New Handles, How Would You Define The Life Of The Axe? Perhaps It Makes More Sense To Talk About Component Life. Also See Economic Life, Useful Life And Average Life For Some More Practical Definitions.	*Plant Engineering*
Equipment Lifetime	Span of time over which equipment is expected to fulfill its intended purpose.	*Reliability Engineering*
Equipment Maintenance Strategies	The Choice Of Routine Maintenance Tasks And The Timing Of Those Tasks, Designed To Ensure That An Item Of Equipment Continues To Fulfill Its Intended Functions.	*Management*
Equipoise	A state of uncertainty where a person believes it is equally likely that either of two treatment options is better. See also: Data monitoring committee	*Quality Engineering*
Equipotential Line	A contour line on the water table or potentiometric surface; a line along which the pressure head of groundwater in an aquifer is the same. Fluid inflow is normal to these lines in the direction of decreasing fluid potential.	*Petroleum Engineering*
Equipped with speed sensors. When a sensor determines that a wheel is decelerating so rapidly that	equipped with speed sensors. When a sensor determines that a wheel is decelerating so rapidly that	*Mechanical Engineering*
Equitransference	Equal diffusion rates of the positively and negatively charged ions of an electrolyte across a liquid junction without charge separation.	*Electronic Process*
Equity	- a procedure and principle said to stem from the days of the King's courts in England. The regular courts which concerned themselves with statutory and common law were not equipped to mete justice, particularly in cases involving property, and the King asked his Chancellor to see that justice was done.	*Industrial Relations*
Equity (financial)	Ownership of shareholders in a corporation represented by stock.	*Energy*
Equity capital	The sum of capital from retained earnings and the issuance of stock.	*Energy*
Equity crude oil	The proportion of production that a concession owner has the legal and contractual right to retain.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Equity financing	The provision of funds by buying shares.	*Mining*
Equity in earnings of unconsolidated affiliates	A company's proportional share (based on ownership) of the net earnings or losses of an unconsolidated affiliate.	*Energy*
Equivalence trial	A trial designed to determine whether the response to two or more treatments differs by an amount that is clinically unimportant. This is usually demonstrated by showing that the true treatment difference is likely to lie between a lower and an upper equivalence level of clinically acceptable differences. See also: Non-inferiority trial	*Quality Engineering*
Equivalent Barrels	Quantities of natural gas and natural gas liquids translated into barrels of oil based on equal energy content. The energy content of six thousand cubic feet of gas (6 MCF) is the rough equivalent of one barrel of oil.	*Petroleum Drilling*
Equivalent Conductance (I)	Equivalent conductance of an electrolyte is defined as the conductance of a volume of solution containing one equivalent weight of dissolved substances when placed between two parallel electrodes 1 cm apart, and large enough to contain between them all of the solution. l is never determined directly, but is calculated from the specific conductance (Ls). If C is the concentration of a solution in gram equivalents per liter, then the concentration of a solution in gram equivalents per liter, then the concentration per cubic centimeter is C/1000, and the volume containing one equivalent of the solute, is, therefore, 1000/C.	*General Engineering*
Equivalent Conductance (I)	Equivalent conductance of an electrolyte is defined as the conductance of a volume of solution containing one equivalent weight of dissolved substances when placed between two parallel electrodes 1 cm apart, and large enough to contain between them all of the solution. l is never determined directly, but is calculated from the specific conductance (Ls). If C is the concentration of a solution in gram equivalents per liter, then the concentration of a solution in gram equivalents per liter, then the concentration per cubic centimeter is C/1000, and the volume containing one equivalent of the solute, is, therefore, 1000/C.	*Electronic Process*
Equivalent Dead Time	To a controller, a process may appear to have more dead time than what it actually has. That is, the controller cannot be tuned tight enough (without going unstable) to make the process variable respond appreciably before an equivalent dead time. More accurately, the characteristic time of the loop is determined by equivalent dead time consisting of pure dead time plus process components contributing more than 180 degrees of phase lag. The phase of dead time increases proportionally with frequency. Any process having more than 180 degrees phase lag has equivalent dead time.	*Process Control*
Equivalent Employment	a job which in most aspects, such as wages, hours of work, opportunity for advancement, seniority, status, etc., is similar to the one held by an employee prior to his discharge or separation.	*Industrial Relations*
Equivalent weight	Molecular or atomic weight divided by the valence of the substance being considered.	*Chemical Engineering*
Era	A large division of geologic time - the Precambrian era, for example.	*Mining*
ERC	emissions reduction credits	*Petro-Chemical Abbreviations*
ERCOT	ERCOT: Electric Reliability Council of Texas	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Erdman Act	Federal Act of Congress passed in 1898 which is replaced the Arbitration Act on 1888.	*Industrial Relations*
Erection	The complete installation of a piping system, including any field assembly, fabrication, testing, and inspection of the system.5	*Maintenance and Repair*
Erosion	to wear away topsoil by water or wind and can be caused by intensive farming and overgrazing	*Agriculture*
Erosion	The wearing away of land or soil by the action of wind, water, or ice.	*Forestry*
Erosion	The breaking down and subsequent removal of either rock or surface material by wind, rain, wave action, freezing and thawing and other processes.	*Mining*
Erosion, Contact	A general loss of material from one or both working surfaces of a pair of mating contacts, as a result of switching an electrical load.	*Electrical Engineering*
Erosion	Destruction of materials by the abrasive action of moving fluids, usually accelerated by the presence of solid particles.	*Maintenance and Repair*
Erosion-corrosion	This effect is a combination of corrosion and mechanical wear effects.	*Material Process*
Erosion-corrosion	Associated action involving corrosion and erosion in the presence of a corrosive substance.	*Paint and Coatings*
ERP	Enterprise Resource Planning.	*Control Engineering*
Erratic	Either a piece of visible gold or a large glacial boulder.	*Mining*
Error	The difference between the value indicated by the transducer and the true value of the measurand being sensed. Usually expressed in percent of full scale output.	*General Engineering*
Error	The difference between the value indicated by the transducer and the true value of the measurand being sensed. Usually expressed in percent of full scale output.	*Electronic Process*
Error	The algebraic difference between the indicated value and the true value of the input pressure. Usually expressed in percent of full scale output, sometimes expressed in percent of the sensor output reading.	*Electrical Engineering*
Error Signal	The signal resulting from the difference between the setpoint reference signal and the process variable feedback signal in a controller.	*Electrical Engineering*
Error (signal)	The signal which is the algebraic summation of an input signal and a feedback signal. F	*Mechanical, Process, and Operations*
Error Band	The allowable deviations to output from a specific reference norm. Usually expressed as a percentage of full scale.	*General Engineering*
Error Band	The band of maximum deviations of the output values from a specified reference line or curve due to those causes attributable to the sensor. Usually expressed as "+ - % of full scale output." The error band should be specified as applicable over at least two calibration cycles, so as to include repeatability, and verified accordingly.	*Electrical Engineering*
Error detection	See probability for error detection.	*Quality*
Error Vector Magnitude	A measure of the difference between the (ideal) waveform and the measured waveform. The difference is called the error vector, usually referred to with regard to M-ary I/Q modulation schemes like QPSK, and shown on an I/Q "constellation" plot of the demodulated symbols.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Error, Zero	The error of a device operating under the specified conditions of use when the input is at the lower range-value.	*Process Control*
Escalator Clause	a provision found in many collective bargaining agreements which is designed to keep the "real income" of the worker reasonably stable during the term of the agreement in the face of price fluctuations.	*Industrial Relations*
Escape Clause	any provision in a contract which permits either party to be relieved of any obligation previously incurred or agreed to.	*Industrial Relations*
Escape Provision	A contract clause allowing one to break a contract, usually with a penalty.	*Energy*
Escape Provision	**A** contract provision which allows a party, such as an electric customer, to get out of it. Usually, there is a penalty.	*Energy*
Escapement	In a gravity or power operated package conveyor, a device to permit the release of packages one at a time on demand.	*Equipment*
Esch-Cummins Act	also known as the Transportation Act of 1920. The Act required employers and unions to exert "every reasonable effort" to avoid strikes and lockouts and to settle disputes through negotiation and collective bargaining.	*Industrial Relations*
ESCIT	Emission System Compatibility Improvement Team - an ASTM team responsible for establishing a method to minimize engine oil effects on emissions control systems.	*Mechanical, Process, and Operations*
Escrow Agreement	an arrangement whereby two parties agree to place a sum of money or valuable documents in the hands of a third party for conditional delivery under specified circumstances.	*Industrial Relations*
Escrowed shares	Shares deposited in trust pending fulfillment of certain conditions, and not ordinarily available to trading until released.	*Mining*
ESD	Emergency Shut Down.	*Control Engineering*
ESDV – Emergency Shut Down Valves	A valve or a system of valves which, when activated, initiate a shut-down of the plant, process, or platform they are tied to.	*Mechanical*
ESI	ESI: Electric Service Identifier	*Energy*
ESP	electrostatic precipitator	*Petro-Chemical Abbreviations*
Espionage	the custom of using or hiring spies in order to thwart or break efforts at unionization.	*Industrial Relations*
Espley Rock	multi-colored, coarse lenticular sandstones found in the Etruria Marl. Exhausted, a word used to describe reserves of coal that have been 'worked out'.	*Mining*
Essential machinery	Essential machinery. See Critical Machinery.	*Reliability Engineering*
Essential Occupations	jobs held by the War Manpower Commission to be vital to the effective prosecution of the war effort during WWII.	*Industrial Relations*
Establishment	An economic unit, generally, at a single physical location where business is conducted or where services or industrial operations are performed. However, "establishment" is not synonymous with "building."	*Energy*
Establishment	Ester	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ester	Any of a class of organic compounds made from the chemical reaction between an alcohol and an organic acid.	*Chemical*
Ester gum	An artificial gum resin, produced by the reaction of a gum resin such as resin, with an alcohol such as glycerin. Used chiefly in the preparation of varnishes and lacquers.	*Material Process*
Esterification	The process of producing an ester.	*Material Process*
Estimate of effect	The observed relationship between an intervention and an outcome expressed as, for example, a number needed to treat to benefit, odds ratio, risk difference, risk ratio, standardized mean difference, or weighted mean difference. Also called: Treatment effect	*Quality Engineering*
Estimated additional resources (EAR)	Uranium in addition to **RAR** that is expected to occur, mostly on the basis of geological evidence, in extensions of well-explored deposits, in little-explored deposits, and in undiscovered deposits believed to exist along well-defined geological trends with known deposits. This uranium can subsequently be recovered within the given cost ranges. Estimates of tonnage and grade are based on available sampling data and on knowledge of the deposit characteristics, as determined in the best-known parts of the deposit or in similar deposits. *Note*: **EAR** corresponds to DOE's probable potential resources category.	*Energy*
Estimated Plant Replacement Value	The Estimated Cost Of Capital Works Required To Replace All The Existing Assets With New Assets Capable Of Producing The Same Quantity And Quality Of Output. This Is A Key Value Often Used In Benchmarking Activities.	*Plant Engineering*
Estimated Plant Replacement Value (EPRV)	The ERV of a plant. A plant can represent part of, or a complete, production facility. To calculate the ERV, determine if the original equipment investment figures reasonably agree with equipment actually in use. Then identify clusters of equipment by the year in which they were acquired. Consider each cluster of investment and escalate it to a current value using a selected inflation index (e.g., the Bureau of Labor Statistics Construction Cost Index (BLS CCI)). Then the indexed clusters of investment are totaled to get the current value of plant and/or equipment. The indexed value of the plant could be compared with other plants recently built, adjusting for size and available insurance values. Even when a company is self-insured, there is normally an established "insurance value" to help define the financial exposure the company risks. An insurance underwriter typically prepares these values, even if the plant is self-insured. Underwriters follow a procedure very similar to the one described. ERV is often used to normalize maintenance cost as a convenient basis for comparing plants of a similar type that vary in size. The rationale for using the ERV rather than the original cost of the plant is to account for construction cost escalation over time (inflation). Two relatively new plants built 10 years apart could have original costs that vary by 50 to 100 percent. Maintenance cost/ERV can be used to set long-term goals, and targets for plant reliability. World-class plants tend to fall in the range of 1 to 2.5 percent.	*Maintenance*
Estimated Recoverable Reserves (coal)	An estimate of coal reserves, based on a demonstrated reserve base, adjusted for assumed accessibility and recovery factors, and does not include any specific economic feasibility criteria.	*Energy*

Please see the Appendix for further illustration

Term	Definition	Industry
Estimating Index	The Ratio Of Estimated Labor Hours Required To Complete The Work Specified On Work Orders To The Actual Labor Hours Required To Complete The Work Specified On Those Work Orders, Commonly Expressed As A Percentage. This Is A Commonly Used Measure Of Labor Productivity, Particularly When There Are Well-Defined Estimating Standards. A Figure Of Greater Than 100% For The Estimating Index Indicates A Higher Than Standard Level Of Productivity, While A Figure Of Less Than 100% Indicates A Lower Than Standard Level Of Productivity.	*Plant Engineering*
Eta layer	the fourth, outer layer of the galvanized coating solely comprised of zinc	*Materials Process*
ETBE	ETBE**:** ethyl tertiary butyl ether	*Energy*
ETBE (ethyl tertiary butyl ether)	$(CH_3)_3COC_2H$: An oxygenate blend stock formed by the catalytic etherification of isobutylene with ethanol.	*Energy*
etc.	etc.	*General Mechanical*
Etch	A roughened surface produced by chemical, electrochemical or mechanical means. To dissolve unevenly a part of the surface of a material to highlight microstructure in metallography.	*Paint and Coatings*
Ethane (C_2H_6)	A straight-chain saturated (paraffinic) hydrocarbon extracted predominantly from the natural gas stream, which is gaseous at standard temperature and pressure. It is a colorless gas that boils at a temperature of -127 degrees Fahrenheit.	*Energy*
Ethanol	a form of natural gas that can be produced from corn	*Agriculture*
Ethanol (C_2H_5OH)	A clear, colorless, flammable alcohol. Ethanol is typically produced biologically from biomass feedstocks such as agricultural crops and cellulosic residues from agricultural crops or wood. Ethanol can also be produced chemically from ethylene. See Biomass, Fuel Ethanol, and Fuel Ethanol Minus Denaturant.	*Energy*
Ether	A generic term applied to a group of organic chemical compounds composed of carbon, hydrogen, and oxygen, characterized by an oxygen atom attached to two carbon atoms (e.g., methyl tertiary butyl ether).	*Energy*
Ether	Any organic compound characterized by the grouping C-O-C, specifically, ethyl ether.	*Material Process*
Ethernet	A family of network protocols based on asynchronous frames. The Ethernet framing structure provides a flexible payload container with basic addressing and error detection mechanisms.	*Electrical Engineering*
Ethocel	Trade name for ethyl cellulose plastics.	*Material Process*
Ethos	Integrity, ethics	*Management Discussion*
Ethyl acetate	A solvent-ester. A colorless liquid with fruity odor, green apple.	*Material Process*
Ethyl aceto-acetate	A colorless liquid, solvent ester.	*Material Process*
Ethyl alcohol	A solvent alcohol. Colorless liquid.	*Material Process*
Ethyl benzene (C2H5C6H5)	Colorless liquid. A raw material for the preparation of vinyl benzene or styrene, which is polymerized to form polystyrene.	*Material Process*
Ethyl cellulose	A thermoplastic material prepared by the ethylation of cellulose by diethyl sulfate or ethyl halides and alkali.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ethyl chloride (CH3CH2Cl)	Colorless liquid or gas. Gaseous ethyl chloride is reacted with sodium cellulose under heat and pressure to yield ethyl cellulose for the production of ethyl cellulose plastics	*Material Process*
Ethyl crotonate	A solvent, ester	*Material Process*
Ethyl ether	A colorless, volatile liquid.	*Material Process*
Ethyl formate	A solvent, ester, colorless liquid.	*Material Process*
Ethyl lactate (CH3CH(OH) COOC2H5)	A colorless liquid, very soluble in ethanol.	*Material Process*
Ethyl phthalyl ether	A solvent for cellulose acetate. Colorless liquid.	*Material Process*
Ethyl phthalyl ethyl glycollate (C2H5 OCOC6H4 COOCH2COOC2H5)	A plasticizer, colorless liquid. Also known as Santicizer E-15.	*Material Process*
Ethylene (C_2H_4)	An olefinic hydrocarbon recovered from refinery or petrochemical processes, which is gaseous at standard temperature and pressure. Ethylene is used as a petrochemical feedstock for many chemical applications and the production of consumer goods.	*Energy*
Ethylene (CH2 CH2)	Colorless gas. An unsaturated gaseous hydrocarbons used as a starting material in numerous organic synthesis, such as the synthesis of acrylic esters.	*Material Process*
Ethylene chloride (CH2ClCH2Cl)	A compound formed by the direct combination of ethylene and chlorine or by heating glycol with hydrochloric acid. Vinyl chloride may be prepared by treating ethylene dichloride with alcoholic potassium hydroxide. Colorless liquid.	*Material Process*
Ethylene chlorohydrin (CH2ClCH2OH)	An intermediate product in the synthesis of acrylic esters for plastics. Also a solvent –halogenated compound. Colorless liquid.	*Material Process*
Ethylene diamine	A colorless liquid. A solvent -amine.	*Material Process*
Ethylene dibromide	A solvent –halogenated compound. Colorless liquid.	*Material Process*
Ethylene dichloride	A colorless, oily liquid used as a solvent and fumigant for organic synthesis, and for ore flotation.	*Energy*
Ethylene dichloride	A solvent-halogenated compound. Colorless liquid.	*Material Process*
Ethylene glycol	A solvent - glycol. Colorless liquid.	*Material Process*
Ethylene glycol diacetate (CH3OCOCH3)3	A colorless liquid. A solvent -ester.	*Material Process*
Ethylene glycol diethyl ether	A solvent- ether.	*Material Process*
Ethylene glycol dipropionate (CH2OCOC2H5)2	A plasticizer.	*Material Process*
Ethylene glycol mono phenyl ether	Solvent-ether.	*Material Process*
Ethylene Propylene Rubber	A synthetic rubber insulation based upon ethylene propylene hydrocarbon.	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
ETLP	Engine Tests of Lubricants Panel (IP)	*Petro-Chemical Abbreviations*
ETS	Engineering Test Services	*Petro-Chemical Abbreviations*
ETV	Environmental Technology Verification program	*Petro-Chemical Abbreviations*
EU	**EU:** European Union	*Energy*
EU Directive on the "Energy performance of buildings"	The EU Directive on the "energy performance of buildings" or EU Buildings Directive, as it is known for short, came into force in January 2003 with the aim of reducing energy consumption in buildings As a matter of principle, the Directive was to be transposed into national law in all EU Member States by the beginning of 2006.	*Thermal Management*
Eucaryotes	An organism having one or more cells with well-defined nuclei.	*Chemical*
Eucolloid	A highly polymerized substance, degree of polymerization over 1000, whose solid is very tough and hard and whose solutions are very viscous.	*Material Process*
Euler flow	Flow at high velocities, where incompressibility of the fluid is of importance whereas the influence of viscous momentum transport is negligible.	*Chemical*
Euler flow	Flow at high velocities, where incompressibility of the fluid is of importance whereas the influence of viscous momentum transport is negligible.	*Chemical Engineering*
EUR Estimated Ultimate Recovery	Refers to the ultimate oil and gas production of the well over its lifetime. Companies may project EUR across a field to show investors how returns on investment will likely occur over a period of time.	*Petroleum Drilling*
Eurasia	The physical land mass containing the continents of Europe and Asia. For Energy Information Administration reporting, it includes the former parts of the Union of Soviet Socialist Republics (U.S.S.R): Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Moldova, Russia, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan.	*Energy*
European chemicals legislation	Mainly based on four legal instruments on chemicals currently in force in the Community	*Chemical*
European chemicals legislation	Mainly based on four legal instruments on chemicals currently in force in the Community	*Chemical Engineering*
EUROPIA	European Petroleum Industry Association	*Petro-Chemical Abbreviations*
Eutectic	That is a mixture of two or more substances which has two lowest melting point of any mixture of those substances.	*Material Process*
Eutectic composition	Composition associated with the minimum temperature at which a binary system is fully melted.	*Material Process*
Eutectic diagram	Binary phase diagram with the characteristic eutectic reaction.	*Material Process*
Eutectic reaction	The transformation of a liquid to two solid phases upon cooling.	*Material Process*
Eutectic Temperature	The lowest possible melting point of a mixture of alloys.	*General Engineering*
Eutectic temperature	Minimum temperature at which a binary system is fully melted.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Eutectoid diagram	Binary phase diagram with the eutectoid reaction.	*Material Process*
EV	electric vehicle	*Petro-Chemical Abbreviations*
EVA	ethyl vinyl acetate	*Petro-Chemical Abbreviations*
Evacuated-tube collector	A collector in which solar thermal heat is captured by use of a collector fluid that flows through an absorber tube contained inside an evacuated glass tube.	*Energy*
Evaluation Kit	Evaluation Kit (EV Kit, Development Kit), A printed circuit board with an integrated circuit and support components to produce a working circuit for evaluation and development. Most Evaluation Kits are fully assembled and tested.	*Electrical Engineering*
Evaluation System	Evaluation kits that also include an interface board for connecting to a personal computer and Windows-based EVKit software.	*Electrical Engineering*
Evaluation System	Evaluation kits that also include an interface board for connecting to a personal computer and Windows-based EVKit software.	*Electrical Engineering*
Evaluation	The work involved in gaining a knowledge of the size, shape, position and value of coal.	*Mining*
Evaporation	Part of the water cycle where water (liquid) from the earth's surface (e.g. water surfaces, land surfaces, snow fields) is transformed to water vapor and added to the atmosphere.	*Petroleum Engineering*
Evaporation	the process by which a liquid enters the vapor (gas) phase.	*Chemical*
Evaporation loss	Water evaporated from the circulating water into the atmosphere by the cooling process.	*Chemical Engineering*
Evaporation pits	A common brine disposal technique intended to recover the brine product (water evaporates leaving behind a concentrated salt solution). Best used in arid regions because rainfall will hinder the process. As with containment ponds, there are concerns regarding leaching and overflow, as well as air pollution.	*Petroleum Drilling*
Evaporation pond	A containment pond (that preferably has an impermeable lining of clay or synthetic material such as hypalon) to hold liquid wastes and to concentrate the waste through evaporation.	*Energy*
Evaporation rate	The rate at which a liquid turns into gas and leaves a system.	*Chemical Engineering*
Evaporative cooler (swamp cooler)	An air-cooling unit that turns air into moist, cool air by saturating the air with water vapor. It does not cool air by use of a refrigeration unit.	*Energy*
Evaporative Loss	The loss of a portion of a lubricant due to volatization (evaporation). Test methods include ASTM D 972 and ASTM D 2595.	*Lubrication*
Evapotranspiration	The transformation of water (liquid) from both the earth's surface (evaporation) and from the surfaces of plants (transpiration) to the atmosphere.	*Petroleum Engineering*
Evapotranspiration	The evaporation of water from the soil and the transpiration of water from the plants that live in that soil.	*Forestry*
Even-age management	A forest management method in which all trees in an area are harvested at one time or in several cuttings over a short time to produce stands that are all at or near the same age.	*Forestry*

Please see the Appendix for further illustration

Term	Definition	Industry
Event Space Method	This is a method for determining the reliability of complex systems. In this method, all mutually exclusive events are determined. The reliability of the system is simply the probability of the union of all mutually exclusive events that yield a system success and vice versa.	*Reliability Engineering*
Event Tree Analysis (ETA)	Starting with an initiating event, event trees employ forward logic to construct a graphical representation of subsequent consequences. If successful operation of a system depends on an approximately chronological, but discrete, operation of its units or subsystems, then an event tree can be an appropriate analysis technique.	*Maintenance*
Eviction From Plant	the physical removal of an individual or group from the plant.	*Industrial Relations*
Evidence	materials presented to a tribunal or court for the purpose of establishing certain facts or refuting factual materials presented by the opposition.	*Industrial Relations*
EWG	EWG: Exempt Wholesale Generator	*Energy*
EWO	See Engineering Work Order	*Plant Engineering*
EWS	Engineering Work Station	*Control Engineering*
ex situ	moved from its original place; excavated; removed or recovered from the subsurface.	*Chemical*
Examination	The procedures for all visual observation and nondestructive testing.	*Maintenance and Repair*
Examination procedure	Set of operations having the objective of determining the value or characteristics of a property. [ISO]	*Quality*
Example - DC-to-DC Converter Combats EMI -	Example - DC-to-DC Converter Combats EMI -	*Electrical Engineering*
Example - Internet access	Example - Internet access	*Electrical Engineering*
Examples - In NTSC television, a 3.579545MHz color subcarrier is quadrature-modulated by two color-difference signals and added to the luminance signal. The PAL television standard uses a subcarrier frequency of 4.43362MHz	Examples - In NTSC television, a 3.579545MHz color subcarrier is quadrature-modulated by two color-difference signals and added to the luminance signal. The PAL television standard uses a subcarrier frequency of 4.43362MHz.	*Electrical Engineering*
Examples	Examples:	*Energy*
Excess Gain	The ratio of optical power available at a given emitter-to-receiver range to the minimum optical power required to trigger the receiver.	*Electrical Engineering*
Excess Measured Depth	the amount of actual hole drilled subtracted by the corresponding planned measured length of drill hole. This value is reported on the THD log header.	*Petroleum Drilling*
Excess statutory depletion	The excess of estimated statutory depletion allowable as an income tax deduction over the amount of cost depletion otherwise allowable as a tax deduction, determined on a total enterprise basis.	*Energy*
Excess zinc	extra amounts of zinc that may accumulate on the steel because of chemical composition of the steel or the profile/design of the steel and/or fabrication	*Materials Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Exchange	Exchange: See energy exchange.	*Energy*
Exchange agreement	A contractual agreement in which quantities of crude oil, petroleum products, natural gas, or electricity are delivered, either directly or through intermediaries, from one company to another company, in exchange for the delivery by the second company to the first company of an equivalent volume or heat content. The exchange may take place at the same time and location or at different times and/or locations. Such agreements may also involve the payment of cash. Note: EIA excludes volumes sold through exchange agreements to avoid double counting of data. See energy exchange.	*Energy*
Exchange energy	Exchange energy: See exchange, electricity.	*Energy*
Exchange interaction	Phenomenon among adjacent electron spins in adjacent atoms that leads to aligned magnetic moments.	*Material Process*
Exchange, electricity	A type of energy exchange in which one electric utility agrees to supply electricity to another. Electricity received is returned in kind at a later time or is accumulated as an energy balance until the end of a specified period, after which settlement may be made by monetary payment. Note: This term is also referred to as exchange energy.	*Energy*
Exchange, natural gas	A type of energy exchange in which one company agrees to deliver gas, either directly or through intermediaries, to another company at one location or in one time period in exchange for the delivery by the second company to the first company of an equivalent volume or heat content at a different location or time period. Note: Such agreements may or may not include the payment of fees in dollar or volumetric amounts.	*Energy*
Exchange, petroleum	A type of energy exchange in which quantities of crude oil or any petroleum product(s) are received or given up in return for other crude oil or petroleum products. It includes reciprocal sales and purchases.	*Energy*
Exchange, power	Delete in favor of the already-defined term exchange energy, which should be renamed exchange electricity or exchange, electricity.	*Energy*
Excipient	Any substances other than the active drug or product which have been appropriately evaluated for safety and are included in a drug delivery system.	*Chemical*
Excipient	Any substances other than the active drug or product which have been appropriately evaluated for safety and are included in a drug delivery system.	*Chemical Engineering*
Excitation	The external application of electrical voltage current applied to a transducer for normal operation.	*Electronic Process*
Excitation	The external source of energy (e.g., electrical voltage or current) applied to a sensor for its operation.	*Electrical Engineering*
Exclusion Criteria	Conditions which preclude entrance of candidates into an investigation even if they meet the inclusion criteria.	*Analysis*
Excrete	to get rid of waste, such as manure	*Agriculture*
Ex-dividend	On stocks selling "ex-dividend", the seller retains the right to a pending dividend payment.	*Mining*
Executive Bargaining Agent	where a union is certified as the collective bargaining agent in a particular unit, it is the "exclusive" bargaining agent for all employees in the unit.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Executive Boards	most international unions are governed by executive boards. These boards are in control of union policy and programs in the interim between convention, which are the final authority within the union.	*Industrial Relations*
Executive Employees	certain classes of workers exempt from minimum wage and overtime hours under section 13 of the Fair Labor Standards Act.	*Industrial Relations*
Executive Order 13101	Entitled Greening the Government Through Waste Prevention, Recycling, and Federal Acquisition, Executive Order (E.O.) 13101 (PDF) (11 pp, 83K, About PDF) was signed on September 14, 1998. This Order replaces E.O. 12873 (PDF) (9 pp, 36K, About PDF)and reinforces the federal government's buy-recycled efforts. E.O. 13101 establishes a process for amending the CPG originally promulgated under E.O. 12873. E.O. 13101 requires EPA to amend the CPG every 2 years, or as appropriate. The Order also requires EPA to issue RMANs concurrent with the CPG amendments, and to update them periodically.	*Environmental Engineering*
Exempt haulers	Truckers who aren't regulated by the Interstate Commerce Commission.	*Agriculture*
Exempt Wholesale Generator	Created under the 1992 Energy Policy Act, these wholesale generators are exempt from certain financial and legal restrictions stipulated in the Public Utilities Holding Company Act of 1935.	*Energy*
Exempt Wholesale Generator (EWG)	An EWG is a category of power producer defined by the Energy Policy Act of 1992. EWG's are independent power facilities that generate electricity for sale in wholesale power markets at market-based rates. The Federal Energy Regulatory Commission is responsible for determining EWG status.	*Energy*
Exfoliation	Corrosion that proceeds laterally from the sites of initiation along planes parallel to the surface, generally at grain boundaries or coating interfaces, forming corrosion products that force metal or coating away from the body of the material, giving rise to a layered appearance.	*Paint and Coatings*
Exhaust air	The mixture of air and its associated vapor leaving the tower (See Air Flow).	*Facility Engineering*
Exhaust fan	Small fans located in the wall or ceiling that exhaust air, odors, and moisture from the bathroom, kitchen, or basement to the outside.	*Energy*
Exhaust Gas Recirculation (EGR)	System to reduce automotive emission of nitrogen oxides (NOx). It routes exhaust gases into the carburetor or intake manifold where they dilute the air/fuel mixture and reduce peak combustion temperatures, thereby reducing the tendency for NOx to form.	*Lubrication*
Exhaust Manifold	The network of passages that gathers the exhaust gases from the various exhaust ports and routes them toward the catalyst, the muffler and the exhaust system.	*Mechanical Engineering*
Exhaust Manifold	The network of passages that gathers the exhaust gases from the various exhaust ports and routes them toward the catalyst, the muffler and the exhaust system.	*Mechanical Engineering*
Exhaust wet-bulb temperature	Average wet-bulb temperature of the air discharged from the tower.	*Facility Engineering*
Exhaustion range	Temperature range over which conductivity in an n-type semiconductor is relatively constant due to the fact that impurity donated electrons have all been promoted to the conduction band.	*Material Process*
Exit basin temperature	Temperature of the circulating water leaving the cold water basin if blowdown or make-up is added to the basin, the temperature will be affected accordingly.	*Facility Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Exit diameter	Diameter of the shell at the top in a hyperbolic natural draft tower or at the top of a fan stack.	*Facility Engineering*
Exit Interview	a meeting between an employee who is leaving the employ of the company, voluntarily or for other reasons, and someone from the personnel office.	*Industrial Relations*
Exothermic	A process is said to be exothermic when it releases heat.	*Electrical*
Exothermic	term indicating the liberation of heat. A reaction which liberates heat.	*Material Process*
Exothermic (Reaction or Material)	Certain materials undergo chemical reactions when thermally sprayed and produce extra heating. This can be useful in improving adhesion of the coating to the substrate.	*Paint and Coatings*
Expanded uncertainty	Quantity defining an interval about the result of a measurement that may be expected to encompass a large fraction of the distribution of values that could reasonably be attributed to the measurand.	*Quality*
Expanding gate valve	A gate valve that is comprised of a separate gate and segment that as the valve operates the gate and segment move without touching the seats, permitting the valve to be opened and closed without wear. In the closed position the gate and segment are forced against the seat. Continued downward movement of the gate causes the gate and segment to expand against the seats. When the valve reaches its full open position, the gate and segment seal off against the seats while the flow is isolated from the valve body.	*Mechanical*
Expansion Joint	A flexible piping component which absorbs thermal and/or terminal movement.	*Maintenance and Repair*
Expansion Factor	Correction factor for the change in density between two pressure measurement areas in a constricted flow.	*General Engineering*
Expansion Joint	a bitumious fiber strip used to separate blocks or units of concrete to prevent cracking due to expansion caused by temperature changes.	*Petroleum Drilling*
Expected date (of a Cochrane Review)	The date by which a user of the Cochrane Database of Systematic Reviews (CDSR) can expect to have access to a completed review. This date appears on Protocols in CDSR.	*Quality Engineering*
Expected Earning Level	a target or standard set under a pieve-rate system which permits an employee to earn a fixed percentage above the base rate.	*Industrial Relations*
Expedite	The act of contacting a supplier or carrier with the goal of speeding up the delivery date of an inbound shipment.	*Procurement*
Expenditure	The incurrence of a liability to obtain an asset or service.	*Energy*
Expenditures per million Btu	The aggregate ratio of a group of buildings' total expenditures for a given fuel to the total consumption of that fuel.	*Energy*
Expenditures per square foot	The aggregate ration of a group of buildings' total expenditures for a given fuel to the total floor space in those buildings.	*Energy*
Expense	**c**ost or charge of money	*Agriculture*
Experience	information, knowledge, and ability obtained through actual work or job performance.	*Industrial Relations*
Experience Rating	a procedure or device used in connection with state unemployment compensation laws to determine the tax rate of an employer.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Experimental intervention	An intervention under evaluation. In a controlled trial, an experimental intervention arm is compared with one or more control arms, and possibly with additional experimental intervention arms. See also: Intervention, Treatment	*Quality Engineering*
Experimental study	A study in which the investigators actively intervene to test a hypothesis. In a controlled trial, one type of experiment, the people receiving the treatment being tested are said to be in the experimental group or arm of the trial.	*Quality Engineering*
Expert System	A Software Based System Which Makes Or Evaluates Decisions Based On Rules Established Within The Software. Typically Used For Fault Diagnosis.	*Management*
Expert Systems	See Knowledge Based Systems (KBS).	*Control Engineering*
Explanatory trial	A trial that aims to test a treatment policy in an ideal situation where patients receive the full course of therapy as prescribed, and use of other treatments may be controlled or restricted. See also: Pragmatic trial	*Quality Engineering*
Explanatory variable	See Independent variable	*Quality Engineering*
Exploration	The search for mineral deposits and the work done to prove or establish the extent of a mineral deposit. Alt: Prospecting and subsequent evaluation.	*Mining*
Exploration	The prospecting, diamond drilling and other work involved in searching for ore.	*Mining*
Exploration and Production companies (E & P)	hey are the first step in the process of harvesting natural gas; they find the natural gas, drill, and get the gas out of the ground. Midstream companies then collect and process the natural gas (using cryogenic or non-cryogenic plants). Pipeline companies then take over and transport the gas.	*Petroleum Drilling*
Exploration drilling	Drilling done in search of new mineral deposits, on extensions of known ore deposits, or at the location of a discovery up to the time when the company decides that sufficient ore reserves are present to justify commercial exploration. Assessment drilling is reported as exploration drilling.	*Energy*
Exploration drilling	Drilling carried out to determine whether hydrocarbons are present in a particular area or structure.	*Petroleum Drilling*
Exploration Phase	The phase of operations which covers the search for oil or gas by carrying out detailed geological and geophysical surveys followed up where appropriate by exploratory drilling.	*Petroleum Drilling*
Exploration phase	The phase of operations which covers the search for oil or gas by carrying out detailed geological and geophysical surveys followed up where appropriate by exploratory drilling.	*Petroleum Drilling*
Exploration Well	A well drilled in an unproven area. Also known as a wildcat well.	*Petroleum Drilling*
Exploration well	A well drilled in an unproven area. Also known as a “wildcat well”.	*Petroleum Drilling*
Exploration	Prospecting, sampling, mapping, diamond drilling and other work involved in searching for ore.	*Mining*
Exploratory	Drilling to locate probable mineral deposits or to establish the nature of geological structures; such wells may not be capable of production if minerals are discovered.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Exploratory well	A hole drilled a) to find and produce oil or gas in an area previously considered unproductive area; b) to find a new reservoir in a known field, i.e., one previously producing oil and gas from another reservoir, or c) to extend the limit of a known oil or gas reservoir.	*Energy*
Explosion proof	The prevention of explosion, triggered by electrical components, through containment in special housings. A requirement for electrical devices, such as solenoids and switches, when exposed to a potentially explosive environment.	*Mechanical*
Explosion-Proof	Equipment designed in accordance with existing codes and standards such that it will operate in a specified hazardous environment without causing an explosion. For further information, contact the National Electrical Manufacturers Association	*Equipment*
Explosion-Proof	A certification that ensures a device has the ability to contain an explosion within itself so it does not ignite its hazardous surroundings.	*Mechanical*
Explosion-proof Enclosure	An enclosure that can withstand an explosion of gases within it and prevent the explosion of gases surrounding it due to sparks, flashes or the explosion of the container itself, and maintain an external temperature which will not ignite the surrounding gases.	*General Engineering*
Explosion-Proof Switch	A UL listed switch capable of withstanding an internal explosion of a specified gas without ignition of surrounding gases.	*Electrical Engineering*
Explosive	Any rapidly combustive or expanding substance. The energy released during this rapid combustion or expansion can be used to break rock.	*Mining*
Explosives casting	a technique designed to blast up to 65 percent of the overburden into the mine pit for easier removal. It differs from conventional overburden blasting, which only fractures the overburden before it is removed by excavating equipment.	*Energy*
Exponential Distribution	This is a lifetime statistical distribution that assumes a constant failure rate for the units being modeled	*Reliability Engineering*
Export packing	Special packing and crating that is required for export shipping. Includes sealing against a salt atmosphere (sea air).	*Mechanical*
Export Revenues	All revenues received by an exporter for the reported quantity exported	*Energy*
Exports	Shipments of goods from within the 50 States and the District of Columbia to U.S. possessions and territories or to foreign countries.	*Energy*
Exposed Coalfield	the area of the coalfield where coal measures are present at the surface. -See also 'Concealed Coalfield'.	*Mining*
Exposed Junction	A form of construction of a thermocouple probe where the hot or measuring junction protrudes beyond the sheath material so as to be fully exposed to the medium being measured. This form of construction usually gives the fastest response time.	*General Engineering*
Exposed Pad	Offered in some packages to improve thermal dissipation or lower the impedance of the ground connection. Normally not electrically isolated, it typically needs to be connected to a ground or power plane, depending on the device. Example: Unit of capacitance.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Expulsion From Union	action by a union under its constitution and bylaws revoking and individual's membership in the union.	*Industrial Relations*
Extended BDV (Blow Down Valve)	EXTENDED BDV (Blow Down Valve)	*Mechanical*
Extender	A substance, often having some bonding properties, added to a plastic composition to reduce the amount of primary binders required.	*Material Process*
Extendible Conveyor	Roller or wheel conveyor that may be lengthened or shortened within limits to suit operating needs. Standard extended lengths are 20 ft., 30 ft., and 40 ft.	*Manufacturing*
Extending length	Length of polymeric molecule that is extended as straight as possible.	*Material Process*
Extension Agency	an outreach arm of an agricultural university which provides educational programs on farming and does research	*Agriculture*
Extension agent	an employee of the Cooperative Extension Service. They go by various names in different states. In Washington they are formally called county faculty because they hold faculty appointments at Washington State University	*Agriculture*
Extension Bonnet	A bonnet with a packing box that is extended above the body-to-bonnet connection so as to maintain the temperature of the packing above (cryogenic service) or below (high-temp service) the temperature of the process fluid.	*Industrial Engineering*
Extension of Collective Agreement	provisions in some contracts setting out the conditions under which the provisions of agreement will be extended to new plants or new members of an employer association.	*Industrial Relations*
Extensions	Any new reserves credited to a previously producing reservoir because of enlargement of its proved area. This enlargement in proved area is usually due to new well drilling outside of the previously known productive limits of the reservoir.	*Energy*
Extensions, discoveries, and other additions	Additions to an enterprise's proved reserves that result from(1) extension of the proved acreage of previously discovered (old) reserves through additional drilling in periods subsequent to discovery and (2) discovery of new fields with proved reserves or of new reservoirs of proved reserves in old fields.	*Energy*
External coating	Coating applied to protect valves against various environments – sea air, salt water, earth buried, normal air exposure.	*Mechanical*
External force	A surface force or body force acting on an object. External forces are sometimes called applied forces.	*Engineering Physics*
External Force Or Load	Forces exerted on a fastener as a result of an applied loading to the joint.	*Maintenance*
External Gear	A gear with teeth on the outer cylindrical surface.	*Mechanical Engineering*
External peer reviewer (of a Cochrane Review)	A person with relevant content, methodological, or user expertise who critically examines Cochrane Reviews in her/his area of expertise. See also: Peer review, Review	*Quality Engineering*
External Thread	A screw thread which is formed on an external cylinder, such as on bolts, screws, studs etc.	*Maintenance*
External validity	The extent to which results provide a correct basis for generalizations to other circumstances. For instance, a meta-analysis of trials of elderly patients may not be generalizable to children. See also: Internal validity, Reference population, Validity Also called: Applicability, Generalizability (also: applicability, external validity)	*Quality Engineering*

Please see the Appendix for further illustration

Term	Definition	Industry
External venting	holes that prevent high-pressure gas buildup in enclosed fabrications dipped in the molten zinc of the galvanizing bath	*Materials Process*
Externalities	Benefits or costs, generated as a byproduct of an economic activity, that do not accrue to the parties involved in the activity. Environmental externalities are benefits or costs that manifest themselves through changes in the physical or biological environment.	*Energy*
Externally Pressurized Seal	A seal that has pressure acting on the seal parts from an external independent source of supply.	*Lubrication*
Extinguishing Agents	Media suitable for controlling or putting out a fire, when properly applied.	*Chemical*
Extra High Strength Strand	A grade of galvanized or bright strand.	*Wire Rope & Cable*
Extra Improved Plow, Steel	A specific wire rope grade.	*Wire Rope & Cable*
Extra Strong	(XS) also referred to as Extra Heavy (XH); A specification of pipe wall specified in API Spec 5L thicknesses. See our table of Carbon Steel Pipe Dimensions.	*Petroleum Engineering*
Extraction	The process of mining and removal of cal or ore from a mine.	*Mining*
Extraction loss	See Natural gas plant liquids (NGPL) production.	*Energy*
extraction well	a well employed to extract fluids (either water, gas, free product, or a combination of these) from the subsurface. Extraction is usually accomplished by either a pump located within the well or suction created by a vacuum pump at the ground surface.	*Chemical*
Extractive industries	Industries involved in the activities of (1) prospecting and exploring for wasting (non-regenerative) natural resources, (2) acquiring them, (3) further exploring them, (4) developing them, and (5) producing (extracting) them from the earth. The term does not encompass the industries of forestry, fishing, agriculture, animal husbandry, or any others that might be involved with resources of a regenerative nature.	*Energy*
Extramural	Outside (the walls or boundaries of) a community or institution. Refers to 'external' sources of support (such as funding) as opposed to 'internal' (intramural) support.	*Quality Engineering*
Extranet	An exclusionary Internet-like network that securely connects customers and suppliers to a corporate or plant intranet in order to access information deemed sharable by the intranet operators.	*Quality*
Extraordinary income deductions (electric utility)	Those items related to transactions of a nonrecurring nature that are not typical or customary business activities of the utility and that would significantly distort the current year's net income if reported other than as extraordinary items.	*Energy*
Extreme pressure (EP) additive	Lubricant additive that prevents sliding metal surfaces from seizing under conditions of extreme pressure. At the high local temperatures associated with metal-to-metal contact, an EP additive combines chemically with the metal to form a surface film that prevents the welding of opposing asperities, and the consequent scoring that is destructive to sliding surfaces under high loads. Reactive compounds of sulfur, chlorine, or phosphorus are used to form these inorganic films.	*Oil Analysis*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Extreme Pressure Property (EP)	That property of a grease that, under high applied loads, reduces scuffing, scoring and seizure of contacting surfaces. Common laboratory tests are Timken OK Load (ASTM D 2509 and ASTM D 2782) and Four Ball Load Wear Index (ASTM D 2596 and ASTM D 2783).	*Lubrication*
Extrinsic gettering	The capture of oxygen in a silicon device by using mechanical damage to produce dislocations as gettering sites.	*Material Process*
Extrinsic semiconductor	Semiconducting material with a purposeful impurity addition that, over a certain temperature range, establishes the level of conductivity.	*Material Process*
Extrude	To force of substance through a confined opening, such as a die.	*Material Process*
Extruded Pipe	Pipe produced from hollow or solid round forgings, usually in a hydraulic extrusion press. In this process the forging is contained in a cylindrical die. Initially a punch at the end of the extrusion plunger pierces the forging. The extrusion plunger then forces the contained billet between the cylindrical die and the punch to form the pipe, the latter acting as a mandrel.	*Maintenance and Repair*
Extruded Nozzles	The forming of nozzle (tee) outlets in pipe by pulling hemi- spherically or conically shaped dies through a circular hole from the inside of the pipe. Although some cold extruding is done, it is generally performed on steel after the area to be shaped has been heated to temperatures between 2000 and 1600°F (1093 and 871°C).	*Maintenance and Repair*
Extrusion	The process of continuously forcing either a plastic or elastomer and a conductor or core through a die, thereby applying an insulation or jacket to the conductor or core.	*Electrical*
Extrusion molding	Processing technique for thermoplastic polymers. A molding procedure for producing rods, tubes, etc., whereby a heat softened plastic is forced through on orifice to produce the cross section of the article desired. Sometimes used in place of injection.	*Material Process*
Extrusive Rocks	Igneous rocks formed from magma that flows out on the earth's surface. These rocks cool rapidly, producing a fine crystalline structure.	*Petroleum Engineering*
Eye	the top or mouth of a shaft; or the opening out of the mainway to the foot of the shaft. (Yorks.); or the central or intake opening of a radial-flow fan.	*Mining*
Eye Or Eye Splice	A loop, with or without a thimble, formed at the end of a wire rope.	*Wire Rope & Cable*
Eyring model	An accelerated life testing model based on quantum mechanics for use when temperature is the accelerating factor.	*Reliability Engineering*
Ezlogic	Electronic Zero Pressure Logic for zero pressure accumulation conveyor systems.	*Manufacturing*
F	F	*Forestry*
--F--	--F--	*Petroleum Drilling*
F.A.S	F.A.S.: See Free Alongside Ship.	*Energy*
F.A.S. – Free Along Side	Term used for ocean shipment. Vendor pays transportation only to shipping dock alongside vessel.	*Mechanical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
f.a.s. value.	Free alongside ship value. The value of a commodity at the port of exportation, generally including the purchase price plus all charges incurred in placing the commodity alongside the carrier at the port of exportation in the country of exportation.	*Energy*
F.E. – Flanged End	F.E. – Flanged End - See "R.F." & "RTJ"	*Mechanical*
F.E.R.C.	Federal Energy Regulatory Commission - A United States government agency which has the final approval of new pipelines, right of ways, etc.	*Mechanical*
F.O.B	F.O.B: See Free On Board.	*Energy*
F.O.B.	Prices denote the so-called free-on-board payment, for material that a consumer or agent will give when he picks it up at a dealer's dock. The f.o.b. prices are usually less than delivered-to-works prices for the same items.	*Metallurgy*
F.O.B. – Free on Board	Transportation charges are absorbed by vendor to the F.O. B. point. Usually shipment is F.O.B. factory. In which case, title and transportation charges pass to the customer when shipment leaves the factory.	*Mechanical*
f.o.b. price	The price actually charged at the producing country's port of loading. The reported price should be after deducting any rebates and discounts or adding premiums where applicable and should be the actual price paid with no adjustment for credit terms.	*Energy*
f.o.b. value (coal)	Free-on-board value. This is the value of coal at the coal mine or of coke and breeze at the coke plant without any insurance or freight transportation charges added.	*Energy*
F.P.C. – Federal Power Commission	The United States government agency which governs and regulates the natural gas and pipeline industry, as well as other energy industries.	*Mechanical*
F=PxA	F=PxA	*Mechanical, Process, and Operations*
F-18	Aviation gasoline (low lead) in limited use by certain NATO nations. Also known as AVGAS 100LL.	*NATO Fuel*
F-34	A military kerosene type aviation turbine fuel with Fuel System Icing Inhibitor FSII (NATO Code S-1745. Additive to aviation turbine fuels as system icing inhibitor) used by land based military gas turbine engined aircraft in all NATO countries. (Until 1986, F-40 was used by land based gas turbine engined aircraft in all NATO countries except France and the United Kingdom which had converted to F-34 some 15 years earlier. Following a decision by NATO Defence Ministers all nations except Turkey switched from F-40 to F-34. The conversion (known as Stage 1 of the Single Fuel Concept) was completed in 1988. Turkey completed its conversion from F-40 to F-34 in 1996.) Also known as JP-8 or AVTUR/FSII.JET A-1 or AVTUR + Additives (The term "additives" used in this Aide Memoire can include FSII corrosion inhibitor/lubricity improver additive and static-dissipator additive or SDA) = JP-8 or AVTUR/FSII.	*NATO Fuel*
F-35	A military kerosene type aviation turbine fuel equivalent to that used by most civil operators of gas turbine engined aircraft. Also known as JET A-1 or AVTUR. JET A-1 or AVTUR; therefore F-34 = F-35 + Additives.	*NATO Fuel*

Term	Definition	*Industry*
F-40	A military wide cut type aviation turbine fuel with FSII used by land based military gas turbine engined aircraft (NOTE 2). Also known as JP-4 or AVTAG/FSII. Within NATO it is an emergency substitute for F-34/F-35.	*NATO Fuel*
F-44	A military high flash point kerosene type aviation turbine fuel with FSII used by ship borne military gas turbine engine aircraft in most NATO countries. Also known as JP-5 or AVCAT/FSII JET A and JET B (See NOTES 4 and 5)	*NATO Fuel*
F-46	A military gasoline fuel used in certain armored and non-armored vehicle spark ignition engines in NATO Europe areas outside Denmark and the United Kingdom. Also known as gasoline automotive: Military (91 RON) or COMBATGAS. Availability of this fuel is now limited and has been replaced by F-57.	*NATO Fuel*
F-54	A military diesel fuel used in compression ignition engines in NATO Europe areas outside Denmark, Greece, Italy, Portugal, Spain and the United Kingdom. Also known as Diesel Fuel: MILITARY or DF-2. It has a Pour Point specification of 18oC maximum.	*NATO Fuel*
F-57	A low leaded gasoline introduced to replace F-46. It is interchangeable with commercial gasoline automotive (98 RON).	*NATO Fuel*
F-65	A low temperature diesel/kerosene fuel blend.	*NATO Fuel*
F-67	An unleaded gasoline automotive interchangeable with commercial gasoline (95 RON).	*NATO Fuel*
F-75	A military diesel fuel used in compression ignition engines in Denmark and Greece. It is normally referred to as FUEL NAVAL DISTILLATE, low pour point. (See Naval fuels).	*NATO Fuel*
F-76	The primary naval fuel used as for F-75 above but it may require special handling and storage due to low temperature characteristics. Also known as FUEL, NAVAL DISTILLATE (Alternative turbine/diesel engine fuel for use in certain naval helicopters).	*NATO Fuel*
F-77	A naval residual fuel used for boiler steam raising for certain ships in France, Greece and Turkey. Also known as FUEL, RESIDUAL, light viscosity boiler or 50/50 FFO (F-77 may also be used in slow speed diesel engines).	*NATO Fuel*
Fabianism	the term applied to the doctrined of a group of socialist organized in 1884 as the Fabian Society.	*Industrial Relations*
Fabricate	To work of material into a finished form by machining, drawing or other operation.	*Material Process*
Fabricated fuel	Fuel assemblies composed of an array of fuel rods loaded with pellets of enriched uranium dioxide.	*Energy*
Fabricated valve	One in which the body and hub parts are not cast – but rather are formed from plate or pipe and the welded, or bolted together.	*Mechanical*
Fabrication	To construct equipment from a set of instructions or blueprints from supplied parts by a manufacturer or expert.	*Procurement*
Fabrication	Primarily, the joining of piping components into integral pieces ready for assembly. It includes bending, forming, threading, welding, or other operations upon these components, if not part of assembly. It may be done in a shop or in the field.	*Maintenance and Repair*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fabrication (UC)	UC "constructed" using equipment and supplies from many vendors under a fabrication number issued by Equipment Management. All orders are inventoried under the same number.	*Procurement*
Fabrication Integrity Point	The differential gas pressure at which the first stream of gas bubbles are emitted from a wetted filter element under standard test conditions.	*Lubrication*
Fabricator	A producer of intermediate products that does not also produce primary metal. Examples include brass, wire and rod mills, which buy copper and other primary or secondary metals to produce brass and other copper alloys, or take raw forms of metal and make building, magnet, telecommunications and/or industrial wire, rod, and similar products.	*Metallurgy*
Face	As applied to a drift, crosscut or stope, is the end in which work is progressing.	*Mining*
Face	Veneers on the exposed surface of plywood or other bonded laminates.	*Material Process*
Face airing	the practice of maintaining a good flow of ventilation air along the coalface and only allowing a small proportion of the total ventilation, or a leakage, to pass through the waste.	*Mining*
Face centered cubic	Common atomic arrangement for metals.	*Material Process*
Face channel or channel sample	a sample taken at the exposed coal in a mine by cutting away any loose or weathered coal then collecting on a clean surface a sample of the coal seam by chopping out a channel of uniform width and depth; a face channel or face sample is taken at or near the working face, the most freshly exposed coal where actual removal and loading of mined coal is taking place. Any partings greater than 3/8 inch and/or mineral concretions greater than 1/2 inch thick and 2 inches in maximum diameter are normally discarded from a channel sample so as better to represent coal that has been mined, crushed, and screened to remove at least gross non-coal materials.	*Energy*
Face cleat	The principal cleavage plane or joint at right angles to the stratification of the coal seam.	*Mining*
Face conveyor	Any conveyor used parallel to a working face which delivers coal into another conveyor or into a car.	*Mining*
Face drill	used in conventional mining to drill shot holes in the coalbed for explosive charges.	*Energy*
Face entry,	the place where men access the coal face.	*Mining*
Face line	the position of a longwall face in relation to other underground features such as roadways, cleat, dip etc; or a term meaning the coalface itself.	*Mining*
Face of Tooth	That surface of the tooth which is between the pitch circle and the top of the tooth.	*Mechanical Engineering*
Face of Weld	Face of Weld. The exposed surface of a weld on the side from which the welding was done.	*Maintenance and Repair*
Face on	the direction that is at right angles to the 'cleat' or 'grain' of the coal seam.	*Mining*
Face room	the total length or productive capacity of all faces available in a mine from which coal can be won.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Face Seal	A device that prevents leakage of fluids along rotating shafts. Sealing is accomplished by a stationary primary seal ring bearing against the face of a mating ring mounted on a shaft. Axial pressure maintains the contact between the seal ring and the mating ring.	*Lubrication*
Face thing	Face thing, -see 'Buttock thing (N. Staffs.).	*Mining*
Face to face	The overall dimension from the inlet face of a valve to the outlet face of a valve (one end to another) allowing valves of the same size and pressure class to be mutually interchangeable, regardless of manufacturer.	*General Mechanical*
Face	The end of a drift, crosscut or stope in which work is taking place.	*Mining*
Face-To-Face	Is the distance between the face of the inlet opening and the face of the outlet opening of a valve or fitting. These dimensions are governed by ANSI/ISA specifications. The following uniform face-to-face dimensions apply.	*Industrial Engineering*
Face-to-face	The overall dimension from the inlet face of a valve to the outlet face of the valve (one end to the other). This dimension is governed by ANSI B16.10 and API-6D to ensure that such valves are mutually interchangeable, regardless of the manufacturer.	*Mechanical*
Face-to-Face Pay	a method of determining compensation in mining operarations based solely on work performed at the face where the ore actually is mined.	*Industrial Relations*
Faceway drift	a face of coal advancing at right angles to a 'Buttock-thing'.	*Mining*
Facilities charge	An amount to be paid by the customer in a lump sum, or periodically as reimbursement for facilities furnished. The charge may include operation and maintenance as well as fixed costs.	*Energy*
Facility	A location where electric energy is generated from energy sources.	*Energy*
Facility data link	Embedded communications channel in ESF DS1 framing. Used to convey both bit-oriented and message-oriented signals.	*Electrical Engineering*
Facing	The finish of the gasket contact surface of a flange.	*General Mechanical*
Facings	another word for joints or cleats.	*Mining*
Fact-Finding Board	a special panel, usually of three or five persons, appointed to review the positions of labor and management in a particular dispute.	*Industrial Relations*
Factionalism	within a union, groups of members who differ on solutions of common problems.	*Industrial Relations*
Factor Comparison Method	one of the methods used in job evaluation.	*Industrial Relations*
Factor of material safety	The ratio of the ultimate strength of a material to its working stress.	*Material Process*
Factor of safety	The ratio of the ultimate breaking strength of the material to the force exerted against it. If a rope will break under a load of 6000 lbs., and it is carrying a load of 2000 lbs., its factor of safety is 6000 divided by 2000 which equals 3.	*Mining*
Factorial design	A trial design used to assess the individual contribution of treatments given in combination, as well as any interactive effect they may have. Most trials only consider a single factor, where an intervention is compared with one or more alternatives, or a placebo. In a trial using a 2x2 factorial design, participants are allocated to one of four possible combinations. For example in a 2x2 factorial	*Quality Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	RCT of nicotine replacement and counseling, participants would be allocated to: nicotine replacement alone, counseling alone, both, or neither. In this way it is possible to test the independent effect of each intervention on smoking cessation and the combined effect of (interaction between) the two interventions. This type of study is usually carried out in circumstances where no interaction is likely. See also: Interaction	
Factory Inspection	a procedure for periodic checking of facilities used for the production of goods and services to determine if they meet health and safety standards determined by law.	*Industrial Relations*
FACTS (Flexible Alternating Current Transmission Systems)	Refers to a group of technologies that enhance the security, capacity and flexibility of power transmission and distribution systems. The technologies can be installed in new or existing power transmission and distribution lines. Examples of FACTS devices are—Static var compensation (SVC), uses an electrical device (see Static var compensator) to regulate and stabilize voltage in bulk power systems. The most advanced version of this technology is called SVC Light and has additional features, in particular more powerful flicker compensation to stabilize heavy and rapidly fluctuating loads, for example arc furnaces, and to smooth voltage flicker. Series Compensation can be fixed or controllable. The latter is called Thyristor Controlled Series Capacitor (TCSC). Series compensation is a straightforward and cost effective way to improve power transmission capacity and preserve voltage stability, particularly in bulk transmission corridors. Thyristor-controlled series compensation is especially useful for damping power oscillation over interconnections between transmission girds.	*Electrical*
Facultative	used to describe organisms that are able to grow in either the presence or absence of a specific environmental factor (e.g., oxygen). See also facultative anaerobe.	*Chemical*
Facultative anaerobes	microorganisms that can grow in either the presence or the absence of molecular oxygen. In the absence of oxygen these microorganism can utilize another compound (e.g., sulfate or nitrate) as a terminal electron acceptor.	*Chemical*
Fading	Any lightening of an initial color possessed by a plastic.	*Material Process*
Fahrenheit	A temperature scale on which the boiling point of water is at 212 degrees above zero on the scale and the freezing point is at 32 degrees above zero at standard atmospheric pressure.	*Energy*
Fail safe valve	A valve designed to fail in a preferred position (open or closed) in order to avoid an undesirable consequence in a piping system.	*Mechanical*
Fail-Closed	Or normally closed. Another way of describing an air-to-open actuator. Approximately 80% of all spring-return diaphragm operators in the field are of this construction.	*Industrial Engineering*
Fail-In-Place	A term used to describe the ability of an actuator to stay at the same percent of travel it was in when it lost its air supply. On spring return actuators this is accomplished by means of a lock-up valve. On piston actuators a series of compressed air cylinders must be employed.	*Industrial Engineering*
Fail-Open	Or normally open. Another way of describing an air-to-close actuator.	*Industrial Engineering*
Fail-Safe	A technique used in RS-485 interface transceivers which forces the output to a predefined state in the event of a line short or open circuit.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Failure	A lack of success in something, or an unsuccessful attempt at doing something. A breakdown or decline in the performance of something, or an occasion when something stops working or stops working adequately. Note that "failure" is an event, as distinguished from "fault" which is a "state."	*Maintenance*
Failure analysis	A systematic methodology for characterizing the failure of the system, process or engineering materials.	*Material Process*
Failure catastrophic	A failure that can cause loss.	*Reliability Engineering*
Failure Cause	The apparent cause of a functional failure, not to be confused with the root cause, which is only determined through a Root Cause Failure Analysis (RCFA). (Used interchangeably with Failure Reason).	*Maintenance*
Failure Characteristics	These are terms used to describe the characteristics of a failure. They include hidden, predictable, preventable and random. A hidden failure singularly results in a complete loss of function without being immediately evident. A predictable failure displays some evidence, at an early stage, of the potential for failure, and a reasonable estimate of the time interval before full functional failure occurs. The term "preventable" describes those failures for which there is a reliable time interval or usage (such as number of cycles) before functional failure occurs. Random refers to a failure that occurs at any time and is not necessarily constrained by time or usage.	*Reliability Engineering*
Failure Code	An alphanumeric code typically entered against a work order in a computerized maintenance management system (CMMS), which indicates the failure cause (e.g. lack of lubrication, metal fatigue, etc.). These codes are employed to facilitate analysis of plant history.	*Maintenance*
Failure Consequences	A term originating from reliability-centered maintenance (RCM). The consequences of all failures are classified as being either hidden, safety, environmental, operational, or non-operational.	*Maintenance*
Failure Descriptor	The term failure descriptor refers to the apparent observation of a failure. The failure descriptor must answer the question of what caused the equipment to fail to perform or fulfill the required function(s).	*Maintenance*
Failure distribution	This is a mathematical model which describes the probability f failures occurring over time. It is also known as the probability density function (PDF), which ids integrated to obtain the probability that the failure time takes a value in a given time interval. It is the basis for other reliability functions, including the reliability function, mean life and the failure rate function.	*Reliability Engineering*
Failure Effect	A description of the events that transpire after a failure has occurred as a result of a specific failure mode.	*Maintenance*
Failure Finding Interval	How often a failure finding task is performed. It is determined by the frequency of failure of the protective device, and the desired availability required of that protective device.	*Maintenance*
Failure Finding Task	A routine maintenance task, normally an inspection or a testing task, designed to determine, for hidden failures, whether an item or component has failed. A failure finding task should not be confused with an on-condition task, which is intended to determine whether an item is about to fail. Failures finding tasks are used in reliability-centered maintenance (RCM), and are sometimes referred to as functional tests.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Failure mechanism	This is the mechanical, chemical , physical or other processes that results in failure	*Reliability Engineering*
Failure Mode	Any Event Which Causes A Failure.	*Plant Engineering*
Failure mode analysis	A procedure aimed at determining why a failure occurred.	*Reliability Engineering*
Failure Mode and Effect Analysis (FMEA)	This is a bottom-ups method for analyzing system design and performance in other to study failures and determine the effects of various types of failures on a system.	*Reliability Engineering*
Failure mode and effects analysis (FMEA)	A procedure by which each potential failure mode in a system is analyzed to determine the resulting effects thereof on the system and to classify each potential failure mode according to its severity.	*Reliability Engineering*
Failure Mode, Effects (& Criticality) Analysis (FME(C)A)	FME(C)A is a procedure that analyzes failures (failure modes) and determines their impact (effect) at both the local and system levels. The analysis can be carried out from the lowest to the highest level of the system (bottom up), which is commonly referred to as a hardware analysis. Alternatively, the analysis can be carried out from the highest level to the lowest level (top down) of the system, which is commonly referred to as a functional FMEA. The functional FMEA considers the functional failure of components within a system.	*Maintenance*
Failure Mode, Effects and Criticality Analysis (FMECA)	This is a procedure that analyzes system design and performance in other to study failures and determine the effects of various types of failures on a system. A criticality factor assigned to each failure mode permits the ranking of failure modes into the most severe and the ones most likely to occur. This aids the identification and subsequent implementation of strategies to reduce their probability of occurrence.	*Reliability Engineering*
Failure Modes and Effects Analysis	A Structured Method Of Determining Equipment Functions, Functional Failures, Assessing The Causes Of Failures And Their Failure Effects. The First Part Of A Reliability Centered Maintenance Analysis Is A Failure Modes And Effects Analysis.	*Plant Engineering*
Failure Modes and Effects Analysis (FMEA)	It is a disciplined approach used to identify possible failures of a product or service and then determine the frequency and impact of the failure.	*Reliability Engineering*
Failure Modes, Effects and Criticality Analysis	A Structured Method Of Assessing The Causes Of Failures And Their Effect On Production, Safety, Cost, Quality Etc.	*Plant Engineering*
Failure or hazard	Any electric power supply equipment or facility failure or other event that, in the judgment of the reporting entity, constitutes a hazard to maintaining the continuity of the bulk electric power supply system such that a load reduction action may become necessary and reportable outage may occur. Types of abnormal conditions that should be reported include the imposition of a special operating procedure, the extended purchase of emergency power, other bulk power system actions that may be caused by a natural disaster, a major equipment failure that would impact the bulk power supply, and an environmental and/or regulatory action requiring equipment outages.	*Energy*
Failure Pattern	The Relationship Between The Conditional Probability Of Failure Of An Item, And Its Age. Failure Patterns Are Generally Applied To Failure Modes. Research In The Airline Industry Established That There Are Six Distinct Failure Patterns. The Type Of Failure Pattern That Applies To Any Given Failure Mode Is Of Vital Importance In Determining The Most Appropriate Equipment Maintenance Strategy. This Fact Is One Of The Key Principles Underlying Reliability Centered Maintenance.	*Plant Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Failure Patterns	See Patterns of Failure.	*Maintenance*
Failure prevention	The application of knowledge obtained by failure analysis to prevent future catastrophes.	*Material Process*
Failure Rate	Failure rate refers to the overall speed of failures, or the number of failures that occur in a given time frame, usually expressed in years. The total number of failures within an item population is divided by the total time expended by that population during a particular measurement interval under stated conditions. Failure rate is the ratio of the number of failures that occur in an interval to the size of the original population, divided by the length of the time interval. Other formats include the number of failures per year, and in some cases, it is common to express failure rate as the number of failures per hour, or the number of failures of an item per unit time. This can be applied to: Observed failure rate: as computed from a sample.	*Maintenance*
Failure Reason	Sometimes used to refer to the apparent root cause of a functional failure, but not to be confused with the real root cause obtained from a thorough root cause failure analysis (RCFA). Used interchangeably with Failure Cause.	*Maintenance*
Failure Scenario	This is a description of a series of events which may lead to a system failure. It may contain a single event or a combination of sequential events	*Reliability Engineering*
Fair Day's Pay	a wage which is regarded by workers as being just and fair for the type of work being performed.	*Industrial Relations*
Fakes	a well-laminated sandy siltstone or sandstone. (Scot.).	*Mining*
Fakey blaes	a banded and cross-bedded stone bind, similar to fakes, but muddier; shale interbedded with more sandy material. (Scot.).	*Mining*
Fakey rock, flaggy sandstone.	Fakey rock, flaggy sandstone.	*Mining*
Fall	A mass of roof rock or coal which has fallen in any part of a mine.	*Mining*
Fall Time	A measure of the time required for the output voltage of a circuit to change from a high voltage level to a low voltage level, once a level change has started (90% to 10%).	*Electrical Engineering*
Fallers	a term used in Lancs. for the keps. Also called 'cage props'.	*Mining*
Falling	that part of the roof that falls, or comes down, on the extraction of the seam. Also called 'Following'. (Scot.).	*Mining*
Fallow	left without tilling or sowing after plowing	*Agriculture*
Fallow	Idle crop land. The most common reasons in modern agriculture are to conserve moisture for future use and for weed control. In extremely dry areas, for instance, wheat is grown every other year. Fields lie fallow.	*Agriculture*
False Brinelling	Fretting of one bearing component against another; may appear as a dent, but original surface finish is worn away.	*Lubrication*
False Brinelling	False brinelling of needle roller bearings is actually a fretting corrosion of the surface since the rollers are the I.D. of the bearing. Although its appearance is similar to that of brinelling, false brinelling is characterized by attrition of the steel, and the load on the bearing is less than that required to produce the	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	resulting impression. It is the result of a combination of mechanical and chemical action that is not completely understood, and occurs when a small relative motion or vibration is accompanied by some loading, in the presence of oxygen.	
False Brinneling	False brinneling occurs in rolling element bearing contact areas due to micro movements under cyclic vibrations, at times when the machine is not rotating. Depending on the intensity of the vibrations, lubrication / preservative condition, and load, a combination of corrosion and wear occurs, which forms shallow depressions in the raceways. In the case of a stationary bearing, the depressions appear at rolling element pitch and may be discolored (red) and shiny.	*Maintenance*
False Information Act	criminal statute making it a crime for an individual to make a false statement to any government department or agency on a matter properly within its jurisdiction.	*Industrial Relations*
False negative	A falsely drawn negative conclusion. [In diagnostic tests:] A conclusion that a person does not have the disease or condition being tested, when they actually do. [In clinical trials:] See also: Type ll error	*Quality Engineering*
False positive	A falsely drawn positive conclusion. [In diagnostic tests:] A conclusion that a person does have the disease or condition being tested, when they actually do not. [In clinical trials:] See also: Type I error	*Quality Engineering*
False Pulse Protection	The circuitry designed to clamp output Off until the power supply has time to reach proper voltage level. Typically 200-500 msec.	*Electrical Engineering*
False Pulse Protection (2)	An improper change of state of the output, usually associated with Turn-Off or Turn-On.	*Electrical Engineering*
False Pulsing	Circuitry designed to clamp output Off until the power supply has time to reach proper voltage level. Typically 200-500 msec.	*Electrical Engineering*
False rejection	See probability for false rejection.	*Quality*
Family Allowances	wage payments, is excess of regular pay for the job, given to employees on the basis of the number of dependents.	*Industrial Relations*
Family of directions	A set of structurally equivalent crystallographic directions.	*Material Process*
Family of planes	A set of structurally equivalent crystallographic planes.	*Material Process*
Famp	thin beds of shale. (N. East).	*Mining*
Fan	A device for moving air in a mechanical draft tower. The fan design may be either an axial flow propeller or centrifugal blower. The fan can be applied as induced draft or forced draft.	*Facility Engineering*
Fan blast	a term used for the forcing of a current of air into the mine by means of wooden or iron pipes (N. Wales).	*Mining*
Fan Controller	An integrated circuit that varies the speed and airflow of a cooling fan using a variable voltage in response to temperature or system commands.	*Electrical Engineering*
Fan Controller – PWM	An integrated circuit that varies the speed and airflow of a cooling fan using a pulse-width-modulated (PWM) voltage in response to temperature or system commands.	*Electrical Engineering*

Term	Definition	*Industry*
Fan deck	The surface enclosing the top of an induced draft tower. In a counterflow tower, the fan deck covers the entire top surface of the tower. In a crossflow tower, the open fan deck covers only the tower plenum area, leaving the distribution system exposed. An extended fan deck encloses the distribution system and covers the entire top surface of the tower.	*Facility Engineering*
Fan drift	the enclosed airtight passage, roadway or gallery leading from the upcast shaft to the ventilation fan.	*Mining*
Fan drive assembly	Mechanical components furnishing power to the fan, usually consisting of driver, drive shaft, speed reducer, and supporting members.	*Facility Engineering*
Fan driver input	Horsepower input to the driver. For 3-phase alternating current (ac) motors:	*Facility Engineering*
Fan driver output	Brake horsepower output of the driver to the drive shaft. Fan driver input x motor efficiency.	*Facility Engineering*
Fan guard	A protective screen installed either at the inlet of a forced draft fan or at the exit of an induced draft fan.	*Facility Engineering*
Fan pitch	The angle that a fan blade makes with the plane of rotation.	*Facility Engineering*
Fan signal	Automation device designed to give alarm if the main fan slows down or stops.	*Mining*
Fan stack	Cylindrical or modified cylindrical structure in which the fan operates. Fan stacks are used on both induced draft and forced draft axial flow propeller fans. Also known as Cylinder.	*Facility Engineering*
Fan stack height	Distance from top of fan deck to top of fan stack.	*Facility Engineering*
Fan support	(See Mechanical Equipment Support).	*Facility Engineering*
Fan, auxiliary	A small, portable fan used to supplement the ventilation of an individual working place.	*Mining*
Fan, booster	A large fan installed in the main air current, and thus in tandem with the main fan.	*Mining*
Fang	a channel cut in the side of an adit or shaft to act as an air course. (Derbys.).	*Mining*
Fangs	the levers at the top of a shaft on which the cage rests when being loaded and off-loaded (S. Wales)—see also 'keps'.	*Mining*
Fanny work	a method of timbering sometimes pronounced 'Panny work'. (Lancs.).	*Mining*
Fans	Fans, -see Keps.	*Mining*
Fare	standing coal that has not been holed or undercut (S. Wales).	*Mining*
farm agent	Term used in some states for county agent, extension agent, or county faculty.	*Agriculture*
Farm Bureau	a non-governmental political agency that works for farmers' rights	*Agriculture*
Farm In	When a company acquires an interest in a block by taking over all or part of the financial commitment for drilling an exploration well.	*Petroleum Drilling*
Farm in	When a company acquires an interest in a block by taking over all or part of the financial commitment for drilling an exploration well.	*Petroleum Drilling*
Farm out (in) arrangement	An arrangement, used primarily in the oil and gas industry, in which the owner or lessee of mineral rights (the first party) assigns a working interest to an operator (the second party), the consideration for which is specified exploration	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	and/or development activities. The first party retains an overriding royalty or other type of economic interest in the mineral production. The arrangement from the viewpoint of the second party is termed a "farm-in arrangement."	
Farm Stand	a location at or near the point of production where Californian farmers and ranchers are allowed to sell their fresh produce and eggs directly to consumers, exempt from packaging, sizing, and labeling regulations. New state regulations also allow growers to sell certain processed agricultural products.	*Agriculture*
Farm use	Energy use at establishments where the primary activity is growing crops and/or raising animals. Energy use by all facilities and equipment at these establishments is included, whether or not it is directly associated with growing crops and/or raising animals. Common types of energy-using equipment include tractors, irrigation pumps, crop dryers, smudge pots, and milking machines. Facility energy use encompasses all structures at the establishment, including the farm house.	*Energy*
farmer	A noun that seems to be losing popularity to such nouns as grower and producer, especially in academic circles. These terms also avoid the need to distinguish between farmers and ranchers, which terms aren't interchangeable.	*Agriculture*
farmers' market	A market at which farmers sell their produce directly to consumers. Punctuation is a frequently debated issue among writers. There is a great deal of inconsistency. On Web pages one often finds farmers both with and without the apostrophe on the same page. The Associated Press Stylebook 2003 doesn't directly answer the question; but a reading of the "possessives" entry (p201) suggests the proper news style would be to place an apostrophe after the s in farmers. Farmers' market.	*Agriculture*
Farm-Labor Party	an outgrowth of the Labor Party of Illinois which organized in 1918.	*Industrial Relations*
farmstead	Farm land with its buildings.	*Agriculture*
Far-set	to timber-up and spragg the face of a stall ready for undercutting. (Mids.).	*Mining*
Farwell v. Boston and Worcester Railroad Co.	A decision of the Massachusetts Supreme Court in 1842 setting out the principle that a worker assumes the ordinary risks involved in his employment.	*Industrial Relations*
FAS	Foreign Agricultural Service, an agency of the USDA.	*Agriculture*
FASB	Financial Accounting Standards Board	*Energy*
Fast	having a solid side more or less at right angles to the working face. - see also Narrow work; or a heading or stall driven in the solid coal. (Scots.); or the first bed of rock met with when sinking through soft ground on which the wedging curb can be laid. (Lancs.).	*Mining*
Fast breeder reactor (FBR)	A reactor in which the fission chain reaction is sustained primarily by fast neutrons rather than by thermal or intermediate neutrons. Fast reactors require little or no moderator to slow down the neutrons from the speeds at which they are ejected from fissioning nuclei. This type of reactor produces more fissile material than it consumes.	*Energy*
Fast end	the dead end of a roadway; or the part of a rib side adjacent to a coalface, the corner between the face line and the rib side.	*Mining*
Fast jenkin or Jenkin	a roadway driven through a pillar to split it into two smaller pillars.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fast Plant Test	A process test designed to quickly gather process model information from slow processes. This method works well with slow loops such as temperatures, compositions, and some tank levels.	*Process Control*
Fast shot	when a shot of explosive fails to have the desired effect, either it is too weak or the stemming is blown out. - see also Standing bobby.	*Mining*
Fast side	the end of the face where there is a solid face more or less at right angles. Also called the 'butt end' or 'fast end'; or the side of a face gate roadway in solid coal, also called a 'rib side' or 'cutting side'.	*Mining*
Fasteners	manufactured steel products (bolts, nails, etc.) used to connect two or more steel members	*Materials Process*
Fat	An animal or vegetable oil which will combine with an alkali to saponify and form a soap.	*Lubrication*
Fat Work	work which pays more money without any extra effort.	*Industrial Relations*
FATG	Fuel Additives Task Group (CMA)	*Petro-Chemical Abbreviations*
Fathom	Six feet square on the vein.	*Mining*
Fatigue	the inability of a worker to continue the level of output due to hours of work without adequate rest or relaxation.	*Industrial Relations*
Fatigue	The general phenomenon of material failure after several cycles to failure.	*Material Process*
Fatigue (Subsurface initiated)	Under the influence of repetitive (especially high) loads in any metallic contact, structural changes occur in steel, and cracks are initiated at a certain depth under the surface, due to volume changes of the altered material. Cracks propagate through the material until they reach the surface. In extreme cases, cracks further propagate until the component completely fractures (ISO/CD 15243).	*Maintenance*
Fatigue (Surface initiated)	Surface initiated fatigue or surface distress refers to the failure of any metal surface contact due to a fatigue process started from the surface. Generally, a surface defect, such as a foreign particle indentation or a corrosion pit, is the initiator. The fatigue process is especially accelerated by a reduced lubrication regime (ISO/CD 15243).	*Maintenance*
Fatigue assessment	Fatigue resistance verification of a component subjected to a number of operating cycles.	*Mechanical*
Fatigue Chunks	Thick three-dimensional particles exceeding 50 microns indicating severe wear of gear teeth.	*Lubrication*
Fatigue Costs	those costs of operation which may be directly or indirectly attributed to the effects of fatigue.	*Industrial Relations*
Fatigue curve	Characteristic plot of stress versus number of cycles to failure.	*Material Process*
Fatigue failure	The fracture of a metal part by a mechanism of slow crack growth with a resulting clamshell fracture surface.	*Material Process*
Fatigue life	The amount of time under defined operational conditions that a product is expected to survive before wear out.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fatigue Life	The theoretical number of revolutions (or hours of operation) a bearing will last under a given constant load and speed before the first evidence of fatigue develops on one or more of the components.	*Lubrication*
Fatigue Platelets	Normal particles between 20 and 40 microns found in gear box and rolling element bearing oil samples observed by analytical ferrography. A sudden increase in the size and quantity of these particles indicates excessive wear.	*Lubrication*
Fatigue Ratio	The dimensionless fatigue ratio f is the ratio of the stress required to cause failure after a specific number of cycles to the yield stress of a material. Fatigue tests are generally run through 107 or 108 cycles. A high fatigue ratio indicates materials which are more susceptible to crack growth during cyclic loading.	*Metallurgy*
Fatigue Resistance	The ability of a repeatedly deformed material to resist crystallization and accompanying failure.	*Electrical*
Fatigue strength	the maximum stress that can be sustained for a specified number of cycles without failure, the stress being completely reversed within each cycle unless otherwise stated	*Materials Process*
Fatigue strength (endurance limit)	Lower limit of the applied stress at which a ferrous alloy will fail by cyclic loading.	*Material Process*
Fatigue Study	efforts to measure the cause and the extent of fatigue and its effect on workers.	*Industrial Relations*
Fatigue Wear	Wear of a solid surface caused by fracture arising from material fatigue.	*Paint and Coatings*
Fatigue, corrosion	The weakening of a piece of metal or pipe due to corrosion.	*Chemical Engineering*
Fatigued	A structural failure of the filter medium due to flexing caused by cyclic differential pressure.	*Lubrication*
fatty acid	A chain of 8 to 30 linked carbons that terminate with a carboxylic acid.	*Agriculture*
Fault	A defect or imperfection. A fault develops when physical degradation has occurred, but the degradation is not severe enough to be termed as failure. A fault is absolute. This means there is a sufficiently high degree of confidence that a detailed physical examination of the component in question will show a fault that is absolutely supported by the symptom(s).	*Maintenance*
Fault Blanking	A function that ignores a fault for a predetermined period. This is done to eliminate nuisance fault indication.	*Electrical Engineering*
Fault casing	Alongside a fault there is often observed a layer of hardened clay or powder formed by the grinding of the edges of rocks in contact. This layer often exhibits grooving and striae due to rock movement along the line of dislocation.	*Mining*
Fault Current	The maximum electrical current that will flow in a short-circuited system prior to the actuation of any current-limiting device. It is far in excess of normal current flow and is limited only by a system's generating capacity and a cable's impedance.	*Electrical*
Fault ride-through (FRT)	Refers to the ability of an electrical device (such as a wind turbine converter) to respond to a temporary fault or voltage change in the transmission and distribution grid, including a zero-voltage dip, and to help the system return to normal operation. Fault ride-through specifications are part of many grid code requirements.	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fault Tolerant	Fault tolerant architecture allows the system to continue working even when part of the system fails. This is usually done by having multiple components running in parallel; when one part fails the redundant devices can take over, allowing engineers to repair the system without disrupting the process.	*Control Engineering*
Fault Trap	A structural trap in the earth, favorable for the retention of petroleum, formed by the cracking and breaking of a rock plane.	*Petroleum Drilling*
Fault tree	The sequence of events that leads to a hazardous incident, logic tree.	*Material Process*
Fault Tree Analysis	Fault Tree Analysis This is a systematic deductive process used to obtain the probability and rate of a failure using the concept of cause-effect relationships. It usually begins with a top-event which is postulated, and the possible ways for this event to occur are systematically deduced	*Reliability Engineering*
Fault Tree Analysis (FTA)	Fault tree analysis is a deductive process by means of which an undesirable event, called the top-event, is postulated, and the possible ways for this event to occur are systematically deduced	*Maintenance*
Fault zone	A fault, instead of being a single clean fracture, may be a zone hundreds or thousands of feet wide. The fault zone consists of numerous interlacing small faults or a confused zone of gouge, breccia, or mylonite.	*Mining*
Fault	A slip-surface between two portions of the earth's surface that have moved relative to each other. A fault is a failure surface and is evidence of severe earth stresses.	*Mining*
Fault-closing device	A system of circuit breakers that serves to contain a fault in a grid, preventing it from spreading to other areas and causing widespread disruption.	*Electrical*
Favoritism	action by the employer or supervisor which is based on considerations other than fairness or equity to all employees involved.	*Industrial Relations*
Faying surfaces	the surface of a piece of metal (or a member) in contact with another to which it is or is to be joined	*Materials Process*
FBC	fuel borne catalyst	*Petro-Chemical Abbreviations*
fbm	Feet board measure (board feet)	*General*
FBP	final boiling point	*Petro-Chemical Abbreviations*
FBR	Fast Breeder Reactor	*Energy*
FBRU	fuel boiling range unleaded gasoline	*Petro-Chemical Abbreviations*
FCC	fluid catalytic cracker	*Petro-Chemical Abbreviations*
FCF	fuel correction factor	*Petro-Chemical Abbreviations*
FCU	Field Control Unit.	*Control Engineering*
FDA	Food and Drug Administration	*Quality*
FDA-cleared or approved test system	A test system cleared or approved by the Food and Drug Administration through the pre-market notification (510k) or pre-market approval (PMA) process for in-vitro diagnostic use.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
FDD controller	abbreviation for our patented Fuzzy Logic Drilling Direction controller.	*Petroleum Drilling*
FDDI	A Fiber Distributed Data Interface is a type of LAN.	*Control Engineering*
FDS Data.MDB	the Microsoft Access database file, in which the FDS user's well data is stored.	*Petroleum Drilling*
FDS	abbreviation for Friendly Drilling Software.	*Petroleum Drilling*
FDS.MDE	the run-time file for the daily drilling report software called Friendly Drilling Software. To run FDS, double-click this file (or a Windows Shortcut thereto), or open it from within Microsoft Access. You may download and use FDS for FREE by clicking here.	*Petroleum Drilling*
FE	fuel economy	*Petro-Chemical Abbreviations*
FEA – Finite Element Analysis	A state of the art method of analyzing complex shapes by organizing the shapes into a series of smaller elements which can be more accurately analyzed to determine whether or not components are suitable for their intended purpose.	*Mechanical*
Feasibility Factor	A factor used to adjust potential energy savings to account for cases where it is impractical to install new equipment. For example, certain types of fluorescent lighting require room temperature conditions. They are not feasible for outdoor or unheated space applications. Some commercial applications, such as color-coded warehouses, require good color rendition, so color distortions could also make certain types of lighting infeasible. The feasibility factor equals 100 percent minus the percent of infeasible applications.	*Energy*
Featherbedding	practices on the part of some unions to make work for their members through the limitation or production.	*Industrial Relations*
Federal coal lease	A lease granted to a mining company to produce coal from land owned and administered by the Federal Government in exchange for royalties and other revenues.	*Energy*
Federal Contracts And Grants	Extramural agreements that fund selected campus activities, and prime contracts governing National Laboratory operations.	*Procurement*
Federal electric utility	A utility that is either owned or financed by the Federal Government.	*Energy*
Federal Emergency Relief Administration	an independent agency of the federal government established in May 1933 to coordinate and subsidize relief programs to the states.	*Industrial Relations*
Federal Employment Stabilization Board	a board set up under the Federal Employment Stabilization Act of 1931.	*Industrial Relations*
Federal Energy Regulatory Commission (FERC)	The regulatory agency, in the U.S. Department of Energy, that has jurisdiction over interstate electricity sales, wholesale rates, licensing, etc.	*Energy*
Federal Labor Unions	local unions which were affiliated with and chartered directly by the American Federation of Labor.	*Industrial Relations*
Federal Mediation and Conciliation Services	an independent agency created under Title II of the Taft-Hartley Act.	*Industrial Relations*
Federal Power Act	An act that includes the regulation of interstate transmission of electrical energy and rates. This act is administered by the Federal Energy Regulatory Commission.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Federal Power Commission (FPC)	The predecessor agency of the Federal Energy Regulatory Commission. The Federal Power Commission was created by an Act of Congress under the Federal Water Power Act on June 10, 1920. It was charged originally with regulating the electric power and natural gas industries. It was abolished on September 30, 1977, when the Department of Energy was created. Its functions were divided between the Department of Energy and the Federal Energy Regulatory Commission, an independent regulatory agency.	*Energy*
Federal region	In a Presidential directive issued in 1969, various Federal agencies (among them the currently designated Department of Health and Human Services, the Department of Labor, the Office of Economic Opportunity, and the Small Business Administration) were instructed to adopt a uniform field system of 10 geographic regions with common boundaries and headquarters cities. The action was taken to correct the evolution of fragmented Federal field organization structures that each agency or component created independently, usually with little reference to other agencies' arrangements. Most Federal domestic agencies or their components have completed realignments and relocations to conform to the Standard Federal Administration Regions (SFARs).	*Energy*
Federal Security Agency	an independent government agency created in 1939 under the President's first reorganization plan.	*Industrial Relations*
Federal Works Program	a program authorized by Congress in the early 1930's which had as a major objective employment for those idle and without finds who were receiving relief.	*Industrial Relations*
Federal-State Jurisdiction	the division of jurisdiction over labor-management relations between the Federal and state governments.	*Industrial Relations*
Federation	a league or alliance of national and international unions designed to provide mutual assistance on the federal level.	*Industrial Relations*
Federation of Organized Trades and Labor Unions	an organization formed in 1881 by skilled craftsmen in many trades who felt that it was important to protect the special needs of skilled workers.	*Industrial Relations*
Fee	to load the coal into tubs. So, Feer, the man who 'fees' or loads the coal into the tubs. (Mids.)	*Mining*
Fee interest	The absolute, legal possession and ownership of land, property, or rights, including mineral rights. A fee interest can be sold (in its entirety or in part) or passed on to heirs or successors.	*Energy*
Feed	a mixture or preparation used for feeding livestock	*Agriculture*
Feed grains	Grain grown to be fed to animals. Examples include corn, and sorghum. Most barley is grown for this purpose. But barley also is grown to make malt or beer, in which case it is classified as a small grain.	*Agriculture*
Feed Lots	a small area where cattle are confined and fed carefully mixed, high-concentrate feed to fatten them	*Agriculture*
Feed temperature	The feed temperature is the temperature of the heating water when it leaves the boiler.	*Thermal Management*
Feedability	The ease with which a grease flows within a dispensing pump.	*Lubrication*
Feedback	The output from a position sensor indicating the position, or state, of the valve.	*General Mechanical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Feedback (or feedback signal)	The output signal from a feedback element.	*Mechanical, Process, and Operations*
Feedback Control	A type of control whereby the controller receives a feedback signal representing the condition of the controlled process variable, compares it to the setpoint, and adjusts the controller output accordingly.	*Electrical Engineering*
Feedback loop	Any closed circuit consisting of one or more forward elements and one or more feedback elements.	*Mechanical, Process, and Operations*
Feedback Management Advisory Group (FMAG) (formerly Criticism Management Advisory Group (CMAG))	Formerly an advisory group to the CCSG. FMAG's remit was to advise on policies and procedures for managing comments and criticisms of Cochrane Reviews. Responsibilities now part of the remit of the CEU. Also called: CMAG, Criticism Management Advisory Group, FMAG	*Quality Engineering*
Feedback Signal	The return signal that results from a measurement of the directly controlled variable. An example would be where a control valve is equipped with a positioner. The return signal is usually a mechanical indication of valve plug stem position which is fed back into the positioner.	*Industrial Engineering*
Feeder	Overhead lines or cables that are used to distribute electrical power to consumers. Feeders connect distribution substations and consumers.	*Electrical*
Feeder cattle	cattle, ready to be finished for market, weighing 550-650 pounds or heavier	*Agriculture*
Feeder line	An electrical line that extends radially from a distribution substation to supply electrical energy within an electric area or sub-area.	*Energy*
Feeder Lockout	This happens when a main circuit is interrupted at the substation by automatic protective devices and cannot be restored until crews investigate. This indicates a serious problem on the circuit, usually equipment failure or a broken conductor.	*Energy*
Feeder	A small vein joining a larger one.	*Mining*
Feedforward Control	A type of control which takes corrective action based on disturbances before the process variable is upset.	*Electrical Engineering*
Feedstock	A term that refers to crude oil, natural gas liquids, natural gas or other materials used as raw ingredients for making gasoline, other refined products or chemicals.	*Electrical*
Feedstock	Stock from which material is taken to be fed (charged) into a processing unit.	*Petroleum Engineering*
Feedwater	Feedwater maintains water levels in the boiler. Feedwater consists of varying proportion of recovered condensed water (return water) and fresh water, which has been purified in varying degrees (make up water). The make-up water is usually natural water either in its raw state, or treated by some process before use. Feed-water composition therefore depends on the quality of the make-up water and the amount of condensate returned to the boiler. See also Raw Water	*Industrial*
Fees	pay or fixed charges for specific services to be performed.	*Industrial Relations*
Feigh	refuse, rubble or rubbish. (Derbys.), (N. East).	*Mining*
FEL	family emission limit	*Petro-Chemical Abbreviations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Feldspar	A group of common rock-forming minerals that includes microcline, orthoclase, plagioclase and others.	*Mining*
Fellow Servant Doctrine	the principle or doctrine in common law which held that the employer could not be held responsible for accidents suffered by a worker resulting from the negligence of the worker.	*Industrial Relations*
Felsic	Term used to describe light-colored rocks containing feldspar, feldspathoids and silica.	*Mining*
Female thread	An internal screw thread designed to mate with a component having male (external) threads of the same size and type.	*Mechanical*
Femto Base Station	A femto base station (also called an Access Point Base Station, femtocell, femto base station or femto basestation) is an in-home base station. Like a standard base station, it connects cell phone voice and data to the cell phone network, but it serves a smaller area (the home). A femto base station benefits the service provider because it offloads cell tower traffic. Subscribers benefit from superior signal strength, due to the proximity of the unit -- especially where a cellular signal is weak or not available. Femto base stations augment the normal network and replicates the usual telecommunications infrastructure. Connection to the cell phone network is provided by VoIP over the Internet.	*Electrical Engineering*
Fence gates	vertically acting security 'curtain' at both ends of the cage for the safety of the men during man-riding.	*Mining*
Fender	a very narrow pillar of coal left between adjacent workings.	*Mining*
FERC	Federal Energy Regulatory Commission	*Petro-Chemical Abbreviations*
FERC guidelines	A compilation of the Federal Energy Regulatory Commission's enabling statutes; procedural and program regulations; and orders, opinions, and decisions.	*Energy*
Fermi function	temperature dependent function that indicates the extent to which a given electron energy level is filled.	*Material Process*
Fermi level	Energy of an electron in the highest filled state in the valence energy band at 0 K.	*Material Process*
Ferrimagnetism Phenomenon	Phenomenon of sharp rise in induction with applied magnetic field strength. Ferromagnetic like behavior that includes some antiparallel spin pairing.	*Material Process*
Ferrimagnetism Phenomenon of sharp	Ferrimagnetism Phenomenon of sharp rise in induction with applied magnetic field strength. Ferromagnetic like behavior that includes some antiparallel spin pairing.	*Material Process*
Ferrite	Ferrous alloy based on the structure of pure iron at room temperature. Also, ferrimagentic ceramic based on the inverse spinel structure.	*Material Process*
Ferritic stainless steel	Corrosion resistant ferrous alloy with a predominant body centered cubic (a) phase.	*Material Process*
Ferroalloy	A metal product commonly used as a raw material feed in steelmaking, usually containing iron and other metals to aid various stages of the steelmaking process such as deoxidation, desulfurization and adding strength. Examples: ferrochrome, ferromanganese and ferrosilicon.	*Metallurgy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ferrobacillus	A type of iron-reducing bacteria.	*Chemical Engineering*
Ferroelectric	Material that exhibits spontaneous polarization under an applied electrical field.	*Material Process*
Ferrography	Magnetic particle analysis.	*Lubrication*
Ferrography	An analytical method of assessing machine health by quantifying and examining ferrous wear particles suspended in the lubricant or hydraulic fluid.	*Lubrication*
Ferromagnetism	Permanent and large magnetizations found in some metals (e.g., Fe, Ni, and Co), which result from the parallel alignments of neighboring magnetic moments.	*Engineering Physics*
Ferrous	Containing iron.	*Mining*
Ferrous alloy	Metal alloy composed of predominantly iron.	*Material Process*
Ferrous metals	metals containing iron	*Materials Process*
Ferrule	A compressible tubular fitting that is compressed onto a probe inside a compression fitting to form a gas-tight seal.	*General Engineering*
Fertile material	Material that is not itself fissionable by thermal neutrons but can be converted to fissile material by irradiation. The two principal fertile materials are uranium-238 andthorium-232.	*Energy*
Fertilizer	Substance that adds inorganic or organic plant nutrients to soil and improves its ability to grow crops, trees, or other vegetation.	*Chemical*
Fertilizer	organic or inorganic nutrients that are added to the soil to help the growth of crops	*Agriculture*
Fetch	the face of an unworked area of coal also called a breast. (Scot.).	*Mining*
Fettle	to put in order, clean or prepare. (Yorks.).	*Mining*
FF	Fieldbus Foundation.	*Control Engineering*
FFI	Pronounced "Fifi", But Has Nothing To Do With A French Maid. See Failure Finding Interval	*Plant Engineering*
FFT or Fast Fourier Transform	A popular computer method of shifting data from the time domain to the frequency domain.	*Reliability Engineering*
FFV	flexible fueled vehicle	*Petro-Chemical Abbreviations*
FFV, Flex Fuel Vehicle	A vehicle capable of running on a multiplicity of gasoline based fuels ranging from 100% gasoline to E85.	*Mechanical, Process, and Operations*
FGD	Flue-Gas Desulfurization	*Energy*
FGIS	Federal Grain Inspection Service.	*Agriculture*
Fiber	Any material that has been drawn into a cylinder with a length-to-diameter ratio greater than about ten.	*Engineering Physics*
FIBER	For the purpose of microscopic particle counting a fiber is a particle whose length is greater than 100 micrometers but at least ten times greater than its width.	*Mechanical, Process, and Operations*
Fiber Center	Cord or rope of vegetable or synthetic fiber used as the axial member of a strand.	*Wire Rope & Cable*
Fiber Core	Cord or rope of vegetable or synthetic fiber used as the axial member of a rope.	*Wire Rope & Cable*

Please see the Appendix for further illustration

Term	Definition	Industry
Fiber Distributed Data Interface	A standard for transmitting data on optical fiber cables at a rate of around 100,000,000 bits-per-second (10 times as fast as 10 Base-T Ethernet; about twice as fast as T-3).	*Electrical Engineering*
Fiber Distributed Data Interface	A standard for transmitting data on optical fiber cables at a rate of around 100,000,000 bits-per-second (10 times as fast as 10 Base-T Ethernet; about twice as fast as T-3).	*Electrical Engineering*
Fiber Grease	A grease with a distinctly fibrous structure, which is noticeable when portions of the grease are pulled apart.	*Lubrication*
Fiber Optics	The transparent fibers of glass or plastic used for conducting and guiding light energy. Fiber optics are used in photoelectrics as light pipes consisting of a bundle of small optical fibers (glass) or single strand (plastic) housed inside a flexible sheathing.	*Electrical Engineering*
Fiber reinforced composite	a composite in which the one material forms the outer matrix forms the outer matrix and transfers any loads applied to the stronger, more brittle fibers	*Physics*
Fiberglass	Composite system composed of a polymeric matrix reinforced with glass fibers.	*Material Process*
Fiber-to-the-home	A method for broadband data (voice, Internet, multimedia, etc.) delivery to the home via optical fiber. Contrast with FTTN (fiber-to-the-node) which uses fiber up to a node outside the home and uses copper to bring the data into the home.	*Electrical Engineering*
Fibonacci series	Mathematical series in which term is the sum of the two previous terms. the limiting value of the ratio of two consecutive terms is the golden ratio (1.618).	*Material Process*
Fibre Channel	A highly-reliable, gigabit interconnect technology that allows concurrent communications among workstations, mainframes, servers, data storage systems, and other peripherals using SCSI and IP protocols. It provides interconnect systems for multiple topologies that can scale to a total system bandwidth on the order of a terabit per second. (The standardized spelling is "fibre channel" but often misspelled as "fiber channel.")	*Electrical Engineering*
Fibril	A tiny fiber barely visible even with an electron microscope. Fibers may be formed by bundles of fibrils that collect together.	*Lubrication*
Fibrous Filler	A material used to fill interstices in cables made from fibers, such as jute, polypropylene, cotton, glass, etc.	*Electrical*
Fick's first and second laws	The basic mathematical description of diffusional flow.	*Material Process*
Fick's law	The first law relates the concentration gradients to the diffusive flux of a solute infinitely diluted in a solvent. The second law introduces the first law into a differential material balance for the solute.	*Chemical*
Fick's First Law	an equation describing the rate at which a gas transfers into solution. The change in concentration of gas in solution is proportional to the product of an overall mass transfer coefficient and the concentration gradient.	*Chemical*
Fick's Second Law	an equation relating the change of concentration with time due to diffusion to the change in concentration gradient with distance from the source of concentration.	*Chemical*
Fieg	a type of slip fault running across the roof above the coal. Although not a major fault, which did not disturb the coal seam, it was often the source of a feeder, bringing surface water into the mine (S. Wales.).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Field	An area consisting of a single reservoir or multiple reservoirs all grouped on, or related to, the same individual geological structural feature and/or stratigraphic condition. There maybe two or more reservoirs in a field that are separated vertically by intervening impervious strata or laterally by local geologic barriers, or by both.	*Energy*
Field	Fields (which can also be called Networks) are Cochrane entities that focus on dimensions of health care other than health problems, such as the setting of care (e.g. primary care), the type of consumer (e.g. older people), the type of provider (e.g. nursing), the type of intervention (e.g. complementary medicine), or a broad area of health care (e.g. cancer). Among their tasks, people working in Fields handsearch specialist journals, help to ensure that priorities and perspectives in their field of interest are reflected in the work of Cochrane Review Groups, compile specialist databases, co-ordinate activities with relevant agencies outside the Collaboration, and comment on Cochrane Reviews relating to their particular area. Also called: Networks	*Quality Engineering*
Field	A geographical area under which an oil or gas reservoir lies.	*Petroleum Drilling*
Field area	A geographic area encompassing two or more pools that have a common gathering and metering system, the reserves of which are reported as a single unit. This concept applies primarily to the Appalachian region.	*Energy*
Field Balancing Equipment	An assembly of measuring instruments for performing balancing operations on assembled machinery which is not mounted in a balancing machine.	*General Engineering*
Field capacity	the maximum amount of water that a soil can retain after excess water from saturated conditions has been drained by the force of gravity.	*Chemical*
Field crops	Originally defined as any crop grown on a larger scale than in gardens. Modern usage may vary, but generally refers to small grains, hay and cotton.	*Agriculture*
Field discovery year	The calendar year in which a field was first recognized as containing economically recoverable accumulations of oil and/or gas.	*Energy*
Field effect transistor	Solid state amplifier.	*Material Process*
Field of View	A volume in space defined by an angular cone extending from the focal plane of an instrument.	*General Engineering*
Field production	Represents crude oil production on leases, including lease condensate. Excludes plant condensate and other processed liquids. **Note: In some EIA publications, field production includes NGPL production, in accordance with definitions used prior to January 2014.**	*Energy*
Field Programmable Gate Array	A family of general-purpose logic devices that can be configured by the end user to perform many, different, complex logic functions. It is often used for prototyping logic hardware.	*Electrical Engineering*
Field Programmable Gate Array	A family of general-purpose logic devices that can be configured by the end user to perform many, different, complex logic functions. It is often used for prototyping logic hardware.	*Electrical Engineering*
Field separation facility	A surface installation designed to recover lease condensate from a produced natural gas stream usually originating from more than one lease and managed by the operator of one or more of these leases.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Field serviceable	A statement indicating that normal repair of the valve or replacement of operating parts can be accomplished in the field without return to the manufacturer.	*Mechanical*
Fieldbus	Fieldbus is a generic term used to describe a common communications protocol for control systems and/or field instruments. Although some standard forms have been agreed for instruments, the DCS industry as a whole have so far no agreed fieldbus. Often, the Foundation Fieldbus is referred to simply as the Fieldbus.	*Control Engineering*
Fiery mine	a colliery in which a seam or several seams give off large amounts of methane and were prone to explosions, also, 'Fiery seam', an individual seam within a mine, which gives off large amounts of methane	*Mining*
Fiery seam	Fiery seam, -see Fiery Mine.	*Mining*
Fifth Wheel	Provides a connection (flexible) between the tractor and the trailer. Pivot mounted, it contains provision for accepting and holding the kingpin of a trailer, Center of the fifth wheel should always be located ahead of the centerline of the rear axle.	*Mechanical Engineering*
Figure 1502	A hammer union model number typically 15,000 psi rated (but down rated (or H2S service).	*Petroleum Engineering*
Figure 2202	A hammer union model number typically 20,000 psi rated (but down rated (or H2S service)	*Petroleum Engineering*
Figure 602	A hammer union model number 6,000 psi rated. Held in stock by	*Petroleum Engineering*
Filamentous bacteria	Bacteria with a long, threadlike shape.	*Chemical Engineering*
File	A set of related records or data treated as a unit.	*General Engineering*
File rate schedule	The rate for a particular electric service, including attendant contract terms and conditions, accepted for filing by a regulatory body with appropriate oversight authority.	*Energy*
Filing	Any written application, complaint, declaration, petition, protest, answer, motion, brief, exception, rate schedule, or other pleading, amendment to a pleading, document, or similar paper that is submitted to a utility commission.	*Energy*
Filing Requirements	provisions of the Labor-Management Reporting and Disclosure Act requiring labor unions to file reports containing financial information with the Department of Labor.	*Industrial Relations*
Fill	Any material that is put back in place of the extracted ore to provide ground support.	*Mining*
Fill bars	The assembly of splash bars comprising the tower filling. Fill bars intercept the downward fall of water at regular intervals, forming splash surfaces which cause water drops to break into smaller droplets, and provide wetted surfaces for air-water contact.	*Facility Engineering*
Fill hanger	Support system in a crossflow tower for fill bars which hold fill in place.	*Facility Engineering*
Fill or Filling	hand loading with a shovel.	*Mining*
Fill support	(See Deck Support).	*Facility Engineering*
Fill-deck	The assembly of splash bars comprising the tower filling. (See Fill Bars for description of operation in a crossflow tower.)	*Facility Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Filler	An inert foreign substance added to a matrix to improve or modify its properties.	*Engineering Physics*
Filler	Any material used in multiconductor cables to occupy interstices between insulated conductors or form a core into a desired shape (usually circular). Also, any substance, often inert, added to a plastic or elastomer to improve its properties or decrease its cost.	*Electrical*
Filler Metal	Filler Metal. Metal to be added in welding, soldering, brazing, or braze welding.	*Maintenance and Repair*
Filler ring	A ring which fills the recess of a "V" or "U" type seal.	*Mechanical, Process, and Operations*
Filler specks	Visible specks of a filler used, such as wood flour or asbestos, which stand out in color contrast against a background of plastics binder. It should be stated whether the specks are visible before or only after removal of the surface film.	*Material Process*
Filler Wire	Small spacer wires within a strand which help position and support other wires. Also the name for the type of strand pattern utilizing filler wires.	*Wire Rope & Cable*
Fillet	A rounded inside corner. The rounding of an outside corner is called beveling.	*Material Process*
Fillet Weld	A weld of an approximately triangular cross section joining two surfaces approximately at right angles to each other in a lap joint, tee joint, corner joint, or socket weld.	*Maintenance and Repair*
Fillet Curve	The concave portion of the tooth profile where it joins the bottom of the tooth space. The approximate radius of this curve is called the Fillet Radius.	*Mechanical Engineering*
Fillet Stress	The maximum tensile stress in the gear tooth fillet.	*Mechanical Engineering*
Filling	That part of a crossflow, counterflow, or natural draft tower consisting of splash bars, vertical sheets of various configurations, or honeycomb assemblies, tile or other materials, which are placed within the tower to effect heat and mass transfer between the circulating water and the air flowing through the tower.	*Facility Engineering*
Filling shift	the shift on which coal is loaded on the face (into either pans, tubs or onto a conveyor).	*Mining*
Filling Solution	A solution of defined composition to make contact between an internal element and a membrane or sample. The solution sealed inside a pH glass bulb is called an internal filling solution. This solution normally contains a buffered chloride solution to provide a stable potential and a designated zero potential point. The solution which surrounds the reference electrode internal and periodically requires replenishing is called the reference filling solution. It provides contact between the reference electrode internal and sample through a junction.	*General Engineering*
Film	In the plywood industry, this term refers to a dry sheet of paper coated on both sides with a resin such as phenol formaldehyde. A well known example is the proprietary product Tego. Film also refers to a thin sheet of plastic.	*Material Process*
Film	Thin, plastic sheeting having nominal thickness usually not greater than 0.010 inch.	*Electrical*
Film Strength	The ability of a lubricant film to withstand the effects of load, speed, and temperature without breaking down or rupturing.	*Lubrication*
Film Strength	Property of a lubricant that acts to prevent scuffing or scoring of metal parts.	*Lubrication*
Filter	See Strainer	*Industrial*

Term	Definition	*Industry*
Filter bed	A pond or tank having a false bottom covered with sand and serving to filter river or pond waters.	*Civil Engineering*
Filter Cake	Debris collected on the surface of the filter.	*Filtration*
Filter Efficiency	Method of expressing a filter's ability to trap and retain contaminants of a given size.	*Oil Analysis*
Filter Efficiency	The amount of removal of particles, at or above a certain diameter, from the fluid by the filter. Efficiency is generally measured in terms of the percentage removal of the particles by weight, and therefore does not reveal the number of particles which may pass through the filter. Efficiency % = (b – 1)/ b x 100. Submicron filters are often rated using titer reduction values. For filters that remove microbes from a fluid, efficiency is often stated as titer reduction. Titer reduction is calculated by the following equation: TR = Total number of CFU influent to the filter, Total number of CFU effluent to the filter where TR is Titer Reduction, CFU is Colony Forming Unit. For compactness, these ratings are often stated as powers of 10, or as logs. If a filter removes 999,999 out of 1,000,000 Brevundimonas diminuta, that filter has a TR value of 106, or a six-log reduction.	*Contamination Control*
Filter head	An end closure for the filter case or bowl that contains one or more ports.	*Oil Analysis*
Filter housing	A ported enclosure that directs the flow of fluid through the filter element.	*Oil Analysis*
Filter Life	A measure of how long a filter will last before replacement or cleaning. It can be stated either in terms of time (30 days between changes) or volume of fluid filtered (10,000 liters processed between filter changes). A filter's actual life will depend on what particulates and conditions it is exposed to in actual usage, so filter life ratings from lab testing with standard contaminants can be used for comparison, but do not necessarily predict actual service life. To predict actual life, testing with the actual application fluids under actual operating conditions is required.	*Contamination Control*
Filter life test	A type of filter capacity test in which a clogging contaminant is added to the influent of a filter, under specified test conditions, to produce a given rise in pressure drop across the filter or until a specified reduction of flow is reached. Filter life may be expressed as test time required to reach terminal conditions at a specified contaminant addition rate.	*Oil Analysis*
Filter media, surface	Porous materials which primarily retain contaminants on the influent face, performing the actual process of filtration.	*Oil Analysis*
Filter Pack	Sand or gravel that is smooth, uniform, clean, well-rounded and siliceous. It is placed in the annulus of the well between the borehole wall and the well screen to prevent formation material from entering the screen.	*Petroleum Engineering*
Filter press	This is used to filter out impurities out of gold.	*Mining*
Filter Regulator	See airset.	*Industrial Engineering*
Filterable solids	The solids retained on a membrane for analysis by weight, count, or observation as it applies to the section on contamination measurement.	*Mechanical, Process, and Operations*
Filtered Water/Permeate/ Filtrate	The treated or clean water produced by membrane filtration.	*Contamination Control*
Filtration	The physical or mechanical process of separating insoluble particulate matter from a fluid, such as air or liquid, by passing the fluid through a filter medium that will not allow the particulates to pass through it.	*Oil Analysis*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Filtration (Beta) ratio	The ratio of the number of particles greater than a given size in the influent fluid to the number of particles greater than the same size in the effluent fluid.	*Oil Analysis*
Filtration Degree	The size of the pores in the filtration medium.	*Filtration*
Filty, Filtry or Filthy	all terms used in Somerset for firedamp or an accumulation of gas.	*Mining*
Fin	Ridge or line left on plastics by the mold parts where they meet in the closing of the mold. Also, known as flash.	*Material Process*
Final Control Element	That component of a control system (such as a valve) which directly changes the manipulated variable.	*Electrical Engineering*
Final order	A final ruling by FERC that terminates an action, decides some matter litigated by the petitioning parties, operates to some right, or completely disposes of the subject matter.	*Energy*
Finances	management of money affairs	*Agriculture*
Financial Accounting Standards Board (FASB)	An independent board responsible, since 1973, for establishing generally accepted accounting principles. Its official pronouncements are called "Statements of Financial Accounting Standards" and "Interpretations of Financial Accounting Standards."	*Energy*
Financial Attributes	Financial attributes measure the financial health of the company. Utility management, security analysts, investors, and regulators use these attributes to evaluate a utility's performance against its historic records and industry averages. Key financial attributes include capital requirements, earnings per share of common equity, capitalization ratios, and interest coverage ratios.	*Energy*
Fine gold	Almost pure gold. Fineness is the proportion of pure gold or silver in jewelry or bullion expressed in parts per thousand. Thus, 925 fine gold indicates 925 parts out of 1,000, or 92.5%, is pure gold.	*Mining*
Fines	The portion of a powder composed of particles which are smaller than the specified size	*Paint and Coatings*
Fines or Coal fines	very fine coal material below 500 μm.	*Mining*
Finished leaded gasoline	Contains more than 0.05 gram of lead per gallon or more than 0.005 gram of phosphorus per gallon. Premium and regular grades are included, depending on the octane rating. Includes leaded gasohol. Blendstock is excluded until blending has been completed. Alcohol that is to be used in the blending of gasohol is also excluded.	*Energy*
Finished motor gasoline	Finished motor gasoline: See Motor gasoline (finished).	*Energy*
Finished-Goods Turn Rate	A measure of asset management that typically is calculated by dividing the value of total annual shipments at plant cost (for the most recent full year) by the average finished-goods inventory value. Plant cost includes material, labor, and plant overhead.	*Maintenance*
Finished-Product First-Pass Yield	The percent of finished-products that meet all quality-related specifications at a final test point. In process industries, yield is often calculated as the percentage of output that meets target-grade specifications (excluding saleable "off-grade" product).	*Maintenance*
Finish-Go-Home Basis of Pay	a method of wage payment which guarantees pay for the day upon completion of the task assigned for the period.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Finishing	final stages of inspection and preparing galvanized steel so that it complies with specification(s)	*Materials Process*
Finite capacity scheduling	Software-based systems that enable simulation of production scheduling (and determination of delivery dates) based on actual unit/hour capacity at each step in the production routing. Finite scheduling systems, running on desktop computers, often compensate for the "infinite capacity" assumptions built into capacity-planning modules in traditional MRP II systems.	*Quality*
Finite element analysis (FEA)	A mathematical method for analyzing stress. FEA is used in product-design software to conduct graphical on-screen analysis of a model's reactions under various load conditions.	*Quality*
Finite element modeling or finite element analysis or FEA	A computer-aided design technique for predicting the dynamic behavior of a possible future mechanical system.	*Reliability Engineering*
Fink	a professional strike-breaker.	*Industrial Relations*
Finned-Tube	Pipe or tube with longitudinal fins equally spaced in array along its length, usually used for thermal heat processes or Heat Exchange. See also Fins	*Industrial*
Fins	Specially shaped fins used in array along the length of a Heat Exchanger or tube, useful in the distribution of heat from the surface of the exchange device. Fins may be welded on, or extruded with the tube. See also Finned-Tube	*Industrial*
FIP	Federal Implementation Plan	*Petro-Chemical Abbreviations*
Fire bank	a waste tip that is on fire due to spontaneous combustion. (Mids.).	*Mining*
Fire basket	Fire basket, -see Fire lamp.	*Mining*
Fire beater	the man who attended the boilers on the pit top. Before the introduction of mechanical feeders when the boilers were stoked by hand the fire beater paid a high price in toil and sweat to keep up a head of steam to run the winding engine. He was only allowed the dirty, low-grade coal from the mine and spent a great deal of time keeping the fire clear of ash and clinker.	*Mining*
Fire damp	The combustible gas, methane, CH4. Also, the explosive methane-air mixtures with between 5% and 15% methane. A combustible gas formed in mines by decomposition of coal or other carbonaceous matter, and that consists chiefly of methane.	*Mining*
Fire gate	A gate or ball valve which is positioned in a pipeline at the entrance to a compressor station. This valve is closed in case of fire in the compressor station. Closing the valve prevents the gas in the pipeline from feeding the fire.	*Mechanical*
Fire Hazard	Situation in which a material of more than average combustibility or explodability exists in the presence of a potential ignition source.5	*Maintenance and Repair*
Fire hydrant	A hydrant for use in extinguishing fires. Also called "fireplug."	*Civil Engineering*
Fire lamp	a round iron cage supported on three legs, or hung by chains, in which a coal fire is maintained for the convenience of the banksmen or others. Also sometimes placed at the bottom of a shaft to produce ventilation in opening out a colliery and this was also known as a 'fire basket'. Fireman, - see Deputy.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fire Point	The temperature at which the fluid will sustain a fire if ignited by an outside ignition source. It is quite common for heat transfer systems to be operated at temperatures above the fire point of the fluid as ignition sources should always be far removed from any heat transfer system.	*Lubrication*
Fire point (Clevelend Open Cup)	The temperature to which a combustible liquid must be heated so that the released vapor will burn continuously when ignited under specified conditions.	*Oil Analysis*
Fire Resistant Fluid	A fluid difficult to ignite which shows little tendency to propagate flame.	*Lubrication*
Fire rib	a solid rib or wall of coal left unworked between the sides of work as a protection against gob fires (S. Staffs.).	*Mining*
Fire safe	A valve design that is capable of passing a fire test with specified limits on leakage to the atmosphere and downstream after being closed subsequent to fire exposure.	*General Mechanical*
Fire stink	the burning smell of spontaneous combustion, also called 'fire stythe'—see also 'Gob stink'.	*Mining*
Fire stone	another word for 'fireclay' (Som.).	*Mining*
Firebreak	Any nonflammable barrier such as mineral soil or slow-burning vegetation used to slow or stop the spread of fire.	*Forestry*
Fireclay or underclay	clay, often occurring beneath a coal and often containing rootlets. Some are suitable for brick making or for refractories.	*Mining*
Fired ceramic	Ceramic material after processing at a sufficiently high temperature to drive off any volatiles and to allow necessary strengthening mechanism, such as sintering.	*Material Process*
Firedamp	methane (CH4); or a mixture of methane gas and air.	*Mining*
Firepan	Firepan—see Furnace	*Mining*
Fire-resistant Fluid	Lubricant used especially in high-temperature or hazardous hydraulic applications. Three common types of fire-resistant fluids are: (1) water-petroleum oil emulsions, in which the water prevents burning of the petroleum constituent; (2) water-glycol fluids; and (3) non-aqueous fluids of low volatility, such as phosphate esters, silicones, and halogenated hydrocarbon-type fluids.	*Lubrication*
Firewall	A double wall between cells used to isolate a fire portion system and designed according to NFPA 214.	*Facility Engineering*
Firing	A high-temperature heat treatment that increases the density and strength of a ceramic piece.	*Engineering Physics*
Firing	The processing of a ceramic by heating raw materials to a high temperature, typically above 1000 °C (1832°F).	*Material Process*
Firing line	an early method of clearing firedamp. A prop with a metal ring nailed near the top would be set where the gas has accumulated. A cord or wire was passed through the ring and brought back to a safe distance. An oil lamp would be fastened to the cord and slowly drawn along towards the prop until it came into contact with the firedamp and exploded it	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Firm	An association, company, corporation, estate, individual, joint venture, partnership, sole proprietorship, or any other entity, however organized, including: (a) charitable or educational institutions; (b) the Federal Government, including corporations, departments, federal agencies and other instrumentalities; and (c) state and local governments.	*Energy*
Firm Energy	Power or power-producing capacity covered by a commitment to be available at all times during the period.	*Energy*
Firm power	Power or power-producing capacity, intended to be available at all times during the period covered by a guaranteed commitment to deliver, even under adverse conditions.	*Energy*
Firm Transmission Service	Service that is reserved for at least one year.	*Energy*
Firmware	Programs stored in PROMs.	*Electronic Process*
First International	an organization of working men of international scope which grew out of the efforts of Marx and Engels to organize workers in the 1840's.	*Industrial Relations*
First order vibration	Rotating machine vibration caused by shaft unbalance. Frequency in hertz (Hz) is calculated by shaft RPM/60. Also called 1x vibration. Additional orders, 2x, 3x .... 36x, etc. are caused by other mechanisms	*Reliability Engineering*
First purchase (of crude oil)	An equity (not custody) transaction commonly associated with the transfer of ownership of crude oil coupled with the physical removal of the crude oil from a property (lease) for the first time. A first purchase normally occurs at the time and place of ownership transfer where the crude oil volume sold is measured and recorded on a run ticket or other similar physical evidence of purchase. The reported price is the first purchase average cost paid by the purchaser, allowing for any adjustments (deductions or premiums) passed on to the producer or royalty owner.	*Energy*
First purchase price	The price for domestic crude oil reported by the company that owns the crude oil the first time it is removed from the lease boundary.	*Energy*
First purchaser	A firm that acquires ownership of domestic crude oil by a first purchase transaction. Physical custody of the crude oil is not a prerequisite. In the case of multiple owners, only one firm should report to avoid double-counting.	*Energy*
First Read Rate	The ratio of the number of successful reads to the number of attempted first reads.	*Gears*
First Round Increases	wage demands made by unions following the end of WWII designed largely to offset the wage "stabilization" during the war.	*Industrial Relations*
First weighting	the first weight which takes place after a longwall face begins working.	*Mining*
First working	the driving of headings to extract coal and form pillars; or the first extraction in a seam that is worked in more than one layer.	*Mining*
First-In First Out	A type of memory that stores data serially, where the first bit read is the first bit that was stored.	*Electrical Engineering*
First-pass yield	The percentage of finished products that meet all quality-related specifications at a final test point. When calculating yield for components, the percentage that meets all quality-related specifications at a critical test point without being scrapped, rerun or reworked. In process industries, yield often is calculated as the percentage of output that meets target-grade specifications (excluding saleable "off-grade" product).	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fiscal year	The U.S. Government's fiscal year runs from October 1 through September 30. The fiscal year is designated by the calendar year in which it ends; e.g., fiscal year 2002 begins on October 1, 2001 and ends on September 30, 2002	*Energy*
Fish	The remnants of a broken drill string, or any object that has been unintentionally dropped down the wellbore. Fishing is the act of using specialized tools to retrieve a fish.	*Petroleum Drilling*
Fish and Boat Commission	Because of the Marcellus gas drilling impact on waterways, this state department has also emerged as an active regulator of Marcellus shale drilling in Pennsylvania.	*Petroleum Drilling*
Fish eye	Small globular mass in a transparent or translucent plastic which has not disappeared or blended completely into surrounding material, creating somewhat the appearance of a fish's eye.	*Material Process*
Fisher clip	a clip used to attach a tub to a haulage rope incorporating a wedging action in which a collar is knocked down on two tapered arms which carry the rope grip. Fissle or Fistle, the faint crackling noise heard in the early stages of creep. (N. East).	*Mining*
Fisher Matrix	A mathematical expression that is used to determine the variability of estimated parameter values based on the variability of the data used to make the parameter estimates. It is used to determine confidence bounds when using maximum likelihood estimation (MLE) techniques	*Reliability Engineering*
Fishing	Retrieving objects from the borehole, such as a broken drillstring, or tools.	*Petroleum Drilling*
Fishing	Retrieving objects from the borehole, such as a broken drillstring, or tools.	*Petroleum Drilling*
Fissile material	Material that can be caused to undergo atomic fission when bombarded by neutrons. The most important fissionable materials are uranium-235, plutonium-239, and uranium-233.	*Energy*
Fission	The process whereby an atomic nucleus of appropriate type, after capturing a neutron, splits into (generally) two nuclei of lighter elements, with the release of substantial amounts of energy and two or more neutrons.	*Energy*
Fissure	An extensive crack, break or fracture in rocks.	*Mining*
Fissure Vein	A fissure or crack in the earth's crust filled with mineral matter.	*Mining*
Fitness for service	This is an assessment carried out to ascertain the structural integrity of an in-service component/system that contains a defect, damage or degradation. Its objectives include;	*Reliability Engineering*
Fitter	a coal broker who conducts the sales of coals between the owner of a colliery and the shipper. (N. East)	*Mining*
Fitting	Any component, other than valves, used with pipe as part of the pressure system and normally referring to items covered by a national standard.	*General Mechanical*
Fitting, Bushing	A short, externally threaded connector with a smaller size internal thread. FITTING, CLOSURE - A cap or a plug.	*Mechanical, Process, and Operations*
Fitting, Compression	A fitting which seals and grips by manual adjustment deformation.	*Mechanical, Process, and Operations*
Fitting, Connector	A fitting for joining a conductor to a component port or to one or more other conductors.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fitting, Flared	A fitting which seals and grips by a performed flare at the end of the tube. FITTING, FLARELESS - A fitting which seals and grips by some means other than a flare.	*Mechanical, Process, and Operations*
Fitting, Reusable hose	A hose fitting that can be removed from a hose and reused. FILTER (OIL) - A device which removes solids from a fluid.	*Mechanical, Process, and Operations*
Five-Day Workweek	a goal of American Labor during the 1920's which was supported by some employers.	*Industrial Relations*
Fivefold symmetry	Property of a structure that is equivalent 360°/5 rotation. this characteristic of quasi crystals is not consistent with traditional crystallography.	*Material Process*
Five-S (5-S) Concept	The "5-S Concept" was developed by the Japanese over a period of time to ensure a culture of organization within the manufacturing and service environments, which leads to higher quality. The 5 S's, closely translate from Japanese to English as Sort, Simplify, Shine, Standardize, and Sustain.	*Maintenance*
Fix, to	to bribe or use other unscrupulous methods in order to prevent the normal application or operation of the law.	*Industrial Relations*
Fixed asset turnover	A ratio of revenue to fixed assets which is a measure of the productivity and efficiency of property, plant, and equipment in generating revenue. A high turnover reflects positively on the entity's ability to utilize properly its fixed assets in business operations.	*Energy*
Fixed assets	Tangible property used in the operations of an entity, but not expected to be consumed or converted into cash in the ordinary course of events. With a life in excess of one year, not intended for resale to customers, and subject to depreciation (with the exception of land), they are usually referred to as property, plant, and equipment.	*Energy*
Fixed Assets	Possessions such as buildings, machinery and land which, as opposed to current assets, are unlikely to be converted into cash during the normal business cycle.	*Mining*
Fixed carbon	The nonvolatile matter in coal minus the ash. Fixed carbon is the solid residue other than ash obtained by prescribed methods of destructive distillation of a coal. Fixed carbon is the part of the total carbon that remains when coal is heated in a closed vessel until all matter is driven off.	*Energy*
Fixed carbon	The part of the carbon that remains behind when coal is heated in a closed vessel until all of the volatile matter is driven off.	*Mining*
Fixed charge coverage	The ratio of earnings available to pay so-called fixed charges to such fixed charges. Fixed charges include interest on funded debt, including leases, plus the related amortizations of debt discount, premium, and expense. Earnings available for fixed charges may be computed before or after deducting income taxes. Occasionally credits for the "allowance for funds used during construction" are excluded from the earnings figures. The precise procedures followed in calculating fixed charges or interest coverages vary widely.	*Energy*
Fixed connection	In two dimensions, a fixed connection between two members restrains all three degrees of freedom of the connected member with respect to one another. A fixed connection is sometimes called a rigid connection or moment-resisting connection.	*Engineering Physics*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fixed Cost	A cost that remains constant, in total, regardless of changes in the level of activity within the relevant range. If a fixed cost is expressed on a per unit basis, it varies inversely with the level of activity.	*Procurement*
Fixed cost (expense)	An expenditure or expense that does not vary with volume level of activity.	*Energy*
Fixed Costs	The annual costs associated with the ownership of property such as depreciation, taxes, insurance, and the cost of capital.	*Energy*
Fixed Displacement Pump	A pump in which the output per cycle cannot be varied.	*Mechanical, Process, and Operations*
Fixed Displacement Pump	A pump in which the displacement per cycle cannot be varied.	*Lubrication*
Fixed Length	Description of a symbology which only allows bar codes of a set number of characters.	*Gears*
Fixed operating costs	Costs other than those associated with capital investment that do not vary with the operation, such as maintenance and payroll.	*Energy*
Fixed Price	A price, usually per kilowatt-hour, that remains the same over the term of the contract.	*Energy*
Fixed Shift	assignment of individuals or groups to the same shift on a regular basis in plants which operate more than one shift.	*Industrial Relations*
Fixed support	In two dimensions, a fixed support restrains three degrees of freedom: two translations and one rotation.	*Engineering Physics*
Fixed-effect model	[In meta-analysis:] A model that calculates a pooled effect estimate using the assumption that all observed variation between studies is caused by the play of chance. Studies are assumed to be measuring the same overall effect. An alternative model is the random-effects model.	*Quality Engineering*
Fixing	in the nitrogen cycle, it is the process of nitrogen changing into a less mobile and more usable form by combining with hydrogen to make ammonia	*Agriculture*
Fixture	A device or attachment fastened to or propelled by the conveying medium; used for supporting or securing objects being processed as they are conveyed.	*Equipment*
Flag	Any of various types of indicators used for identification of a condition or event; for example, a character that signals the termination of a transmission.	*General Engineering*
Flags	Flags signal drivers of events or conditions. Green, white, white/red, black, checkered, blue, yellow, red and red/yellow flags each have a different meaning. See each individual color for an explanation of what each flag means.	*NASCAR*
Flail	a wooden bar with a wooden handle used for removing grain or seeds from stalks	*Agriculture*
Flame Hardening	The localized surface heating of a medium carbon steel by an impinging gas flame so that the temperature is raised above 900oC. The part is quenched (or self-quenches by virtue of the remaining cool bulk of the component) and tempered to produce a hard martensitic structure at the surface.	*Paint and Coatings*
Flame Resistance	The ability of a burning material to extinguish its own flame, once its flame-initiating heat source is removed.	*Electrical*
Flame Retardance	Ability of a material to prevent the spread of combustion by a low rate of travel so the flame will not be conveyed.	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Flame retardant	Additive used to reduce the inherent combustibility of certain polymers.	*Material Process*
Flame retardants	Any chemical compound used to raise the ignition point of such materials as cloth or plastic, and thereby increase their resistance to combustion	*Chemical*
Flame retardants	Any chemical compound used to raise the ignition point of such materials as cloth or plastic, and thereby increase their resistance to combustion	*Chemical Engineering*
Flame Spraying	A thermal spraying process in which the particles are heated and accelerated in a flame (combustion flame, plasma flame). Old term for thermal spray process.	*Paint and Coatings*
Flameproof	Electrical apparatus is said to be flameproof when, in its normal working, it is incapable of igniting firedamp in the surrounding air.	*Mining*
Flameproofing	Modifying plastics, as by incorporation of phosphates, asbestos, and the like, so as to make them more resistant to flame.	*Material Process*
Flammability	Ease of ignition, stated as ignition temperature. Rapidity of burning.	*Material Process*
Flammable	A material which is easily ignited.	*Chemical*
Flamper, clay ironstone found in beds or seams. (Derbys.).	Flamper, clay ironstone found in beds or seams. (Derbys.).	*Mining*
Flange	Flanges are available in round, square, and rectangular, but are typically ring shaped, and form a rim at the end of a pipe. Flanges are used for variety of purposes, but the main purpose is to connect pipes and other equipment, such as a tee, valve, pump, etc. A blind flange can be a plate for covering or closing the end of a pipe. Flanges can also be placed on beams to provide additional strength. See also Flange Tables.	*Industrial*
Flange 6B	API6B A term relating to API Spec 6A flanges which have R or RX ring grooves. API originally specified these flanges in API STD 6B, R or RX appears in the prefix of the numbered ring gaskets, which fit 6B flanges.	*Petroleum Engineering*
Flange 6BX	(API6BX also called BX). API Spec 6A flanges, which have 'BX', ring grooves.	*Petroleum Engineering*
Flange Series	Out of date term, applied in the past to API flanges. The flange series because the ANSI (ASME) Rating. API6A flanges are now rated in psi working pressure.	*Petroleum Engineering*
Flange Tables	Flanges tables are a universal reference which detail the outside and inside diameter sizes and bolt hole drilling patterns for various standard plate flanges.	*Industrial*
Flange, Adaptor	A flange that will connect between two different flanges. Usually a Double Studded Adaptor (DSA), or a Single Studded Adapter (SSA). Also can be a Double Flanged Adaptor.	*Petroleum Engineering*
Flange, ANSI	A flange specified in American National Standards Institute, (ANSI) standards.	*Petroleum Engineering*
Flange, API	A flange specified, in American Petroleum Institute (API) standards.	*Petroleum Engineering*
Flange, Blind	A flange with no bore or outlet, designed to close off an outlet or end connection.	*Petroleum Engineering*
Flange, Companion	A Raised Face or Ring Joint (RTJ) Flange, with a threaded outlet. Also called a Threaded Flange.	*Petroleum Engineering*
Flange, MSS	A flange specified to Manufacturing Standardization Society, Standard Practice MSS-SP-44. Typically specified for 26″ and larger flanges.	*Petroleum Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Flange, Open Face	A flange connection with drilled through bolt holes. An open face flange will mate with another open face flange or with a Studded Face Flange.	*Petroleum Engineering*
Flange, Outlet	An integral flange outlet, connected to a Body usually a side outlet (for example on a tee or a spool).	*Petroleum Engineering*
Flange, RTJ	A flange that utilizes a Ring Gasket has the designation "Ring Type Joint" (RTJ). All API Spec. 6A flanges have "Ring Type Joint" sealing surfaces. ASME (ANSI) standard flanges are also available in RTJ.	*Petroleum Engineering*
Flange, Spacer	A flange, usually made with a ring joint connection on both sides, to fit between two other flanges to space them apart.	*Petroleum Engineering*
Flange, Studded Face	A flange connection with the bolt circles drilled and tapped into its face so as to accept Tapped End Studs (i.e., the connections on a Studded Cross or Tee). A studded face flange will mate with an Open Face Flange.	*Petroleum Engineering*
Flange, SV	API Specification 17D specifies Swivel Flanges (flanges that swivel around a hub) identified as 'SV Flanges'. Specified in a limited range of sizes in 5,000 psi and 10,000 psi.	*Petroleum Engineering*
Flange, Target	See Target Flange	*Petroleum Engineering*
Flange, Test	A Blind Flange, with a tapped test port in its center or side to allow application of pressure or the attachment of a gauge.	*Petroleum Engineering*
Flange, Threaded	A screwed flange with an internal (also called Flange, Companion) or external thread opposite its Ring Groove side to mate with threaded pipe.	*Petroleum Engineering*
Flange, Weld Neck	A flange with a butt weld neck for welding to pipe or buttweld fittings. Material grade may vary from that required for Integral Flanges in order to facilitate field welding to carbon steel pipe.	*Petroleum Engineering*
Flangeless	A valve that does not have integral line flanges. This type of valve is sometimes referred to as a Wafer Style valve. The valve is installed by bolting it between the companion flanges with a set of bolts or studs, called line bolting. Care should be taken that strain-hardened bolts and nuts are used in lieu of all-thread, which can stretch when subjected to temperature cycling.	*Industrial Engineering*
Flank of Tooth	That surface which is between the pitch circle and the bottom land. The flank includes the fillet.	*Mechanical Engineering*
Flannels	Iron-stained shales containing many flattened 'mussel' shells.	*Mining*
Flapper action	A valve design in which output control pressure is regulated by a pivoted flapper in relation to one or two orifices.	*Mechanical, Process, and Operations*
Flapper Gate	A hinged or pivoted plate used for selectively directing material handled.	*Manufacturing*
Flare	A tall stack equipped with burners used as a safety device at wellheads, refining facilities, gas processing plants, and chemical plants. Flares are used for the combustion and disposal of combustible gases. The gases are piped to a remote, usually elevated, location and burned in an open flame in the open air using a specially designed burner tip, auxiliary fuel, and steam or air. Combustible gases are flared most often due to emergency relief, overpressure, process upsets, startups, shutdowns, and other operational safety reasons. Natural gas that is uneconomical for sale is also flared. Often natural gas is flared as a result of the unavailability of a method for transporting such gas to markets.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Flare Gas	flares are used to burn off waste gas, typically containing H2S or hydrogen sulfide, so that it does not pose a hazard to humans or animals. Flares used on Eagle Ford Shale wells typically contain a self-igniting system to keep the flame burning. Can be used as a verb, as in "they are flaring gas now."	*Petroleum Drilling*
Flared natural gas	Flared natural gas: See flare.	*Energy*
Flaring	The burning of natural gas that cannot be conserved. It is restricted primarily to short term testing, well workovers, or exceedingly rare emergency situations.	*Petroleum Engineering*
Flash	The portion of the charge flows from or is extruded from the mold.	*Material Process*
Flash ADCs	An analog-to-digital converter that uses a series of comparators with different threshold voltages to convert an analog signal to a digital output.	*Electrical Engineering*
Flash lines	Marks formed where excess material flowed out of a mold.	*Material Process*
Flash mold	A type of mold designed to permit escape of excess molding material, relaying on back pressure to close the mold to put the piece or pieces under pressure.	*Material Process*
Flash Point	The temperature at which the vapors produced from a fluid will ignite (flash off) with the presence of an ignition source (the fluid will not burn at this point). The flash point is important from the viewpoint of safety; however it is quite common for heat transfer systems to be operated at temperatures above the flash point of the fluid.	*Lubrication*
Flash point (Cleveland Open Cup)	The temperature to which a combustible liquid must be heated to give off sufficient vapor to form momentarily a flammable mixture with air when a small flame is applied under specified conditions. (ASTM Designation D 92.)	*Oil Analysis*
Flash Vessel	In the flash vessel the steam is separated from the water, and then fed into a low pressure steam system. The condensate remaining in the flash vessel is discharged into a condensate tank.	*Industrial*
Flashboard	A board, or one of a series of boards, as on a milldam, used to increase the depth of the impounded water.	*Civil Engineering*
Flashing	The act of creating an artificial flood in a conduit or stream, as in a sewer for cleansing it.	*Civil Engineering*
Flat	a district of the mine, a work area. (N. East).	*Mining*
Flat Position	The position of welding which is performed from the upper side of the joint, while the face of the weld is approximately horizontal.	*Maintenance and Repair*
Flat and meter rate schedule	An electric rate schedule consisting of two components, the first of which is a service charge and the second a price for the energy consumed.	*Energy*
Flat Claims	Minerals found on flats.	*Mining*
Flat demand rate schedule	An electric rate schedule based on billing demand that provides no charge for energy.	*Energy*
Flat Face (FF)	A flange surface in which the gasket sealing area is the entire surface from the ID to the outside edge. Usually used for class 125 cast iron valves.	*General Mechanical*
Flat Face Pulley	A pulley on which the face is a straight cylindrical drum, i.e. uncrowned.	*Manufacturing*
Flat plate	a flat piece of steel plate on which tubs were turned	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Flat plate pumped	A medium-temperature solar thermal collector that typically consists of a metal frame, glazing, absorbers (usually metal), and insulation and that uses a pumped liquid as the heat-transfer medium predominant use is in water-heating applications.	*Energy*
Flat Rate	A fixed charge for goods and services that does not vary with changes in the amount used, volume consumed, or units purchased.	*Energy*
Flat Rope	Wire rope that is made of a series of parallel, alternating right-lay and left-lay ropes, sewn together with relatively soft wires.	*Wire Rope & Cable*
Flat sheets	square or oblong sheets of cast-iron about ¾ inch thick which were nailed on planking at the top or bottom of a pit and form a metal floor for the free movement of the coal tubs. They were often also used in the workings where roads cross or converge, as at the top and bottom of small inclines, &c.	*Mining*
Flat spot	If a driver locks a tire (brakes so hard that the wheel stops turning), he'll grind a flat spot on the surface of the tire. This causes vibration that can make the car almost undrivable.	*NASCAR*
Flat	A rectangular container that holds several units of product; e.g., a flat of strawberries holds 12 pints of strawberries in pint-size containers. Flats may have single or multiple layers.	*Agriculture*
Flat-lad or Flat-man	the man or older lad who worked on the flat or landing, making up sets of tubs to be sent out of the mine. (N. East).	*Mining*
Flat-Land Bevel	A square extended root face preparation extensively used in inert-gas, root-pass welding of piping.	*Maintenance and Repair*
Flat-lying	Said of deposits and coal seams with a dip up to 5 degrees.	*Mining*
Flatman	similar to a craneman, the difference being that when tubs were used for the conveyance of coal no cranes were necessary, they did not have to be hoisted on to the rolleys as in the case of corves, they were merely linked together at the flat or level by the flatman. (N. East).	*Mining*
Flat-Rolled Steel	Steel processed on rolls with flat faces as opposed to grooved or cut faces. Flat-rolled products include sheet, strip and tin plate, among others.	*Metallurgy*
Flats	beds or sheets of trap rock or whin; or coal seams that lie at a moderately inclined angle in areas containing rearer seams (N. Staffs.); or cut slabs of wood used in roof supports.	*Mining*
Flattened Strand Rope	Wire rope that is made either of oval or triangular shaped strands in order to form a flattened rope surface.	*Wire Rope & Cable*
Flatting	drawing or leading tubs of coal underground with horses and lads. (Derbys.).	*Mining*
Flatting agent	A material added to paints, varnishes and other coating materials to reduce the gloss of the dried film.	*Material Process*
Flaw	An imperfection of unintentional discontinuity which is detectable by a nondestructive examination.7	*Maintenance and Repair*
Flaw induced fracture	The rapid failure	*Material Process*
Flax	Fiber obtained from the inner bark of the flax plant. The fabric, called linen, is used as a filler for high strength laminated plastics.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fleaing	a system of robbing as much coal as possible from the sides of a gate road which was about to be abandoned (S. Staffs.).	*Mining*
Fleck	White to tan necrotic lesions up to a few millimeters in length or diameter, usually confined to the upper surface of leaves.	*Forestry*
Fleet Angle	That angle between the rope's position at the extreme end wrap on a drum, and a line drawn perpendicular to the axis of the drum through the center of the nearest fixed sheave. See DRUM and SHEAVE.	*Wire Rope & Cable*
Fleet vehicle	Any motor vehicle a company owns or leases that is in the normal operations of a company. Vehicles which are used in the normal operation of a company, but are owned by company employees are not fleet vehicles. If a company provides services in addition to providing natural gas, only those vehicles that are used by the natural gas provider portion of a company should be counted as fleet vehicles. Vehicles that are considered "off-road" (e.g., farm or construction vehicles) or demonstration vehicles are not to be counted as fleet vehicles. Fleet vehicles include gasoline/diesel powered vehicles and alternative-fuel vehicles.	*Energy*
Flex Life	The number of bends or twists, of specified type, that a cable will withstand before failure.	*Electrical*
Flexibility	Flexibility is the inverse of stiffness. When a force is applied to a structure, there is a displacement in the direction of the force; flexibility is the ratio of the displacement divided by the force. High flexibility means that a small load produces a large displacement.	*Engineering Physics*
Flexible assembly systems	Automated assembly equipment and/or cross-trained work teams that can accommodate a variety of product configurations in small lots.	*Quality*
Flexible fuel vehicle	A vehicle that can operate on	*Energy*
Flexible fuel vehicle and variable fuel vehicle are synonymous terms.	Flexible fuel vehicle and variable fuel vehicle are synonymous terms.	*Energy*
Flexible fuel vehicles	have a single fuel system to handle alternative and petroleum-based fuels.	*Energy*
Flexible Load Shape	The ability to modify your utility's load shape on short notice. When resources are insufficient to meet load requirements, load shifting or peak clipping may be appropriate.	*Energy*
Flexible machining centers	Automated machining equipment that can be rapidly reprogrammed to accommodate small-lot production of a variety of product or component configurations.	*Quality*
Flexible manufacturing system (FMS)	Automated manufacturing equipment and/or cross-trained work teams that can accommodate small-lot production of a variety of product or part configurations. From an equipment standpoint, an FMS is typically a group of computer-based machine tools with integrated material handling that is able to produce a family of similar parts.	*Quality*
Flexible membrane molding	Process of applying pressure by the use of flexible membrane to transmit uniform pressure to all surfaces under molding.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Flexible Retail PoolCo	This provides a model for the restructured electric industry that features an Independent System Operator (ISO) operating in parallel with a commercial Power Exchange, which allows end-use customers to buy from a spot market or "pool" or to contract directly with a particular supplier.	*Energy*
Flexible Schedule	a work schedule which permits the adjustment of the daily time.	*Industrial Relations*
Flexible shaft	(See Drive Shaft).	*Facility Engineering*
Flexible tube valve	A special valve using a flexible sleeve or tube which acts as the closure element. Pressure applied to the jacket space surrounding the outside of the tube, controls the opening and closing of the valve.	*Mechanical*
Flexicoking	A thermal cracking process which converts heavy hydrocarbons such as crude oil, tar sands bitumen, and distillation residues into light hydrocarbons. Feedstocks can be any pumpable hydrocarbons including those containing high concentrations of sulfur and metals.	*Energy*
Flexing Test	Any test to determine the ability of a cable to withstand repeated bending and twisting.	*Electrical*
Flexsound	Flexsound describes a set of digital audio signal processing blocks used in Maxim's products to provide or enhance audio functions such as compression, limiting, or equalization. Maxim's Flexsound processor is a fully programmable digital audio signal processing system that includes a programmable DSP core, hard-wired digital macros, and an associated memory architecture.	*Electrical Engineering*
Flexural strength	Failure stress of a material, as measured in bending. The pressure in pounds necessary to break a given sample when applied to the center of the sample which has been supported at its ends.	*Material Process*
Flexure	Bending deformation, i.e., deformation by increasing curvature.	*Engineering Physics*
Flight	The metal strap or crossbar attached to the drag chain-and-flight conveyor.	*Mining*
Flights or Flight bars	the bars that scrape material along in a chain conveyor	*Mining*
Flint mill	Flint mill, -see Steel or Steel mill.	*Mining*
Flip-Flop	A digital component or circuit with two stable states and sufficient hystereses so that it has "memory". When the state is changed with a control pulse, a continuous control signal is now necessary for it to remain in that state.	*Mechanical, Process, and Operations*
Flit	to move a coal-cutting machine from one place to another under its own power.	*Mining*
Flitch	A bundle of dry sheets of veneer arranged in sequence of cutting and held together for shipment. Adjacent sheets of a flitch have almost identical grain figuration.	*Material Process*
Flitching	removing a thin slice of coal from the sides of a coal pillar in pillar and stall working (N. Staffs.).	*Mining*
Float	Pieces of rock that have been broken off and moved from their original location by natural forces such as frost action or glaciers.	*Mining*
Float bridge	A bridge, as from a pier to a boat, floating at one end and hinged at the other to permit loading and unloading at any level of water.	*Civil Engineering*

Term	Definition	*Industry*
Float dust	Fine coal-dust particles carried in suspension by air currents and eventually deposited in return entries. Dust consisting of particles of coal that can pass through a No. 200 sieve.	*Mining*
Float valve	A valve that is actuated by a float, generally used to control makeup water supply to a cooling system.	*Chemical Engineering*
Float valve	A valve which automatically opens or closes as the level of a liquid changes. The valve is operated mechanically by a float which rests on the top of the liquid.	*Mechanical*
Float	Loose rock or isolated masses of ore, or ore detached from the original formation.	*Mining*
Floatation	A milling process by which some mineral particles are induced to become attached to bubbles and float, and others to sink. In this way the valuable minerals are concentrated and separated from the worthless gangue.	*Mining*
Floater	a worker who drifts from job to job.	*Industrial Relations*
Floating ball	A ball valve design in which the ball is not rigidly held on its rotational axis and so is free to float between the seat rings.	*General Mechanical*
Floating foundation	A foundation used in yielding soil, having for its footing a raft tending to displace a weight greater than that of the building.	*Civil Engineering*
Floating Type Flange Joint	A conventional flanged joint in which a gasket is compressed by bolts - the gasket is not rigidly located. Calculation methods such as the ASME code in the USA and the EN1591 code in Europe.	*Maintenance*
Floats, or asbestos floats or fines	The form of asbestos most generally used for filler, consisting of very fine short fibers with associated dust and nonfibrous asbestic material.	*Material Process*
Floc Point	The temperature at which wax or solids separate in an oil	*Lubrication*
Flocculant	Flocculants are products used in waste treatment to separate unwanted components from water and sludge.	*Chemical*
Flocculation	The process of agglomerating coagulated particles into settleable flocs, usually of a gelatinous nature.	*Chemical Engineering*
Flock	Very short fibers such as short cotton fibers, wood fibers, or wood fibers such as those obtained by shearing the nap of cloth, used as an inexpensive filler.	*Material Process*
Flood control	The act or technique of controlling river flow with dams, dikes, artificial channels, etc. So as to minimize the occurrence of floods.	*Civil Engineering*
Flood irrigation	A type of irrigation in which fields are flooded with water.	*Agriculture*
Flood wall Civil Engineering	A wall built along a shore or bank to prevent floods by giving a raised, uniform freeboard and by allowing unimpeded flow to water in a channel	*Civil Engineering*
Flooded	A condition in which the pump inlet is charged by placing the reservoir oil level above the pump inlet port.	*Mechanical, Process, and Operations*
Floodgate	Civil Engineering a gate designed to regulate the flow of water.	*Civil Engineering*
Floodplain	The surface or strip of relatively smooth land adjacent to a river channel, constructed by the present river, and covered with water when the river overflows its banks. It is built of alluvium carried by the river during floods and deposited in the sluggish water beyond the influence of the swiftest current.	*Petroleum Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Floodway	The channel and adjacent shore areas under water during a flood, esp. as determined for a flood of a given height.	*Civil Engineering*
Floor	That part of any underground working upon which a person walks or upon which haulage equipment travels; simply the bottom or underlying surface of an underground excavation.	*Mining*
Floor (coal)	The upper surface of the stratum underlying a coal seam. In coals that were formed in persistent swamp environments, the floor is typically a bed of clay, known as "underclay," representing the soil in which the trees or other coal-forming swamp vegetation was rooted.	*Energy*
Floor coal	Floor coal, -see Bottom coal.	*Mining*
Floor Conveyor	Any of several types of conveyors using chain, cable, or other linkage mounted near or flush with the floor for the purpose of assembling, or finishing built-up products and subassemblies.	*Equipment*
Floor Finish	The top layer of protective floor coatings.	*Chemistry*
Floor price	A price specified in a market-price contract as the lowest purchase price of the uranium, even if the market price falls below the specified price. The floor price may be related to the seller's production costs.	*Energy*
Floor space	The area enclosed by exterior walls of a building, including parking areas, basements, or other floors belowground level. It is measured in square feet.	*Energy*
Floor Supports	Supporting members with vertical adjustments for leveling the conveyor.	*Manufacturing*
Floor Under Wages	generally has reference to the minimum wage provisions of the Fair Labor Standards Act, since it sets an hourly wage floor below which an employer is not allowed to go.	*Industrial Relations*
Floor, wall, or pipeless furnace	Space-heating equipment consisting of a ductless combustor or resistance unit, having an enclosed chamber where fuel is burned or where electrical-resistance heat is generated to warm the rooms of a building. A floor furnace is located below the floor and delivers heated air to the room immediately above or (if under a partition) to the room on each side. A wall furnace is installed in a partition or in an outside wall and delivers heated air to the rooms on one or both sides of the wall. A pipeless furnace is installed in a basement and delivers heated air through a large register in the floor of the room or hallway immediately above.	*Energy*
Floorhand	Laborer responsible for the overall maintenance of the rig.	*Petroleum Drilling*
Floor-weight or Floor-lift	the upheaval of the floor of a mine due to strata pressures. - see also Creep and Heave.	*Mining*
Floppy Disk	A small, flexible disk carrying a magnetic medium in which digital data is stored for later retrieval and use.	*Electrical*
Flotation	A milling process in which valuable mineral particles are induced to become attached to bubbles and float as others sink.	*Mining*
Flour Gold/Gold Dust	Gold that is so fine that it looks and feels like flour or dust.	*Mining*
Flow	The direction of travel of the product on the conveyor.	*Equipment*
Flow	A fluid in motion in a conducting line.	*Mechanical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Flow Characteristic	The relationship between valve capacity and valve travel. It is usually expressed graphically in the form of a curve. control valves have two types of characteristics inherent and installed. The inherent characteristic is derived from testing the valve with water as the fluid and a constant pressure drop across the valve. When valves are installed into a system with pumps, pipes and fittings, the pressure dropped across the valve will vary with the travel. When the actual flow in a system is plotted against valve opening, the curve is known as the installed flow characteristic. Valves can be characterized by shaping the plugs, orifices or cages to produce a particular curve. Valves are characterized to try to alter the valve gain. Valve gain is the flow change divided by the control signal change. This is done in an effort to compensate for nonlinearities in the control loop.	*Industrial Engineering*
Flow Chart	A flow chart is a diagram that uses graphic symbols to depict the nature and flow of the steps in a process. Another name for this tool is "flow diagram." A flow chart is a graphical representation of a process, depicting inputs, outputs and units of activity. It can represent the entire process at a high or detailed (depending on your use) level of observation, allowing analysis and optimization of workflow.	*Maintenance*
Flow Coefficient	See the definition for Cv.	*Industrial Engineering*
Flow control	The laws, regulations, and economic incentives or disincentives used by waste managers to direct waste generated in a specific geographic area to a designated landfill, recycling, or waste-to-energy facility.	*Energy*
Flow control valve	A manually controlled valve generally located in the hot water supply line used to increase or decrease the flow of a liquid in a system.	*Chemical Engineering*
Flow Control Valve	A valve whose primary function is to control flow rate.	*Lubrication*
Flow Divider Valve	A valve which divides the flow from one source into two or more branches. (Includes "priority" and "proportional" types.)	*Mechanical, Process, and Operations*
Flow Fatigue Rating	The ability of a filter element to resist a structural failure of the filter medium due to flexing caused by cyclic differential pressure.	*Oil Analysis*
Flow laminar	The flow of a viscous fluid in which the fluid moves in parallel layers with a fixed velocity gradient from the centerline to the containing walls of the conduit. Sometimes referred to as "streamline" flow.	*Mechanical*
Flow line	Any pipeline, that contains, transports and controls the fluid.	*Petroleum Engineering*
Flow lines	Lines appearing on the surface of a piece, generally caused by failure of the material to flow and knit together properly. Term not recommended.	*Material Process*
Flow marks	Wavy appearance of a plastic caused by flowing of the material.	*Material Process*
Flow meter	An instrument used to measure flow rate or total flow or both.	*Mechanical*
Flow Rate	Actual speed or velocity of fluid movement.	*General Engineering*
Flow rate	The volume or weight of a fluid passing thru a pipeline or conductor per unit of time, i.e., 3000 barrels of oil per day; 4 MMCF of gas per hour.	*Mechanical*
Flow tube	a calibrated flow measuring device made for a specific range of flow velocities and fluids.	*Chemical*
Flow, laminar	A flow situation in which fluid moves in parallel lamina or layers.	*Oil Analysis*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Flow, Laminar (streamlined)	A flow situation in which the fluid particles move in parallel lamina or layers. (See Reynold's Number.)	*Mechanical, Process, and Operations*
Flow, Turbulent	The random flow of a fluid in which the velocity at a certain point in the fluid varies irregularly.	*Mechanical*
Flowback water	After the hydraulic fracturing procedure is completed and pressure is released, the direction of fluid flow reverses, and water and excess proppant flow up through the wellbore to the surface. Both the process and the returned water are commonly referred to as "flowback."	*Petroleum Drilling*
Flowback	The process where frac fluids, (including water, oil and natural gas,) return to the surface following a hydraulic fracturing operation. Flowback technicians may stay on the wellsite for several days as this process is completed, checking the amount of oil and gas production and adjusting chokes (restrictive valves) in the well that regulate how much gas and fluid flows back. The flowback process is very critical, since damage can be done to the oil and gas producing formation and the well if it is not done correctly.	*Petroleum Drilling*
Flowing Artesian Well	One that has penetrated into an artesian aquifer. Artesian aquifers have pressure built-up within themselves. This pressure results from a portion of the aquifer being at a higher elevation. The pressure is released when a well is bored into it. This causes the well to flow spontaneously.	*Petroleum Engineering*
Flowmeter	A device used for measuring the flow or quantity of a moving fluid.	*Electronic Process*
Flowsheet	The sequence of operations, step by step, by which ore is treated in a milling, concentration, or smelting process.	*Mining*
Flowsheet	An illustration showing the sequence of operations, step by step, by which ore is treated in a milling, concentration or smelting process.	*Mining*
Flow-through shares	Shares in an exploration company that allow the tax deduction or credits for mineral exploration to be passed to the investor.	*Mining*
Flue	An enclosed passage way for directing products of combustion to the atmosphere.	*Energy*
Flue gas desulfurization	Equipment used to remove sulfur oxides from the combustion gases of a boiler plant before discharge to the atmosphere. Also referred to as scrubbers. Chemicals such as lime are used as scrubbing media.	*Energy*
Flue gas loss	The flue gas loss is that portion of the thermal energy that escapes unused together with the flue gases.	*Thermal Management*
Flue-gas desulfurization unit (scrubber)	Equipment used to remove sulfur oxides from the combustion gases of a boiler plant before discharge to the atmosphere. Chemicals such as lime are used as the scrubbing media.	*Energy*
Flue-gas particulate collector	Equipment used to remove fly ash from the combustion gases of a boiler plant before discharge to the atmosphere. Particulate collectors include electrostatic precipitators, mechanical collectors (cyclones), fabric filters (baghouses), and wet scrubbers.	*Energy*
Fluid	Fluid	*Mechanical, Process, and Operations*
Fluid	Any non-solid substance that can be made to flow. Both liquids and gases are fluids.	*Mechanical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fluid Coking	A thermal cracking process utilizing the fluidized-solids technique to remove carbon (coke) for continuous conversion of heavy, low-grade oils into lighter products.	*Energy*
Fluid compatibility	The suitability of filtration medium and seal materials for service with the fluid involved.	*Oil Analysis*
Fluid Friction	Occurs between the molecules of a gas or liquid in motion, and is expressed as shear stress. Unlike solid friction, fluid friction varies with speed and area.	*Lubrication*
Fluid friction	Friction due to the viscosity of fluid.	*Mechanical, Process, and Operations*
Fluid leakoff	The process by which injected fracturing fluid migrates from the created fractures to other areas within the hydrocarbon-containing formation.	*Petroleum Drilling*
Fluid Opacity	Related to the ability of a fluid to pass light.	*Oil Analysis*
Fluid Power	Energy transmitted and controlled through use of a pressurized fluid.	*Oil Analysis*
Fluid power system	A system that transmits and controls power through use of a pressurized fluid within an enclosed circuit.	*Mechanical, Process, and Operations*
Fluid pressure molding	Process of applying pressure by the use of a fluid to transmit uniform pressure to all surfaces under molding.	*Material Process*
Fluid Velocity	The measured speed at which a fluid moves through the inside of a tube.	*Lubrication*
Fluid, Fatty oil	A fluid composed of fats derived from animal, marine, or vegetable origin. It may contain additives.	*Mechanical, Process, and Operations*
Fluid, Fire resistant (Non-Flammable)	A fluid difficult to ignite and which shows little tendency to propagate flame.	*Mechanical, Process, and Operations*
Fluid, Hydraulic	A fluid suitable for use in a hydraulic system.	*Mechanical, Process, and Operations*
Fluid, Pneumatic	A fluid suitable for use in a pneumatic system.	*Mechanical, Process, and Operations*
Fluidic	Of or pertaining to devices, systems, assemblies, etc., utilizing fluidic components. FLUIDICS - Engineering science pertaining to the use of fluid dynamic phenomenon to sense, control,	*Mechanical, Process, and Operations*
Fluidity	Rate of flow, reciprocal of viscosity.	*Material Process*
Fluidized Bed Combustion	A process with a high degree of ability to remove sulfur from coal during combustion. Crushed coal and limestone are suspended in the bottom of a boiler by an upward stream of hot air. The coal is burned in this bubbling, liquid-like (or "fluidized") mixture. Rather than released as emissions, sulfur from combustion gases combines with the limestone to form a solid compound recovered with the ash.	*Mining*
Fluidized-bed combustion	A method of burning particulate fuel, such as coal, in which the amount of air required for combustion far exceeds that found in conventional burners. The fuel particles are continually fed into a bed of mineral ash in the proportions of 1 part fuel to 200 parts ash, while a flow of air passes up through the bed, causing it to act like a turbulent fluid.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Flume	An artificial channel or trough for conducting water, as one used to transport logs or provide water power. To transport in a flume. To divert (a stream) by a flume.	*Civil Engineering*
Fluorescent lamp	A glass enclosure in which light is produced when electricity is passed through mercury vapor inside the enclosure. The electricity creates a radiation discharge that strikes a coating on the inside surface of the enclosure, causing the coating to glow. Note: Traditional fluorescent lamps are usually straight or circular white glass tubes used in fixtures specially designed for them. A newer type of fluorescent lamp, the compact fluorescent lamp, takes up much less room, comes in many differently-shaped configurations, and is designed to be used in some fixtures originally intended to house in candescent lamps.	*Energy*
Fluorescent light bulbs	These are usually long, narrow, white tubes made of glass coated on the inside with fluorescent material, which is connected to a fixture at both ends of the light bulb; some are circular tubes. The light bulb produces light by passing electricity through mercury vapor, which causes the fluorescent coating to glow or fluoresce.	*Energy*
Fluorescent lighting other than compact fluorescent bulbs	In fluorescent lamps, energy is converted to light by using an electric charge to "excite" gaseous atoms within a fluorescent tube. Common types are "cool white," "warm white," etc. Special energy efficient fluorescent lights have been developed that produce the same amount of light while consuming less energy. Note: for definition of compact fluorescent bulbs, go to compact fluorescent bulbs.	*Energy*
Fluorite	Compound crystal structure.	*Material Process*
Fluoro-Carbon Thread Coating	A low friction coating applied to threads. This type of coating is frequently used to prevent thread fouling when an assembly containing threaded fasteners is painted. Unless masked in some way before painting, electro deposited primers can cover the threads. If this occurs assembly difficulties can result unless the expensive chore of cleaning the threads is completed. A fluoro-carbon thread coating eliminates the need for masking or cleaning since paint will not adhere to the coating. This type of coating can also prevent problems caused by weld splatter obstructing the threads of weld nuts during their placement. Such coatings also have the property of reducing the torque-tension scatter during tightening.	*Maintenance*
Fluoropolymer	Fluoropolymers are inert to most chemicals and resistant to high temperatures. They also have low coefficients of friction and have superb dielectric properties. Therefore, fluoropolymers are used in electronics, as well as in pipe and in chemical processing equipment. It is also found in the non-stick coatings used for cookware.	*Material Engineering*
Fluoropolymer Coating	A specialized coating typically used on stud bolts, nuts, and other surfaces that need characteristics of low friction, wear resistance, and protection from corrosion; (commonly used for offshore service) also marketed as 'Xylan' or Teflon coating.	*Petroleum Engineering*
Fluoroscence	Luminescence in which photon emission occurs rapidly, in less than about ten nanoseconds.	*Material Process*
Flush	adjacent surfaces even, or in same plane (flat against).	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Flushing	the filling of the waste by waterborne material from a pipeline. Also called 'Pneumatic stowing'; or the crumbling of the roof or sides around the supports in an excavation.	*Mining*
Flux	The rate of water flow per unit of membrane filtration area.	*Filtration*
Flux	the rate of movement of mass through a unit cross-sectional area per unit time in response to a concentration gradient or some advective force.	*Chemical*
Flux density	Magnitude of the magnetic induction.	*Material Process*
Flux inclusions	Flux carried out onto the work from the top flux blanket incorporated in the 'wet' process; occurs only in the 'wet' galvanizing process	*Materials Process*
Flux material	A substance used to promote fusion, e.g., of metals or minerals.	*Energy*
Flux	A chemical substance that reacts with gangue minerals to form slags, which are liquid at furnace temperature and low enough in density to float on the molten bath of metal or matte.	*Mining*
Flux-Cored Arc Welding (FCAW)	An arc welding process that employs a continuous tubular filler metal (consumable) electrode having a core of flux for shielding. Adding shielding may or may not be obtained from an externally supplied gas or gas mixture.	*Maintenance and Repair*
Fluxgate magnetometer	An instrument used in geophysics to measure total magnetic field.	*Mining*
Fluxing	the process by which steel is dipped in aqueous zinc ammonium chloride to remove undesirable substances and to protect it from further oxide formation prior to entering the galvanizing bath	*Materials Process*
Fly ash	Particulate matter mainly from coal ash in which the particle diameter is less than 1 x 104 meter. This ash is removed from the flue gas using flue gas particulate collectors such as fabric filters and electrostatic precipitators.	*Energy*
Fly ash	The finely divided particles of ash suspended in gases resulting from the combustion of fuel. Electrostatic precipitators are used to remove fly ash from the gases prior to the release from a power plant's smokestack.	*Mining*
Flying cradle	a frame about 4ft x 1½ft on which one or more men sit astride to do any temporary work in the shaft	*Mining*
Flying Squadron	a group of specially trained employees who are familiar with all or most of th key jobs in a plant or other production unit.	*Industrial Relations*
Flywheel	A metal disc bolted to the end of the crankshaft. The inertia of the spinning flywheel while the engine is running smoothes the engine's operation.	*Mechanical Engineering*
FM	Factory Mutual Research Corporation. An organization which sets industrial safety standards.	*General Engineering*
FM Approved	An instrument that meets a specific set of specifications established by Factory Mutual Research Corporation.	*General Engineering*
FME	Free Market Economies. Countries that are members of the Council for Mutual Economic Assistance (CMEA) are not included.	*Energy*
FMEA	Failure Mode Effect Analysis.	*Maintenance*
FMECA	See Failure Mode, Effects (& Criticality) Analysis (FME(C)A).	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
FNS	Food and Nutrition Service, an agency of the USDA.	*Agriculture*
Foal	a young putter, also called 'Halfmarrows'. (N. East).	*Mining*
Foam	A mass of bubbles formed on liquids by agitation.	*Chemistry*
Foam Inhibitor	A substance introduced in a very small proportion to a lubricant or a coolant to prevent the formation of foam due to aeration of the liquid, and to accelerate the dissipation of any foam that may form	*Lubrication*
Foaming	A frothy mixture of air and a petroleum product (e.g., lubricant, fuel oil) that can reduce the effectiveness of the product, and cause sluggish hydraulic operation, air binding of oil pumps, and overflow of tanks or sumps. Foaming can result from excessive agitation, improper fluid levels, air leaks, cavitation, or contamination with water or other foreign materials. Foaming can be inhibited with an antifoam agent. The foaming characteristics of a lubricating oil can be determined by blowing air through a sample at a specified temperature and measuring the volume of foam, as described in test method ASTM D 892.	*Lubrication*
Foaming Agent or Surfactant	A substance capable of reducing the surface tension of a liquid in which it is dissolved. Used in air-based drilling fluids to produce foam, and during well development to disaggregate clays.	*Petroleum Engineering*
FOB	Free on board.	*Lubrication*
Focused-factory production	A plant configuration and organization structure in which equipment and manpower are grouped to create essentially self-contained "mini-businesses," each with a specific product line or customer focus. A single plant may be divided into several focused-factory units, designed around process flows, each of which has control over such support activities as maintenance, manufacturing engineering, purchasing, scheduling, and customer service.	*Quality*
Fog	Cloudy or dull surface caused by a deposit on mold or pressing plate.	*Material Process*
Fogging	A fog condition created when the exhaust air or plume from a cooling tower becomes supersaturated so that part of the water vapor condenses into visible liquid droplets.	*Facility Engineering*
Fold	Any bending or wrinkling of rock strata.	*Mining*
Foldback Current Limit	A circuit which reduces the current limit once the device enters current-limited operation. Commonly seen on RS-422/RS-485 drivers and some power circuits.	*Electrical Engineering*
Folding boards	Before keps came into use the boards were used to rest the cage on while it was being unloaded. Also known as shuts. (Scot.)	*Mining*
Follow valve	A control valve which ports oil to an actuator so the resulting output motion is proportional to the input motion to the valve.	*Mechanical, Process, and Operations*
Follower Joint	A non-load-carrying ball joint that maintains the position of the steering knuckle and provides the correct steering axis inclination angle; sometimes called pilot joint or friction joint.	*Mechanical Engineering*
Follow-up	Observation over a period of time of an individual, group, or initially defined population whose relevant characteristics have been assessed in order to observe changes in health status or health-related variables.	*Analysis*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Food Grade Lubricants	Lubricants acceptable for use in meat, poultry and other food processing equipment, applications and plants. The lubricant types in food-grade applications are broken into categories based on the likelihood they will contact food. The USDA created the original food-grade designations H1, H2 and H3, which is the current terminology used. The approval and registration of a new lubricant into one of these categories depends on the ingredients used in the formulation.	*Lubrication*
Food Miles	the distance food travels from where it was grown to where it is consumed.	*Agriculture*
Food Safety and Inspection Service, (FSIS)	A consumer protection agency within the USDA. Its mission is to protect consumers by ensuring that meat, poultry, and egg products are safe, wholesome, and accurately labeled.	*Agriculture*
Foot blocks	square blocks of thick wood used to spread the load at the base of an arch support girder	*Mining*
Foot checking	wooden guides set alongside the rails on curves to stop the tubs from derailing (N. Staffs.).	*Mining*
Footage drilled	Total footage for wells in various categories, as reported for any specified period, includes (1)the deepest total depth (length of well bores) of all wells drilled from the surface, (2) the total of all bypassed footage drilled in connection with reported wells, and (3) all new footage drilled for directional sidetrack wells. Footage reported for directional side-track wells does not include footage in the common bore that is reported as footage for the original well. In the case of old wells drilled deeper, the reported footage is that which was drilled below the total depth of the old well.	*Energy*
Footbridge	A bridge intended for pedestrians only.	*Civil Engineering*
Footprint	The mark left by a loaded tire's tread as it meets the road surface.	*Mechanical Engineering*
Footprint Area	The amount or area of contact in square inches the tire has with the road. This is dependent upon both load and inflation pressure as well as tire dimensions.	*Mechanical Engineering*
Footrail, Footrill or Futteril	the entrance to, or a drift mine.	*Mining*
Footwall	The wall or rock on the underside of a vein or ore structure.	*Mining*
Footwall	The layer of rock immediately under the vein.	*Mining*
Forage	Vegetation such as leaves, stems, buds, and some types of bark, that can be eaten for food and energy.	*Forestry*
Forage	Plants, other than grain, grown for animal feed.	*Agriculture*
Force	A directed interaction between two objects that tends to change the momentum of both. Since a force has both direction and magnitude, it can be expressed as a vector	*Engineering Physics*
Force	A push or pull acting upon a body. In a hydraulic cylinder, it is the product of the pressure on the fluid; multiplied by the effective area of the cylinder piston. It is measured in pounds or tons.	*Mechanical, Process, and Operations*
Force day	A low temperature, below 180-200 °F (82.22 - 93.33 °C) cure as differentiated from a true bake, which involves contact with a temperature above 180-200 °F (82.22-93.33 °C).	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Force Differential	The difference between the operating force and the release force.	*Electrical Engineering*
Force Feed Lubrication	A system of lubrication in which the lubricant is supplied to the bearing surface under pressure.	*Lubrication*
Force motor	A type of electromechanical transducer having linear motion used in the input stages of servovalves.	*Mechanical, Process, and Operations*
Force plate	Plate carrying plunger or force plug of a mold, sometimes called the steam plate.	*Material Process*
Force System	See system of forces.	*Engineering Physics*
Force, Contact	The force holding closed contacts together.	*Electrical Engineering*
Forced draft water cooling tower	Type of mechanical draft tower in which one or more fans are located at the air inlet to force air into the tower.	*Facility Engineering*
Forced Labor	labor which is required or compelled by government.	*Industrial Relations*
Forced Outage	An outage that results from emergency conditions and requires a component to be taken out of service automatically or as soon as switching operations can be performed. The forced outage can be caused by improper operation of equipment or by human error. If it is possible to defer the outage, the outage becomes a scheduled outage.	*Energy*
Forced Vibration	Vibration of a system caused by an imposed force. Steady-state vibration is an unchanging condition of periodic or random motion.	*General Engineering*
Forced vibration.	The vibratory motion of a system caused by some mechanical excitation. If the excitation is periodic and continuous, the response motion eventually becomes steady-state.	*Reliability Engineering*
Force-Sense	Measurement technique in which a voltage (or current) is forced at a remote point in a circuit; then the resulting current (or voltage) is measured (sensed).	*Electrical Engineering*
Forcing frequency	In sinusoidal vibration testing or resonance searching, the frequency at which a shaker vibrates.	*Reliability Engineering*
Forcing function	A climatic or mechanical environmental input to an item of equipment that affects its design, service life or ability to function. (Also referred to as an environmental condition or an environmental stress.	*Reliability Engineering*
Fore and Aft Weight Transfer	A load factor where weight is transferred from the front tires to the rear tires during acceleration and from the rear to the front tires during braking.	*Mechanical Engineering*
Fore winning	winning out in front of other workings.	*Mining*
Forecast/Demand Management Software	Software that provides front-end input to master production scheduling systems and helps to optimize inventory planning. Such software not only takes into account historical demand trends, but also may calculate the impact of planned sales promotions, price reductions, and other factors that cause spikes in demand levels.	*Maintenance*
Foreign access	Refers to proved reserves of crude, condensate, and natural gas liquids applicable to long-term supply agreements with foreign governments or authorities in which the company or one of its affiliates acts as producer.	*Energy*
Foreign Agricultural Service, (FAS)	A USDA agency that represents interests of U.S. farmers and the food and agricultural sector abroad.	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Foreign currency transaction gains and losses	Gains or losses resulting from the effect of exchange rate changes on transactions denominated in currencies other than the functional currency (for example, a U.S. enterprise may borrow Swiss francs or a French subsidiary may have a receivable denominated in kroner from a Danish customer). Gains and losses on those foreign currency transactions are generally included in determining net income for the period in which exchange rates change unless the transaction hedges a foreign currency commitment or a net investment in a foreign entity. Intercompany transactions of a long-term investment nature are considered part of a parent's net investment and hence do not give rise to gains or losses.	*Energy*
Foreign currency translation effects	Gains or losses resulting from the process of expressing amounts denominated or measured in one currency in terms of another currency by use of the exchange rate between the two currencies. This process is generally required to consolidate the financial statements of foreign affiliates into the total company financial statements and to recognize the conversion of foreign currency or the settlement of a receivable or payable denominated in foreign currency at a rate different from that at which the item is recorded. Translation adjustments are not included in determining net income, but are disclosed as separate components of consolidated equity.	*Energy*
Foreign matter	Particles of substance included in a plastic which seem foreign to its composition.	*Material Process*
Foreign operations	These are operations that are located outside the United States. Determination of whether an enterprise's mobile assets, such as offshore drilling rigs or ocean-going vessels, constitute foreign operations should depend on whether such assets are normally identified with operations located outside the United States.	*Energy*
Foreign-controlled firms (coal)	Foreign-controlled firms are U.S. coal producers with more than 50 percent of their stock or assets owned by a foreign firm.	*Energy*
Foreman	generally the first line of management in the operation of the plant or facility.	*Industrial Relations*
Foreman Training	programs designed by management for supervisory employees which have for their purpose the more effective functioning of the foreman on the job.	*Industrial Relations*
Fore-pole	a kind of horsehead or forward support used in drivages or tunnels—see Spile and Spill.	*Mining*
Forest management	Proper care and control of wooded land to maintain health, vigor, product flow, and other values such as soil condition, water quality, wildlife preservation and beauty, and to accomplish specific objectives.	*Forestry*
Forest management plan	Written guidelines for current and future management practices needed to meet an owner's objectives.	*Forestry*
Forest plot	A graphical representation of the individual results of each study included in a meta-analysis together with the combined meta-analysis result. The plot also allows readers to see the heterogeneity among the results of the studies. The results of individual studies are shown as squares centered on each study's point estimate. A horizontal line runs through each square to show each study's confidence interval—usually, but not always, a 95% confidence interval. The overall estimate from the meta-analysis and its confidence interval are shown at the bottom, represented as a diamond. The centre of the diamond represents the pooled point estimate, and its horizontal tips represent the confidence interval.	*Quality Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Forest stewardship plan	A written document emphasizing long-term, forest sustainability and activities that enhance or improve wildlife, timber, soil, water, recreation, and aesthetics.	*Forestry*
Forest stewardship program	A cooperative, technical -assistance program designed to encourage multiple resource management.	*Forestry*
Forest type	growing in the same stand because their environmental requirements are similar.	*Forestry*
Forestry	The science, art, and practice of managing and using trees, forests, and their associated resources.	*Forestry*
Forewings	Front pair of wings.	*Forestry*
Forfeiture	A failure to comply with the laws prescribing the quantity of work.	*Mining*
Forge Weld	A method of manufacture similar to hammer welding. The term forge welded is applied more particularly to headers and large drums, while hammer welded usually refers to pipe.	*Maintenance and Repair*
Forged and Bored Pipe	Pipe produced by boring or trepanning of a forged billet.	*Maintenance and Repair*
Forged Steel	Steel, pressed and shaped, under heat, using compressive force to breakup and close any internal Discontinuities.	*Petroleum Engineering*
Forged steels	steels formed by plastically deforming metal, usually hot, into desired shapes with compressive force, with or without dies	*Materials Process*
Forging	Mechanical forming of a metal or alloy by heating and hammering.	*Engineering Physics*
Fork or Hambone	a clip used to attach tubs to the endless rope. (N. East).	*Mining*
Form	To apply force to plastic materials with the intention of making them flow, bend or otherwise conform to a given shape.	*Material Process*
Formal Notification	procedures which are occasionally required in a collective bargaining agreement which specify the form a particular type of notice is to take in order to assure the parties that the information will be properly and efficiently delivered.	*Industrial Relations*
Formaldehyde (HCHO) Colorless gas	An aldehyde most widely used in plastics. It condenses with phenol, urea, aniline, melamine, etc., to form a synthetic resins, and is used as a hardener for casein and other protein plastics.	*Material Process*
Formalin	A 40% aqueous solution of formaldehyde.	*Material Process*
Formamide (HCONH2)	Used as a curing or hardening agent for zein and other protein plastics.	*Material Process*
Formation	Any assemblage of rocks which have some character in common, whether of origin, age, or composition. Often, the word is loosely used to indicate anything that has been formed or brought into its present shape.	*Mining*
Formation Pressure	The pressure at the bottom of a well when shut in at the wellhead.	*Petroleum Drilling*
Formation pressure	The pressure at the bottom of a well when it is shut in at the wellhead.	*Petroleum Drilling*
Formation Stabilizer	Sand or gravel placed in the annulus of the well between the borehole wall and the well screen to provide temporary to long-term support for the borehole.	*Petroleum Engineering*
Formation Water	Salt water underlying gas and oil in the formation.	*Petroleum Drilling*
Formation water	Salt water underlying gas and oil in the formation.	*Petroleum Drilling*

Term	Definition	*Industry*
Formica	Trade name for phenolic laminated material.	*Material Process*
Formula car	Formula cars must fit within a specific set of design rules or "formula." The formulas are usually quite complex, but basic issues include minimum weight, engine displacement, vehicle dimensions, wing sizes and placement, ground-effects tunnel size and configuration, tire and wheel size, and safety considerations.	*NASCAR*
Fortran	Formula Translation language. A widely used high-level programming language well suited to problems that can be expressed in terms of algebraic formulas. It is generally used in scientific applications.	*General Engineering*
Forward bias	Orientation of electrical potential to provide a significant flow of charge carriers in a rectifier.	*Material Process*
Forward contract	The sale or purchase of a commodity for delivery at a specified future date.	*Mining*
Forward Converter	A power-supply switching circuit that transfers energy to the transformer secondary when the switching transistor is on.	*Electrical Engineering*
Forward cost (1)	Forward costs are those operating and capital costs yet to be incurred at the time an estimate of reserves is made. Profits and "sunk" costs, such as past expenditures for property acquisition, exploration, and mine development, are not included. Therefore, the various forward-cost categories are independent of the market price at which uranium produced from the reserves would be sold.	*Energy*
Forward cost (2)	The operating and capital costs still to be incurred in the production of uranium from in-place reserves. By using forward costing, estimates for reserves for ore deposits in differing geological settings and status of development can be aggregated and reported for selected cost categories. Included are costs for labor, materials, power and fuel, royalties, payroll taxes, insurance, and applicable general and administrative costs. Excluded from forward cost estimates are prior expenditures, if any, incurred for property acquisition, exploration, mine development, and mill construction, as well as income taxes, profit, and the cost of money. Forward costs are neither the full costs of production nor the market price at which the uranium, when produced, might be sold.	*Energy*
Forward costs (uranium)	The operating and capital costs that will be incurred in any future production of uranium from in-place reserves. Included are costs for labor, materials, power and fuel, royalties, payroll taxes, insurance, and general and administrative costs that are dependent upon the quantity of production and, thus, applicable as variable costs of production. Excluded from forward costs are prior expenditures, if any, incurred for property acquisition, exploration, mine development, and mill construction, as well as income taxes, profit, and the cost of money. Note: By use of forward costing, estimates of reserves for ore deposits in differing geological settings can be aggregated and reported as the maximum amount that can theoretically be extracted to recover the specified costs of uranium oxide production under the listed forward cost categories.	*Energy*
Forward coverage	Amount of uranium required to assure uninterrupted operation of nuclear power plants.	*Energy*
Forward Error Correction	A technique for detecting and correcting errors from imperfect transmission by adding a small number of extra bits. FEC allows optical transmission over longer distances by correcting errors that can happen as the signal-to-noise ratio decreases with distance.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Forward Workload	All Known Backlog Work And Work Which Is Due Or Predicted To Become Backlog Work Within A Pre-Specified Future Time Period.	*Plant Engineering*
Fossil fuel	An energy source formed in the Earth's crust from decayed organic material. The common fossil fuels are petroleum, coal, and natural gas.	*Energy*
Fossil fuel electric generation	Electric generation in which the prime mover is an internal combustion engine or a turbine rotated by high-pressure steam produced in a boiler or by a hot exhaust gas produced from the burning of fossil fuels.	*Energy*
Fossil fuel plant	A plant using coal, petroleum, or gas as its source of energy.	*Energy*
Fossil fuel steam-electric power plant	An electricity generation plant in which the prime mover is a turbine rotated by high-pressure steam produced in a boilerby heat from burning fossil fuels.	*Energy*
Fossil fuel	Any naturally occurring fuel of an organic nature, such as coal, crude oil and natural gas.	*Mining*
FOT	Free on truck.	*Lubrication*
Fother	a measure of coal, being 1/3 of a chaldron, or 17 2/3 cwt.; a good single horse cart load	*Mining*
Foul	a term used when describing air contaminated with firedamp to an extent that it is potentially explosive.	*Mining*
Foulant	Material that obstructs, such as sediment or biological material that blinds a filter or intake.	*Filtration*
Foul-coal	impure coal, admixed with shale etc. (N. East).	*Mining*
Fouling	Fouling is when a fluid goes through the Heat Exchanger, and the impurities in the fluid precipitate onto the surface of the tubes, which can cause scale. This precipitation reduces the surface area for heat to be transferred and causes an increase in the resistance to heat transfer across the heat exchanger. Fouling can be prevented with proper water purification. See also Maintenance	*Industrial*
Fouling	Contamination (plugging) of the membrane, either decreasing flux, or increasing differential pressure or TMP. Membrane fouling may necessitate a flux maintenance procedure or a membrane cleaning.	*Contamination Control*
Foulness	inflammable air. (N. East).	*Mining*
Foundation	Support material beneath the tower.	*Facility Engineering*
Foundry	An operation where metal castings are produced, using coke as a fuel.	*Energy*
Foundry coke	This is a special coke that is used in furnaces to produce cast and ductile iron products. It is a source of heat and also helps maintain the required carbon content of the metal product. Foundry coke production requires lower temperatures and longer times than blast furnace coke.	*Energy*
Four Ball Tester	This name is frequently used to describe either of two similar laboratory machines, the Four-Ball Wear Tester and the Four-Ball EP Tester. These machines are used to evaluate a lubricant's anti-wear qualities, frictional characteristics or load carrying capabilities. It derives its name from the four 1/2 inch steel balls used as test specimens. Three of the balls are held together in a cup filled with lubricant while the fourth ball is rotated against them.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Four Wheel Drive (4WD)	In a Four Wheel Drive system, a secondary transmission assembly, called a transfer case, is driven from the main transmission. The transfer case distributes power to both axles to drive all four wheels. It is the heart of the Four-Wheel Drive system. Four-Wheel Drive can be full-time, in which power is delivered to both axles at all times or part-time, where the driver selects two or four wheel drive. Four wheel drive is often combined with independent suspension systems and off-road type tires to enhance drive ability on rough, off-road terrain, or on-road drive ability in unfavorable driving conditions.	*Mechanical Engineering*
Four Wheel Independent Suspension	A type of suspension in which all wheels are mounted to separate suspension members with no rigid axle connecting them. Therefore a disturbance affecting one wheel has no effect on the opposite wheel. Four wheel independent suspension reduces the un-sprung weight, improves ride and handling over rough surfaces and permits room for a larger trunk.	*Mechanical Engineering*
Fourier	See Fast Fourier Transform or FFT. Term honors mathematician Baron Jean Baptiste Joseph Fourier 1768-1830.	*Reliability Engineering*
Fourier's low	Relationship between rate of heat transfer and temperature gradient.	*Material Process*
Fourth Quantum Number (Ms)	Number that represents the spin of the electron	*Physics*
Fourth quantum numbers	allow every electron in an atom to be characterized uniquely	*Physics*
Fourth Round Increase	Wage requests made by unions in the major industries in 1949.	*Industrial Relations*
Four-Way valve	A directional valve having four flow paths.	*Mechanical, Process, and Operations*
Four-Wheel Anti-Lock Brakes	All four wheels are equipped with speed sensors. When these sensors determine that the wheels are decelerating so rapidly that lockup may occur, the Electro-Hydraulic Control Unit (EHCU) is activated. The EHCU then modulates the brake pressure in the appropriate brake lines by means of the solenoid-operated valves. This is intended to prevent wheel lockup and help the vehicle maintain directional stability during potentially hazardous braking situations.	*Mechanical Engineering*
FPC	Federal Power Commission	*Energy*
FPM	Flow velocity in feet per minute.	*General Engineering*
FPS	Flow velocity in feet per second.	*General Engineering*
FQP	Fuel Quality Position (EMA)	*Petro-Chemical Abbreviations*
Frac	Refers to the process of hydraulically fracturing a well using water, sand and some chemicals. (Propane is also used to frac wells as part of a new technology invented by GasFrac, a Canadian company.) Frac can be used as a noun (they did a frac or frac job on the well,) and as a verb, (they are going to frac the well next week.)	*Petroleum Drilling*
Frac Fluid	A fluid used in the fracturing process, Under extreme high hydraulic pressure, frac fluids (which can include distillate, diesel fuel, crude oil, dilute hydrochloric acid, water or kerosene) are pumped downward through production tubing or the drill pipe.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Frac job	Slang term for hydraulic fracturing, a process whereby an oil or gas well is stimulated by pumping special fluids into the reservoir, fracturing the formation.[2]	*Petroleum Drilling*
Fracing, or "Fracking"	Fracing, or "Fracking" – See Hydraulic Fracturing.	*Petroleum Drilling*
Frack fluid	This is the water-based compound drillers use to fracture the shale. It's composed of very large amounts of water – up to several million gallons -- mixed with any number of chemicals, plus sand. It is pumped into wells under very high pressure to break up underground rock formations, which releases natural gas. The environmental impact(pdf link) of frack fluid has been a running controversy in Pennsylvania, almost since Marcellus drilling began in the state.	*Petroleum Drilling*
Frack water recycling	The reuse of water or brine that comes up out of the well after the shale has been fractured. Companies treat the used fluid and dilute it with new fresh water. After Pennsylvania passed stricter limits on total dissolved solids (TDS) discharge, companies have been recycling more frack fluid.	*Petroleum Drilling*
Fraction	One of the portions of fractional distillation having a restricted boiling range.	*Petroleum Engineering*
Fractionating column	Process unit that separates various fractions of petroleum by simple distillation, with the column tapped at various levels to separate and remove fractions according to their boiling ranges.	*Petroleum Engineering*
Fractionation	The process by which saturated hydrocarbons are removed from natural gas and separated into distinct products, or "fractions," such as propane, butane, and ethane.	*Energy*
Fractire mechanics	Analysis of failure of structural materials with preexisting flaws.	*Material Process*
Fracture	?	*Engineering Physics*
Fracture (fatigue)	Fatigue fracture results from frequently exceeding a fatigue strength limit, often under bending condition or excessive compressive loads. Cracks are initiated at little defects and propagate stepwise through the component.	*Reliability Engineering*
Fracture (forced)	Forced fracture is caused by high stress concentration in excess of material tensile strength by local overloading (e.g. by impact).	*Reliability Engineering*
Fracture toughness	Critical value of the stress intensity factor for which crack extensions occurs.	*Engineering Physics*
Fracture	A break in the rock, the opening of which allows mineral-bearing solutions to enter. A "cross-fracture" is a minor break extending at more-or-less right angles to the direction of the principal fractures.	*Mining*
Fracturing	A method of breaking down a formation by pumping fluid at very high pressures. The objective is to increase production rates from a reservoir.	*Petroleum Drilling*
Fragility	The maximum load an equipment can stand before failure (malfunction, irreversible loss of performance or structural damage) occurs.	*Reliability Engineering*
Fragility test	Expensive but highly useful dynamic tests of several samples (to account for variations in tolerances, material properties and manufacturing processes) at potentially destructive frequencies, to determine fragility.	*Reliability Engineering*
Frame	The structure which supports the machinery components of a conveyor.	*Equipment*
Frame Relay	A high-speed, packet-switched data communications service similar to X.25. Frame relay is a leading contender for LAN-to-LAN interconnect services, and is well suited to the burst-intensive demands of LAN environments.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Frame Spacer	Cross members to maintain frame rail spacing. Also referred to as Bed Spacer.	*Manufacturing*
Framer	A device used to align/synchronize to an embedded framing pattern in a serial bit stream. Once synchronized and data fields are properly aligned, overhead bits for alarms, performance monitoring, embedded signaling, etc. may be extracted and processed.	*Electrical Engineering*
Framework Convention on Climate Change (FCCC)	An agreement opened for signature at the "Earth Summit" in Rio de Janeiro, Brazil, on June 4, 1992, which has the goal of stabilizing greenhouse gas concentrations in the atmosphere at a level that would prevent significant anthropogenically forced climate change.	*Energy*
Framework members	The structural members designed to support all live and dead loads. They consist of columns, horizontal ties, diagonals and joists and beams. Can also include shear walls if designed accordingly as in a concrete tower.	*Facility Engineering*
Franchise Area	This is the territory in which a utility system supplies service to customers.	*Energy*
Franchise Monopoly	Under this system, a utility has the right to be the sole or principal supplier of electric power at a retail level in a specific region or area known as the franchise service territory. In return for its sole supplier privilege, the utility has an obligation to serve anyone who requests service, and agrees to be accountable to state and/or federal regulatory bodies that regulate the utility's performance, accounting procedures, pricing structures, and plant planning and siting.	*Energy*
Frass	Solid larval insect excrement; mixed with wood fragments in woodboring or bark-boring insects.	*Forestry*
Free air	Any compressible air trapped within a hydraulic system that does not dissolve to form a part of the system fluid.	*Mechanical, Process, and Operations*
Free Air	Air at ambient temperature, pressure, relative humidity, and density.	*Lubrication*
Free Along Side (FAS)	Shipping term meaning that the price quoted for goods includes carriage to the ship, but does not include loading or subsequent carriage costs.	*Maintenance*
Free alongside ship (f.a.s.)	The value of a commodity at the port of exportation, generally including the purchase price plus all charges incurred in placing the commodity alongside the carrier at the port of exportation.	*Energy*
Free coal	Free coal,	*Mining*
Free electron	Conducting electron in a metal.	*Material Process*
Free energy	A thermodynamic quantity that is a function of both the internal energy and entropy of a system.	*Engineering Physics*
Free Gold	Gold easily separated from the quartz or dirt.	*Mining*
Free Labor Market	theoretically a place where an employer is free to hire workers and where there is competitive bidding by employees for available jobs.	*Industrial Relations*
Free level	another term for an adit.	*Mining*
Free milling	Ores of gold or silver from which the precious metals can be recovered by concentrating methods without resorting to pressure leaching or other chemical treatment.	*Mining*
Free milling	Ores of gold or silver from which the precious metals can be recovered by concentrating methods without resort to roasting or chemical treatment.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
free on board	Goods delivered without delivery charge and placed on board a carrier at a specific point. Carrier may be a truck, barge, ship or airplane.	*Agriculture*
Free On Board (City, Shipping point, or Delivered)	Free On Board (seller will load truck or rail car). "FOB delivered" keeps the vendor responsible for the shipment until it reaches your door. "FOB shipping point" or "FOB originating city" makes you responsible for the shipment. If there is a problem with a FOB originating city shipment, you still have to pay the vendor and file a claim with the carrier.	*Maintenance*
Free on board (f.o.b.)	In the international petroleum industry, this term typically refers to the price of oil or natural gas actually charged at the producing country's port of loading. The reported f.o.b. price includes deductions for any rebates and discounts or additions of premiums where applicable and should be the actual price paid to the seller with no adjustment for the cost of ocean freight, insurance, or credit. For coal and breeze, f.o.b. has the dual meaning of the price of coal at the coal mine, or the price of coal at the producer country's port of loading, both before the cost of insurance, freight, and credit.	*Energy*
Free Position of the Plunger	The position of the plunger when there is no external force other than gravity applied to it.	*Electrical Engineering*
Free product	a petroleum hydrocarbon in the liquid ("free" or non-aqueous) phase (see also non-aqueous phase liquid, NAPL).	*Chemical*
Free radical	Reactive atom or group of atoms containing an unpaired electron.	*Material Process*
Free-Range	livestock or poultry that is permitted to forage in large area of open land rather than confined to a feedlot. According to the USDA "free range" must have access to the outdoors, but the amount or quality is not regulated.	*Agriculture*
Free Riders	employees who do not belong to a contract holding union.	*Industrial Relations*
Free vibration	Free vibration occurs without forcing, as after a reed is plucked.	*Reliability Engineering*
Free water	Water droplets or globules in the system fluid that tend to accumulate at the bottom or top of the system fluid depending on the fluid's specific gravity.	*Mechanical, Process, and Operations*
Free well	A well drilled and equipped by an assignee as consideration for the assignment of a fractional share of the working interest, commonly under a farm-out agreement.	*Energy*
Freeboard	Civil Engineering the height of the watertight portion of a building or other construction above a given level of water in a river, lake, etc.	*Civil Engineering*
Freedom of Association	the right of people to assemble in public or private for the purpose of joining for the common cause.	*Industrial Relations*
Freedom of Contract	a doctrine developed by the courts in many labor cases holding that certain types of legislation infringed upon the rights of employees "to contract".	*Industrial Relations*
Freedom of Organization	the right protected by federal law to organize for the purpose of collective bargaining.	*Industrial Relations*
Freehold oil and gas rights	Mineral rights not owned by the Province. The Federal Government, First Nations, corporations, or individuals may own these mineral rights.	*Petroleum Engineering*
Freeze	the fixing or stabalizing of wages, prices, or manpower at a point desired by government during a period of emergency or war.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Freezing Point	The temperature at which the substance goes from the liquid phase to the solid phase.	*General Engineering*
Freight Bill	The carrier's invoice for transportation charges applicable to a shipment.	*Procurement*
Freight Claims	A claim against a carrier due to loss of, or damage to, goods transported by that carrier; also for erroneous rates and weights in assessment of freight charges.	*Procurement*
Frenkel Defect	In an ionic solid, a cation-vacancy and cation-interstitial pair.	*Engineering Physics*
Frenkel defect	Vacancy interstitial defect combination.	*Material Process*
Frenzied coal	coal crushed by weight, usually in pillars, and rendered beyond economic use.	*Mining*
Frequency	The number of cycles over a specified time period over which an event occurs. The reciprocal is called the period.	*General Engineering*
Frequency	Oscillations	*Electrical Engineering*
Frequency Bin	The frequency range and resolution on the frequency axis of a spectrum graph depends on the sampling rate and the size of the data record (the number of acquisition points). The number of frequency points or lines or bands in the power spectrum is NRECORD/2, where NRECORD is the number of signal points captured in the time domain.	*Electrical Engineering*
Frequency converter (frequency changer)	A device used to adjust the frequency of alternating current. Frequency converters are a central component in variable-speed drives to control the speed, torque or power on the shaft of an electric motor by adjusting the frequency and voltage of the electricity powering the machine. Frequency converters are used to control the rotational speed of wind turbines to stabilize the frequency of the electricity they produce.	*Electrical*
Frequency converters	also used to connect electrical systems operating at different frequencies. For example in shore-to-ship power connections, these devices are used to enable ships, most of which have onboard electrical systems running at 60 Hz, to onshore power supplies that most commonly run at 50 Hz.	*Electrical*
Frequency Diversity	In radio systems, Frequency Diversity spreads a signal across multiple channels by transmitting multiple versions of the signal on different frequencies.	*Electrical Engineering*
Frequency Hopping Spread Spectrum	A transmission technology in which the data signal is modulated by a narrow-band carrier signal which changes frequency ("hops") over a wide band of frequencies. The hopping seems random but is prescribed by an algorithm known to the receiving system.	*Electrical Engineering*
Frequency Modulated Output	A transducer output which is obtained in the form of a deviation from a center frequency, where the deviation is proportional to the applied stimulus.	*Electrical*
Frequency Modulation	A modulation method in which the carrier frequency changes with the input signal amplitude.	*Electrical Engineering*
Frequency of errors, frequency of occurrence of analytical errors,	A performance characteristic of a measurement procedure that describes how frequently analytical errors are expected to occur. Related to the stability of the measurement procedure.	*Quality*
Frequency of Inspection	The regularity with which inspections are undertaken. Typically these are: Annually (once per year)	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Frequency of Vibration	The number of cycles occurring in a given unit of time. RPM - revolutions per minute. CPM- cycles per minute.	*General Engineering*
Frequency Output	An output in the form of frequency which varies as a function of the applied input.	*General Engineering*
Frequency range	**Frequency range** - see bandwidth.	*Reliability Engineering*
Frequency response	The portion of the frequency spectrum over which a device can be used, within specified limits of amplitude error.	*Reliability Engineering*
Frequency Response Characteristic	The frequency dependent relation, in both amplitude and phase, between steady-state sinusoidal inputs and the resulting fundamental sinusoidal outputs.	*Process Control*
Frequency Shift Keying	A method of transmitting digital data by shifting the frequency of a carrier signal to represent binary 1s and 0s.	*Electrical Engineering*
Frequency spectrum	A description of the resolution of any electrical signal into its frequency components, giving the amplitude (sometimes also phase) of each component.	*Reliability Engineering*
Frequency Synthesizer	A frequency synthesizer is an electronic circuit that uses an oscillator to generate a preprogrammed set of stable frequencies with minimal phase noise. Primary applications include wireless/RF devices such as radios, set top boxes, and GPS.	*Electrical Engineering*
Frequency, Natural	The frequency of free (not forced) oscillations of the sensing element of a fully assembled transducer.	*Electrical*
Frequency, Natural	The frequency of free (not forced) oscillations of the sensing element of a fully assembled sensor.	*Electrical Engineering*
Fresh air base	an underground station in the intake airway which is used by the rescue teams during underground fires and rescue operations. The base has to be as close to the fire as safety will permit, adequately ventilated, and in constant touch with the surface by telephone.	*Mining*
Fresh feed input	Represents input of material (crude oil, unfinished oils, natural gas liquids, other hydrocarbons and oxygenates or finished products) to processing units at a refinery that is being processed (input) into a particular unit for the first time.	*Energy*
Fresh feeds	Crude oil or petroleum distillates that are being fed to processing units for the first time.	*Energy*
Fresh water	sodium-chloride-free water, especially when considered as a natural resource	*Materials Process*
Fretting	Wear resulting from small amplitude motion between two surfaces; may produce red or black oxide.	*Lubrication*
Fretting	A type of wear resulting from minute reciprocal sliding motion which produces fine particulate contamination without chemical change.	*Mechanical, Process, and Operations*
Fretting Corrosion	A form of fretting wear in which corrosion plays a significant role.	*Paint and Coatings*
Fretting Corrosion	Can take place when two metals are held in contact and subjected to repeated small sliding, relative motions. Other names for this type of corrosion include wear oxidation, friction oxidation, chafing, and brinelling.	*Lubrication*
Fretting Wear	Wear arising as a result of fretting (see fretting).	*Paint and Coatings*
Friable	easily crumbled, not cohesive or sticky.	*Chemical*

Term	Definition	*Industry*
Friable	Easy to break, or crumbling naturally. Descriptive of certain rocks and minerals.	*Mining*
Friction	Resistance to motion of one object over another. Friction depends on the smoothness of the contacting surfaces, as well as the force with which they are pressed together.	*Lubrication*
Friction	The resisting force encountered at the common boundary between two bodies when, under the action of an external force, one body, moves or tends to move relative to the surface of the other.	*Lubrication*
Friction Clutch	Any clutch in which driving effort is developed by contact between pressure elements through friction alone. General use is for the purpose of engaging and disengaging revolving parts. Also used as a safety device to permit slip when over	*Equipment*
Friction Stabilizers	Coating materials used on fasteners with the intention of reducing the scatter in the thread and bearing surface friction coefficients.	*Maintenance*
Frictional Unemployment	a catch-all category of those unemployed because of temporary conditions in the labor market, personal desires of workers with respect to available jobs, lack or mobility in the labor market because of the conditions set by employers or unions.	*Industrial Relations*
Fringe Benefits	non-wage benefits or payments received by workers.	*Industrial Relations*
Front connected	A condition wherein piping connections are on normally exposed surfaces of hydraulic components.	*Mechanical, Process, and Operations*
Front Wheel Drive (FWD)	A drive system where the engine and trans axle components apply the driving force to the front wheels rather than the rear wheels. Benefits of Front-Wheel drive include: Maximized passenger space. Enhanced cargo area. excellent drive traction; particularly on wet or Slippery surfaces, since the drive is through the front wheels, which carry a heavier load.	*Mechanical Engineering*
Front-end loader	a tractor with a digging bucket mounted and operated on the front. It is often used to remove overburden in contour mining and to load coal.	*Energy*
Frost	Field of micropits; form of microadhesive wear.	*Lubrication*
Frosting	An apparently crystalline pattern on the surface of a plastic.	*Material Process*
Frozen Seniority	the protection of a worker's length of service as of a specific time.	*Industrial Relations*
FRS	Financial Reporting System Survey (EIA survey).	*Energy*
Fructose	A 6-carbon sugar.	*Agriculture*
Fruiting body	A specialized structure, often macroscopic, on or in which spores are produced.	*Forestry*
Frush,	brittle, soft and easily broken up. As in the floor of a roadway when pavement brushing. (Scot.).	*Mining*
Frying pan	see Pit pan.	*Mining*
FS	Forest Service, an agency of the USDA.	*Agriculture*
FSIS	Food Safety and Inspection Service, a consumer protection agency within the USDA. Its mission is to protect consumers by ensuring that meat, poultry, and egg products are safe, wholesome, and accurately labeled.	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
FSV	short for Free Steered Vehicle, a rubber-tyred, self-propelled, diesel powered general purpose underground vehicle.	*Mining*
FT	Fischer–Tropsch	*Petro-Chemical Abbreviations*
FTA	Fault Tree Analysis	*Plant Engineering*
FTC	Federal Trade Commission (US)	*Petro-Chemical Abbreviations*
F-test	A statistical test of significance in which the difference between two variances is tested. A variance is the square of a standard deviation. The F-test is often used to compare the imprecision of two analytical methods. The hypothesis being tested (called a null hypothesis) is that there is no difference between the two variances. If the calculated F-value is greater than the critical value which is obtained from a statistics table, then the null hypothesis is rejected. This means that a difference exists and that the difference is statistically significant, or real. If the calculated F-value is less than the critical value, the null hypothesis cannot be rejected, therefore, there is no difference between the two variances being tested, and the difference is not statistically significant.	*Quality*
FTIR	Fourier Transform Infrared Spectroscopy. A test where infrared light absorption is used for assessing levels of soot, sulfates, oxidation, nitro-oxidation, glycol, fuel, and water contaminants.	*Lubrication*
FTIR = Fourier Transform Infrared Spectroscopy	A test where infrared light absorption is used for assessing levels of soot, sulfates, oxidation, nitro-oxidation, glycol, fuel, and water contaminants.	*Oil Analysis*
ft-lbs	foot-pounds (of torque or turning effort) gpm - gallons per minute	*Mechanical, Process, and Operations*
FTP	File Transfer Protocol	*Energy*
FTP (File Transfer Protocol) Server	Enables users to open a connection to a host computer and transfer files between the host computer and a remote computer.	*Quality Engineering*
FTTN	FTTN is "Fiber-to-the-node."	*Electrical Engineering*
Fuel	Any material substance that can be consumed to supply heat or power. Included are petroleum, coal, and natural gas (the fossil fuels), and other consumable materials, such as uranium, biomass, and hydrogen.	*Energy*
Fuel Adjustment	A clause in the rate schedule that provides for adjustment of the amount of a bill as the cost of fuel varies from a specified base amount per unit. The specified base amount is determined when rates are approved. This item is shown on all customer bills and indicates the current rate for any adjustment in the cost of fuel used by the company. It can be a credit or a debit. The fuel adjustment lags two months behind the actual price of the fuel. For example, the cost of oil in January will be reflected in March's fuel adjustment.	*Energy*
Fuel cell	A device in which chemical energy released by the oxidation of a liquid (such as methanol) or gaseous fuel is converted directly into electrical energy.	*Electrical*
Fuel Cell	An advanced energy conversion device that converts fuels to power very efficiently and with minimal environmental impact.	*Energy*

Please see the Appendix for further illustration

Term	Definition	Industry
Fuel Chain	The chain of activities involved in transforming energy into forms more convenient for society. This chain may include some or all of the following: fuel exploration, extraction, preparation, transportation, conversion to electricity, distribution and waste disposal.	*Energy*
Fuel Charge	The rate charged per kilowatt-hour (or cubic feet) to cover the costs of the fuel used to produce power (or gas)	*Energy*
Fuel cycle	The entire set of sequential processes or stages involved in the utilization of fuel, including extraction, transformation, transportation, and combustion. Emissions generally occur at each stage of the fuel cycle.	*Energy*
Fuel Dilution	The amount of raw, unburned fuel that ends up in the crankcase of an engine. It lowers an oil's viscosity and flash point, creating friction-related wear almost immediately by reducing film strength.	*Lubrication*
Fuel Diversity	A utility or power supplier that has power stations using several different types of fuel. Avoiding over-reliance on one fuel helps avoid the risk of supply interruption and price spikes.	*Energy*
Fuel Economy	The amount of fuel required to move a machine over a given distance.	*Lubrication*
Fuel efficiency	See Miles per gallon.	*Energy*
Fuel emergencies	An emergency that exists when supplies of fuels or hydroelectric storage for generation are at a level or estimated to be at a level that would threaten the reliability or adequacy of bulk electric power supply. The following factors should be taken into account to determine that a fuel emergency exists 1. Fuel stock or hydroelectric project water storage levels are 50 percent or less of normal for that particular time of the year and a continued downward trend in fuel stock or hydroelectric project water storage level is estimated; or 2. Unscheduled dispatch or emergency generation is causing an abnormal use of a particular fuel type, such that the future supply of stocks of that fuel could reach a level that threatens the reliability or adequacy of bulk electric power supply.	*Energy*
Fuel Escalation	The annual rate of increase of the cost of fuel, including inflation and real escalation, resulting from resource depletion, increased demand, etc.	*Energy*
Fuel ethanol	Ethanol intended for fuel use. Fuel ethanol in the United States must be anhydrous (less than 1 percent water). Fuel ethanol is denatured (made unfit for human consumption), usually prior to transport from the ethanol production facility, by adding 2 to 5 volume percent petroleum, typically pentanes plus or conventional motor gasoline. Fuel ethanol is used principally for blending in low concentrations with motor gasoline as an oxygenate or octane enhancer. In high concentrations, it is used to fuel alternative-fuel vehicles specially designed for its use. See Alternative-Fuel Vehicle, Denaturant, E85, Ethanol, Fuel Ethanol Minus Denaturant, and Oxygenates.	*Energy*
Fuel Ethanol Minus Denaturant	An unobserved quantity of anhydrous, biomass-derived, undenatured ethanol for fuel use. The quantity is obtained by subtracting the estimated denaturant volume from fuel ethanol volume. Fuel ethanol minus denaturant is counted as renewable energy, while denaturant is counted as nonrenewable fuel. See Denaturant, Ethanol, Fuel Ethanol, Nonrenewable Fuels, and Oxygenates	*Energy*
Fuel Expenses	Costs associated with the generation of electricity.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fuel gas	Refinery gas used for heating.	*Petroleum Engineering*
Fuel injection	A fuel delivery system whereby gasoline is pumped to one or more fuel injectors under high pressure. The fuel injectors are valves that, at the appropriate times, open to allow fuel to be sprayed or atomized into a throttle bore or into the intake manifold ports. The fuel injectors are usually solenoid operated valves under the control of the vehicle's on-board computer (thus the term "electronic fuel injection"). The fuel efficiency of fuel injection systems is less temperature-dependent than carburetor systems. Diesel engines always use injectors.	*Energy*
Fuel Injection, Electronic	A computer-controlled method of delivering fuel under pressure. The computer monitors signals from coolant temperatures, manifold vacuum, exhaust oxygen sensor, and engine cranking sensor. It "tells" the injectors to release and adjust the fuel to yield an air/fuel mixture assuring engine operation well matched with emission requirements, optimum fuel economy and overall vehicle performance.	*Mechanical Engineering*
Fuel loading	A buildup of easily ignited, fast-burning fuels such as pinestraw, small branches, and other highly flammable, woody material.	*Forestry*
Fuel mixtures	containing 85 percent or more by volume of methanol, denatured ethanol, and other alcohols with gasoline or other fuels	*Energy*
Fuel oil	A liquid petroleum product less volatile than gasoline, used as an energy source. Fuel oil includes distillate fuel oil (No. 1, No. 2, and No. 4), and residual fuel oil (No. 5 and No.6).	*Energy*
Fuel oil supplier	See Energy supplier.	*Energy*
Fuel Pump	A mechanical or electrical device that draws fuel from the fuel tank and delivers it to the carburetor, injectors, or injector pump.	*Mechanical Engineering*
Fuel purchase agreement	An agreement between a company and a fuel provider which stipulates that the company agrees to purchase its fuel from the fuel provider. If the company has a credit card for use at a fuel provider's locations, but is not bound by an additional agreement to purchase fuel from that provider, the credit card agreement alone is not considered a fuel purchase agreement.	*Energy*
Fuel ratio	The ratio of fixed carbon to volatile matter in coal.	*Energy*
Fuel switching capability	The short-term capability of a manufacturing establishment to have used substitute energy sources in place of those actually consumed. Capability to use substitute energy sources means that the establishment's combustors (for example, boilers, furnaces, ovens, and blast furnaces) had the machinery or equipment either in place or available for installation so that substitutions could actually have been introduced within 30 days without extensive modifications. Fuel-switching capability does not depend on the relative prices of energy sources; it depends only on the characteristics of the equipment and certain legal constraints.	*Energy*
Fuel wood	Wood and wood products, possibly including scrubs and branches, etc, bought or gathered, and used by direct combustion.	*Energy*
Fuel	A substance that can be burned to product heat.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fuel/fabricator assembly identifier	Individual assembly identifier based on a numbering scheme developed by individual fuel fabricators. Most fuel fabricator assembly identifiers schemes closely match the scheme developed by the American National Standards Institute (ANSI) and are therefore unique.	*Energy*
fuels (other than alcohol)	derived from biological materials (biofuels such as soy diesel fuel)	*Energy*
Fuels solvent deasphalting	A refining process for removing asphalt compounds from petroleum fractions, such as reduced crude oil. The recovered stream from this process is used to produce fuel products.	*Energy*
Fuel-switching DSM program assistance	DSM program assistance where the sponsor encourages consumers to change from one fuel to another for a particular end-use service. For example, utilities might encourage consumers to replace electric water heaters with gas units or encourage industrial consumers to use electric microwave heaters instead of natural gas-heaters.	*Energy*
Fuel-Use Attributes	Fuel-use attributes are important to utilities concerned about reliance on a single fuel or reduction in usage of a particular fuel. These attributes include annual fuel consumption by type and percent energy generation by fuel.	*Energy*
Fugitive emissions	Unintended leaks of gas from the processing, transmission, and/or transportation of fossil fuels.	*Energy*
Full ben	the target achieved, 'a full day's work'. (Scot.).	*Mining*
Full bore (full opening)	Describes a valve in which the bore (port) is nominally equal to the bore of the connecting pipe.	*General Mechanical*
Full bore (full port)	Describes a valve in which the bore (port) is nominally equal to the bore of the connecting pipe.	*Mechanical*
Full Bridge	A Wheatstone bridge configuration utilizing four active elements or strain gages.	*General Engineering*
Full Bridge	A Wheatstone bridge configuration utilizing four active elements or strain gages.	*Electronic Process*
Full Crew Rule	provisions generally in law seeking to satisfy safety requirements by specifying a full complement of men to handle an operation.	*Industrial Relations*
Full Diameter Shank	Equal to major diameter of thread. Produced by cut thread or by roll thread on extruded blank. Characteristic of machine bolts and cap screws.	*Fastening*
Full Dinner Pail	a demand of wage earners directed to provide adequate income for the necessities of life.	*Industrial Relations*
Full Duplex	A channel providing simultaneous transmission in both directions.	*Electrical Engineering*
Full Employment	a desired goal in a free enterprise system which provides employment opportunities for all who desire employment and are able and willing to work.	*Industrial Relations*
Full flow	In a filter, the condition where all the fluid must pass through the filter element or medium.	*Mechanical, Process, and Operations*
Full flow filter	A filter that, under specified conditions, filters all influent flow.	*Oil Analysis*
Full flow Pressure	The pressure at which a valve is wide open and passes its full flow.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Full Fluid Film Lubrication	Presence of a continuous lubricating film sufficient to completely separate two surfaces, as distinct from boundary lubrication. Full-fluid-film lubrication is normally hydrodynamic lubrication, whereby the oil adheres to the moving part and is drawn into the area between the sliding surfaces, where it forms a pressure	*Lubrication*
Full forced outage	The net capability of main generating units that are unavailable for load for emergency reasons.	*Energy*
Full opening	Describes a valve whose bore (port) is nominally equal to the bore of the connecting pipe.	*Mechanical*
Full Overtravel Force	The force required to depress the plunger of a switch to the full overtravel point.	*Electrical Engineering*
Full Overtravel Point	The position of the plunger beyond which further overtravel would cause damage to the switch or actuator.	*Electrical Engineering*
Full penetration weld	Describes the type of weld wherein the weld metal extends through the complete thickness of the parts being joined.	*Mechanical*
Full power day	The equivalent of 24 hours of full power operation by a reactor. The number of full power days in a specific cycle is the product of the reactor's capacity factor and the length of the cycle.	*Energy*
Full power operation	Operation of a unit at 100 percent of its design capacity. Full-power operation precedes commercial operation.	*Energy*
Full requirements consumer	A wholesale consumer without other generating resources whose electric energy seller is the sole source of long-term firm power for the consumer's service area. The terms and conditions of sale are equivalent to the seller's obligations to its own retail service, if any.	*Energy*
Full Scale Output	The algebraic difference between the minimum output and maximum output.	*General Engineering*
Full Scale Output (Span)	The algebraic difference between output curve end points (outputs at specified upper and lower output limits).	*Electrical Engineering*
fullerenes	allotropic forms of carbon made up of a network of 60 carbon atoms bonded together in the shape of a soccer ball also known as buckyballs	*Physics*
Full-Fillet Weld	A fillet weld whose size is equal to the thickness of the thinner member joined.8	*Maintenance and Repair*
Full-flow filtration	A system of filtration in which the total flow of a circulating fluid system passes through a filter.	*Oil Analysis*
Full-fluid-film lubrication	Presence of a continuous lubricating film sufficient to completely separate two surfaces, as distinct from boundary lubrication. Full-fluid-film lubrication is normally hydrodynamic lubrication, whereby the oil adheres to the moving part and is drawn into the area between the sliding surfaces, where it forms a pressure -- or hydrodynamic -- wedge.	*Oil Analysis*
Full-Forced Outage	The net capability of main generating units that is unavailable for load for emergency reasons.	*Energy*
Full-Forced Outage	Net capability of generating units unavailable for load for emergencies.	*Energy*
Full-Time Earnings	the amount earned by a worker who has worked a full schedule of hours for a designated period of time.	*Industrial Relations*
Full-Time Job	a job which requires the complete attention of the employee for a set work schedule.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Full-Time Worker Rate	the wage rate paid to a regular employee who works on a full-time basis.	*Industrial Relations*
Fully developed laminar flow	Laminar flow along a channel or pipe that only has velocity components in the main direction of the flow. The velocity profile perpendicular to the flow does not change downstream in the flow.	*Chemical*
Fumarole	A vent from which gas or steam issue; a geyser or spring that emits gases.	*Energy*
Fumigation	The natural or controlled exposure of plants to toxic gases or volatile substances.	*Forestry*
Function	A definition of the objective that an equipment item intents to achieve, with respect to its role in the process. The statement should specify the operating context and contain a verb, a noun (object), and a performance standard. For example: "To supply crude oil to the separator V1022 at a flow rate of 60 m3 per hour and a pressure of between 5.5 Bar and 6 Bar."	*Maintenance*
Function Block	Smart devices on a fieldbus are capable of operating independently. The microprocessors which store control software are the function blocks. They are particular to an application.	*Control Engineering*
Function Check-out	Action taken after maintenance activities to verify that the asset is able to perform the required function.	*Maintenance*
Functional	Used In Reliability Centered Maintenance Terminology. The Inability Of An Item Of Equipment To Fulfill One Or More Of Its Functions. Interchangeably Used With Failure.	*Plant Engineering*
Functional biomaterials	materials that interact or replace biological systems with a primary function other than providing support, such as artificial blood, or skin	*Physics*
Functional Failure	A specific failure that refers to the termination of, or degradation in the ability of an item to perform any one of the stated required functions.	*Maintenance*
Functional sensitivity, FS	This term is commonly used to refer to an estimate of detection limit that is calculated from replicate measurements of low concentration patient samples. By definition, FS is the lowest concentration at which the method provides a 20% coefficient of variation (CV).	*Quality*
Functional Test	See Failure Finding Task	*Plant Engineering*
Functional Unbundling	The functional separation of generation, transmission, and distribution transactions within a vertically integrated utility without selling of "spinning off" these functions into separate companies.	*Energy*
Functionalization	a technical term used to describe the organization of management functions and work performance in a manner designed most effectively to achieve the basic objectives on an enterprise.	*Industrial Relations*
Functions	Three mode PID controller. A time proportioning controller with integral and derivative functions. The integral function automatically adjusts the system temperature to the set point temperature to eliminate droop due to the time proportioning function.	*General Engineering*
Fundamental Deviation	An intentional clearance between internal or external thread and the design form of the thread when the thread form is on its maximum metal condition. For metric threads the fundamental deviation are designated by letters, capitals for internal threads and small letters for external threads. Some tolerance classes have a fundamental deviation of zero. For imperial threads the fundamental deviation is called the allowance.	*Maintenance*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Fundamental frequency	The number of hertz or cycles per second of the lowest-frequency component of a complex, cyclic motion. (See also **Harmonic** and **Subharmonic**.)	*Reliability Engineering*
Fundamental mode of vibration	The mode having the lowest natural frequency. • To ensure personnel and public safety	*Reliability Engineering*
Fundamental Triangle Height	The fundamental triangle height is normally designated with the letter H. This is the height of the thread when the profile is extended to a sharp vee form. For 60 degree thread forms such as metric and Unified thread series, H equals 0.866025 times the thread pitch.	*Maintenance*
Funded Pension Pay	a plan in which pension benefits are built up over a period by setting aside funds in reserve.	*Industrial Relations*
Funders' Forum	A group of people with an interest in establishing infrastructure funding for the work of The Cochrane Collaboration. This initiative is led by the Department of Health in England; the group usually meets during Cochrane Colloquia.	*Quality Engineering*
Funding Arbiter	In forming a commercial sponsorship policy for The Cochrane Collaboration, the CCSG established the position of Funding Arbiter in March 2004, analogous to the Publication Arbiter. The Funding Arbiter is a CCSG member and convenes a standing panel of three to give guidance on difficult cases of potential sponsorship. Also called: Arbiter, Funding	*Quality Engineering*
Fungi	Simple, plant-like life forms that lack true roots, stems, leaves, and chlorophyll. They are filamentous in structure (e.g., mushrooms, mildews, molds, and yeasts).	*Chemical Engineering*
Fungi	aerobic, multicellular, nonphotosynthetic, heterotrophic microorganisms. The fungi include mushrooms, yeast, molds, and smuts. Most fungi are saprophytes, obtaining their nourishment from dead organic matter. Along with bacteria, fungi are the principal organisms responsible for the decomposition of carbon in the biosphere. Fungi have two ecological advantages over bacteria - (1) they can grow in low moisture areas, and (2) they can grow in low pH environments.	*Chemical*
Fungicide	A chemical agent that destroys fungi.	*Chemistry*
Funicular	A funicular shape is one similar to that taken by a suspended chain or string subjected to a particular loading.	*Engineering Physics*
Funnel plot	A graphical display of some measure of study precision plotted against effect size that can be used to investigate whether there is a link between study size and treatment effect. One possible cause of an observed association is reporting bias.	*Quality Engineering*
Furfural or furfuralaldehyde(C4H3 OCHO) Colorless liquid	An aldehyde obtained from pentosons (found in farm products such as oat hulls, woody fibers, etc.) which can be condensed with phenol and other substances to form synthetic resins and which itself polymerizes.	*Material Process*
Furfuryl alcohol	A solvent-furan.	*Material Process*
Furlough	a leave of absence from work or other duties usually initiated by an employee to meet some special problem.	*Industrial Relations*
Furnace	The part of a boiler or warm-air space-heating plant in which combustion takes place.	*Energy*
Furnace Charging	An overhead crane moves the scrap in the charge bucket to the furnace for melting. It takes three or four charge buckets to produce one heat.	*Steel*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Furnace coke plant	A coke plant whose coke production is used primarily by the producing company.	*Energy*
Furnace or Firepan,	a coal fire at the bottom of the upcast shaft that causes air to rise in the shaft and create a ventilation circuit.	*Mining*
Furnaces that heat directly, without using steam or hot water (similar to a residential furnace)	Furnaces burn natural gas, fuel oil, propane/ butane (bottled gas), or electricity to warm the air. The warmed air is then distributed throughout the building through ducts. Many people use the words "boilers" and "furnaces" interchangeably. They are not the same. We mean that warm air is produced directly by burning some fuel. Warm-air furnaces typically rely on air ducts to carry the warm air throughout the building. Warm-air furnaces are often built in combination with central air-conditioning systems, so that they can use the same air ducts for either heating or air-conditioning (depending on the season). Other terms for describing this type of equipment include "central system," "split system," and "forced air/forces air furnace."	*Energy*
Furniture Cleaner/Polish	A liquid, paste or aerosol spray designed to remove dust and stains from wood surfaces, confer shine and protection against water spots, and is formulated to reduce wax buildup with continued use.	*Chemistry*
Furring	in building, thin boards providing a basis for laths, plaster, etc.	*Petroleum Drilling*
furrow	A narrow grove made in the ground by a plow. Furrows serve different purposes, one of which is to contain a rill of water for surface irrigation.	*Agriculture*
Fuse	A cord-like substance used in the ignition of explosives. Black powder is entrained in the cord and, when lit, burns along the cord at a set rate. A fuse can be safely used to ignite a cap, which is the primer for an explosive.	*Mining*
Fused Coatings	A process in which the coating material is deposited by thermal spraying and then fused by post heat treatment. This can be done by flame, induction heating, furnace or by laser.	*Paint and Coatings*
Fused Crushed Powder	Powder formed from a fused solid mass which is then crushed to the appropriate size for spraying.	*Paint and Coatings*
Fusibility	The ease with which a material is melted.	*Material Process*
Fusion	The melting together of filler and base metal, or of base metal only, which results in coalescence.8	*Maintenance and Repair*
Fusion casting	Ceramic processing technique similar to metal casting.	*Material Process*
Fusion Zone	The area of base metal melted as determined on the cross section of a weld.	*Maintenance and Repair*
Future Benefit PM	Preventive maintenance (PM) tasks that are initiated by a breakdown rather than a schedule. The PM is done on a whole machine, assembly line, or process after a section or subsection breaks down. This is a popular method with manufacturing cells where the individual machines are closely coupled. When one machine breaks, the whole cell undergoes a preventive maintenance activity. Future benefit PM is considered "packaging of opportunistic work" given that an opportunity has arisen to do that work (often due to the failure of an associated piece of equipment).	*Maintenance*
Future Farmers of America (FFA)	an educational organization for young adults who plan to have a career in agriculture	*Agriculture*
Future Service Benefits	the retirement credits earned by a worker during the period of his membership in a pension plan.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Futures Contract	Legally binding agreement to buy or sell a commodity.	*Metallurgy*
Futures market	A trade center for quoting prices on contracts for the delivery of a specified quantity of a commodity at a specified time and place in the future.	*Energy*
Fuzzy Logic	Fuzzy logic is designed for situations where information is inexact and traditional digital on/off decisions are not possible. It divides data into vague categories such as "hot", "medium" and "cold".	*Control Engineering*
Fuzzy Logic controller	a rule based methodology in which system inputs (observables) are systematically and mathematically related to system outputs (controllables). A Fuzzy controller is a highly non-linear function. In the common engineering sense, the formulation of a Fuzzy controller is not model based; that is, the rules which govern the controller are not necessarily derived from a physics-based model of the system. Rather, the designer describes in approximate or vague terms the relationships between quantities thought or desired to hold true. There is nothing fuzzy about the logic itself; it is the words, represented with Fuzzy sets, that are ambiguous or uncertain. With Fuzzy logic a controller may be designed to employ experience and common sense knowledge, since rules-of-thumb exist mainly in the form of linguistic statements that are usually, but not always, true.	*Petroleum Drilling*
Fuzzy Logic	an extension of classical Boolean logic that uses Fuzzy sets rather than Boolean sets; is based on rules of the form "if … then …" in which inputs convert outputs--one fuzzy set transforming another.	*Petroleum Drilling*
Fuzzy rule	a logic statement that associates Fuzzy set input to Fuzzy set output. For example, If <Error> is [Near_Zero], Then <DStabilizer_Force> should be [No_Change]. Here, [Near_Zero] is a Fuzzy set that describes the observable <Error> in the vicinity of zero. [No_Change] is a Fuzzy set that describes the controllable <DStabilizer_Force> in the vicinity of zero.	*Petroleum Drilling*
Fuzzy set	a mathematical concept whereby the degree to which an element belongs to a particular notion about some domain of definition is classified as completely true (1), completely false (0), or partially true/false ([0-1]). For example, consider the domain of all room temperatures; 76.2 degrees Fahrenheit may be a member of the set of "comfortable room temperatures" to a degree of 0.5, and also of the set of "warm room temperatures" to a degree of 0.5, depending on where the Fuzzy sets (also called degree of membership functions) are defined. The mathematical manipulations of Fuzzy sets--Fuzzy Logic--are not vague.	*Petroleum Drilling*
Fuzzy	a general term that refers to a system or methodology that to some degree employs the use of one or multiple Fuzzy sets. Fuzzy controller, Fuzzy expert system, and Fuzzy neural net each are examples of different methodological systems that share the employment of fuzzy sets in their designs.	*Petroleum Drilling*
FWD	front- or four-wheel drive	*Mechanical*
FZG	Forschungstelle für Zahnräder und Getriebau	*Lubrication*
FZG Four Square Gear Oil Test	Used in developing industrial gear lubricants to meet equipment manufacturer's specifications. The FZG test equipment consists of two gear sets, arranged in a four square configuration, driven by an electric motor. The test gear set is run in the lubricant at gradually increased load stages until failure, which is the point at which a 10 milligram weight loss by the gear set is recorded. Also called Niemann Four Square Gear Oil Test.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
G	G	*Forestry*
g units or gravitational units.	A way to express an acceleration, in terms of a ratio. Divide a given acceleration by the appropriate value (on Earth use 9.80665 m/s² or 386.087 in/sec² or 32.1739 ft/sec²).	*Reliability Engineering*
G	Gas.	*Petroleum Drilling*
G.A.F. Carbonyl Iron Powders	Trade mark for microscopic, almost perfect spheres of extremely pure iron. They are produced in ten carefully controlled grades, ranging in particle size from one-half to fifteen microns in diameter. The iron content of some types is as high as 99.6–99.9%.	*Material Process*
G/C—Gas Condensate	G/C – Gas Condensate	*Petroleum Drilling*
G/C	Gas Condensate.	*Petroleum Drilling*
G-11	Trade mark for a brand of hexachlorophene.	*Material Process*
G-4	Trade mark for a brand of dichlorophene.	*Material Process*
G-942	Trade mark for specialty tanning product based on the partial sodium salt of a polymeric carboxylic acid. Viscous straw colored liquid approximately 25% solids. Use as a plumping and tanning agent, primarily for light weight skins.	*Material Process*
GAAP	See Generally Accepted Accounting Principles.	*Energy*
GaAs MESFET	A Gallium Arsenide (GaAs) Metal-Semiconductor Field-Effect-Transistor (MESFET) is a transistor built with gallium arsenide semiconductor material. The conducting channel is built using a metal-semiconductor (Schottky) junction.	*Electrical Engineering*
Gabbie	a hook on the end of a rope or chain. (Scot.).	*Mining*
Gabbro	A dark, coarse-grained igneous rock.	*Mining*
Gablock	see Ringer and Chain.	*Mining*
Gabon (1975-1994)	Gabon (1975-1994)	*Energy*
Gad or Moil	an iron wedge used for breaking down coal.	*Mining*
Gadolinite (YFeBe2(SiO4) 2O2)	A natural silicate of beryllium, iron, and the yttrium and rare earth metals. Black, greenish black, or brown, luster vitreous to greasy, hardness 6.5–7.0.	*Material Process*
Gadolinium (Gd)	Element having atomic number 64. Exhibits a high degree of magnetism, especially at low temperatures. Crystalline compounds of gadolinium, especially gadolinium sulfate octahydrate, are used in magnetic method of obtaining extremely low temperatures. Gadolinium may be of importance in the control of nuclear reactors.	*Material Process*
Gafite (–CH2CClCOOCH3–)	Trade mark for methyl alphachloroacrylate polymer in thermoplastic cast sheets. Glazing for supersonic aircraft, component in instruments, dials, lenses, signs, etc., is used.	*Material Process*
Gage	A standard SAE designation of wire sizes. Expressed in AWG (American wire gage). The larger the number the smaller the wire size.	*Mechanical Engineering*
Gage Factor	A measure of the ratio of the relative change of resistance to the relative change in length of a piezoresistive strain gage.	*Electronic Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gage Factor	A measure of the ration of the relative change of resistance to the relative change in length of a resistive strain sensor (strain gage).	*Electrical Engineering*
Gage Length	The distance between two points where the measurement of strain occurs.	*General Engineering*
Gage Length	The distance between two points where the measurement of strain occurs.	*Electronic Process*
Gage manometer	A differential pressure gage in which pressure is indicated by the height of a liquid column of known density. Pressure is equal to the difference in vertical height between two connected columns multiplied by the density of the manometer liquid. Some forms of manometers are "U" tube, inclined tube, well, and bell types.	*Mechanical, Process, and Operations*
Gage pressure	Absolute pressure minus local atmospheric pressure.	*Electronic Process*
Gage Pressure	A form of differential pressure measurement in which atmospheric pressure is used as a reference.	*Electrical Engineering*
Gage Pressure Transducer	A transducer which measures pressure in relation to the ambient pressure.	*Electronic Process*
Gage, Pressure	A gage which indicates the pressure in the system to which it is connected.	*Mechanical, Process, and Operations*
Gage, Vacuum	A pressure gage for pressures less than atmospheric.	*Mechanical, Process, and Operations*
Gagging	a small embankment or heap of slack or rubbish made at the entrance to a heading as a means of fencing it off (S. Staffs.).	*Mining*
Gain	The amount of amplification used in an electrical circuit.	*Electrical*
Gain	The ratio of change in output divided by the change in input that caused it. Both input and output must be in the same units; hence gain is a dimensionless number.	*Electrical Engineering*
Gain (of the controller)	This is another way of expressing the "P" part of the PID controller. GAIN = 100/(Proportional Band). The more gain a controller has the faster the loop response and more oscillatory the process.	*Process Control Engineering*
Gain (of the process)	Gain is defined as the change in input divided by the change in output. A process with high gain will react more to the controller output changing. For example, picture yourself taking a shower. You are the controller. If you turned the hot water valve up by half a turn and the temperature changed by 10 degrees this would be a higher gain process than if the temperature changed only 3 degrees.	*Process Control*
Gain Error	The gain error of a data converter indicates how well the slope of an actual transfer function matches the slope of the ideal transfer function. Gain error is usually expressed in LSB or as a percent of full-scale range. Gain error can be calibrated out with hardware or in software. Gain error is the full-scale error minus the offset error.	*Electrical Engineering*
Gain Margin	The difference in the logarithms of the amplitude ratios at the frequency where the combined phase angle is 180 degrees lag is the GAIN MARGIN.	*Process Control*
Gain Sharing	any method whereby workers participate with management in gains due to increased productivity.	*Industrial Relations*
Gain, Closed Loop	The gain of a closed loop system, expressed as the ration of the output change to the input change at a specified frequency.	*Process Control*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gain, Dynamic	The magnitude ration of the steady-state amplitude of the output sign from an element or system to the amplitude of the input signal to that element or system, for a sinusoidal signal. Note: It may be expressed as a ratio, or in decibels as 20 times the log of that ratio for a specified frequency.	*Process Control*
Gain, Loop	The ratio of the change in the return signal to the change in its corresponding error signal at a specified frequency. Note: The gain of the loop elements is frequently measured by opening the loop, with appropriate terminations. The gain so measured is often called the open loop gain.	*Process Control*
Gain, Proportional	The ratio of the change in output due to proportional control action to the change in input.	*Process Control*
Gain, Static	The value of the gain approached as a limit as frequency approaches zero.	*Process Control*
Gain,	a transverse, channel or cutting made in the sides of a roadway for the insertion of a dam or permanent stopping to prevent any gas escaping or air entering and to retain the dam in a firm position (S. Staffs.).	*Mining*
Gainful Occupation	any work for which a person receives pay or in which the person helps in the production of goods or services.	*Industrial Relations*
Gait,	a journey or a trip. Sometimes used for the distance a man travelled along the waggonway (N. East).	*Mining*
gal	gallon	*Energy*
Galactose (C6H12O6) A monosaccharide	Galactose (C6H12O6) A monosaccharide commonly occurring in milk sugar or lactose. White crystals soluble in water and alcohol, slightly soluble in glycerol.	*Material Process*
Galacturonic acid ($C_6H_{12}O_7$)	A compound found as a major constituent of plant pectine. It exhibits mutarotation, having both an alpha and a beta form. Soluble in water , slightly soluble in hot alcohol, insoluble in ether.	*Material Process*
Galalith	Trade name of a well known casein plastic of foreign make.	*Material Process*
Gale	a royalty, Forest of Dean.	*Mining*
Galee.	the owner of a gale (F. of D.).	*Mining*
Galega	Whole plant of Galega officinalls.	*Material Process*
Galena (galenite, lead glance) (PbS)	Natural lead sulfide. Color lead gray, streak lead gray, luster metallic. Soluble in strong nitric acid, also in excess of hot hydrochloric acid.	*Material Process*
Galena	Lead ore; sulfur and lead	*Mining*
Galex	Trade name for a stable non-oxidizing rosin consisting principally of dehydroabietic acid. Soluble in ordinary organic solvents, paraffin wax, beeswax, carnauba wax, natural and reclaim rubber and many natural and synthetic resins. Uses for rubber based pressure sensitive adhesives and tapes, water insoluble adhesives, extender for natural and synthetic resins, in the manufacture of soldering fluxes, metal salts, greases and lubricants, soaps, etc..	*Material Process*
Galipot gum	A resin similar to Burgundy pitch, obtained from Pinus maritima.	*Material Process*
Gall"	A swelling or outgrowth of tissue induced by a pathogen or insect on a slant. [1] Fin.Swe.	*Forestry*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gallamine triethiodide acid (C6H3 (OCH2CH2N (C2H5)3I)3)	White, fluffy, hygroscopic powder, m.p. 150 °C (302 °F). Freely soluble in water, soluble in alcohol, very slightly soluble in chloroform, insoluble in ether.	*Material Process*
Gallery	A horizontal or a nearly horizontal underground passage, either natural or artificial.	*Mining*
Galliard balls	large ironstone concretions in sandstone, (Yorks.).	*Mining*
Galliard or Calliard	a compact sandstone with splintery fracture. - see Cank; or another name for ganister, (Yorks.).	*Mining*
Gallic acid (C6H2 (OH)3CO2H (H2O))	Colorless or slightly yellow, crystalline needles or prismas. Soluble in alcohol and glycerol, sparingly soluble in water and ether.	*Material Process*
Galling	An action that can occur when unsuitable materials, particularly stainless steels, rub together. It is typified by deep scoring and a build up of material.	*Industrial Engineering*
Galling	A form of wear in which seizing or tearing of the gear or bearing surface occurs.	*Lubrication*
Gallium (Ga)	Silver white metal. Element of atomic number 31. Soluble in acid, alkali and slightly soluble in mercury. Gallium reacts with most metals at high temperatures. It is prepared commercially from bauxite, containing approximately one ounce of galium per ton. Also, prepared commercially from zinc ores.	*Material Process*
Gallium arsenide	A semiconductor material used for optoelectronic products such as LEDs, and for high-speed electronic devices.	*Electrical Engineering*
Gallium arsenide field-effect transistor	GaAsP Gallium Arsenide Phosphide (or, Gallium Arsenic Phosphide): A semiconductor material used for optoelectronics, including LEDs and photodiodes.	*Electrical Engineering*
Gallium arsenide field-effect transistor	**Gallium arsenide field-effect transistor** - GaAsP	*Electrical Engineering*
Gallon	cubic inches) used to measure fuel oil. One barrel equals 42 gallons.	*Energy*
Gallowa	horse or pit pony. (N. East).	*Mining*
Gallows timber	a crown-tree with a prop placed under each end, (N. East).	*Mining*
Gals	another name for pit ponies (?girls).	*Mining*
Galvanic attack	Corrosion behavior caused by the current generated when one metal type is in contact with a different metal type.	*Chemical Engineering*
Galvanic cell	Electrochemical cell in which the corrosion and associated electrical current are due to the contact of two dissimilar metals.	*Material Process*
Galvanic corrosion	Corrosion formed from galvanic attack.	*Chemical Engineering*
Galvanic corrosion	corrosion associated with the current of a galvanic cell consisting of two dissimilar conductors in an electrolyte solution, or two similar conductors in dissimilar electrolytes	*Materials Process*
Galvanic couple	The contact of one metal type with another as seen with a steel bolt in an aluminum sheet or a copper joint on an iron pipe, which allows a differential current to be generated.	*Chemical Engineering*
Galvanic Isolation	Refers to a design technique that separates signal current from AC power distribution introduced stray noise current.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Galvanic protection	Galvanic protection Design configuration in which the structural component to be protected is made to be the cathode and, thereby, protected from corrosion.	*Material Process*
Galvanic protection Design configuration	Galvanic protection Design configuration in which the structural component to be protected is made to be the cathode and, thereby, protected from corrosion.	*Material Process*
Galvanic Series	A list of metals and alloys arranged according to their relative corrosion potentials in a given environment.	*Paint and Coatings*
Galvanic series	Systematic listing of relative corrosion behavior of metal alloys in an aqueous environment, such as seawater.	*Material Process*
Galvanic Series of Metals	a listing of metals and alloys arranged according to their relative electrode potentials in a specified environment; indicates what metal(s) will corrode first when two or more metals are in contact	*Materials Process*
Galvanised	Galvanised (U.S. Galvanized) steel is widely used in steam applications. Galvanisation is the chemical process to keep it from corroding. The steel gets alloyed in layers of zinc, as zinc is a protective metal that will not rust. The zinc does not form a seal around the metal, by through a chemical reaction becomes permanently a part of the material being galvanised. See also Stainless Steel.	*Industrial*
Galvanising	A hot dip process for deposition of zinc for galvanic corrosion protection of steel.	*Paint and Coatings*
Galvanization	Production of a zinc coating on a ferrous alloy for the purpose of corrosion protection.	*Material Process*
Galvanized	Zinc coating for corrosion resistance.	*Wire Rope & Cable*
Galvanized iron (hot-dip process)	Iron coated with zinc by dipping the metal into a bath of molten zinc held at a temperature somewhat above the melting point (810–875°F) (432.22–458.33°C).	*Material Process*
Galvanized Rope	Rope made of galvanized wire.	*Wire Rope & Cable*
Galvanized steel	Steel with a zinc coating for the purpose of corrosion protection.	*Material Process*
Galvanized Strand	Strand made of galvanized wire.	*Wire Rope & Cable*
Galvanized Wire	Wire coated with zinc.	*Wire Rope & Cable*
Galvanizing	The process by which steel is coated with a layer of zinc. The zinc coating provides the steel with greater corrosion resistance.	*Metallurgy*
Galvanizing	the act of coating steel with zinc in order to provide barrier and cathodic protection from corrosion	*Materials Process*
Galvanizing temperature	the temperature at which the molten zinc bath is kept in order to react with the steel; typically, this temperature is between 830 F (443 C) and 850 F (454 C)	*Materials Process*
Galvanometer	An instrument that measures small electrical currents by means of deflecting magnetic coils.	*General Engineering*
Galvene	Brand name of proprietary line of chemical restrainers used in acid pickling of iron, steel, and ferrous alloys.	*Material Process*
Galvoline	Brand name for a proprietary product consisting of a cored magnesium ribbon used as a continuous anode for the cathodic protection of buried pipe lines and other metal structures.	*Material Process*
Galvo-link	Trade mark for a cored, link type magnesium anode used in the cathodic protection of water heater tanks.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Galvomag	Trade mark for magnesium alloy composition for use in anode in cathodic protection.	*Material Process*
Galvopak	Brand name for a proprietary product consisting of magnesium anode packed with back –fill material. Used in the cathodic protection of buried pipe lines and other metal structures.	*Material Process*
Galvorod	Trade mark for a cored magnesium rod used as an anode in the cathodic protection of water heater tanks.	*Material Process*
Gambir (gambier, catechu, pale, tetra japonica)	Dried aqueous extract from the leaves and twigs of an Indian shrub.	*Material Process*
Gamboge (gambogia)	A gum-resin from Garcinia hanburii.	*Material Process*
Gamete	One of two sex cells that unite at fertilization to form a zygote.	*Agriculture*
Gamma	A unit of measurement of magnetic intensity.	*Mining*
Gamma Correction	The application of a function that transforms brightness or luminance values. Gamma functions are usually nonlinear but monotonic and designed to affect the highlights (whitest values), midtones (grayscale), and shadows (dark areas) separately. Most commonly applied to make a light-emitting device, such as a display, match the human eye's brightness curve. In other terms: A gamma correction function can be used to alter the luminance (light intensity) of a display such that its brightness (the human-perceived values) looks correct.	*Electrical Engineering*
Gamma Correction	The application of a function that transforms brightness or luminance values. Gamma functions are usually nonlinear but monotonic and designed to affect the highlights (whitest values), midtones (grayscale), and shadows (dark areas) separately. Most commonly applied to make a light-emitting device, such as a display, match the human eye's brightness curve. In other terms - A gamma correction function can be used to alter the luminance (light intensity) of a display such that its brightness (the human-perceived values) looks correct.	*Electrical Engineering*
Gamma layer	the first layer of zinc-iron alloy growth from the base steel formed during the galvanizing process; the chemical composition of this layer is approximately 75% zinc and 25% iron; the Gamma layer has a DPN of 250, compared to the base steel's DPN of 159	*Materials Process*
Gamma ray	Electromagnetic radiation similar to X-rays except that gamma rays originate in the nucleus of an atom whereas X-rays originate in the extra nuclear structure. Gamma rays usually have higher energies and correspondingly shorter wave lengths than X-rays.	*Material Process*
Gammacide	Brand name for insecticide and fungicide products containing benzene hexachloride.	*Material Process*
Gammexane	Trade mark for benzene hexachloride.	*Material Process*
Gance pitch (manjak)	An asphaltite resembling gilsonite in external appearance but having a decidedly black streak instead of a brown one. It is also has a larger percentage of fixed carbon. The best known glance pitch comes from the Barbadoes, the material found on the surface of the veins being harder, more brittle and of a higher fusing point than that at the lower mine levels. Black in mass, conchoidal to hackly fracture, bright to fairly bright luster, black streak (on porcelain). Soluble in carbon disulfide.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gang	a number of tubs moving together along a haulage road. Also known as a Train, Set or Run.	*Mining*
Gang Boss	a minor supervisor in charge of a small group or gang operation.	*Industrial Relations*
Gang Rider	a miner who rode on or with the trams to act as a guard. A train attendant. - see Gang.	*Mining*
Gangue	The minerals and rock material mined with a metallic ore but valueless in themselves or used only as a by product. They are separated from the ore in the milling and extraction processes. Common gangue materials are quartz, calcite, limonite, feldspar, pyrite, and rock of various kinds.	*Material Process*
Ganister	hard siliceous sandstone seatearth, often with root traces (pencil ganister). (Can be used, crushed, to make fire bricks).	*Mining*
Ganister	A highly refractory siliceous sedimentary rock used for the manufacture of refractory brick. Typical analysis 98.20% SiO2, 0.30% Fe2O3, 0.90% Al2O3, 0.15% CaO, 0.10%MgO.	*Material Process*
Gannen	a bord down which coals where transported in tubs on rails, as opposed to in corves or on runners. (N. East).	*Mining*
Ganney	a small piece of timber. (Som.).	*Mining*
Gannin board	a main roadway. (N. East).	*Mining*
Gannins	coal workings at the end of tunnels. (N. East).	*Mining*
Gantrisin	Trade mark for sulfisoxazole. A soluble sulfonamide drug.	*Material Process*
Gantt Chart	A bar chart of scheduled activities that shows the duration and sequence of activities and resources planned.	*Maintenance*
Gantt Chart	a graphic device which is designed to measure the relatin between actual and anticipated production records.	*Industrial Relations*
Gantt Task and Bonus Plan	an incentive method which incorporates the Halsey Plan, but provides an extra bonus for employees who reach the standard or 100% efficiency.	*Industrial Relations*
GAO	General Accounting Office (US)	*Petro-Chemical Abbreviations*
Garland	a wooden or cast iron curb (gutter) set in the walling of a pit shaft to catch and convey away into a pipe or a lodge any water which runs down the sides of the shaft; or a wooden frame, rectangular in shape, strengthened with iron corner-plates, used for keeping the lumps of coal together on the top of a tram in a mine where heavy loading was practiced. The coals being piled high on the tram.	*Mining*
Garnet	Ferrimagnetic ceramic with a crystal structure similar to that of the natural gem garnet.	*Material Process*
Garnierite (Ni, Mg)6 (OH) 6Si4 O11 H2O)	A natural hydrous nickel-magnesium silicate, occurring as a natural alteration of magnesium silicate rocks. Color apple green, luster dull to earthy.	*Material Process*
Garspar	A mixture of finely ground glass and quartz, produced in the grinding of plate glass.	*Material Process*
Gas	A non-solid, non-liquid combustible energy source that includes natural gas, coke-oven gas, blast-furnace gas, and refinery gas.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gas	One of the three states of mater. A material in the gaseous state is characterized by very low density and viscosity, relatively great expansion and contraction with changes in pressure and temperature. Ability to diffuse readily into other gases and ability to distribute itself readily with almost complete uniformity throughout the whole of any container.	*Material Process*
Gas Tungsten Arc Welding (GTAW)	An arc welding process that employs a tungsten (nonconsumable) electrode. Shielding is obtained from a gas or gas mix-	*Maintenance and Repair*
Gas black (carbon black, channel black, furnace black)	Another name for carbon black, produced from natural gas burned in an insufficient supply of air, used as a pigment.	*Material Process*
Gas cap	methane burning as a blue cone shape on the testing flame of a safety lamp, the height of the cone indicating the percentage of methane present in the mine atmosphere.	*Mining*
Gas Carburizing	See Carburising	*Paint and Coatings*
Gas Chromatagraphs	Gas chromatagraphs are used to analyze the make up of a gas at various points in the process. It has been suggested that neural networks might be used to replace their functions in some circumstances at much lower cost.	*Control Engineering*
Gas coal	coal which yielded large amounts of commercial gas with little sulfur or other impurities.	*Mining*
Gas Condensate Well Gas	Natural gas remaining after the removal of the lease condensate.	*Energy*
Gas cooled fast breeder reactor (GCFB)	A fast breeder reactor that is cooled by a gas (usually helium) under pressure.	*Energy*
Gas drain	a heading driven for the sole purpose of carrying firedamp away from the waste or old workings, or a borehole drilled to drain off firedamp.	*Mining*
Gas Field	A field containing natural gas but no oil.	*Petroleum Drilling*
Gas field	A field containing natural gas but no oil.	*Petroleum Drilling*
Gas Flow Rate	The flow rate of gas (e.g., liters per minute) through the spraying torch.	*Paint and Coatings*
Gas Injection	The process whereby separated associated gas is pumped back into a reservoir for conservation purposes or to maintain reservoir pressure.	*Petroleum Drilling*
Gas injection	The process whereby separated associated gas is pumped back into a reservoir for conservation purposes or to maintain the reservoir pressure.	*Petroleum Drilling*
Gas Metal Arc Welding (GMAW)	An arc welding process that employs a continuous solid filler metal (consumable) electrode. Shielding is obtained entirely from an externally supplied gas or gas mixture 4,8 (Some methods of this process have been called MIG or CO2 welding.)	*Maintenance and Repair*
Gas Nitriding	See Nitriding	*Paint and Coatings*
Gas Nitrocarburizing	See Nitrocarburizing	*Paint and Coatings*
Gas oil	Middle-distillate petroleum fraction with a boiling range of about 350°-750° F, usually includes diesel fuel, kerosene, heating oil, and light fuel oil.	*Petroleum Engineering*
Gas oil	A liquid petroleum distillate with a viscosity and boiling range between kerosene and lubricating oil. The boiling range is about 450–800°F (232.22–436.66°C). Used for absorption oil, cracking in petroleum refineries and in enriching water gas.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gas plant operator	Any firm, including a natural gas processing plant owner, that operates a gas plant and keeps the gas plant records.	*Energy*
Gas pocket	A clearly defined area caused by trapped gas, resulting in a different degree of reflection over the area.	*Material Process*
Gas processing unit	A facility designed to recover natural gas liquids from a stream of natural gas that may or may not have passed through lease separators and/or field separation facilities. Another function of natural gas processing plants is to control the quality of the processed natural gas stream. Cycling plants are considered natural gas processing plants.	*Energy*
Gas to liquids (GTL)	A process that combines the carbon and hydrogen elements in natural gas molecules to make synthetic liquid petroleum products, such as diesel fuel.	*Energy*
Gas Turbine	An engine that uses the energy of expanding gases passing through a multistage turbine to create rotating power.	*Reliability Engineering*
Gas turbine plant	A plant in which the prime mover is a gas turbine. A gas turbine consists typically of an axial-flow air compressor and one or more combustion chambers where liquid or gaseous fuel is burned and the hot gases are passed to the turbine and where the hot gases expand drive the generator and are then used to run the compressor.	*Energy*
Gas Welding	Welding process in which coalescence is produced by heating with a gas flame or flames, with or without the application of pressure and with or without the use of filler metal.4	*Maintenance and Repair*
Gas well	A well completed for production of natural gas from one or more gas zones or reservoirs. Such wells contain no completions for the production of crude oil.	*Energy*
Gas well productivity	Derived annually by dividing gross natural gas withdrawals from gas wells by the number of producing gas wells on December 31 and then dividing the quotient by the number of days in the year.	*Energy*
Gas, Gaseous	The state of matter distinguished from the solid and liquid states by: relatively low density and viscosity; relatively great expansion and contraction with changes in pressure and temperature; the ability to diffuse readily; and the spontaneous tendency to become distributed uniformly throughout any container.	*Industrial*
Gas/Oil Ratio	The volume of gas at atmospheric pressure produced per unit of oil produced.	*Petroleum Drilling*
Gas/oil ratio	The volume of gas at atmospheric pressure produced per unit of oil produced.	*Petroleum Drilling*
Gaseous Fuels	Liquefied or compressed hydrocarbon gases (propane, butane or natural gas), which are finding increasing use in motor vehicles as replacements for gasoline and diesel fuel.	*Lubrication*
Gaseous reduction	A cathodic reaction that can lead to the corrosion of an adjacent metal.	*Material Process*
Gash Vein	A vein wide above and narrow below.	*Mining*
Gasification	A method for converting coal, petroleum, biomass, wastes, or other carbon-containing materials into a gas that can be burned to generate power or processed into chemicals and fuels.	*Energy*
Gasification	Any of various processes by which coal is turned into low, medium, or high Btu gases.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gas-insulated switchgear	**Gas-insulated switchgear** - see Switchgear.	*Electrical*
Gasket	A component softer than the parts to be sealed, which is compressed between two flanges to prevent the system fluid leaking to atmosphere.	*Industrial Engineering*
Gasket	A component whose purpose is to seal a joint between two larger components, softer than the surfaces of the joint being sealed and usually squeezed by means of bolting to affect the seal.	*General Mechanical*
Gasket Kit	A collection of gaskets required to overhaul an engine or part of an engine.	*Mechanical Engineering*
Gasohol	A blend of finished motor gasoline containing alcohol (generally ethanol but sometimes methanol) at a concentration between 5.7 percent and 10 percent by volume. Also see Oxygenates.	*Energy*
Gasoil	European and Asian designation for No. 2 heating oil and No. 2 diesel fuel.	*Energy*
Gasoline	See Motor gasoline (finished).	*Energy*
Gasoline (petrol, motor spirits)	A mixture of volatile hydrocarbons suitable for operation of an internal combustion engine. The major components are usually hydrocarbons with boiling points ranging from 60–200°C (140–392°F). These include straight-chain and branched-chain paraffins, naphthenes, and aromatic hydrocarbons, such as n-heptane, iso-octane, methyl cyclohexane, benzene and toluene. Alcohols and other combustibles are also present in some special gasolines.	*Material Process*
Gasoline alkylate	Gasoline made by alkylation.	*Material Process*
Gasoline Antioxidant No. 22 Di-sec-butyl-para-phenylenediamine containing no solvent	A mobile liquid readily soluble in gasoline in all proportions at room temperature. A using for reducing the of gum in gasoline. Concentration required: 0.001-0.005% by weight.	*Material Process*
Gasoline Antioxidant No. 5	A solution of n-butyl-ara-aminophenol in alcohols having the following weight composition: 50% n-butyl-para-aminophenol, 30% anhydrous isopropanol, 20% anhydrous methanol. the solution is readily soluble in gasoline in normal use concentrations. A using for reducing the formation of gum and precipitation of lead in gasoline. Required concentration 0.002–0.1% by weight.	*Material Process*
Gasoline blending components	Naphthas which will be used for blending or compounding into finished aviation or motor gasoline (e.g., straight-run gasoline, alkylate, reformate, benzene, toluene, and xylene). Excludes oxygenates (alcohols, ethers), butane, and pentanes plus.	*Energy*
Gasoline gas	A mixture of atmospheric air and light hydrocarbons vapor in varied percentages generally above the explosive limit , produced by allowing air to bubble through a volatile gasoline under controlled conditions. This gas was developed to meet the requirements of isolated localities where the quantity of gas required is so small that the installation of the usual form of coal-or water-gas apparatus was not profitable. Typical composition: Illuminants 1.5%, hexane (C6H14) 10.3%, oxygen (O2) 18.5%, nitrogen (N2) 69.7%, candle power varies.	*Material Process*
Gasoline grades	The classification of gasoline by octane ratings. Each type of gasoline (conventional, oxygenated, and reformulated) is classified by three grades - Regular, Midgrade, and Premium. Note: Gasoline sales are reported by grade in accordance with their classification at the time of sale. In general, automotive octane requirements are lower at high altitudes. Therefore, in some areas of the United States, such as the Rocky Mountain States, the octane ratings for the gasoline grades may be 2 or more octane points lower.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gasoline motor, (leaded)	Contains more than 0.05 grams of lead per gallon or more than 0.005 grams of phosphorus per gallon. The actual lead content of any given gallon may vary. Premium and regular grades are included, depending on the octane rating. Includes leaded gasohol. Blendstock is excluded until blending has been completed. Alcohol that is to be used in the blending of gasohol is also excluded.	*Energy*
Gasoline treated as blendstock (GTAB)	Non-certified Foreign Refinery gasoline classified by an importer as blendstock to be either blended or reclassified with respect to reformulated or conventional gasoline. GTAB is classified as either reformulated or conventional quality based on emissions performance, formulation, and intended end use.	*Energy*
Gasoline, casinghead	Gasoline, casinghead See gasoline natural.	*Material Process*
Gasoline, cracked	Gasoline produced by the thermal and /or catalytic decomposition of high boiling components of petroleum. In general such gasolines have higher octane ratings than gasoline produced by fractional distillation of petroleum. The difference is due to the prevalence of unsaturated, aromatic and branched-chain hydrocarbons in the cracked gasoline. The actual properties vary widely with the nature of the starting material, and the temperature, time, pressure and catalyst used in cracking process.	*Material Process*
Gasoline, ethyl	Gasoline, ethyl See gasoline leaded.	*Material Process*
Gasoline, leaded (gasoline, ethyl)	Gasoline to which tetraethyl lead has been added to increase its antiknock properties.	*Material Process*
Gasoline, natural (gasoline, casinghead)	A volatile gasoline obtained by recovering the butane, pentane, and hexane hydrocarbons present in small proportion in certain natural gases. It is used in blending to produce a finished gasoline with adjusted volatility.	*Material Process*
Gasoline, polymer	A gasoline produced by polymerization of low molecular weight hydrocarbons such as ethylene, propene, and butenes. It is used in small amounts for blending with other gasolines to improve their octane number.	*Material Process*
Gasoline, reformed	A high octane gasoline obtained from low octane gasoline by heating the vapors to a high temperature or by passing the vapors through a suitable catalyst.	*Material Process*
Gasoline, straight run	Gasoline produced	*Material Process*
Gasoline/Ethanol Blend	A spark-ignition automotive engine fuel containing denatured fuel ethanol in a base gasoline. It may be leaded or unleaded.	*Lubrication*
Gastex	Trade mark for semi reinforcing furnace carbon blacks for use in rubber.	*Material Process*
Gas-Turbine Electric Power Plant	A plant in which the prime mover is a gas turbine. A gas turbine typically consists of an axial-flow air compressor and one or more combustion chambers where liquid or gaseous fuel is burned. The hot gases expand to drive the generator and then are used to run the compressor.	*Energy*
GATC	gross additive treat cost	*Petro-Chemical Abbreviations*
Gate	A device or structure by means of which the flow of may be stopped or regulated. Also, a section of conveyor equipped with a hinged mechanism for movable service often called a hinged section.	*Equipment*
Gate	The closure element of a gate valve (sometimes called wedge or disc).	*Mechanical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gate station	Location where the pressure of natural gas being transferred from the transmission system to the distribution system is lowered for transport through small diameter, low pressure pipelines.	*Energy*
gate valve	a valve regulated by the position of a circular plate.	*Chemical*
Gate valve	A straight through pattern valve in which closure element is a wedge situated between two fixed seating surfaces, with means to move it in or out of the flow stream in a direction perpendicular to the pipeline axis. Used as a block valve, or on-off valve.	*General Mechanical*
Gate-end box	the electrical supply point (panel) at the intake end of the face which supplies the electrical power to the shearer by means of a trailing cable.	*Mining*
Gate-end loader	Gate-end loader, - see Stage loader.	*Mining*
Gatehouse	A house or structure at the gate of a dam, reservoir, etc., with equipment or controls for regulating the flow of water.	*Civil Engineering*
Gateside pack	a pack built to support the gate road.	*Mining*
Gather	to drive a heading through broken or faulty ground to reach the coal on the other side. (Derbys.).	*Mining*
Gatherer	A company primarily engaged in the gathering of natural gas from well or field lines for delivery, for a fee, to a natural gas processing plant or central point. Gathering companies may also provide compression, dehydration, and/or treating services.	*Energy*
Gathering conveyor; gathering belt	Any conveyor which is used to gather coal from other conveyors and deliver it either into mine cars or onto another conveyor. The term is frequently used with belt conveyors placed in entries where a number of room conveyors deliver coal onto the belt.	*Mining*
Gathering system	The pipelines and other infrastructure that move raw gas from the wellhead to processing and transmission facilities.	*Petroleum Engineering*
Gatterman–Koch reaction	The formation of aromatic aldehydes from phenols by the use of anhydrous hydrogen cyanide, dry hydrogen chloride, and an aluminum chloride or zinc	*Material Process*
Gauge	A pre-calibrated device for determining the relative size or shape of an object compared to a standard (such as a Drift). A device to measure pressure of a pressure containing system.	*Petroleum Engineering*
Gauge door	a door fitted in a roadway in the mine with a sliding section, which acts as a shutter. The shutter was used to regulate the flow of air along the roadway. - see also Ventilation regulator.	*Mining*
Gauge, Pressure	An instrument, usually with a threaded connection, for measuring and indicating the pressure in a piping system at the point at which it is connected.	*Mechanical*
Gaussian error function	Mathematical function based on the integration of the bell-shaped curve. It appears in the solution to many diffusion related problems.	*Material Process*
Gaussian curve, Normal curve, Normal distribution	Refers to a symmetrical bell-shaped distribution whose shape is given by a specific equation (called the normal equation) in which the mean and standard deviation are variables. It is commonly assumed that the random error of an analytical method fits the Gaussian distribution and therefore can be characterized by calculating the standard deviation. The standard deviation is not a valid statistic if a distribution is not Gaussian.	*Quality*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gaussian distribution	see Normal distribution	*Reliability Engineering*
Gaussian frequency-shift keying	A type of FSK modulation which uses a Gaussian filter to shape the pulses before they are modulated. This reduces the spectral bandwidth and out-of-band spectrum, to meet adjacent-channel power rejection requirements.	*Electrical Engineering*
Gaussian minimum shift keying	GMSK is a form of frequency shift keying (FSK) used in GSM systems. The tone frequencies are separated by exactly half the bit rate. It has high spectral efficiency.	*Electrical Engineering*
Gautten	a Scots term for a ditch or gutter cut in the floor of the roadway to allow water to be drained away. Also pronounced 'gatton'. (Scot.). They were also known as a 'Grip' in S. Derbys., a 'Culvert' in Coventry and a 'Sough' in Lancs.	*Mining*
Gaveller	the Crown Agent or Gale Giver, who granted gales to the Free Miners of the Forest of Dean.	*Mining*
Gavelock	an iron bar, used as a lever. (N. East). - see also Gablock.	*Mining*
Gawl	an unevenness in the coal wall or face. (Lancs.).	*Mining*
Gay-Lussac acid	The sulfuric acid-nitrogen oxides mixture which is the product of the Gay-Lussac power in the chamber process for manufacture of sulfuric acid.	*Material Process*
Gaylussite (Na2Ca(CO3)2 5H2O)	Natural hydrated carbonate of sodium and calcium, found in dry lakes. Colorless to yellowish white, luster vitreous.	*Material Process*
Gazogene	A combustible gas mixture made by passing a limited quantity of air over charcoal, developed as a substitute for gasoline.	*Material Process*
Gbion	A metal cylinder filled with stones and sunk in water, used in laying the foundations of a dam or jetty.	*Civil Engineering*
GDI	Gasoline Direct Injection - a gasoline engine design that utilizes fuel injection directly into the combustion chamber.	*Mechanical, Process, and Operations*
GDP	Gross Domestic Product	*Petro-Chemical Abbreviations*
GDTC	gross delivered treating cost	*Petro-Chemical Abbreviations*
Gear	A machine part which transmits motion and force by means of successively engaging projections, called teeth. The smaller gear of a pair is called the pinion; the larger, the gear. When the pinion is on the driving shaft, the gear set acts as a speed reducer; when the gear drives, the set acts as a speed multiplier. The basic gear type is the spur gear, or straight-tooth gear, with teethe cut parallel to the gear axis. Spur gears transmit power in applications utilizing parallel shafts. In this type of gear, the teeth mesh along their full length, creating a sudden shift in load from one tooth to the next, with consequent noise and vibration. This problem is overcome by the helical gear, which has teeth cut at an angle to the center of rotation, so that the load is transferred progressively along the length of the tooth from one edge of the gear to the other. When the shafts are not parallel, the most common gear type used is the bevel gear, with teeth cut on a sloping gear face, rather than parallel to the shaft. The spiral bevel gear has teeth cut at an angle to the plane of rotation, which, like the helical gear, reduces vibration and noise. A hypoid gear resembles a spiral bevel gear, except that the	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	pinion is offset so that its axis does not intersect the gear axis; it is widely used in automobiles between the engine driveshaft and the rear axle. Offset of the axes of hypoid gears introduces additional sliding between the teeth, which, when combined with high loads, requires a high-quality EP oil. A worm gear consists of a spirally grooved screw moving against a tooth wheel; in this type of gear, where the load is transmitted across sliding, rather than rolling surfaces, compounded oils or EP oils are usually necessary to maintain effective lubrication.	
Gear Oil	A high-quality oil with good oxidation stability, load-carrying capacity, rust protection, and resistance to foaming, for service in gear housings and enclosed chain drives. Specially formulated industrial EP gear oils are used where highly loaded gear sets or excessive sliding action (as in worm gears) is encountered.	*Lubrication*
Gear reducer	A reduction gear, commonly used on fan drivers to reduce driver speed to fan speed requirements. Also known as Speed Reducer.	*Facility Engineering*
Gearbox (gear housing)	A casing for gear sets that transmit power from one rotating shaft to another. A gear box has a number of functions: it is precisely bored to control gear and shaft alignment, it contains the gear oil, and it protects the gears and lubricant from water, dust, and other environmental contaminants. Gear boxes are used in a wide range of industrial, automotive, and home machinery. Not all gears are enclosed in gear boxes; some are open to the environment and are commonly lubricated by highly adhesive greases.	*Lubrication*
Gearbox	The transmission attached to the rear of the engine. Open wheeled cars have "sequential" shift patterns, which is more like a motorcycle gear change than the traditional "H" pattern on most street cars.	*NASCAR*
Gearhead	the drive unit of a conveyor.	*Mining*
Gearless mill drive (GMD)	a system consisting of a ringmotor and its associated equipment such as transformers and control systems. Its main application is to drive (rotate) mills in the minerals or cement industry.	*Electrical*
Gearmesh frequency	A potential vibration frequency on any machine employing gears. Multiply the number of teeth on a gear times its RPM, then divide by 60	*Reliability Engineering*
Gearmotor	A motor and speed reducer combination where the two units are flanged for connection to each other and have one output shaft; or where the two units are closely coupled with the motor resting on a base which is an integral part of the speed re	*Equipment*
Gears	heavy wooden props. Two uprights and a crown piece being a set of gears or a pair of gears, used to support the roof. (Scot).	*Mining*
Gedanite	A resin resembling rosin, not containing succinic acid. Found on this shores of the Baltic.	*Material Process*
Gees	a mixture of alternate hard and soft layers of coal with smut partings.	*Mining*
Geiger counter	An instrument used in the search for radioactive minerals, particularly uranium, as it is capable of detecting (by means of a Geiger Mueller tube) the rays emanating from such minerals. It registers the frequency or intensity of these rays either visually (by dial or flashing light), audibly (by earphones) or both.	*Mining*
Gel	The name given to any gelatinous solid mass produced from a solution of a colloid body, opposed to sol.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
GEL	A colloidal solution in which the intermingling of internal and external phases results in a system viscosity greater than the viscosity of the external phase alone, i.e., a jelly-like substance.	*Mechanical, Process, and Operations*
Gel Layer	Thin layer of retained molecules that forms on a membrane surface during filtration.	*Contamination Control*
Gel paint (thixotropic paint)	A paint formulation which has a semi-solid or gel consistency when undisturbed but which flows readily under the brush or when stirred or shaken. After removal of the stress, it becomes stiff again and has little tendency to spill, drip, or run. The thixotropic quality is obtained by the carefully controlled reaction of a relatively small proportion of a polyamide resin with an alkyd resin vehicle.	*Material Process*
Gel Strength	The minimum shearing stresses that will produce permanent deformation of a colloidal suspension.	*Petroleum Engineering*
Gelamite	Trade mark for a semigelatin high explosive of relatively high weight strength of 65% very good water resistance.	*Material Process*
Gelatin	A protein obtained by boiling skin, ligaments, tendons, bones, etc. with water. Its production differs from that of glue in that the raw materials are selected, cleaned and treated with special care so that the resulting product is cleaner, purer and generally clearer and lighter in color than glue. Colorless or slightly yellow powder.	*Material Process*
Gelatin, explosive	A powerful explosive formed by mixing collodion cotton with about nine times its weight of nitroglycerin, the product being a galatinized mass. It is less sensitive to shock and friction than ordinary dynamics and at one time was largely used. High explosive.	*Material Process*
Gelation	Formation of a gel.	*Material Process*
Gelbvieh	A breed of beef cattle that originated in Baveria , Germany. It is red. Registration is with the American Gelbvieh Association	*Agriculture*
gelding	A castrated male horse.	*Agriculture*
Gelex	Trade mark for semi-gelatin dynamite shaving plasticity and water resistance ratings between the ammonia dynamites and special gelatins. Have a very good fume rating. It is used in mining metallic ores, gypsum, limestone, in quarry medium hard rock, and in construction working.	*Material Process*
Gelfoam	Trade mark for an absorbable surgical sponge.	*Material Process*
Gelloid	Trade mark for a line of purified extracts of various types of Irish moss seaweed which are rich in mucilaginous content. The gel producing ingredient is known as calcium carragheen sulfate. Products of varying gel strength and solubility are prepared by a specialized extraction and filtration procedure with subsequent solvent treatment to give dry, odorless, non-toxic, edible powders used in extensive food and pharmaceutical applications, as stabilizers, emulsifiers, moisture retentive agents, and emollient bases.	*Material Process*
Gelobel	Trade mark for gelatin type permissible explosives, high density and high water resistance ratings.	*Material Process*
Gelsemine (C20H22O2N2)	White crystals, poisonous, soluble in alcohol, ether, and dilute acids.	*Material Process*
Gelsemium (yellow jasmin, wild woodbine)	Yellow masses, chief constituents gelsemine, gelseminine and gelsemic acid.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gelva	Trade mark for vinyl acetate polymers. Available in a variety of aqueous emulsions, as solids or in organic solution. Gelva emulsions generally contain 55% solids with emulsion viscosities unusually stable. They are used as adhesives, binders, coatings, paints, permanent starches, and in textile and paper finishing. They are readily compatible with many plasticizers, small amounts of solvents, other resins and extenders. Solid Gelva polyvinyl acetate is available in several grades. Major uses are as hot melt adhesives, as a chewing gum base, and general coating purposes.	*Material Process*
Gelva C-3 Emulsion	A 55% solids emulsion of an alkali soluble copolymer of vinyl acetate. It is used for adhesives, textile sizes and finishes, paints, floor polishes, leather finishes, paper, coatings, etc.	*Material Process*
Gelva C-3-V-10, C-3-V-20, C-3-V-30	Gelva C-3-V-10, C-3-V-20, C-3-V-30 Alkali soluble copolymers, and Gelva C-5-V-10 a copolymer with greater alkali solubility, are used in the adhesive and coating field being especially valuable in paper coating and book binding where recovery of paper scrap is desirable.	*Material Process*
Gelva Emulsion S 55	A heterogeneous mixture of particle sizes, possessing exceptional quick tack as an adhesive and used as an all purpose emulsion having outstanding mechanical stability.	*Material Process*
Gelvatol	Trade mark for polyvinyl alcohol resins. Compatible with many natural and synthetic resins and used for adhesives, textile sizing, paper coating, emulsifying agents and to form gas proof films having excellent tensile strength. These resins are all water soluble and resistant to most organic solvents.	*Material Process*
Gem	Prefix used in organic chemistry, which is an abbreviation of geminate, meaning two identical groups attached to the same carbon atom.	*Material Process*
Geminate	Geminate See gem.	*Material Process*
Gene	the DNA code in the cells of all living things; they determine physical characteristics such as fur color	*Agriculture*
gene -	A sequence of DNA that is related to a particular trait.	*Agriculture*
General Electric Case	on December 14, 1964, the NLRB handed down its decision in one of the most bitterly litigated cases in the Board's history.	*Industrial Relations*
General Electric X-Ray Rule	departing from the precedent, the NLRB in 1946 decided that "a mere naked assertion" of majority representation by a union did not have the same standing as a formal petition for certification.	*Industrial Relations*
General Labor Union	a term generally applied to an organization of workers which accepts into membership all those desirous of joining.	*Industrial Relations*
General Log-Linear Model	This is an accelerated life testing model that can account for multiple non-thermal stresses as acceleration factors.	*Reliability Engineering*
General Packet Radio Service	A radio technology for GSM networks that adds packet-switching protocols and shorter set-up time for ISP connections; it offers the possibility to charge by amount of data sent rather than connect time.	*Electrical Engineering*
General purpose coals	coals that were graded other than high-quality steam or coking coal	*Mining*
General Purpose I/O	A flexible parallel interface that allows a variety of custom connections.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
General Purpose Interface Bus	A standard bus for controlling electronic instruments with a computer. Also called IEEE-488 bus because it is defined by ANSI/IEEE Standards 488-1978, and 488.2-1987. Also called HP-IB, a trademarked term of Hewlett-Packard, which invented the protocol.	*Electrical Engineering*
General Strike	the concerted and sympathetic refusal of workers throughout an entire geographic or political area to perform their normal services or activities.	*Industrial Relations*
General Wage Increase	a wage adjustment given at one time to all or a significant group of the workers in a plant, company, or industry.	*Industrial Relations*
General yielding	The slow failure of a material due to plastic deformation occurring at the yield strength.	*Material Process*
Generalised Gamma Distribution	It is a kind of distribution which s normally not often used by itself to model life data and is not as frequently used as other distributions. This distribution has the ability to mimic the attributes of other distributions such as Weibull or log-normal, based on the values of the distribution's parameters. It helps in making a choice about which type of distribution to use to model a particular set of data since it can behave like any of them.	*Reliability Engineering*
Generalized gamma distribution	While not as frequently used for modeling life data as other life distributions, the generalized gamma distribution does have the ability to mimic the attributes of other distributions such as the Weibull or lognormal, based on the values of the distribution's parameters. While the generalized gamma distribution is not often used to model life data by itself, its ability to behave like other more commonly-used life distributions is sometimes used to determine which of those life distributions should be used to model a particular set of data.	*Reliability Engineering*
Generally accepted accounting principles (GAAP)	Defined by the FASB as the conventions, rules, and procedures necessary to define accepted accounting practice at a particular time, includes both broad guidelines and relatively detailed practices and procedures.	*Energy*
Generated Contaminant	Caused by a deterioration of critical wetted surfaces and materials or by a breakdown of the fluid itself.	*Oil Analysis*
Generating facility	An existing or planned location or site at which electricity is or will be produced.	*Energy*
Generating station	A station that consists of electric generators and auxiliary equipment for converting mechanical, chemical, or nuclear energy into electric energy.	*Energy*
Generating Station (Generating Plant or Power Plan	The location of prime movers, electric generators, and auxiliary equipment used for converting mechanical, chemical, and nuclear energy into electric energy.	*Energy*
Generating Unit	Combination of connected prime movers that produce electric power.	*Energy*
Generation	The process of producing electric energy by transforming other forms of energy; also, the amount of electric energy produced, expressed in kilowatt hours.	*Energy*
Generation (Electricity)	Process of producing electric energy by transforming other forms of energy.	*Energy*
Generation Charges	Part of the basic service charges on every customer's bill for producing electricity. Generation service is competitively priced and is not regulated by Public Utility Commissions. This charge depends on the terms of service between the customer and the supplier.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Generation company	An entity that owns or operates generating plants. The generation company may own the generation plants or interact with the short-term market on behalf of plant owners.	*Energy*
Generation Company (Genco)	A regulated or non-regulated entity (depending upon the industry structure) that operates and maintains existing generating plants. The Genco may own the generation plants or interact with the short term market on behalf of plant owners. In the context of restructuring the market for electricity, Genco is sometimes used to describe a specialized "marketer" for the generating plants formerly owned by a vertically-integrated utility.	*Energy*
Generation Dispatch and Control	Aggregation and dispatching (sending off to some location) generation from various generating facilities, providing backup and reliability services.	*Energy*
Generation mix	The generation mix is a term used to describe the contribution various sources of electricity make to the power supply serving a particular region or population. The portion of renewable energy in the global generation mix is rising in response to concern over climate change and increasing demand for electrical power.	*Electrical*
Generation	The successive developmental stages from reproduction to reproduction, e.g., egg, larva, pupa, adult.	*Forestry*
Generator	Machine used to convert mechanical energy into electrical energy.	*Energy*
Generator	A device that converts rotating mechanical movement into electric power. The current generated can be either alternating (AC) or direct (DC). ABB manufactures a range of generators, including wind-turbine generators. In a simple AC generator, a loop of wire is placed between the poles of a permanent magnet. The magnet is then rotated and the electromotive force produced by the movement of the electric field causes a current to flow in the wire. This is the principle of the synchronous motor and big generators in power plants. A DC generator operates on the same principle as the AC generator, but includes a device (a commutator), which effectively prevents the current from alternating.	*Electrical*
Generator capacity	The maximum output, commonly expressed in megawatts (MW), that generating equipment can supply to system load, adjusted for ambient conditions.	*Energy*
Generator nameplate capacity (installed)	The maximum rated output of a generator, prime mover, or other electric power production equipment under specific conditions designated by the manufacturer. Installed generator nameplate capacity is commonly expressed in megawatts (MW) and is usually indicated on a nameplate physically attached to the generator.	*Energy*
Genetic Algorithms (Gas)	These are routines which are capable of self adaption. As with neural networks, they are based on an analogy with nature; in this case the best algorithms breed with each other to provide new variants in a "survival of the fittest". As yet this cutting edge technology is not widely used in process control.	*Control Engineering*
Genetic engineering	Human-directed alteration of genetic code through any of a variety of biotechnical means.	*Agriculture*
Genetically Modified Organism (GMO)	an organism that has been altered genetically, typically through the transfer of DNA from another organism. Alterations result in the expression of new characteristics not naturally belonging to that organism. Genetic modification is currently allowed in conventional agriculture in the United States. (also Genetic Engineering)	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Genin	The steroid portion which is linked to a sugar residue in certain glycosides. Important genins are found in the digitalis glycosides which are used in medicine as hearth stimulants.	*Material Process*
General Counsel	under the Taft-Hartley Act, the legal officer of the NLRB who has the responsibility to issue complaints in cases involving unfair labor practices under the Act.	*Industrial Relations*
Gentex	Brand name of line of water dispersed organic pigment dye stuff. It is used for the printing of textiles.	*Material Process*
Gentex Supra	Proprietary name for pigments for textile printing.	*Material Process*
Gentisic acid (C6H3 (OH)2COOH) Crystals, m.p. 199-200 °C (°F)	soluble in water, alcohol, and ether, insoluble in carbon disulfide, chloroform, and benzene.	*Material Process*
Gentlemen's Agreement	an agreement or understanding based solely on the good will and word of the parties involved.	*Industrial Relations*
GEO	natural gas engine oil	*Petro-Chemical Abbreviations*
Geochemistry	The study of the chemical properties of rocks.	*Mining*
Geocronite (Pb5(Sb,As) 2 S8)	Light lead gray mineral, luster metallic, hardness 2.5.	*Material Process*
Geode	A cavity studded around with crystals or mineral matter, a rounded stone containing such a cavity.	*Mining*
Geographic Information Systems (GIS)	A computer system capable of assembling, storing, manipulating, and displaying geographically referenced information	*Petroleum Drilling*
Geographic Information Systems (GIS)	A computer system capable of assembling, storing, manipulating, and displaying geographically referenced information.	*Petroleum Drilling*
Geographic Wage Differentials	variations in wages paid for similar work by companies located in different sections of the country.	*Industrial Relations*
Geographical Mobility	a measure of the movement of workers in a particular labor market area.	*Industrial Relations*
Geologic assurance	State of sureness, confidence, or certainty of the existence of a quantity of resources based on the distance from points where coal is measured or sampled and on the abundance and quality of geologic data as related to thickness of over burden, rank, quality, thickness of coal, areal extent, geologic history, structure, and correlations of coal beds and enclosing rocks. The degree of assurance increases as the nearness to points of control, abundance, and quality of geologic data increases.	*Energy*
Geologic considerations	Conditions in the coal deposit or in the rocks in which it occurs that may complicate or preclude mining. Geologic considerations are evaluated in the context of the current state of technology and regulations, so the impact on mining may change with time.	*Energy*
Geologic sequestration	A type of engineered sequestration, where captured carbon dioxide is injected for permanent storage into underground geologic reservoirs, such as oil and natural gas fields, saline aquifers, or abandoned coal mines.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Geological and geophysical (G) costs	Costs incurred in making geological and geophysical studies, including, but not limited to, costs incurred for salaries, equipment, obtaining rights of access, and supplies for scouts, geologists, and geophysical crews.	*Energy*
Geological Log	A detailed description of all underground features discovered during the drilling of a well, including types of formations encountered and their physical characteristics.	*Petroleum Engineering*
Geological repository	A mined facility for disposal of radioactive waste that uses waste packages and the natural geology as barriers to provide waste isolation.	*Energy*
Geologist	One who studies the constitution, structure, and history of the earth's crust, conducting research into the formation and dissolution of rock layers, analyzing fossil and mineral content of layers, and endeavoring to fix historical sequence of development by relating characteristics to known geological influences (historical geology).	*Mining*
Geology	The science or study of rocks in the earth.	*Mining*
Geology	The science concerned with the study of the rocks which compose the earth.	*Mining*
Geometric isomerism	The existence of isomeric forms of a compound because of symmetry or lack of symmetry about the double bond in the molecule of an organic compound.	*Material Process*
Geometry, Spherical	The plane geometry on the surface of a sphere. In a plane geometry, the basic concepts are points and lines. In spherical geometry, points are defined in the usual way, but lines are defined such that the shortest distance between two points lies along them. Therefore, lines in spherical geometry are great circles. A great circle is the largest circle that can be drawn on a sphere. The longitude lines and the equator are great circles of the Earth. Latitude lines, except for the equator, are not great circles. Great circles are lines that divide a sphere into two equal hemispheres. Spherical geometry is used by pilots and ship captains as they navigate around the globe. Working in spherical geometry has some non-intuitive results. For example, did you know that the shortest flying distance from Florida to the Philippine Islands is a path across Alaska? The Philippines are south of Florida - why is flying north to Alaska a short-cut? The answer is that Florida, Alaska, and the Philippines are collinear locations in spherical geometry (they lie on a great circle). Another odd property of spherical geometry is that the sum of the angles of a triangle is always greater than 180°. Small triangles, like those drawn on a football field, have very, very close to 180°. Big triangles, however, (like the triangle with veracities: New York, L.A. and Tampa) have significantly more than 180°.	*Mathematical*
Geometry, Euclidean	The geometry with which we are most familiar is called Euclidean geometry. Euclidean geometry was named after Euclid, a Greek mathematician who lived in 300 BC. His book, called "The Elements", is a collection of axioms, theorems and proofs about squares, circles acute angles, isosceles triangles, and other such things. Most of the theorems which are taught in high schools today can be found in Euclid's 2000 year old book. Euclidean geometry is of great practical value. It has been used by the ancient Greeks through modern society to design buildings, predict the location of moving objects and survey land.	*Mathematical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Geometry, Hyperbolic	The geometry of which the Non-Euclid software is a model. Hyperbolic geometry is a "curved" space, and plays an important role in Einstein's General theory of Relativity. Hyperbolic geometry is also has many applications within the field of Topology. Hyperbolic geometry shares many proofs and theorems with Euclidean geometry, and provides a novel and beautiful prospective from which to view those theorems. Hyperbolic geometry also has many differences from Euclidean geometry. The following sections discuss and explore hyperbolic geometry in some detail.	*Mathematical*
Geometry, Non-Euclidean	The geometry that is different from Euclidean geometry. Each Non-Euclidean geometry is a consistent system of definitions, assumptions, and proofs that describe such objects as points, lines and planes. The two most common non-Euclidean geometries are spherical geometry and hyperbolic geometry. The essential difference between Euclidean geometry and these two non-Euclidean geometries is the nature of parallel lines: In Euclidean geometry, given a point and a line, there is exactly one line through the point that is in the same plane as the given line and never intersects it. In spherical geometry there are no such lines. In hyperbolic geometry there are at least two distinct lines that pass through the point and are parallel to (in the same plane as and do not intersect) the given line.	*Mathematical*
Geon	Lactice Water dispersions of polyvinyl chloride resins. Unplasticized, plasticized, and internally plasticized forms available. Total solids approximately 50%, pH ranges from 6-9. Properties of value include low moisture vapor transmission, low gas permeability, resistance to flame and many chemicals. Decorative, washable, and wear resistant coatings for paper and fabric.	*Material Process*
Geon	General Purpose Resins General purpose thermoplastic resins for calendaring, coating, extrusion, and injection molding. They are characterized by thermal and light stability, toughness, chemical inertness, resistance to water and flame, and electrical insulation properties.	*Material Process*
Geon Plastics for Extrusion and Injection Molding	Completely compounded vinyl plastics with a selective degree of hardness, gloss, chemical resistance, weathering ability, flexibility at low temperatures, nontoxicity, abrasion resistance and flame resistance.	*Material Process*
Geon Resins and Compounds for Rigid Applications	Resistant to chemicals, water, flame, and abrasion. Designed for compounding without plasticizer to provide desired rigidity and strength. The properties of tensile strength impact resistance, flexibility, and chemical and electrical resistance vary from resin to resin, so compounding to various specifications is possible. Formulated rigid compounds are widely used for extrusion and molding.	*Material Process*
Geon Polyblend	A colloidal blend of nitrile rubber and polyvinyl chloride in which the rubber is used as the plasticizer. The nitrile plasticizer is nonmigrating, nonextractable, and nonvolatile. Polyblend can be used as a thermoplastic vinyl, as a vulcanizate, or to modify conventional vinyls and rubbers.	*Material Process*
Geon Solution Resins	Designated for high solids solutions, these high molecular weight polymers and copolymers are soluble in ketone systems and meet requirements for a wide range of application specifications in the coating industries. A modified vinyl-vinylidene chloride copolymer is specifically designed for direct solubility in toluene, xylene, hydrocarbons, and aromatic naphthas. They form coatings that have good adhesion to tin, aluminum, steel, fabric, paper, and other cellulosic materials. Coatings may be sprayed, brushed, or rolled. water and fire resistant fabrics, paint and lacquer formulations.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Geophysical exploration	The study of the physics of the Earth, especially its electrical, gravitational and magnetic fields and propagation of elastic (seismic) waves within it. Geophysical data are used by exploration and development personnel to make predictions about the presence, nature and size of subsurface hydrocarbon accumulations.	*Petroleum Engineering*
Geophysical survey	A scientific method of prospecting that measures the physical properties of rock formations. Common properties investigated include magnetism, specific gravity, electrical conductivity and radioactivity.	*Mining*
Geophysics	The study of the physical properties of rocks and minerals.	*Mining*
Geopressured	A type of geothermal resource occurring in deep basins in which the fluid is under very high pressure.	*Energy*
Geordy	safety-lamp invented by George Stephenson.	*Mining*
Geotextile	A synthetic material placed beneath road fill and used to confine the road aggregate and to distribute the weight of the load.	*Forestry*
Geothermal energy	Hot water or steam extracted from geothermal reservoirs in the earth's crust. Water or steam extracted from geothermal reservoirs can be used for geothermal heat pumps, water heating, or electricity generation.	*Energy*
Geothermal plant	A plant in which the prime mover is a steam turbine. The turbine is driven either by steam produced from hot water or by natural steam that derives its energy from heat found in rock.	*Energy*
Geothermal Power	The natural heat of the Earth that is conducted or convected to the Earth's surface through volcanoes and hot springs. By harnessing this energy and using it to power steam turbines, we can convert geothermal energy into electricity that we can use.	*Energy*
Geothermal	An electric generating station in which steam tapped from the earth drives a turbine-generator, generating electricity.	*Energy*
German Energy Savings Directive (EnEV)	The German Energy Savings Directive (EnEV) came into force in February 2002 and defines minimum standards for the insulation and the quality of the heating system of new and existing residential buildings. The aim of the Directive is to reduce the primary energy demand for space heating and the hot water preparation.	*Thermal Management*
Germans	Germans, -see Straw fuse.	*Mining*
Germicide	Any substance that kills germs. A disinfectant.	*Chemistry*
Germination	The process within a seed that leads to visible penetration of the seed coat by the radicle. It begins with water uptake and involves formation and activation of enzymes that convert starch, fats and protein in the endosperm and/or cotyledons into smaller chemical components that are transported to sites of embryo growth.	*Agriculture*
Geronimo Line	An escape line that provides a rapid escape path for the Derrickman if needed due to well conditions or mechanical failure.	*Petroleum Drilling*
Get or Getting	the mining or extraction of coal from the seam prior to loading.	*Mining*
Getter	one who works out the coal.	*Mining*
Gettering	A process used to capture oxygen and remove it from a region of silicon wafer where device circuitry is developed.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Geyes	inferior cannel coal, also known as Jacks, Rattlejacks, Jay, Jays, Jay coal or Johnnies.	*Mining*
Geyser	A special type of thermal spring that periodically ejects water with great force.	*Energy*
GF-2/3	passenger car motor oil classifications (ILSAC) prior to 2004	*Petro-Chemical Abbreviations*
GF-4	passenger car motor oil classification (ILSAC) from 2004 through Sept 30, 2011	*Petro-Chemical Abbreviations*
GF-5	passenger car motor oil classification (ILSAC) first licensed Oct 1, 2010	*Petro-Chemical Abbreviations*
GFC	Groupement Français de Coordination	*Petro-Chemical Abbreviations*
GGBF	Ground granulated blast furnace slag. A by-product of iron blast furnaces. The slag is ground into granules finer than Portland cement and can be used as an ingredient in concrete.	*Environmental Engineering*
Ghent Plan	a system, inaugurated by the city of Ghent in 1900-1901, designed to encourage private voluntary organizations to extend or establish systems of unemployment benefit payments to their members.	*Industrial Relations*
GHG	greenhouse gas	*Petro-Chemical Abbreviations*
Ghost Town	a term applied to a community once active and prosperous, but which has become depopulated.	*Industrial Relations*
Gibbs phase rule	General relationship between microstructure and state variable.	*Material Process*
Gibs	another word for 'sprags', i.e. holing props.	*Mining*
Gig or Ginny	gravity or self-acting haulage, or a winding engine. (Scot.).	*Mining*
Giga	One billion	*Energy*
Gigabit Interface Converter	A removable transceiver module permitting Fibre-Channel and Gigabit-Ethernet physical-layer transport.	*Electrical Engineering*
Gigawatt	This is a unit of electric power equal to one billion watts, or one thousand megawatts - enough power to supply the needs of a medium-sized city.	*Energy*
Gigawatt (GW)	One billion watts or one thousand megawatts.	*Energy*
Gigawatt hour (GWh)	One billion watt hours.	*Energy*
Gigawatt-electric (GWe)	One billion watts of electric capacity.	*Energy*
Gigawatt hour (GWh)	One billion watt hours.	*Energy*
Gild (Guild) System	a system of manufacturing prior to the industrial revolution in Europe, in which the master craftsmen organized in a tightly knit organization called the "gild", regulated by trade.	*Industrial Relations*
Gilsonite	Trademark name for uintaite (or uintahite), a black, brilliantly lustrous natural variety of asphalt found in parts of Utah and western Colorado.	*Energy*
Gin	an old form of hoisting apparatus, usually powered by a horse. –see Cog and rung gin and Horse whim.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ginger (zingiber)	Irregularly branched pieces, aromatic odor, aromatic burning taste. Ginger oil (volatile), a resin and gingerol. It is using in medicine, confectionery, condiment and soft drinks.	*Material Process*
Ginger oil	A pale yellow thick liquid, characteristic odor, aromatic, somewhat burning taste. Soluble in alcohol, ether, and chloroform, also in benzyl benzoate, diethyl phthalate, mineral oil, and most fixed oils, insoluble in glycerin, propylene glycol, and water.	*Material Process*
Ginging	the walling of a pit shaft with brick, rather than lining the shaft with timber. Also called 'gingoni'. (Derbys.).	*Mining*
Gin-pit	a shallow mine or pit shaft worked by a gin.	*Mining*
Ginseng (panax)	Root of perennial herb Panax quinquefolium having sweet, somewhat aromatic taste.	*Material Process*
Ginze	Slang term for a worker of the lowest "rank", often a rookie with no oilfield experience whatsoever.	*Petroleum Drilling*
GIPSA	Grain Inspection, Packers and Stockyards Administration, a unit within the USDA.	*Agriculture*
Girard's P reagent (C5H5NClCH2 CONHNH2)	White to faintly pinkish crystals with little or no odor, m.p.190-200 °C (374-392 °F). Soluble in water, insoluble in oils. It is using for separation of aldehydes and ketones from natural oily or fatty materials, extraction of hormones.	*Material Process*
Girard's T reagent (CH3)3NClCH2 CONHNH2)	White to faintly pinkish crystals, little or no odor, m.p. 182-192 °C (359.6-377.6 °F). Soluble in water, insoluble in oils, very hygroscopic. It is using for separation of aldehydes and ketones from natural oily or fatty materials, extraction of hormones.	*Material Process*
Girbotol absorption process (amine absorption process)	A process for the removal of hydrogen sulfide or carbon dioxide from a gaseous mixture. An organic amine such as ethanolamine or diethanolamine, which are basic is allowed to flow down a tortuous path through a tower where it is contacted by and absorbs and hydrogen sulfide or carbon dioxide from the gas to be purified while it is moving up to tower. The amine which is contaminated with hydrogen sulfide or carbon dioxide is sent from the bottom of the tower to a steam stripper, where it flows countercurrent to steam, which strips the hydrogen sulfide or carbon dioxide from it. The process implying diethanolamine is widely used in the petroleum industry for purifying refinery and natural gases and for recovery of hydrogen sulfide for sulfur manufacture. Removal of carbon dioxide from gases is usually done with monoethanolamine.	*Material Process*
Girder	a straight or arched steel roof support.	*Mining*
Girdles	sandstone bands in shale, (N. East).	*Mining*
Girdling	A physical cutting or disruption of the cambial sap flow that often results in tree mortality.	*Forestry*
Girdling	Destruction of tissue in a ring around a twig, branch, or stem.	*Forestry*
Girt	(See Horizontal Tie).	*Facility Engineering*
GIS	See: Geographic Information Systems	*Petroleum Drilling*
Gitoxin (C41H64O14)	A digitalis glycoside. White needles, m.p. 266-269 °C (510.8 - 516.2. °F), slightly soluble in water, alcohol, and chloroform.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
GK	Compound Trade name for a hotpour	*Material Process*
GL-4/5	gear service characteristics (API)	*Petro-Chemical Abbreviations*
Glacial acetic acid	Acetic acid in concentrated form, m.p. 16.7 °C (62.06 °F).	*Material Process*
Glacial Drift	A general term for unconsolidated sediment transported by glaciers and deposited directly on land or in the sea.	*Petroleum Engineering*
Glacial drift	Sedimentary material that has been transported by glaciers.	*Mining*
Glacial striations	Lines or scratches on a smooth rock surface caused by glacial abrasion.	*Mining*
Glaciofluval	Pertaining to the meltwater streams flowing from wasting glacier ice, and especially to the deposits and landforms produced by such streams.	*Petroleum Engineering*
Glance coal	another term for anthracite.	*Mining*
Gland	The component that is used to compress the gland packing.	*Industrial Engineering*
Gland follower or gland flange	The component used to hold down or retain the gland in the stuffing box.	*Mechanical*
Gland Nut	The gland nuts are used to exert a force on the gland.	*Industrial Engineering*
Gland or Gland bushing	That part of a valve which retains or compresses the stem packing in a stuffing box (where used) or retains a stem O-ring, lip seal, or stem O-ring bushing. Sometimes manually adjustable. See "Packing," "Stuffing Box."	*Mechanical*
Gland or gland bushing	The part of the valve which retains or compresses the stem packing in a stuffing box.	*General Mechanical*
Gland Packing	A soft conformable material fitted to a valve stuffing box to create a seal between the process fluid and the atmosphere.	*Industrial Engineering*
Gland plate	The plate in a valve which retains the gland, gland bushing or stem seals and sometimes guides the stem.	*Mechanical*
Glasphalt	A road-surfacing material composed of asphalt and crushed glass. To reduce to a level or to practicable degrees of inclination. Example: to grade a road.	*Civil Engineering*
Glass	An inorganic product of fusion which has cooled to a rigid condition without crystallizing.	*Engineering Physics*
Glass-	Fine grained, crystalline ceramic produced by the controlled devitrification of a glass.	*Material Process*
Glass	Glass Noncrystalline solid unless otherwise noted, with a chemical composition comparable to a crystalline ceramic. An amorphous transparented or translucent brittle material usually made by fusion of silica, soda ash, lime, and salt cake or similar materials. Other materials are used for various special glasses. The composition of ordinary window glass(soda lime glass, lime glass) maybe expressed as approximately 20% sodium oxide, 5% calcium oxide, 70-75% silica and small amounts of other components. Ordinary glass is very slowly dissolved by water, but more rapidly attacked by alkaline solutions.	*Material Process*
Glass and Ceramic Workers of North America; United (AFL-CIO)	one of the major unions in the glass industry, formerly with the C.I.O.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Glass Bottle Blowers Association of the United States and Canada (AFL-CIO)	the United Green Glass Workers' Association formed in 1890 and withdrew from the Knights of Labor in 1891.	*Industrial Relations*
Glass colors	This term is applied to chemicals or mixtures used to confer special properties on glass. In addition to the color producing compounds separately cited under various colored glasses the following are included as glass colors: acid resistant, alkali resistant, leadless type, sulfide resistant, very soft nonresistant etc.	*Material Process*
Glass Cutters League of America; Window (AFL-CIO)	early organization of window glass cutters that dates from the time of the Knights of Labor.	*Industrial Relations*
Glass fiber	A continuous filament or staple fiber having unusual resistance to heat and chemicals. It is the strongest fiber known and is perfectly elastic up to its ultimate strength. It is attacked by hydrofluoric acid and alkalies, resistant to most other chemicals and solvents. Colored by resin-bonded pigments or by dyeing an applied protein film. It is not flammable. Electrical insulation, plastic laminates, filter cloth and paper, surgical sutures, fireproof curtains and drapes.	*Material Process*
Glass forming	Processing technique for a glass.	*Material Process*
Glass safety	A thin plastic sheet is cemented between two sheets of plate glass. The plastic is usually polyvinyl butyral, but various other materials have been used. If the glass is broken, the pieces do not fly but remain attached to the plastic. the term is also applied to highly tempered solid glass.	*Material Process*
Glass sand	A sand suitable for making glass. the principal component is quartz. A typical analysis is silica (SiO2) 99.41%, aluminum trioxide (Al 2O3) 0.21%, iron trioxide (Fe2O3) 0.07%, calcium oxide (CaO) 0.07%, and magnesium oxide (MgO) 0.68%.	*Material Process*
Glass transition temperature	The temperature range, above which a glass becomes a supercooled liquid, and below which, it is a true, rigid solid.	*Material Process*
Glass Transition Temperature	The glass transition temperature or Tg is a temperature range which marks a change in mechanical behavior. Above the glass transition temperature a polymer will behave like a ductile solid or highly viscous liquid. Below Tg the material will behave as a brittle solid. Depending on the desired properties materials may be used both above and below their glass transition temperature.	*Metallurgy*
Glass-ceramic	A fine-grained crystalline material that was formed as a glass and subsequently devitrified (crystallized).	*Engineering Physics*
Glassine	A thin transparent paper used for packaging and made with addition of a urea formaldehyde resin to improve strength characteristics.	*Material Process*
Glaze	Glass coating applied to a ceramic such as clay ware pottery.	*Material Process*
Glennie blink, the miners' name for 'Nystagmus'	Glennie blink, the miners' name for 'Nystagmus'. - see also Stag.	*Mining*
Glitch Immunity	A term used in microprocessor supervisory circuit datasheets to describe the maximum magnitude and duration of a negative-going VCC supply-voltage pulse without causing the reset output to assert.	*Electrical Engineering*
Global climate change	Global climate change: See Climate change	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Global climate change	This term usually refers to the gradual warming of the earth caused by the greenhouse effect. Many scientists believe this is the result of man-made emissions of greenhouse gases such as carbon dioxide, chlorofluorocarbons (CFC) and methane, although there is no agreement among the scientific community on this controversial issue.	*Mining*
Global Positioning System	A satellite-based navigation system in which two or more signals, received from satellites, are used to determine the receiver's position on the globe.	*Electrical Engineering*
Global System for Mobile Communications	A land, mobile, pan-European, digital, cellular radio-communications system.	*Electrical Engineering*
Global System for Mobile Communications	A land, mobile, pan-European, digital, cellular radio-communications system.	*Electrical Engineering*
Global warming	An increase in the near surface temperature of the Earth. Global warming has occurred in the distant past as the result of natural influences, but the term is today most often used to refer to the warming some scientists predict will occur as a result of increased anthropogenic emissions of greenhouse gases.	*Energy*
Global warming potential (GWP)	An index used to compare the relative radiative forcing of different gases without directly calculating the changes in atmospheric concentrations. GWPs are calculated as the ratio of the radiative forcing that would result from the emission of one kilogram of a greenhouse gas to that from the emission of one kilogram of carbon dioxide over a fixed period of time, such as 100 years.	*Energy*
Globe Doctrine	the policy set forth by the NLRB in the Matter of Globe Machine and Stamping Company. In which the Board provided for special balloting to determine the representation wishes of employees.	*Industrial Relations*
Globe valve	A valve whose closure element is a flat disc or conical plug sealing on a seat which is usually parallel to the flow axis. Can be used for throttling services.	*General Mechanical*
Globe valve	a type of stemmed valve that is used for flow control. The valve has a globe shaped plug that rises or falls vertically when the stem handwheel is rotated.	*Chemical*
Glory hole	An open pit from which ore is extracted, especially where broken ore is passed to underground workings before being hoisted.	*Mining*
Gloss	Brightness or luster of a body proceeding from a smooth surface.	*Material Process*
Glue	An impure or degraded form of gelatin obtained by action of heat and water on protein animal tissues of bones, hides, horns. It absorbs cold water with much swelling and dissolves in hot water, the solution solidifying to jelly on cooling.	*Material Process*
Glut	pieces of timber used for packing behind the crib or tubbing in a shaft. (N. East); or a thin tapering wedge of wood used to fill in gaps between posts and their lids (N. Staffs.); or a wooden wedge driven into a water feeder to stop or reduce the flow.	*Mining*
Glutamic acid (COOH(CH2)2CH (NH2) COOH)	Alfa amino glutaric acid, a nonessential amino acid present in all complete proteins. the naturally occurring form is L(+)-glutamic acid. The monosodium salt, L(+)-sodium glutamate, is important commercially as a flavoring intensifier.	*Material Process*
Glutaric acid (COOH (CH2)2COOH)	n-pyrotartaric acid is colorless crystals, m. p. 97 °C (206.6 °F). Soluble in water, alcohol and ether.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Glutaronitrile (NC(CH2) CN)	Colorless to straw colored viscous liquid, b.p. 144-146 °C (291.2-294.8°F). Soluble in water and alcohol, insoluble in ether and carbon disulfide.	*Material Process*
Glutathione (C10H17) O6N3S)	A universal component of the living cell. Contains glutamic acid, cysteine, and glycine chemically bound. Hydrolysis sets free these three constituent amino acids. White crystalline powder, colorless, m.p. 190-192 °C (374-377.6°F), mild sour taste, soluble in water, insoluble in alcohol. The especial interest as relates to radiation damage.	*Material Process*
Gluten	Vegetable albumen. A mixture of proteins derived from grain. The protein of bread. A yellowish gray powder or a gray-brown sticky tough mass that is insoluble in water and remains after the starch is washed out of wheat flour with water. Soluble in alkali and strong acetic acid. Crude commercial gluten contains 5-20% starch as a filler. Gluten uses to supplement corn bran, for production of whole-corn proteins, as gluten meal for cattle feed, destarched gluten with associated fiber and fate in coatings, adhesives and plastic compositions and also in amino acid production.	*Material Process*
Glutin	Amorphous, odorless, tasteless protein, having great adhesive strength. Soluble in hot water. A constituent of glue.	*Material Process*
Glutol (glutoform, formaldehyde gelatin)	A hard, clear transparent mass which may be pulverized, or white to yellow odorless powder. Insoluble in cold water, soluble in hot water under pressure.	*Material Process*
Glyceraldehyde (glyceric aldehyde) (HOCH2CHOHCHO)	Isomeric with dihydroxyacetone. It is produced by the oxidation of sugars in the body. DL glyceraldehydes tasteless crystals from alcohol–ether mixture, m.p. 145 °C (293°F), insoluble in benzene, petroleum ether and pentane.	*Material Process*
Glyceride	An ester of glycerol and fatty acids in which one or more of the hydroxyl groups of the glycerol have been replaced by acid radicals. The latter may be identical or different, so that the glyceride may contain up to three different acid groups. Glycerides occur naturally or may be made synthetically. Mono- and triglycerides are of commercial importance.	*Material Process*
Glyceride	Glyceride An ester of glycerol and fatty acids in which one or more of the hydroxyl groups of the glycerol have been replaced by acid radicals. The latter may be identical or different, so that the glyceride may contain up to three different acid groups. Glycerides occur naturally or may be made synthetically. Mono- and triglycerides are of commercial importance.	*Material Process*
Glyceril tripropionate (C3H5(OCOC2H5)3) (glycerol triproprionate)	Solubility in water 0.313% of weight. Plasticizer.	*Material Process*
Glycerin	Glycerin See glycerol.	*Material Process*
Glycerin carbonate (hydroxymethyl ethylene carbonate or 2,3-carbonate-1-propanol)	Pale yellow, odorless, hygroscopic liquid. Boiling range 125-130 °C (257-266°F). Solvent, miscible with water, alcohol, ether, soluble in ethylene dichloride, insoluble in carbon tetrachloride, benzene, and aliphatic hydrocarbons.	*Material Process*
Glycerin dynamite	A grade of glycerol.	*Material Process*
Glycerinophosphoric acid	Glycerinophosphoric acid. See glycerophosphoric acid.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Glycerogen	A glycerol substitute consisting of 35% glycols, 35% glycerol, 25-28% hexitol, erythritol and other compounds. Colorless, reasonably sweet in taste, non-toxic and resembling glycerol in viscosity. It derivates by continuous catalytic hydrogenolysis of sugar at 200 °C (392°F) and 325 atmospheres. Glycerogen is used as softening and conditioning agent in tobacco, cellulose films, cosmetics and pharmaceuticals.	*Material Process*
Glycerol mannitan laurate	A mixed poly alcohol fatty acid ester. Red-brown oily liquid. Dispersible or insoluble in water and most solvents. Wetting agent, spreading agent in insecticides.	*Material Process*
Glycerol boriboate	Pale yellow liquid obtained by heating glycerin, sodium borate and boric acid. Composition varies Soluble in cold water, absolute alcohol, other alcohols, glycerin. Used as adhesive , binder, fabric softener, fire resistant on fabrics.	*Material Process*
Glycerol diacetate (C3H5(OH)(OOCCH3)2)	A plasticizer. Also called diacetin.	*Material Process*
Glycerol esters	Products of esterification of glycerol with acids some are useful as plasticizers, e.g. the glycol acetate.	*Material Process*
Glycerol glue	See glue.	*Material Process*
Glycerol monoacetate (C3H5(OH) (OOCCH3))	A plasticizer. Also called acetin.	*Material Process*
Glycerol monolaurate (glyceryl monolaurate, lauryl glycerin)	Glycerol monolaurate (glyceryl monolaurate, lauryl glycerin) (C11H23 COOCH2CHOHCH2OH) Cream colored, semi-solid paste, very faint odor. Dispersible in water, soluble in methanol, ethanol, toluene, naphtha, mineral oil, cotton seed oil, ethyl acetate. An ester of glycerol and lauric acid. Emulsifying and dispersing agent for the manufacture of food products. Emulsifying agent for oils, waxes and solvents, antifoaming agent, dry-cleaning soap base.	*Material Process*
Glycerol monooleate (glyceryl monooleate) (C17H33 COO CH2CHOH CH2OH)	A yellow oil, insoluble in water, soluble in alcohol and most organic solvents.	*Material Process*
Glycerol monoricinoleate (glyceryl monoricinoleate) (C17H33OCOOC3H5 (OH) 2) Orange–red, oily liquid	Glycerol monoricinoleate (glyceryl monoricinoleate)(C17H33OCOOC3H5 (OH) 2) Orange–red, oily liquid, soluble in methanol, ethanol, toluene, cotton seed oil, ethyl acetate, disperses in water, insoluble in naphtha, and mineral oil. It is used for nondrying emulsifying agent, solvent, plasticizer, in polishes, in cosmetics, in textile, paper, and leather processing. Lowers surface tension. High lubricating value even at low temperatures.	*Material Process*
Glycerol monostearate (monostearin or glyceril monostearate) (C17H35 COOCH2CHOHCH2OH)	Pure white or cream-colored, wax-like solid with faint odor, and fatty, agreeable taste. Dispersible in hot water. Soluble (hot) in alcohol, oils and hydrocarbons. It is stearic acid ester of glycerol. Thickening and emulsifying agent for margarine, shortenings and other food products, emulsifying agent for oils, waxes and solvents, protective coating for hygroscopic powders, cosmetics etc.	*Material Process*
Glycerol of borax	Borax dissolved in glycerol, used in medicine.	*Material Process*
Glycerol triacetate (C3H5(OH) (OOCCH3)3)	A plasticizer. Also called triacetin.	*Material Process*
Glycerol tributyrate (CH3CH2CH2CO)3 C3H5O3)	A plasticizer. Also called tributyrin.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Glycerol triproprionate (C3H5(OCO C2H5) (OOCCH3)3)	A plasticizer. Also called tripropionin.	*Material Process*
glycerol	A molecule to which 1, 2 or 3 fatty acids or phosphate may attach.	*Agriculture*
Glycerol, or Glycerin, Glycyl alcohol (CH2OHCHOHCH2OH)	Colorless liquid or rhombic crystals. Clear, colorless, or pale yellow, odorless, sweet, warm taste, hygroscopic. It is soluble in water and alcohol, insoluble in ether, benzene and chloroform. Purifying by redistillation ion exchange techniques. Glycerol is used as a modifier in numerous plastics, especially to increase the transparency of cast phenolics. It also has a hardening effect. Glycerol is used for alkyd resins, explosives, ester gums, medicine, pharmacy, perfumery, plasticizer for regenerated cellulose, cosmetics, conditioning tobacco, liqueurs, solvent, printers ink rolls etc...	*Material Process*
Glycerophosphoric acid (C3H5(OH)2 H2 PO4) (gycerolphosphoric acid or glycerinophosphoric acid)	Colorless, odorless liquid, soluble in water and alcohol. It derivates by interaction of glycerol and phosphoric acid. It is used in medicine and manufacture of glycerophosphates.	*Material Process*
Glyceryl benzoate (C3H5(OOCC6H5)3) (tribenzoin)	Colorless, non hygroscopic, crystalline solid. Soluble in most anhydrous lacquer solvents with the exception of petroleum hydrocarbons.	*Material Process*
Glyceryl monolaureate	See glycerol monolaureate.	*Material Process*
Glyceryl monooleate	See glycerol monooleate.	*Material Process*
Glyceryl monoricinoleate	See glycerol monoricinoleate.	*Material Process*
Glyceryl monostearate	See glycerol monostearate.	*Material Process*
Glyceryl phthalate (glycerol phthalate)	Water white, solid resin. Insoluble in water. Soluble (hot) in methanol, ethanol, acetone, and ethyl acetate. Partly soluble in toluene and naphtha. Synthetic resin used in the manufacture of varnishes, lacquers, etc.	*Material Process*
Glyceryl tri – [1, 2 hydroxystearate] (C3H5 (OOCOC17H35)3) (castor, oil hydrogenated)	Hard, brittle wax-like solid, yellowish cream to milk, white in color. Used as lubricants, metallic stearates, waxes, plasticizers, cosmetics, chemical intermediate.	*Material Process*
Glyceryl tributyrate (C3H5(OCOC3H7)3)	Glyceryl tributyrate (C3H5(OCOC3H7)3) (tributyrin or glycerol tributyrate) Plasticizer, soluble in water 0.010%.	*Material Process*
Glyceryl triricinoleate (C3H5(OOCOC2H5)3) (glyceryl ricinoleate)	The triglyceride of ricinoleic acid. It constituent about 80% of Castrol oil. A light amber oil, non-drying emulsifying oil.	*Material Process*
Glycine (NH2CH2COOH) (amino acid)	The principal amino acid in sugar cane. White very sweet crystals, soluble in water, insoluble in alcohol and ether. It is derivated by the action of concentrated ammonium hydroxide on monochloro acetic acid, or by alkaline hydrolysis of gelatin. Uses as buffering agent. Not to be confused with the photographic developer, para-hydroxyphenyl aminoacetic acid, also known as glycine, which is poisonous.	*Material Process*
Glycocholic acid (C26H43NO6) (cholyglycine)	Occurs as sodium salt in bile. It is formed by the combination of the amino acid glycine with cholic acid. As the sodium salt, it aids in the digestion and absorption of fats. Crystallizes from water containing 1.5 moles water (H2O). Practically insoluble in water. The sodium salt is soluble in water and alcohol.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Glycocoll. See glycine.	Glycocoll See glycine.	*Material Process*
Glycogen (animal starch, liver starch) (C6H10O5)n)	A glycose polysaccharide. It is the storage carbohydrate of the animal organism, found especially in the liver and rested muscle. White powder, forms a dextro-rotatory colloidal solution, partially soluble in water, sweet tasting. It is isolated from liver by treatment with 30% sodium hydroxide solution and precipitating glycogen from the solution with alcohol.	*Material Process*
Glycol Ethylene glycol.	Glycol Ethylene glycol.	*Material Process*
Glycol diacetate (-CH3COOCH2CH2 OOCCH3)	Colorless liquid, faint odor, soluble in alcohol, ether, benzene, slightly soluble in water (10%). A solvent.-ester. Solvent for cellulose esters and ethers, resins, lacquers, printing inks.	*Material Process*
Glycol sebacate (-CH2CH2 OCO(CH2)8 COO-)n	A plasticizer. Also called Paraplex.	*Material Process*
Glyptal	An alkyd synthetic resin made by heating together phthalic anhydride and glycerol used in paints, varnishes, lacquers, and as a shellac substitute.	*Material Process*
GM	General Motors	*Petro-Chemical Abbreviations*
GMOT	General Motors oxidation test	*Petro-Chemical Abbreviations*
Gneiss	A layered or banded crystalline metamorphic rock, the grains of which are aligned or elongated into a roughly parallel arrangement.	*Mining*
GNP	Gross National Product	*Energy*
GO	Gear Operated - The actuation of a valve thru a – ear set which multiplies the torque applied to the valve stem. See "BGO", "MGO."	*Mechanical*
Goaf	The area from which the coal has been entirely extracted. The word is thought to have been derived from the Welsh word for cave. Along with 'goave' the term is often found in technical books on coal mining but is seldom, if ever, used by miners. The term 'gob' is the more common name. - see also Waste.	*Mining*
Gob	To leave in a mine coal and other materials that cannot be sold.	*Energy*
Gob fire	spontaneous combustion or fire in the waste.	*Mining*
Gob Pile	A pile of loose waste material in a mine, or backfill waste material packed in stopes (steps or layers) to support the roof of a mine. A gob pile is also called a "honey" or "refuse" pile. This term is primarily used in underground mining.	*Energy*
Gob road	-see Scour	*Mining*
Gob side	the side of a roadway that ran parallel to the waste, or the waste side of a conveyor that runs along the coalface.	*Mining*
Gob stink	- see Fire stink.	*Mining*
Gob	The term applied to that part of the mine from which the coal has been removed and the space more or less filled up with waste. Also, the loose waste in a mine. Also called goaf.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Goff or Goth	A sudden outburst of coal at the working face accompanied by a loud report. As a rule the coal and stone are projected from the face in a very shattered, and often powdered, condition. The outburst is due to the settlement of the roof producing a state of strain in the coal or its roof, or floor, eventuating in the sudden rupture, which is termed 'goth'. Firedamp may, or may not, be liberated by this occurrence.	*Mining*
Going board	where the crane, flat, or station, is not at the end of the headways-course at the face, and the coals are brought down to it by a board for one, two, or more pillars, this board is called the going (or "gannen") board. (N. East).	*Mining*
Going headways	usually the headways-course next to the face. (N. East).	*Mining*
Going Rate, The	the predominant rate or the rate most commonly paid to workers in a specific occupation in an industry or area.	*Industrial Relations*
GO-J	Mack gear oil specification	*Petro-Chemical Abbreviations*
Gold loan	A form of debt financing whereby a potential gold producer borrows gold from a lending institution, sells the gold on the open market, uses the cash for mine development, then pays back the gold from actual mine production.	*Mining*
Gold Panning in the American West Outcrop	That portion of a vein appearing at the surface.	*Mining*
Gold Plating	The electrolytic deposition of gold for decorative or electrical applications.	*Paint and Coatings*
Gold standard	The method, procedure, or measurement that is widely accepted as being the best available, against which new developments should be compared.	*Quality Engineering*
Goldbricking	giving the appearance or pretense of working.	*Industrial Relations*
Golden ratio	Golden ratio. The irrational number [(5½)+1]/2= 1.618, which plays a fundamental role in numerous shapes in the natural world, including the recently discovered quasi -crystals.	*Material Process*
Golden ratio The irrational number	**Golden ratio.** The irrational number **[(5½)+1]/2=1.618, which plays a fundamental role in numerous shapes in the natural world, including the recently discovered quasi-crystals.**	*Material Process*
Goldfinger v. Feintuch	a case in which the New York Court of Appeals upheld the right of a union to engage in secondary picketing where it was peaceful and in furtherance of the union's efforts to persuade customers not to buy in stores selling products produced by union labor under sub-standard wage conditions.	*Industrial Relations*
Go-Line	Used In Relation To Mobile Equipment. Equipment Which Is Available, But Not Being Utilized Is Typically Parked On The Go-Line. This Term Is Used Interchangeably With Ready Line.	*Plant Engineering*
Gompers' Non-Partisan Policy	the policy of the American Federation of Labor, attributed to Samuel Gompers, which sought to use the two major political parties to assist the A.F. of L. to achieve its industrial objectives without being committed to either party.	*Industrial Relations*
Gompers v. Buck Stove and Range Company	a case involving the secondary boycott and the use by the A.F. of L. of its "Unfair" and "We do not patronize" lists.	*Industrial Relations*

Term	Definition	*Industry*
Gompersite	an individual who supported the labor policies of Samuel Gompers.	*Industrial Relations*
Gompertz Model	A reliability growth model that is used to model reliability at different stages of development and produces an S-shaped reliability growth curve.	*Reliability Engineering*
Good engineering practice (GEP) scheme	A scheme approved by the BC Oil and Gas Commission under regulation for the exploration, evaluation and development of petroleum and natural gas (now referred to as a special project).	*Petroleum Engineering*
Good Utility Practice	Methods and practices that are approved by a significant portion of the industry.	*Energy*
Good-Faith Bargaining	negotiations between representatives of union and company to reach a mutually satisfactory agreement setting forth the conditions of employment under a collective bargaining contract.	*Industrial Relations*
Goodwill	One of the intangible values beyond its net worth that a business acquires from suppliers and customers as a result of their business relationships. It is promoted by granting more business as a reward for good service, sharing plans and forecasts, working together to solve problems, mutual research and developing, etc.	*Procurement*
Goon	a slang term for a person, pluggly, thug, roughneck, slugger, etc. hired by an employer or union during a labor dispute to create or resist violence.	*Industrial Relations*
Goon Squad	a group of thugs or sluggers who are hired by an employer or union to create or resist violence.	*Industrial Relations*
Goose	a water barrel or tub taken down the mine for the horses, or to suppress the dust when shot-firing. (F. of D.).	*Mining*
Gooseneck	The curved connection between the rotary hose and the swivel.	*Petroleum Drilling*
GOR	Gas To Oil ratio refers to the amount of crude oil produced compared to produced natural gas. High GOR wells produce more gas than oil. In Texas, a gas well is defined as one where the GOR is 100 Mcf/bbl or more.	*Petroleum Drilling*
Goskins or ghoskins	nodules of inferior quality ironstone.	*Mining*
Gossan	The rust-colored capping or staining of a mineral deposit, generally formed by the oxidation or alteration of iron sulfides.	*Mining*
GOT	Graphic Operator Terminal. A kind of HMI.	*Control Engineering*
Got-on-Knobs	an early system of working the Thick Coal of South Staffordshire. A kind of bord and pillar system. The main roads were driven to the boundary and the coal was then worked on the retreat (S. Staffs.).	*Mining*
Gouge	Fine, putty-like material composed of ground-up rock found along a fault.	*Mining*
Gout water	foul mine water (F. of D.).	*Mining*
GOUT	Formation of swellings at nodes or at the base of buds.[1]	*Forestry*
Government Employees	workers employed by an instrumentality of government.	*Industrial Relations*
Government Seizure	a procedure used by the government, usually during a war period or other emergency, to take over the operation plants necessary to the prosecution of the war effort.	*Industrial Relations*
Government-owned stocks	Oil stocks owned by the national government and held for national security. In the United States, these stocks are known as the Strategic Petroleum Reserve.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gowl	The roof and sides were said to 'gowl' or 'gowl out' when they began to break down and cause trouble. (Derbys.).	*Mining*
GPA	gasoline performance additives	*Petro-Chemical Abbreviations*
GPH	Volumetric flow rate in gallons per hour.	*General Engineering*
GPM	(Abbr.) Gallons per minute	*Facility Engineering*
GPS	global positioning system	*Petro-Chemical Abbreviations*
Grab sample	A sample from a rock outcrop that is assayed to determine if valuable elements are contained in the rock. A grab sample is not intended to be representative of the deposit, and usually the best-looking material is selected.	*Mining*
Graben	A downfaulted block of rock.	*Mining*
Grade	classification system of food quality	*Agriculture*
Grade and Gradation	the rate of decent or ascent (slope) and the act of becoming a different grade.	*Petroleum Drilling*
Graded	An engineering term pertaining to a soil, or an unconsolidated sediment, consisting of particles of several or many sizes, or having a uniform or equable distribution of particles from coarse to fine.	*Petroleum Engineering*
Graded index fiber	Optical fiber with a parabolic variation in index of refraction within the core.	*Material Process*
Grades, Rope	Classification of wire rope by the wire's metallic composition and the rope's nominal strength.	*Wire Rope & Cable*
gradient	the rate of change in value of a physical or chemical parameter per unit change in position. For example, hydraulic gradient is equal to the difference in head measured at two points (usually wells) divided by the distance separating the two points. The dimensions of head and distance are both lengths, therefore the gradient is expressed as a dimensionless ratio (L/L).	*Chemical*
Gradualism	the process of achieving a goal or result through slow progression and by degrees so that wide acceptance can be achieved through education.	*Industrial Relations*
Graduated Wage	generally has reference to wages which are adjusted on the basis of length of service with the company, or length of service coupled with certain standards of performance.	*Industrial Relations*
Graduation mark	The marks that define the scale intervals on a measuring instrument are known as graduation marks.	*Reliability Engineering*
Graft copolymer	Combination of polymeric components in which one or more components is grafted onto a main polymeric chain.	*Material Process*
Graft in Union	the acquisition by union officials or employees of money, position, or profit through dishonest means.	*Industrial Relations*
Grain	Individual crystallite in a polycrystalline microstructure.	*Material Process*
Grain boundary diffusion	Enhanced atomic flow along the relatively open structure of the grain boundary region.	*Material Process*
Grain boundary dislocation (GBD)	Linear defect within a grain boundary, separating regions of good correspondence.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Grain growth	Increase in average grain size of a polycrystalline microstructure due to solid state diffusion.	*Material Process*
Grain Inspection, Packers and Stockyards Administration, (GIPSA)	A unit within the USDA.	*Agriculture*
Grain or Green	the 'cleat' or most pronounced planes of division traversing coal seams from roof to floor (N. Staffs.).	*Mining*
Grain-size number	Index for characterizing the average grain size in a microstructure.	*Material Process*
Gram atom	Avogadro's number of atoms of a given element.	*Material Process*
Grand Lodge	the term applied to the head office of a union organized along fraternal lines or using the language of fraternal societies.	*Industrial Relations*
Grange	an organization of farmers that provides support and plans social functions	*Agriculture*
Granite	A coarse-grained intrusive igneous rock consisting of quartz, feldspar and mica.	*Mining*
Granolith	A composition stone for pavements, made from crushed granite or the like and cement.	*Civil Engineering*
Granular Powder	Particles having approximately equidimensional nonspherical shapes.	*Paint and Coatings*
Granular structure	Apparent incomplete fusion of and at least partial retention of their original form by the particles from which a plastic is formed, either within it or on its surface.	*Material Process*
Granule	An information granule is a term used by some fuzzy logic experts to describe a fuzzy set of objects which can be seen as a unit in fuzzy logic calculations.	*Control Engineering*
Graphite	Flexible carbon material used to make gaskets and packing. The gaskets may be flat graphite sheet or have metal inserts for added strength. The packing is a combination of lattice braided rings used as anti-extrusion or wiper rings and die-formed rings which are compressed to affect the seal.	*General Mechanical*
Graphite	Flexible carbon material used to make gaskets and packing. The gaskets may be flat graphite sheet or have metal inserts for added strength. The packing is a combination of lattice braided rings used as anti-extrusion or wiper rings and die-formed rings which are compressed to effect the seal.	*Mechanical*
Grass	a type of plant with jointed stems, slender flat leaves and spike like flowers such as corn and wheat	*Agriculture*
Grass crop	another name for the outcrop of a coal seam. (Scot.).	*Mining*
Grass Fed	a USDA standard requiring that an animal's only feed source be grass or forage, except for milk consumed prior to weaning. Animals are required to have continuous access to pasture during the growing season. Grass-fed animals may not be fed grain or grain byproducts at any time during their lifetime.	*Agriculture*
Grathe	to put in order, to dress or replace a worn clack or bucket leather in a mine pump.	*Mining*
Gravel-Packed Well	A well in which filter material is placed in the annular space to increase the effective diameter of the well, and to prevent fine-grained sediments from entering the well.	*Petroleum Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Graveyard Shift	a work schedule, usually in plants on continuous operation, which begins around midnight and ends during the early morning.	*Industrial Relations*
Gravimetric Analysis	A method of analysis whereby the dry weight of contaminant per unit volume of fluid can be measured showing the degree of contamination in terms of milligrams of contaminant per liter of fluid.	*Oil Analysis*
Gravimetric value	The weight of suspended solids per unit volume of fluid. A method employing membrane filters for this determination is outlined in Society of Automotive Engineers Aerospace Recommended Practices - 785.	*Mechanical, Process, and Operations*
Gravity	An attractive force between two objects; each object accelerates at a rate equal to the attractive force divided by the object's mass. Objects near the surface of the earth tend to accelerate toward the earth's center at a rate of ; this value is often called the gravitational constant and denoted as g.	*Engineering Physics*
Gravity Bracket	Brackets designed to permit gravity conveyors to be attached to the ends of a powered conveyor.	*Manufacturing*
Gravity Conveyor	Roller or wheel conveyor over which objects are advanced manually by gravity.	*Manufacturing*
Gravity dam	A dam resisting the pressure of impounded water through its own weight.	*Civil Engineering*
Gravity meter, gravimeter	An instrument for measuring the gravitational attraction of the earth; gravitational attraction varies with the density of the rocks in the vicinity.	*Mining*
Gravity Separation	A method of separating two components from a mixture. Under the influence of gravity, separation of immiscible phases (gas-solid, liquid-solid, liquid-liquid, solid-solid) allows the denser phase to settle out.	*Lubrication*
Gravity Unit	One gravity unit (abbreviated g) is an acceleration of 32.2 feet per second per second.	*Electrical Engineering*
Gray cast iron	A form of cast iron containing sharp graphite flakes that contribute to a characteristic brittleness.	*Material Process*
Gray Dogs	laminated sandstone with coal streaks.	*Mining*
Grease	A lubricant composed of an oil or oils thickened with a soap, soaps or other thickener to a semisolid or solid consistency.	*Lubrication*
Grease fitting	A device which permits injection of grease into a bearing surface.	*General Mechanical*
Grease Fitting	A small fitting which connects a grease gun and the component to be lubricated. The fitting is installed by a threaded connection, leaving a nipple to which the grease gun attaches.	*Lubrication*
Grease Gun	A tool (normally hand-powered) which is used for lubrication tasks. By squeezing the trigger of the gun, grease is applied through an aperture to a specific point.	*Lubrication*
Grease marks	Dull or pitted surface areas caused by excessive amounts of lubricants. Term not recommended.	*Material Process*
Green engineering	Environmentally sensitive engineering design.	*Material Process*
Green flag	The green flag is used by the starter to signal drivers that the race is under way, either at the start of the event or at the conclusion of a full-course yellow flag condition. Green flags are used by corner workers on road courses to let drivers know that they have passed beyond a yellow flag area and may resume passing.	*NASCAR*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Green Hands	workers who are new to a job or occupation, or inexperienced in the performance of the work.	*Industrial Relations*
Green Power	Power that is generated from renewable energy sources. Specific definitions of green power vary in each state. Typically, wind, solar and bio-mass fuels are considered sources of green power.	*Energy*
Green pricing	In the case of renewable electricity, green pricing represents a market solution to the various problems associated with regulatory valuation of the nonmarket benefits of renewables. Green pricing programs allow electricity customers to express their willingness to pay for renewable energy development through direct payments on their monthly utility bills.	*Energy*
Green rock	an igneous intrusion into the coal measures, sometimes burning and/or destroying part or all of the coal seam (S. Staffs.).	*Mining*
Green roof	roof of the coal at the face that has not had to stand open long supported on timber before being underpinned by the advancing pack.	*Mining*
Greener	a very strongly marked cleavage plane in the coal seam, which is specially utilized in working off the coal (N. Staffs.).	*Mining*
Greenfield Plant	This refers to a new electric power generating facility built from the ground up.	*Energy*
Greenhouse effect	The result of water vapor, carbon dioxide, and other atmospheric gases trapping radiant (infrared) energy, thereby keeping the earth's surface warmer than it would otherwise be. Greenhouse gases within the lower levels of the atmosphere trap this radiation, which would otherwise escape into space, and subsequent re-radiation of some of this energy back to the Earth maintains higher surface temperatures than would occur if the gases were absent.	*Energy*
Greenhouse gases	Those gases, such as water vapor, carbon dioxide, nitrous oxide, methane, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulfur hexafluoride, that are transparent to solar (short-wave) radiation but opaque to long-wave (infrared) radiation, thus preventing long-wave radiant energy from leaving Earth's atmosphere. The net effect is a trapping of absorbed radiation and a tendency to warm the planet's surface.	*Energy*
Greenstone belt	An area underlain by metamorphosed volcanic and sedimentary rocks, usually in a continental shield.	*Mining*
Greet stone	coarse grained, gritty sandstone.	*Mining*
Gregarious	Living in groups or communities.	*Forestry*
Grew or Grewn	When the coal seam passes by fine graduations into the shale roof (or floor), the roof (or floor) and the seam are said to be 'grewn'.	*Mining*
Grey bind	a sandy mudstone or shale.	*Mining*
Grey literature	Grey literature is the kind of material that is not published in easily accessible journals or databases. It includes things like conference proceedings that include the abstracts of the research presented at conferences, unpublished theses, and so on.	*Quality Engineering*
Grey metal	shale.	*Mining*
Grey post	sandstone.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Greyhound Cases	cases in which the Supreme Court in 1983 upheld orders of the NLRB disestablishing company dominated unions.	*Industrial Relations*
Grid	Matrix of an electrical distribution system.	*Energy*
Grid code	This term refers to the requirements developed by power utilities that power generators of all kinds must meet to ensure the proper functioning and stability of the electrical transmission and distribution grid. that define grid fault and other conditions that must be responded to by wind power plants. These include regulations such as n-1 and fault ride-through capabilities (see n-1 and Fault ride-through).	*Electrical*
Grid Operator	The entity that oversees the delivery of electricity over the grid to the customer, while assuring consistently high levels of reliability, and public and worker safety. The grid operator potentially could be independent of the utilities and suppliers.	*Energy*
Grid reliability	Power utilities strive to maintain electricity supplies without unexpected dips or surges that can cause disruptions ranging from flickering lights to equipment damage. To avoid these problems, utilities therefore need to control the flow of power under normal running conditions and in emergency situations. This is done by installing sophisticated switching and protection equipment (fuses, circuit breakers, transformers, etc.) in substations, and monitoring equipment (protection relays, phase monitoring units, thermal line sensors etc) at strategic points on the grid. The monitoring units measure the rate and direction of power flow, its stability, the temperature of hot power lines, and other parameters critical to the normal functioning of the grid. The data are transmitted to a central computer, which uses them to calculate the settings for the control equipment housed in the substations and generating plants. This allows power flow to be directed, compensating for overloaded sections of the grid and even shutting down certain connections to prevent the spread of disturbances or to allow maintenance work to be carried out. (See FACTS, Network control, SCADA, Wide-Area Monitoring Systems.)	*Electrical*
Grid	The starting order of cars, as determined by qualifying position.	*NASCAR*
Grids	Parallel, channel-shaped, cast-iron supports that hold the steam plates away from the press platens during knockout operation and also provide air spaces between plates and platens to reduce loss of heat.	*Material Process*
Grievance	any complaint by an employee or by a union, concerning any aspect of the employment relationship.	*Industrial Relations*
Grievance Machinery	the provisions set up, usually in th collective bargaining agreement, to resolve problems which arise out of the agreement.	*Industrial Relations*
Grievance Adjustment	methods of settling or adjusting a grievance vary from contract to contract.	*Industrial Relations*
Grievance Committee	the group of union and/or management representatives that reviews grievances after they have come up the lower steps of the grievance machinery.	*Industrial Relations*
Grieve	the man who weighed the coal coming out of the mine for the coal owner. The 'pitheadsman'. (Scot.).	*Mining*
Griffith crack model	Prediction of stress intensification at the tip of a crack in a brittle material.	*Material Process*
Grimes	a term used in S. Wales for 'bobbers' and 'bell moulds'. - see Coal balls.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Grinding	The removal of material by the use of fixed abrasives like grinding wheels or emery paper.	*Paint and Coatings*
Grinding	mechanically removing material from a work-piece with a grinding wheel or abrasive belt	*Materials Process*
Grip Length	Total distance between the underside of the nut to the bearing face of the bolt head; includes washer, gasket thickness etc.	*Maintenance*
Grisley	coarse pyritous coal, irregular in thickness, and possessing spherical structure.	*Mining*
Grist	a black coaly stratum found in the proximity of a coal seam (S. Wales).	*Mining*
Grit	the inside of a corn kernel exposed after the outer covering, or hull, is removed	*Agriculture*
Grit Blasting	A pressurized stream of hard metal or oxide grit material used to clean and roughen surfaces prior to coating.	*Paint and Coatings*
Grit-blasting	abrasive blasting with small irregular pieces of steel, malleable cast iron or hard nonmetallic materials	*Materials Process*
Grizzle	inferior coal with an admixture of specks and patches of pyrites, often sooty in appearance.	*Mining*
Grizzly	A grating (usually constructed of steel rails) placed over the top of a chute or ore pass for the purpose of stopping the larger pieces of rock or ore.	*Mining*
Grizzly (or mantle)	A grating, usually constructed of steel rails, placed over the top of a chute or ore pass for the purpose of stopping large pieces of rock or ore that may hang up in the pass.	*Mining*
Grizzly	Bars set in a flume to strain out the large stones used in hydraulic mining.	*Mining*
Groin	Also, "groyne" a small jetty extending from a shore to prevent beach erosion.	*Civil Engineering*
Grommet	An endless circle or ring fabricated from one continuous length of strand or rope.	*Wire Rope & Cable*
Groove	The opening provided for a groove weld.	*Maintenance and Repair*
Groove Angle	The total included angle of the groove between parts to be joined by a groove weld.	*Maintenance and Repair*
Groove Face	That surface of a member included in the groove.	*Maintenance and Repair*
Groove Radius	The radius of a J or U groove.	*Maintenance and Repair*
Groove Weld	A weld made in the groove between two members to be joined. The standard type of groove welds are square, single-V, single-bevel, single-U, single-J, double-V, double-U, double-bevel, double-J, and flat-land single, and double-V groove welds.	*Maintenance and Repair*
Groove	see Line.	*NASCAR*
Grooved Drum	Drum with a grooved surface that accommodates the rope &/or wire rope and guides it for proper winding.	*Wire Rope & Cable*
Grooves	Circumferential channels between the tread ribs of a tire	*Mechanical Engineering*
Grooving	A tread cutting process in which grooves of varying depths and angles are cut into a tire's tread to improve forward traction, braking, or lateral stability.	*Mechanical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gross	All acreage covered by any working interest, regardless of the percentage of ownership in the interest.	*Energy*
Gross additions to construction work in progress for the month	This amount should include the monthly gross additions for an electric plant in the process of construction.	*Energy*
Gross Additive Treating Cost (GATC)	The cost of additive in one volume unit of finished product not including base fluid credit or shipping costs.	*Lubrication*
Gross Average Hourly Earnings	a figure computed monthly by the Bureau of Labor Statistics as part of its regular employment and pay-roll reporting program.	*Industrial Relations*
Gross Average Weekly Earnings	a figure computed monthly by the Bureau of Labor Statistics as part of its regular employment and pay-roll reporting program.	*Industrial Relations*
Gross Axle Weight Rating (GAWR)	The maximum weight that the front or rear axle can carry. The front and rear gross axle weights must not exceed the front and rear GAWR's. Gross Combination Weight Rating (GCWR) - The total weight of the loaded tow vehicle and the loaded trailer.	*Mechanical Engineering*
Gross calorific value	The gross calorific value indicates the amount of heat that is released when the fuel is burned, including the heat contained in the flue gases (so-called condensation heat).	*Thermal Management*
Gross company-operated production	Total production from all company-operated properties, including all working and nonworking interests.	*Energy*
Gross Delivered Treating Cost (GDTC)	The cost of additive in one volume unit of finished product including shipping cost, but not base fluid credit.	*Lubrication*
Gross domestic product (GDP)	The total value of goods and services produced by labor and property located in the United States. As long as the labor and property are located in the United States, the supplier (that is, the workers and, for property, the owners) may be either U.S. residents or residents of foreign countries.	*Energy*
Gross domestic product (GDP) implicit price deflator	The implicit price deflator, published by the U.S. Department of Commerce, Bureau of Economic Analysis, is used to convert nominal figures to real figures.	*Energy*
Gross energy intensity	Total consumption of a particular energy source(s) or fuel(s) by a group of buildings, divided by the total floor space of those buildings, including buildings and floor space where the energy source or fuel is not used, i.e., the ratio of consumption to gross floor space.	*Energy*
Gross gas withdrawal	The full-volume of compounds extracted at the wellhead, including nonhydrocarbon gases and natural gas plant liquids.	*Energy*
Gross Generation	Amount of electric energy produced by generating units as measured at the generator terminals.	*Energy*
Gross head	A dam's maximum allowed vertical distance between the upstream's surface water (headwater) forebay elevation and the downstream's surface water (tailwater) elevation at the tail-race for reaction wheel dams or the elevation of the jet at impulse wheel dams during specified operation and water conditions.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Gross input to atmospheric crude oil distillation units	Total input to atmospheric crude oil distillation units. Includes all crude oil, lease condensate, natural gas plant liquids, unfinished oils, liquefied refinery gases, slop oils, and other liquid hydrocarbons produced from tar sands, gilsonite, and oil shale.	*Energy*
Gross inputs	The crude oil, unfinished oils, and natural gas plant liquids put into atmospheric crude oil distillation units.	*Energy*
Gross national product (GNP)	The total value of goods and services produced by the nation's economy before deduction of depreciation charges and other allowances for capital consumption. It includes the total purchases of goods and services by private consumers and government, gross private domestic capital investment, and net foreign trade.	*Energy*
gross profit	The difference between the warehouse cost and retail price, expressed as a percentage of the retail price.	*Agriculture*
Gross value	The theoretical value of ore determined simply by applying the assay of metal or metals and the current market price. It must be used only with caution and severe qualification.	*Mining*
Gross value royalty	A share of gross revenue from the sale of minerals from a mine.	*Mining*
Gross Vehicle Weight (GVW)	The total weight of the vehicle, including passengers, fuel, cargo, and attachments.	*Mechanical Engineering*
Gross vehicle weight rating (GVWR)	Vehicle weight plus carrying capacity.	*Energy*
gross weight	Full weight of a shipment, including both goods and packaging.	*Agriculture*
Gross withdrawals fuel on the lease	Full well stream volume from both oil and gas wells, including all natural gas plant liquids and nonhydrocarbon gases after oil, lease condensate, and water have been removed. Also includes production delivered as royalty payments and production used as fuel on the lease.	*Energy*
Gross working interest	The reporting company's working interest plus the proportionate share of any basic royalty interest or overriding royalty interest related to the working interest.	*Energy*
Gross working interest ownership basis	Gross working interest ownership is the respondent's working interest in a given property plus the proportionate share of any royalty interest, including overriding royalty interest, associated with the working interest.	*Energy*
Ground	1. The electrical neutral line having the same potential as the surrounding earth. 2. The negative side of DC power supply. 3. Reference point for an electrical system.	*Electrical*
Ground	A conducting path, intentional or accidental, between an electric circuit or equipment and the earth, or some large conducting body serving in place of the earth (a voltage reference).	*Electrical Engineering*
Ground control	The regulation and final arresting of the closure of the walls of a mined area. The term generally refers to measures taken to prevent roof falls or coal bursts.	*Mining*
Ground crab	-see Crab.	*Mining*
Ground effects	In airplanes, this refers to a cushion of air that builds up as a plane nears the ground. In racecars, this refers to artificially generated low-pressure areas underneath the car that help it adhere to the ground. This is done by "tunnels' on each side of the bottom of the car, which start off small near the front and gradually get bigger towards the rear, creating a vacuum as the car moves forward	*NASCAR*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	using the ground as the fourth side of the tunnel. The specifications of these ground effects tunnels are carefully monitored. Rules specify the dimensions of the tunnels and how high the outside edge of each tunnel must be from the ground. The greater the gap between the tunnel side and the ground, the more air escapes and the less downforce is generated.	
Ground Loop	A current loop created when a signal source and a signal measurement device are grounded at two separate points on a ground bus through which noise currents flow. These currents generate voltage drops between the two ground connections, causing measurement errors.	*Reliability Engineering*
Ground Potential	Zero potential with respect to the ground or earth.	*Electrical*
Ground pressure	The pressure to which a rock formation is subjected by the weight of the superimposed rock and rock material or by diastrophic forces created by movements in the rocks forming the earth's crust. Such pressures may be great enough to cause rocks having a low compressional strength to deform and be squeezed into and close a borehole or other underground opening not adequately strengthened by an artificial support, such as casing or timber.	*Mining*
Ground State	an atom with all of electrons in the lowest possible energy levels that do not violate the Pauli Exclusion Principle	*Physics*
Ground water	The supply of fresh water found beneath the Earth's surface, usually in aquifers, which supply wells and springs. It provides a major source of drinking water.	*Petroleum Drilling*
Grounded Junction	A form of construction of a thermocouple probe where the hot or measuring junction is in electrical contact with the sheath material so that the sheath and thermocouple will have the same electrical potential.	*Electrical*
Grounded Neutral	A circuit operates with grounded neutral when the neutral is metallically connected to ground and there is a provision for immediate removal of a faulted element.	*Electrical*
Grounding Conductor	A conductor used to connect equipment or the grounded circuit of a wiring system to a grounding electrode or electrodes; usually colored green.	*Electrical*
Groundwater	water held underground that has seeped through soil layers and bedrock	*Agriculture*
groundwater	the water contained in the pore spaces of saturated geologic media.	*Chemical*
Groundwater (confined)	Groundwater under pressure significantly greater than atmospheric, with its upper limit the bottom of a bed with hydraulic conductivity distinctly lower than that of the material in which the confined water occurs.	*Petroleum Engineering*
Groundwater (unconfined)	Water in an aquifer that has a water table exposed to the atmosphere.	*Petroleum Engineering*
Groundwater Contamination	Occurs when water carries contaminants downward, infiltrating the soil to the groundwater without being adequately filtered or naturally treated.	*Petroleum Engineering*
Groundwater Recharge	Inflow of water to a groundwater reservoir from the surface. Infiltration of precipitation and its movement to the water table is one form of a natural recharge. Also, the volume of water added by this process.	*Petroleum Engineering*
Groundwater Table	The surface between the zone of saturation and the zone of aeration. The surface of an unconfined aquifer.	*Petroleum Engineering*
Group 3	A petroleum products spot market trading hub based in Tulsa, Oklahoma that serves the U.S. Mid-Continent region.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Group Bonus	a method of wage payment based on the performance of a group of persons on the job.	*Industrial Relations*
Group Insurance	a program designed to provide low-cost protection to large groups of workers through a plan, generally negotiated with an insurance company, to cover life, accident, sickness, hospitalization, and medical and surgical benefits.	*Industrial Relations*
Group Leader	a worker who acts as a foremen, usually over a small group of employees.	*Industrial Relations*
Group name	The DOE/EIA-assigned name identifying a composite supply source (i.e., commonly metered gas streams from more than one field), which is often the case in contract areas, field areas, and plants. A group name can also be a pipeline purchase (i.e., FERC Gas Tariff, Canadian Gas, Mexican Gas, and Algerian LNG). Emergency purchases and short term purchases are also group names. Group Code - The DOE/EIA-assigned code identifying a composite supply source.	*Energy*
Group quarters	Living arrangement for institutional groups containing ten or more unrelated persons. Group quarters are typically found in hospitals, nursing or rest homes, military barracks, ships, halfway houses, college dormitories, fraternity and sorority houses, convents, monasteries, shelters, jails, and correctional institutions. Group quarters may also be found in houses or apartments shared by ten or more unrelated persons. Group quarters are often equipped with a dining area for residents.	*Energy*
GROUP SELECTION	A specific type of selective cutting resulting in the removal of small groups of trees in order to regenerate shade-intolerant trees.	*Forestry*
Group	A group is a logical grouping of assemblies with similar characteristics. All assemblies in a group have the same initial average enrichment, the same cycle/reactor history, the same current location, the same burnup, the same owner, and the same assembly type.	*Energy*
Grout	A fluid mixture of cement or bentonite with water of a consistency that can be forced through a pipe and placed as required.	*Petroleum Engineering*
grout	a watery mixture of cement (and commonly bentonite) without aggregate that is used to seal the annular space around well casings to prevent infiltration of water or short-circuiting of vapor flow.	*Chemical*
Grouting	The process of sealing off a water flow in rocks by forcing thin cement slurry, or other chemicals into the cervices; usually done through a diamond drill hole.	*Mining*
Grove	an old term for a mine, usually a lead or iron mine, but in the early days of coal mining it was also used for a coalmine. (Derbys.). –see also Day hole.	*Mining*
Growl	Coal pillars were said to growl when they were undergoing a crushing weight. (Mids.).	*Mining*
GRPE	Groupe de Rapporteurs pour la Pollution et l'Energie	*Petro-Chemical Abbreviations*
GRUB	An insect larva; a term loosely applied, usually to larvae of Coleoptera; larva is thick-bodied with well-developed thoracic legs but no abdominal prolegs.	*Forestry*
Grubstake	Finances or supplies of food, etc., furnished a prospector on promise of some share in any discoveries he make.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
GSA	General Services Administration (US)	*Petro-Chemical Abbreviations*
GTAB	gasoline treated as blend stock	*Petro-Chemical Abbreviations*
GTL	gas to liquids	*Petro-Chemical Abbreviations*
Guarantee on Trial Rate	a minimum rate set while trial runs are made on new work in order to set piece rates.	*Industrial Relations*
Guaranteed Annual Wage	a plan adopted by some employers to provide a stable labor force on a year-round basis.	*Industrial Relations*
Guaranteed Base Rate	the amount guaranteed per hour or other period for workers on piece rates or other incentive wage-payment plans.	*Industrial Relations*
Guaranteed Earnings	provision under some contracts which safeguards for an employee a guaranteed minimum wage where failure to maintain production is caused by machinery breakdown or other causes beyond the employee's control.	*Industrial Relations*
Guaranteed Employment	a program, instituted by an employer or by joint negotiation with a union, assuring workers a specified number of hours of work per week pr number of weeks per year.	*Industrial Relations*
Guard Rail	Members paralleling the path of a conveyor and limiting the objects or carriers to movement in a defined path.	*Equipment*
Guard Rail Cable	A galvanized wire rope or strand erected along a highway.	*Wire Rope & Cable*
Guerilla Unionism	a term used to describe activities of a union whose prime concern is with violence and ruthlessness in its dealing with employers.	*Industrial Relations*
Guernsey	A breed of dairy cattle that originated on the Isle of Guernsey, in the British Isles.	*Agriculture*
Guffey Coal Act	a law passed by Congress in 1937 for the purpose of stabalizing the coal industry through price regulation and promotion of fair competition.	*Industrial Relations*
Gug	a self acting haulage incline. Also known as a 'running gug'. (Som.).	*Mining*
GUI	The standard abbreviation for Graphic User Interface; this is an interface which uses graphics rather than characters to communicate.	*Control Engineering*
Guided Wave testing (GWT)	One of latest methods in the field of non-destructive evaluation. The method employs mechanical stress waves that propagate along an elongated structure while guided by its boundaries. This allows the waves to travel a long distance with little loss in energy. Nowadays, GWT is widely used to inspect and screen many engineering structures, particularly for the inspection of metallic pipelines around the world. In some cases, hundreds of meters can be inspected from a single location. It is also known as Long range ultrasonic testing.	*Reliability Engineering*
Guides	Vertical rails of wood, metal or wire ropes to guide the cages in the shaft. -see Conductor and Rigid conductors. Also called 'cage guides' or 'shaft guides'. Generally of two types, i) rigid guides of timber or steel (rails or channels), or ii) rope guides, comprising steel wire ropes hung from the headframe and held vertical and taut by weights hung at their lower ends.	*Mining*

Term	Definition	*Industry*
GUIDES	The timber along the sides of a shaft for the purpose of steadying, or guiding, the cage or conveyance.	*Mining*
Guides	The timber rails installed along the walls of a shaft for steadying, or guiding, the cage or conveyance.	*Mining*
Guilds	organizations of skilled craftsmen which acted as mutual benefit societies to take care of the needs of their members.	*Industrial Relations*
Guimpe	A type of garment covering the neck and shoulders, often part of a nun's habit	*Breakroom*
Guinier–Preston zone	Structure developed in the early stages of precipitation of an Al–Cu alloy.	*Material Process*
Gulch Claims	Minerals found in gullies which are usually dry during part of the year.	*Mining*
Gulch	A ravine.	*Mining*
Gulching	the moving and crackling noise made by a weight coming on (N. Staffs.).	*Mining*
Gullet	a fissure in the strata allowing amounts of water or gas into the pit. (N. East).	*Mining*
Gum	free-burning small coal, slack or duff. (Scot.).	*Mining*
Gum	Viscous exudation from trees or plants which hardens on exposure to air but, unlike a resin, is soluble either in cold water or alcohol. The name is often loosely6 applied to natural resins in the varnish industry.	*Material Process*
Gum flinger	a 'gummer' who throws cuttings into the goaf. Also called a 'gum stower'.	*Mining*
Gummer	a person or machine used to clean the cuttings behind the coal-cutting machine; or a device attached to a coal cutter that deposits cuttings ejected behind the machine; or a device attached to and driven by an A F C that removes fine material deposited under the delivery sprockets.	*Mining*
Gummings	fine coal dust resulting from the action of a chain, bar, or gib coal-cutting machine, or just a general term for fine coal. Also known as 'Buggy', 'Bug-dust', 'Scuftings' or 'Kirvings'.	*Mining*
Guncotton	Highly nitrated cellulose, of about 13% nitrogen content, used as a propellant charge in gunifer, not used as such in lacquers or plastics.	*Material Process*
Gunite	mortar supplied by a cement gun to the roof and sides of an excavation or the face of a stopping; or to spray with a cement gun.	*Mining*
Gunite	A cement applied by spraying to the roof and sides of a mine passage.	*Mining*
Gurdy or Gurdy wheels	an arrangement of three pulleys with breaks for use on a self-acting incline. (Scot.).	*Mining*
Gurney flap	On the front and rear wings there are often small vertical strips along the trailing edges of the wings, set at 90 degrees to the plane of the wing. Because these strips greatly reduce turbulent air behind the wing, they can add significant downforce with a minimal amount of drag. On the rear wing, it can be easily exchanged for a different size during a pit stop. American racing legend Dan Gurney is generally credited with creating this device, which is also known as a "wickerbill."	*NASCAR*
GUS	Global User Station	*Control Engineering*
Gusher	An oil well that comes in with such great pressure that oil flows out of the well head into the air. Such wells used to be commonplace, but with improved drilling methods, notably the use of drilling mud, gushers are a rarity today.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Guss and crook or Guss harness	a length of rope fastened around the waist of the carting boy or 'twin-boy'. The rope was attached to a chain and crook, which was used to pull along the carts or puts underground.	*Mining*
Gutter	a ditch cut in the main roadways to carry water away from the workings, or an airway through the goaf; or long narrow cavities in the roof of the face or a roadway.	*Mining*
Guy Line	Strand or rope, usually galvanized, for stabilizing or maintaining a structure in fixed position.	*Wire Rope & Cable*
GVW	gross vehicle weight	*Petro-Chemical Abbreviations*
GW	see Gigawatt	*Energy*
Gwe	See Gigawatt-electric.	*Energy*
GWh	see Gigawatthour	*Energy*
GWP	see Global Warming Potential	*Energy*
Gypsum	Calcium sulfate dihydrate ($CaSO_4$ $2H_2O$) a sludge constituent from the conventional lime scrubber process, obtained as a byproduct of the dewatering operation and sold for commercial use.	*Energy*
Gypsum	A sedimentary rock consisting of hydrated calcium sulfate.	*Mining*
Gyratory crusher	A machine that crushes ore between an eccentrically mounted crushing cone and a fixed crushing throat. Typically has a higher capacity than a jaw crusher.	*Mining*
Gyro	Can be either a wireline (lowered down into the wellbore) or MWD based (instrument placed near the drill bit when well is being drilled) device that uses an electronic gyro-compass to determine the angle of the well. Gyro tools can provide the angle of the wellbore and direction. This information ensures that the well is going in the right direction, stays on target, and does not collide with other wells. Gyro surveys are also required by the Texas Railroad Commission on each vertical or horizontal oil and gas well.	*Petroleum Drilling*
H	H	*Forestry*
--H--	--H--	*Petroleum Drilling*
H1 Lubricant	Food-grade lubricants used in food processing environments where there is some possibility of incidental food contact. Lubricant formulations may only be composed of one or more approved base stocks, additives and thickeners (if grease) listed in Guidelines of Security Code of Federal Regulations (CFR) Title 21, §178.3570.	*Lubrication*
H2 Lubricant	Lubricants used on equipment and machine parts in locations where there is no possibility that the lubricant or lubricated surface contacts food. Because there is not the risk of contacting food, these lubricants do not have a defined list of acceptable ingredients. They cannot, however, contain intentionally heavy metals such as antimony, arsenic, cadmium, lead, mercury or selenium. Also, the ingredients must not include substances that are carcinogens, mutagens, teratogens or mineral acids.	*Lubrication*

Please see the Appendix for further illustration

Term	Definition	*Industry*
H2S	Hydrogen Sulfide.	*Petroleum Engineering*
H2S Service	Hydrogen Sulfide Service. A term to indicate that equipment material specifications meet the requirements of NACE Standard MR-0175, for use in controlling fluid containing partial pressure (a specific percentage as nominated by the standard) of Hydrogen Sulfide.	*Petroleum Engineering*
H3 Lubricant	Also known as soluble or edible oil. These are used to clean and prevent rust on hooks, trolleys and similar equipment.	*Lubrication*
HA	The absolute pressure on the surface of the liquid in the supply tank. Typically atmospheric pressure (vented supply tank), but can be different for closed tanks. Don't forget that altitude affects atmospheric pressure (HA in Denver, CO will be lower than in Miami, FL). Always positive (may be low, but even vacuum vessels are at a positive absolute pressure)	*Heat Transfer Process*
Haarlem oil (linseed oil)	Sulfurated and terebinthinated, Duch drops. Brownish- red oil, soluble in oil of turpentine, insoluble in water.	*Material Process*
Habeas Corpus, Writ of	an order issued by a competent court ordering the person having custody of another person to produce him at a specific time and place and to show cause to the court why the person should not be set free.	*Industrial Relations*
Haber process	Original process for synthesis of ammonia from nitrogen and hydrogen.	*Material Process*
Haber-Bosch process	Early process for synthesis of ammonia, operating at 200 atmospheres pressure, 550 °C, (1022°F), with a promoted iron catalyst.	*Material Process*
Habitat	An area in which a specific plant or animal can naturally live, grow, and reproduce.	*Forestry*
Habitat diversity	A variety of food or cover for wildlife that is often critical to the survival of a species.	*Forestry*
HACCP	Hazard Analysis and Critical Control Points (HACCP) was started by NASA in conjunction with the Apollo space program to insure astronaut food supplies were safe to consume over the course of their mission. The logic was simple for NASA; keep the astronauts from getting sick during the mission. According to the United States Food and Drug Administration (FDA) HACCP is "a state of the art approach to food safety." Consisting of seven principles, HACCP outlines the guidance for, and implementation of the food safety program to include both animal and plant products.	*Maintenance*
Hack	a heavy pick used in shaft sinking or for breaking stone.	*Mining*
Hackney	There are two hackney breeds, one a horse, the other a pony. Both are bred for their brilliant, high-stepping performance in harness. The Hackney horse developed in Great Britain in the early 18th Century as a stylish, spirited light horse favored by English sportsmen and aristocrats as a carriage horse. The Hackney pony was developed by crossing the Hackney horse	*Agriculture*
Hade	The angle made by the line of a fault with the vertical: paradoxically, when this angle approaches 90° the fault is said to be one having a 'low hade'.	*Mining*
Hafnium (Hf)	Element of atomic number 72, metal resembling zirconium. Very difficult to separate from zirconium.	*Material Process*
Hag	to hag, to cut with an axe, or to bring down the coal with a pick. (Scot.).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hagafilm	Trade mark for a protective film forming amine added to boilers or steamlines to inhibit condensate corrosion caused by oxygen and low pH. Available in liquid and solid forms.	*Material Process*
Hagamin	Trade mark for powdered organic dispersing agent and antifoam compound used for minimizing scale formation in boilers.	*Material Process*
Hagen–Poiseuille equation	Equation that relates the mass rate of flow in a tube as proportional to the pressure difference per unit length and to the fourth power of the tube radius. The law is valid for fully developed laminar flow.	*Chemical*
Hagen-poiseuille Law	The friction factor of Darcy's Formula or the ratio of 64 to Reynold's Numbers when flow is laminar.	*Mechanical, Process, and Operations*
Hague Case	case in which former Mayor Frank Hague and other officials of Jersey City, N.J. were enjoined from enforcing so-called street meting ordinance that had been invoked by the officials to forbid union members to hold meetings in streets and parks.	*Industrial Relations*
Hairpin	A sharp, 180-degree turn.	*NASCAR*
Halane	Trade mark for 1,3-dichloro5,5-dimethylhydantoin. It contains 66% minimum, available chlorine and reacts with water to liberate hydrochlorous acid at a slow and controlled rate. Major uses are in dry household laundry bleaches and in water treating.	*Material Process*
Halazone (HOOCC6H4SO2NCl2) (para-sulfondichloramino-benzoic acid)	Halazone (HOOCC6H4SO2NCl2) (para-sulfondichloraminobenzoic acid) White crystalline powder strong chlorine odor, affected by light, soluble in glacial acetic acid, benzene, slightly soluble in water, chloroform, insoluble in petroleum ether. It is used in the form of tablets as a powerful water disinfectant.	*Material Process*
Half bar or Split bar	a long prop split down the middle used with props or dowties as roof supports. Also called 'Planks'. (N. East).	*Mining*
Half Bridge	Two active elements or strain gages.	*Electronic Process*
Half cell reaction	Chemical reaction associated with either the anodic or the cathodic half of an electrochemical cell.	*Material Process*
Half course	a road driven in seam at an angle of about 45° to the full dip.	*Mining*
Half effect	Sideways deflection of charge carriers associated with the application of a magnetic field perpendicular to an electrical current.	*Material Process*
Half heading system	a method of ripping at the end of a longwall advancing face in which the line of the rib side of the face working coincides with the centerline of the gate being driven, following the face. Half of the cross sectional area of the ripping adjacent to the face resembles a normal ripping while the other half resembles a solid heading.	*Mining*
Half life	In water treatment, the time it takes to lose "of a slug fed product from the system through blowdown, drift and windage when taking into account its continuous concentration by evaporation and dilution by fresh makeup.	*Chemical Engineering*
Half life	The time required for the decomposition of half of a sample of a radioactive substance, and this a measure of the rate of such processes. Half lives vary from fractions of a second for some of the radioactive elements produced in recent nuclear studies to thousands of year for relatively stable radioactive elements such as uranium. **The term is also applied to any process in which a single substance changes in some way.**	*Material Process*

Please see the Appendix for further illustration

Term	Definition	Industry
Half life	Half life. The time required for the decomposition of half of a sample of a radioactive substance, and this a measure of the rate of such processes. Half lives vary from fractions of a second for some of the radioactive elements produced in recent nuclear studies to thousands of year for relatively stable radioactive elements such as uranium. The term is also applied to any process in which a single substance changes in some way.	*Material Process*
Half-Duplex	One way at a time data communication; both devices can transmit and receive data, but only one at a time.	*Electrical*
Half-edge seam	a highly inclined seam of coal. Hence the term 'cutting half-edge' meaning cutting on a steep incline. (Scot.). - see also Rearing seams.	*Mining*
Half-Flash	An ADC architecture which uses a bank of comparators first to digitize the upper half bits, then uses a digital-to-analog converter (DAC) to subtract that voltage from the input, and then digitizes what remains of the input signal to get the lower half bits. Also see application note 748, "The ABCs of ADCs."	*Electrical Engineering*
Half-life	The time it takes for an isotope to lose half of its radioactivity.	*Energy*
Halfmarrows	young putters. –see also Foal. (N. East).	*Mining*
Halibut liver oil (haliver oil) Pale yellow	Halibut liver oil (haliver oil) Pale yellow to dark red liquid characteristic, slightly fishy but not rancid odor and fishy taste. Soluble in alcohol, ether, chlorophor, and carbon disulfide, insoluble in water.	*Material Process*
Halite	Rock salt.	*Mining*
Halite (NaCl) (rock salt)	A natural sodium chloride found in the earth in beds varying from a few feet to over three thousand feet in thickness. Color , white or colorless, but often yellow, brown, deep blue from impurities, streak, white, vitreous luster, taste salty.	*Material Process*
Haliver oil	See halibut oil.	*Material Process*
Hall Effect	The phenomenon whereby a force is brought to bear on a moving electron or hole by a magnetic field that is applied perpendicular to the direction of motion. The force direction is perpendicular to both the magnetic field and the particle motion directions.	*Engineering Physics*
Hall Effect Sensor (Hall Sensor)	A type of position sensor that senses magnetic field strength and produces a voltage that changes with this strength. Hall sensors can have digital or analog outputs.	*General Mechanical*
Hall Effect Technology	The description given to the following phenomena; when a semiconductor, through which a current is flowing, is placed in a magnetic field, a difference in potential (voltage) is generated between the two opposed edges of the conductor in the direction mutually perpendicular to both the field and the conductor. Typically used in sensing magnetic fields.	*Electrical Engineering*
Hall process	The electrolitic process by means of which metallic aluminum is recovered from aluminum oxide (usually bauxite). The aluminum oxide, after being purified from iron and other substances in preliminary chemical operations, is dissolved in a bath of molten cryolite (sodium aluminum fluoride). Passage of a direct current through this molten mixture results in formation and liberation of carbon dioxide at the carbon anodes, and production and collection of molten aluminum in the in the bottom of the cell, whose carbon lining serves as the cathode. The molten aluminum is periodically tapped through a suitable opening.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Halloysite (Al2O2 3SiO2 2H2O)	A variety of clay used to some extent in refractories and as a petroleum cracking catalyst.	*Material Process*
Halo Effect	a term used to describe a noticeable error among those who rate employees because of the frequency with which a single or general impression tends to permeate the rating of all other factors.	*Industrial Relations*
Halocarbon plastics	Plastic based on resins made by the polymerization of monomers composed only of carbon and a halogen or halogens. The halocarbon plastics are characterized by extreme chemical resistance, excellent electrical properties, and good resistance to heat.	*Material Process*
Halogen lamp	A type of incandescent lamp that lasts much longer and is more efficient than the common incandescent lamp. The lamp uses a halogen gas, usually iodine or bromine, that causes the evaporating tungsten to be redeposited on the filament, thus prolonging its life. Also see Incandescent lamp.	*Energy*
Halogen Tin Addition Agent 2 Special	A clear, colorless stable liquid. It uses for continuous tin platting on steel strip and copper or steel wire. Bath permits high current densities and rapid plating.	*Material Process*
Halogenated substances	A volatile compound containing halogens, such as chlorine, fluorine or bromine.	*Energy*
Halogenation	Incorporation of one of the halogen elements, usually chlorine or bromine, into a chemical compound. Thus benzene is treated with chlorine to form chlorobenzene and ethylene is treated with bromine to form ethylene dibromide Compounds of chlorine and bromine are sometimes used as the source of the halogen, phosphorous pentachloride being a good example.	*Material Process*
Halogens	The chemically related elements, fluorine, chlorine, bromine and iodine.	*Material Process*
Halopont	Trade mark for a line of pigment colors used for tinting white paper.	*Material Process*
Halotrichite (FeAl2(SO4) 22H2O)	A natural sulfate of iron and aluminum. Colorless to white, yellowish, or greenish, usually in groups of needle-shaped crystals, or incrustations. Taste astringent.	*Material Process*
Halsey Premium (Gain Sharing) Plan	considered the first incentive wage plan which offered a guaranteed wage in addition to an extra bonus for output in excess of the standard.	*Industrial Relations*
HALT	Acronym for Highly accelerated life test. See Accelerated Life test.	*Reliability Engineering*
Hamamelis (witch-hazel, winter bloom, snapping hazel, striped alder, tobacco wood)	Alcoholic extract used in medicine, pharmacy, toilet preparations.	*Material Process*
Hambone	see 'Fork'.	*Mining*
Hamburg blue	A name applied loosely to any of a number of the varieties of iron blue pigments.	*Material Process*
Hammer pond	An artificial pond for maintaining a head of water at a water mill.	*Civil Engineering*
Hammer Unions	(Wing Unions) fast acting connectors and commonly used in temporary flowlines. Hammer Unions consists of 3 pieces.	*Petroleum Engineering*
Hammer Weld	Method of manufacturing large pipe (usually NPS 20 or DN 500 and larger) by bending a plate into circular form, heating the overlapped edges to a welding temperature, and welding the longitudinal seam with a power hammer applied to the outside of the weld while the inner side is supported on an over-hung anvil.	*Maintenance and Repair*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hammer Wrench	"Flogging Spanner" A wrench with a heavy box end and shortened heavy handle having an elongated square shaped end. Designed to allow heavy striking with a sledge hammer to tighten or loosen nuts on stud bolts.	*Petroleum Engineering*
Hammertone	Trade name for an enamel finish resembling hammered metals.	*Material Process*
Hampshire	A black hog with a white belt over the shoulders. It is one of the oldest breeds in the United States. Although its origins are unknown, it is believed to have derived from old British breeds common in Scotland and bordering English counties. It is thought to have come to America between 1825-1835. Once locally known by many names, in 1904 the name Hampshire was adopted by its breed association, the Hampshire Swine Registry. The breed has been highly popular in the United States since 1910.	*Agriculture*
Hanane	A mixture of bis-(dimethylamino)-fluorophosphine oxide and bis-(dimethylamino(-phosphonous anhydride. Colorless liquid, faint odor. Soluble in water and most organic liquids. Dangerous to handle. Used as a systemic insecticide to control mealybugs on cocoa plants.	*Material Process*
Hand	Term used to describe the touch or handle of fabrics.	*Material Process*
Hand Cleanser	A cleaner designed to clean hands with an emphasis on removing oils, grease and other occupational soils.	*Chemistry*
Hand gears	a hand-operated windlass, used at the beginning of a shaft sinking or to wind coal from a shallow mine shaft (S. Staffs.).	*Mining*
Hand Labor Work	work which requires the actual manual manipulation of materials by physical handling.	*Industrial Relations*
Hand loading	An underground loading method by which coal is removed from the working face by manual labor through the use of a shovel for conveyance to the surface. Though rapidly disappearing, it is still used in small-tonnage mines.	*Energy*
Hand move	An irrigation system in which sections of sprinkler pipe are moved by hand, one by one, from one setting to another.	*Agriculture*
Hand wheel	A wheel-shaped valve operating device intended to be grasped with one or both hands which allows turning the valve stem or operator shaft to which it is attached.	*Mechanical*
Handbook	See Cochrane Handbook for Systematic Reviews of Interventions (formerly Cochrane Reviewers' Handbook)	*Quality Engineering*
Handbook Advisory Group (HAG)	The Handbook Advisory Group is an advisory group to the CCSG. It is responsible for the Cochrane Handbook for Systematic Reviews of Interventions (previously called the Cochrane Reviewers' Handbook). Also called: HAG	*Quality Engineering*
Hand-filled	to fill coal using a shovel on to a face conveyor as opposed to machine-loading; or to separate the large from the small coals in the mine and fill them by hand into a tub or corf etc. Also called 'handgot'.	*Mining*
Handgot	-see Hand-filled.	*Mining*
Handicapped Worker	a person who has mental or physical disabilities which limit his working potential.	*Industrial Relations*
Handicapped Worker Rate	a special rate, below the legal minimum, permitted under the Fair Labor Standards Act for workers who are physically handicapped.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Handicraft Economy	one of the stages of economic development in which specialized handwork was performed either in th family unit or a small productive organization.	*Industrial Relations*
Handling	the process by which steel articles are carried throughout the galvanizing facility, by chain, wire, hook, or racked in a fixture	*Materials Process*
Handover	Switching an on-going call to a different channel or cell in a wireless cellular network. Also known as "handoff."	*Electrical Engineering*
Handrail	A horizontal or sloping rail placed along an access way or at the edge of a platform. Usually at 3'-6" above the walkway or floor. (See Safety Handrail. See OSHA for design criteria.)	*Facility Engineering*
Handsearching, Handsearcher	Handsearching within The Cochrane Collaboration refers to the planned searching of a journal page by page (i.e. by hand), including editorials, letters, etc., to identify all reports of randomized controlled trials and controlled clinical trials. All the identified trials, regardless of the topic, are sent to the United States Cochrane Center, for inclusion in CENTRAL, and forwarding to the US National Library of Medicine (NLM) for re-tagging in MEDLINE. Trials that are within the scope of a Cochrane Review Group or Field go into their specialized register of trials. A handsearching manual is available through the US Cochrane Center. A journal handsearch registration form must be completed for each journal title and sent to the US Cochrane Center to avoid duplication of effort.	*Quality Engineering*
Handshake	An interface procedure that is based on status/data signals that assure orderly data transfer as opposed to asynchronous exchange.	*Electrical*
Handwheel	A manual override device used to stroke a valve or limit its travel. The handwheel is sometimes referred to as a hand jack. It may be top-mounted, side-mounted, in-yoke mounted or shaft-mounted and declutchable.	*Industrial Engineering*
Handy flux	Trade mark for flux useful with silver brazing alloys between 1100 and 1600°F (533.33 and 871.11 °C). Said to dissolve and absorb nearly all refractory oxides, including chromium oxide. Made in paste form and applied by brush. At 800 °F (426.66 °C) it begins to melt and is fully liquid and active at 1100 °F (533.33 °C) where its water clear appearance serves as a temperature guide. Claimed to be the best flux for taking full advantage of Sil-Fos and Easy Flo low temperature brazing alloys.	*Material Process*
Hang or Hing	the lie or hade of a fault. (Bris.); or a slope or an incline. (Scot.).	*Mining*
Hanger	Refers to several different tools. The casing hanger is the portion of a wellhead assembly which provides support for the casing string when it is lowered into the wellbore. The liner hanger is used to hang casing liners (casing strings that do not reach the surface) from the internal wall of a previous casing string. The instrument hanger is a downhole tool on which downhole gauges or instruments that are to be temporarily left in the wellbore are attached. The tubing hanger attaches to the topmost tubing joint in the wellhead to support the tubing string.	*Petroleum Drilling*
Hangers and Supports	Hangers and supports include elements which transfer the load from the pipe or structural attachment to the supporting structure or equipment. They include hanging-type fixtures such as hanger rods, spring hangers, sway braces, counterweights, turnbuckles, struts, chains, guides, and anchors and bearing-type fixtures such as saddles, bases, rollers, brackets, and sliding supports.	*Maintenance and Repair*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hanging coal	undercut coal that fails to fall.	*Mining*
Hanging wall	The wall or rock on the upper or top side of a vein or ore deposit.	*Mining*
Hanging wall	The rock on the upper side of a vein or ore deposit.	*Mining*
Hansa	Trade mark of proprietary line of pigments. Used for wallpaper, lacquer, plastics, paints, rubber and coated paper. Characterized by very good fastness to light, etc.	*Material Process*
Hansa Yellow	A class name for a group of organic azo pigments that have good brightness, light-fastness and alkali resistance. Their tinting strength is about four times that of a good chrome yellow of approximately the same shade. Hansa Yellow has comparatively poor opacity in enamels and poor flow and is seldom used except where a non-toxic pigment is required, prohibiting the use of a chrome or cadmium yellow. The heat resistance of Hansa Yellow is not particularly good, and therefore it is not well adapted for use in baking enamels.	*Material Process*
Hansgirg process	The production of magnesium from magnesium oxide by carbon reduction. Magnesium oxide is fed into an electric arc furnace lined with carbon where it is vaporized at a temperature of 2100 °C (3812 °F). The mixture of magnesium vapor and carbon monoxide is withdrawn from the furnace and cooled to 200 °C (392 °F) by diluting with natural gas (so the carbon monoxide will not oxidize the magnesium). A fine dust, containing 65% magnesium mixed with the oxide and carbon, is collected with electrostatic precipitators and sublimed at 750°C (1382°F) in electric retorts using high vacuum. The product thus obtained is better than 99% pure magnesium.	*Material Process*
HAPEM	Hazardous Air Pollution Exposure Model	*Petro-Chemical Abbreviations*
Hard binds	see Blackband ironstones.	*Mining*
Hard Chromium Plating	The electrolytic deposition of chromium to form a very hard (1000Hv), tough coating with good wear resistance. The structure is micro-cracked.	*Paint and Coatings*
Hard Facing	A material that is harder than the surface to which it is applied. It is normally used to resist fluid erosion or to reduce the chance of galling between moving parts. Hard facing may be applied by fusion welding, diffusion or spray coating the material. Stellite is a common material used for this purpose.	*Industrial Engineering*
Hard facing	A surface preparation in which an alloy is deposited on a metal surface usually by weld overlay to increase resistance to abrasion and or corrosion.	*Mechanical*
Hard Failure	This is a failure in a system or equipment which would require the intervention of a specialist to get the system or equipment working again.	*Reliability Engineering*
Hard head	A term applied to the impurities obtained when tin is refined.	*Material Process*
Hard heading	see Stone drift.	*Mining*
Hard Joint	A joint in which the plates and material between the nut and bolt bearing surfaces have a high stiffness when subjected to compression by the bolt load. A joint is usually defined as hard if the bolt is tightened to its full torque and it rotates through an angle of 30 degrees or less after it has been tightened to its snug condition.	*Maintenance*
Hard Labor	labor requiring unusual physical exertion.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hard magnet	Magnet relatively immobile domain walls.	*Material Process*
Hard Rock Mine	A tunnel that is dug into solid rock for the sole purpose of finding valuable or precious rocks, minerals, or metals.	*Mining*
Hard sphere	Atomic or ionic model of an atom as a spherical particle with a fixed radius.	*Material Process*
Hard spot	Glossy spot having insufficient impregnation. Small isolated lump of transparent partially colloided material occurring in or under the surface of a transparent plastic. (Also, called cat's eye, cold shot, cold slug, fish eye, stone and tear drop.)	*Material Process*
Hard Water	Water containing soluble salts of calcium and magnesium, and sometimes iron.	*Chemistry*
Hard drawn Wire	As applied to aluminum and copper, wire that has been cold drawn to final size so as to approach the maximum strength obtainable.	*Electrical*
Hardcopy	Output in a permanent form (usually a printout) rather than in temporary form, as on disk or terminal display.	*Electrical*
Hardcopy	Output in a permanent form (usually a printout) rather than in temporary form, as on disk or display terminal.	*Electronic Process*
Hardenability	A measure of the depth to which a specific ferrous alloy may be hardened by the formation of martensite upon quenching from a temperature above the upper critical temperature.	*Engineering Physics*
Hardened Washers	The force under the head of a bolt or nut can exceed, at high preloads, the compressive yield strength of the clamped material. If this occurs excessive embedding and deformation can result in bolt preload loss. To overcome this hardened washers under the bolt head can be used to distribute the force over a wider area into the clamped material. A more modern alternative is to use a flange headed nuts and bolts.	*Maintenance*
Hardener	Chemical curing or hardening agent. Example, formaldehyde used to harden protein and for curing some phenolics.	*Material Process*
Hardfacing	The application of a cladding or coating of material designed to resist wear.	*Paint and Coatings*
Hardfacing	A surface preparation in which an alloy is deposited on a metal surface usually by weld overlay to increase resistance to abrasion and or corrosion.	*General Mechanical*
Hardness	The measure of some materials' resistance to deformation by surface indentation or by abrasion.	*Engineering Physics*
Hardness	Parameter defined by Moh's scale.	*Material Process*
Hardness Test	A test designed to assess the resistance to penetration from a load. The surface is indented under a defined load and the depth or area of penetration is measured.	*Paint and Coatings*
Hardness, calcium	The calcium compounds dissolved in water, usually expressed as calcium carbonate.	*Chemical Engineering*
Hardness, carbonate	The calcium and magnesium carbonate and bicarbonate dissolved in water, expressed as calcium carbonate. Other metallic cations such as ferrous iron, barium, zinc and manganous ions are also included.	*Chemical Engineering*
Hardness, magnesium	Magnesium compounds dissolved in water, expressed as calcium carbonate.	*Chemical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hardness, noncarbonate	The difference between the total hardness and the total alkalinity of a water.	*Chemical Engineering*
Hardness, permanent	The hardness that cannot be removed from water by precipitation reactions. Essentially, the same thing as the non-carbonate hardness.	*Chemical Engineering*
Hardness, temporary	The hardness that can be removed from water by precipitation. Essentially, the same as the carbonate hardness.	*Chemical Engineering*
Hardness, total	The sum of the calcium and the magnesium hardness. Also the sum of the permanent hardness and temporary hardness. The U.S. Geological Survey hardness criteria for potable water are: soft water 0-60 ppm, moderately hard water 61-120 ppm, hard water 121-180 ppm, very hard water >180 ppm.	*Chemical Engineering*
Hards	coals of a hard and closed-grained character. (Mids.); or the name given to large pieces of best quality coal. (Som.).	*Mining*
Hardstand	A hard-surfaced area on which heavy vehicles or airplanes can be parked	*Civil Engineering*
Hardstop	cement-like material for sealing stoppings.	*Mining*
Hardware	The electrical, mechanical and electromechanical equipment and parts associated with a computing system, as opposed to its firmware or software.	*Electrical*
Hardwired	To be physically interconnected and intended for a specific purpose. Hardwired logic is essentially unalterable.	*Electrical Engineering*
Hardwood	Relatively high strength wood from deciduous trees with covered seeds.	*Material Process*
Hardwoods (deciduous trees)	Trees with broad, flat leaves shed on an annual basis whose wood hardness varies among individual species.	*Forestry*
Hare Core of Unemployment	that group in the labor market which is able and willing to work but which, even in periods of short labor supply, still remain unemployed.	*Industrial Relations*
Harflex 300X	Trade name for a high molecular weight polymeric type plasticizer. Very viscous, light yellow liquid, odorless, low volatility, heat and light resistant, high compatibility for vinyl resins. Plasticizing vinyl resins used wherever resistance to extraction by cold or boiling water, soapy solutions, gasoline and oils is required.	*Material Process*
Harflex 500X	Trade name for low temperature plasticizer. Light yellow liquid, Extruded products, such as wire coverings and garden hose, unsupported films, such as shower curtains, handbag, coated fabrics, such as upholstery plastisols.	*Material Process*
Hargreaves process	The manufacture of sodium sulfate (salt cake) from sodium chloride and sulfur dioxide. A mixture of sulfur dioxide and air is passed through sodium chloride brine in a countercurrent manner to produce sodium sulfate and hydrochloric acid.	*Material Process*
Harmonic	A sinusoidal quantity having a frequency that is an integral multiple (′2, ′3, etc.) of a fundamental (′1) frequency.	*Reliability Engineering*
Harmonic Distortion	The presence of frequencies in the output of a device that are not present in the input signal, and are multiples of components of the input signal. Clipping is a common cause but other nonlinearities can also introduce harmonics.	*Electrical Engineering*
Harmonic extraction	the working of one or more coal seams by means of a special layout and time sequence of extraction to minimize the effects of subsidence at the surface.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Harmonics	Generally, harmonics are oscillations in the base power frequency. In electrical AC systems, the base frequency is typically 50 or 60 hertz (Hz) and harmonics occur in multiples of this, for example 100 Hz, 150 Hz, 200 Hz, etc. where the base frequency is 50 Hz. Harmonics occur whenever there is a disturbance of the voltage or current, e.g., if the current is interrupted or if AC current is synthesized in a converter. The problem with harmonics is that electrical devices may react differently when exposed to a different frequency than the one they are designed for, which may cause damage. Harmonics are an increasing problem in power systems as most power electronics solutions cause harmonics. Harmonics can be reduced by the use of power filters.	*Electrical*
Harmony Clause	this is a provision in a collective bargaining contract setting the "tone" of employer-union-employee relationships as cooperation in the best interests of all.	*Industrial Relations*
Harotz or harrotz	a bed of hard coal in the Top Hard (Worksop Area); sometimes a term for dirty fusain.	*Mining*
Harp,	a cross between a shovel and a fork. The blade of the shovel was cut away to leave a series of slots to allow the small coal and slack to fall through to be left in the mine. Also known as a Branded shovel, or to fill a hutch with coal at the face using a harp. (Scot.).	*Mining*
Harrie or Herrie	to rob pillars. To load the loose coal that had come down due to the action of weighting or to take a strip of coal without taking the whole pillar. This was an easy way of winning coal but dangerous by taking away support for the roof. (Scot.). - see also Lameskirting and Pillar robbing.	*Mining*
Harris process	Process for the removal of arsenic, antimony, tin, and zinc from virgin or secondary lead by agitating the molten metal with molten caustic soda and salt. All undesirable metals are oxidized and the oxides dissolved in the caustic with exception of silver which is removed in a subsequent desilvering operation.	*Material Process*
HART	HART (Highway Addressable Remote Transducer) is a communications protocol that converts a 4-20mA analog signal into a digital signal, making communication to smart field devices possible.	*Mechanical*
Hartshorn	Spirit oil An alcoholic or aqueous solution of ammonia.	*Material Process*
Harvest	to gather a crop when it is finished growing	*Agriculture*
Hash	Distortion (usually non-harmonic) on a signal. May be viewed on an oscilloscope trace. (slang).	*Reliability Engineering*
HASS	Highly accelerated stress screening. See environmental stress screening (ESS).	*Reliability Engineering*
HASS	Highly accelerated stress screening.	*Reliability Engineering*
Hasson or Hassing	a vertical gutter between the water rings or garlands in a shaft, which carried the water down the shaft to the sump. Also called the 'gauton'. (Scot.).	*Mining*
Hastelloy	Trademark for a series of nickel base alloys, having high resistance to corrosives, such as hot hydrochloric acid, hot sulfuric acid, wet chlorine as well as excellent physical and mechanical properties. Used for agitators, autoclaves, concentrators, heat exchangers, exhausters, evaporators, condensers, dryers, heating and cooling coils, injectors, blowers, burner parts, chlorinating equipment, pickling equipment, pyrometer equipment, thermometer wells, pipe and fittings, pumps, valves, kettles, tanks, and vessels for all kinds of chemical plant service.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hat rollers	cast iron or steel rollers shaped like a hat, revolving on a vertical pin for guiding haulage ropes round curves.	*Mining*
Hatch Act	the Federal Corrupt Practices Act, Section 313 of which was amended by Section 304 of the Labor Management Relations Act of 1947.	*Industrial Relations*
Hatchens	rise roadways from the main levels. (Som.).	*Mining*
Hatchettite	A soft variety of ozocerite or mineral wax. Color yellowish white, yellow, or greenish yellow.	*Material Process*
Hatching	a method of working a steeply inclined thin seam - see Topple, or a self-acting haulage incline in a thin seam. (Bris.).	*Mining*
Hatters' Shakes	a form of industrial mercury poisoning.	*Industrial Relations*
Haulage	the transportation of men or materials from one place to another; or a powered system for transporting tubs, usually involving a rope, track and an engine.	*Mining*
Haulage cost	Cost of loading ore at a mine site and transporting it to a processing plant.	*Energy*
Haulage engine	an engine employed to move coal, men and material along the haulage roadways in a mine.	*Mining*
Haulage Rope	Wire Rope used for pulling movable devices such as cars that roll on a track.	*Wire Rope & Cable*
Haulage	The horizontal transport of ore, coal, supplies, and waste. The vertical transport of the same is called hoisting.	*Mining*
Haulageway	Any underground entry or passageway that is designed for transport of mined material, personnel, or equipment, usually by the installation of track or belt conveyor.	*Mining*
Haunt	the coal trade carried out at the pit head. The term was said to have originated when customers used to come and haunt the pit until they could be supplied (Som.)—see also Coal hill and Landsale.	*Mining*
Hausmannite (Mn3O4)	A natural manganese oxide. Color brownish black to black streak chestnut brown, luster greasy metallic.	*Material Process*
Hauynitte (Na, Ca8Al6 Si6O24 (SO4)2)	A feld spathoid mineral similar to sodalite, found in lava and other igneous rocks.	*Material Process*
Haveg	A molded structural material completely acid-, alkali- and solvent-resistant used for tanks, towers, coolers, piping and valves.	*Material Process*
Hawes-Cooper Act	a statute enacted by Congress on 1929 which permitted any state after January 1934 to regulate or limit within its jurisdiction the sale of goods made by prison labor.	*Industrial Relations*
Hawkins v. Bleakly	a decision by th United States Supreme Court in 1917 holding constitutional a workmen's compensation law of the State of Iowa.	*Industrial Relations*
Hawser	Wire rope, usually galvanized, used for towing or mooring marine vessels.	*Wire Rope & Cable*
Haylage	Livestock feed produced by acid-producing fermentation of grass or alfalfa.	*Agriculture*
Haymarket Riot	a mass meeting in Haymarket Square in Chicago, held on May 4, 1886, to listen to speeches on labor unionism and the eight-hour day, turned into a riot when someone threw a bomb at the police.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Haynes "Manit" Wage Plan	a method of incentive wage payments introduced in 1921 which attempts to reduce all work to a common denominator- Manit, or work performed in a man-minute.	*Industrial Relations*
Haynes Stellite	Trade mark for a series of metal-cutting tool alloy consisting chiefly of cobalt, chromium, and tungsten with only a small percentage of iron.	*Material Process*
Haystellite	Trade mark for tungsten carbide possessing great hardness and toughness. Inserts, composite rod, tube rod, application by welding, to oil-well drilling tools and other parts subjected to extreme abrasion.	*Material Process*
Hazard	A hazard is a situation that poses a level of threat to life, health, property, or environment. It is any situation that has the potential of causing harm to people, property or the environment.	*Reliability Engineering*
Hazard analysis	Hazard analysis is technique for the quantitative assessment of a hazard, after it has been identified by an operability study.	*Material Process*
Hazard potential (HP)	The hazard potential is governed by the number of persons who stay in this impact area without protection.	*Material Process*
Hazard Rate	Hazard rate is the instantaneous speed of failure. Hazard rate is the ratio of failures that occur in an interval to the size of the population at the start of the interval, divided by the length of time.	*Maintenance*
Hazard ratio	A measure of effect produced by a survival analysis. This represents the increased risk with which one group is likely to experience the outcome of interest. For example, if the hazard ratio for death for a treatment is 0.5, then we can say that treated patients are likely to die at half the rate of untreated patients.	*Quality Engineering*
Hazardous Location	Defined as an area in which explosive, toxic, flammable or combustible mixtures are present.	*Electrical Engineering*
Hazardous material	Hazardous material are substances which, by chemical action, cause severe damage on contact with living tissue, or in the case of leakage, materially damage, or even destroy, other goods or the means of transport, they may also cause other hazards.	*Material Process*
Hazardous Material	Any substance having the properties capable of producing adverse effects on the health or safety of people.	*Chemistry*
Hazardous Materials	Materials that have been determined by the Department of Transportation (DOT) to be a risk to health, safety, and property; including such items as explosives, flammable, poisons, corrosives, and radioactive materials. These materials must be packaged, labeled, handled, and transported according to stringent regulation from several agencies (current U.S. regulations appear in the Code of Federal Regulations, Title 49, Parts 171-178). International shipments must comply with docket HM-181, where the term "dangerous goods" is often used interchangeably with hazardous materials.	*Procurement*
Hazardous Occupations	work which has been held dangerous to the health of women and minors by state and federal laws.	*Industrial Relations*
Hazardous Waste	Automotive wastes that are on the EPA's list of hazardous materials or that have one or more hazardous characteristics.	*Mechanical Engineering*
Haze (Internal)	An indefinite cloudy appearance within a transparent plastic.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Haze (Surface)	An indefinite cloudy appearance on the surface of a plastic not describable by the terms Chalking, Frosting, or Lubricant bloom.	*Material Process*
Hazel or Hazle	In some mining areas 'hazel' was an old mining term for sandstone. It was also another name for the roof or top directly above a coal seam.	*Mining*
HAZID	Acronym for Hazard Identification which is a tool for analyzing hazards which is usually applied early in a project as soon as process flow diagrams, draft heat and mass balances, and plot layouts are available. The method is a design-enabling tool, acting to help org anise the HSE deliverables in a project. The structured brainstorming technique typically involves designer and client personnel engineering disciplines, project management, commissioning and operations. The main major findings and hazard ratings help to deliver HSE compliance, and form part of the project Risk Register required by many licensing authorities.	*Reliability Engineering*
Hazop	A Structured Process, Originally Developed By Ici Following The Flixborough Disaster, Intended To Proactively Identify Equipment Modifications And/ Or Safety Devices Required In Order To Avoid Any Significant Safety Or Environmental Incident As A Result Of Equipment Failure. Similar, In Some Respects To Reliability Centered Maintenance, But Not As Rigorous As Reliability Centered Maintenance In Identifying Underlying Causes Of Failure, And Does Not Consider, In Any Depth, The Possibility Of Avoiding Such Incidents Through Applying Appropriate Proactive Maintenance Tasks.	*Plant Engineering*
HAZOP (Hazard and Operability)	HAZOP stands for a structured technique that may be applied typically to a chemical production process, identifying hazards resulting from potential malfunctions in the process. It is essentially a qualitative process. A HAZOP would typically be undertaken by a multi-disciplinary team, asking a series of "what if?" questions using guidewords representing deviations from the intended process parameters. By undertaking a HAZOP at an early design stage, potential problems can be avoided instead of having to make costly modifications. HAZOP is similar in some respects to Reliability-centered Maintenance (RCM), but not as rigorous in identifying underlying causes of failure, and does not consider the possibility of avoiding such incidents through applying appropriate proactive maintenance tasks.	*Maintenance*
HB-40	Trade mark for partially hydrogenated terphenyl. Clear, mobile, high-boiling hydrocarbon, almost colorless, with faint, pleasant odor. Insoluble in water, miscible in all proportions at room temperature with a number of solvents and oils. Plasticizer for vinyl compounds, for styrene water dispersion paints, paper coatings, adhesives and styrene coating resins.	*Material Process*
H-bomb	Abbreviation for hydrogen bomb (nuclear fusion).	*Material Process*
H-Bridge	A circuit diagram which resembles the letter "H." The load is the horizontal line, connected between two pairs of intersecting lines. It is very common in DC motor-drive applications where switches are used in the "vertical" branches of the "H" to control the direction of current flow, and thus the rotational direction of the motor.	*Electrical Engineering*
HBW	Brinell Hardness abbreviation.	*Petroleum Engineering*
HCCI	homogeneous charge compression ignition	*Petro-Chemical Abbreviations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
HCFC	See Hydrochlorofluorocarbon	*Energy*
HDD	See Heating Degree Days.	*Energy*
HDDO	heavy-duty diesel oil	*Petro-Chemical Abbreviations*
HDDT	heavy-duty diesel trucks	*Petro-Chemical Abbreviations*
HDE	heavy-duty engine	*Petro-Chemical Abbreviations*
HDGT	heavy-duty gasoline trucks	*Petro-Chemical Abbreviations*
HDMO	Heavy duty diesel engine oil	*Petro-Chemical Abbreviations*
HDT	heavy-duty trucks	*Petro-Chemical Abbreviations*
HDVIP	Heavy Duty Vehicle Inspection Program	*Petro-Chemical Abbreviations*
Head	The product of the water's weight and a usable difference in elevation gives a measurement of the potential energy possessed by water.	*Energy*
Head coal	an old term for the band of coal next to the roof; or the upper section of a thick seam that was worked in two or more lifts; or the top coal on a loaded wagon. (Scot.).	*Mining*
Head gate	A control gate at the upstream end of a canal or lock. A floodgate of a race, sluice, etc.	*Civil Engineering*
Head Loss	The loss of pressure in a flow system measured using a length parameter (i.e., inches of water, inches of mercury).	*General Engineering*
Head or Heading	a roadway, generally in a coal seam; or to excavate a roadway or narrow passage; or 'head out', to outcrop.	*Mining*
Head out	to outcrop.	*Mining*
Head piece	the top, horizontal wooden bar in a set of roadway supports. Two vertical posts or props comprising the other components. Also called a 'collar'.	*Mining*
Head Pressure	Pressure in terms of the height of fluid, P = yrg, where r = fluid density and y = the fluid column heights. Expression of a pressure in terms of the height of fluid, r = yrg, where r is fluid density and y = the fluid column height. g = the acceleration of gravity.	*General Engineering*
Head section	A term used in both belt and chain conveyor work to designate that portion of the conveyor used for discharging material.	*Mining*
Head tree	a piece of a crown-tree, a foot long or so, placed upon a prop to support the roof.	*Mining*
Head grade	The average grade of ore fed into a mill.	*Mining*
HEAD, STATIC DISCHARGE	The static head from the centerline of the pump to the free discharge surface.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Head, Velocity	The equivalent head through which the liquid would have to fall to attain a given velocity. Mathematically, it is equal to the square of the velocity (in feet) divided by 64.4 feet per second squared.	*Mechanical, Process, and Operations*
Header	In a counterflow tower, the main pipe carrying hot water to a series of laterals for distribution over the fill material. In a crossflow tower, it is the main pipe carrying hot water to the distribution basin of each cell. (See Manifold.)	*Facility Engineering*
Header	A manifold that distributes fluid from a series of smaller pipes or conduits.	*Petroleum Engineering*
Headers	miners who are engaged in the drivage of new roadways underground.	*Mining*
Headframe	The structure surmounting the shaft which supports the hoist rope pulley, and often the hoist itself.	*Mining*
Headgear. Headstocks, Headsticks or Headframe	the head frame of a mine shaft supporting the winding wheels (pulleys). The term may also include all the raised structure around the shaft, which is used for loading and unloading cages. Also called the 'pithead gear'.	*Mining*
Heading	The vein above the drift.	*Mining*
Heading	A vein above a drift. An interior level or airway driven in a mine. In longwall workings, a narrow passage driven upward from a gangway in starting a working in order to give a loose end.	*Mining*
Headings	In placer mining, the mass or gravel above the head of sluice.	*Mining*
Head-On	A condition whereby the target approaches the sensing face of the proximity sensor with its center along the sensing face.	*Electrical Engineering*
Headrace	The race, flume, or channel leading to a water wheel or the like.	*Civil Engineering*
Headroom	the height between the floor and the roof in a roadway.	*Mining*
Heads	see heading.	*Mining*
Headsman	a lad who was not strong enough alone to put, but able to do so with the assistance of a small boy, called a 'foal'. (N. East).	*Mining*
Head-way	a method of working. A roadway driven parallel to the cleat of the coal. Also called 'walls' and 'narrows'. –see also Endways; or a heading driven at right angles to the strike of the seam. (N. East); or a pair of narrow drifts driven into the solid coal.	*Mining*
Headways	When a pair of roadways are driven for exploring or winning the coal, they are called exploring or winning headways, the principal of which is called the fore-headways, and the other the back-headways. (N. East).	*Mining*
Headways course	a line of walls or holings extending from side to side of a panel of boards. (N. East).	*Mining*
Headways face	see End face. Heap, the pit heap. The colliery waste tip. - see also Bing.	*Mining*
Headwork	work which requires the use of the brain rather than brawn.	*Industrial Relations*
Health and Decency Standard of Living	a term used to describe the requirements of a family, which includes low rental housing in a nice neighborhood, with private toilet facilities and adequate light and heat.	*Industrial Relations*
Health and Safety Executive	A UK government agency that monitors organizations to ensure that they carry out their operations abiding by laid down regulations.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Health Benefit Programs	plans, generally worked out through collective bargaining, which provide for sick benefit payments and other programs conducive to maintaining a healthy work force.	*Industrial Relations*
Health Insurance	generally applied to medical services and costs due to illness.	*Industrial Relations*
Health physics	The branch of physics which deals the protection of personnel from the hazards of radiation. The chief duties of a health physicist are to set the standard for safe levels of exposure to various radiations, to aid in the detection of radiation in order to avoid overexposures, and to develop suitable methods for protection against radiation.	*Material Process*
Health, Education and Welfare; Department of	an executive department of government established in 1953 which took over the functions of the Federal Security Agency created in 1939.	*Industrial Relations*
Heap leach solutions	The separation, or dissolving-out from mined rock of the soluble uranium constituents by the natural action of percolating a prepared chemical solution through mounded (heaped) rock material. The mounded material usually contain slow grade mineralized material and/or waste rock produced from open pit or underground mines. The solutions are collected after percolation is completed and processed to recover the valued components.	*Energy*
Heap leaching	A process whereby valuable metals, usually gold and silver, are leached from a heap, or pad, of crushed ore by leaching solutions percolating down through the heap and collected from a sloping, impermeable liner below the pad.	*Mining*
Heapstead	the entire surface works about a colliery shaft including the headgear, loading and screening plant, winding and pumping engines etc. with their respective buildings.	*Mining*
Hearing	the proceeding in which a court or an administrative body receives evidence for the purpose of performing an adjunctionary function or also, in the case of an administrative body, a fact-finding or rule-making function.	*Industrial Relations*
Heat	Thermal energy. Heat is expressed in units of calories or BTU's.	*General Engineering*
HEAT	1. Added energy that causes substances to rise in temperature, fuse, evaporate, expand, or undergo any of various other related changes, that flows to a body by contact with or by radiation from bodies at higher temperatures, and can be produced in a body (as by compression). 2. The energy associated with the random motions of the molecules, atoms, or smaller structural units of which matter is composed (See Joule).	*Mechanical, Process, and Operations*
HEAT	As used in the Health Considerations paragraphs of this document, heat refers to thermal burns for contact with hot surfaces, hot liquids and vapors, steam, etc.	*Petroleum Engineering*
Heat analysis	A chemical analysis conducted by a foundry immediately prior to pouring which measures the exact chemical composition of a particular batch of molten metal.	*General Mechanical*
heat capacity	the quantity of energy that must be supplied to raise the temperature of a substance. For contaminated soils heat capacity is the quantity of energy that must be added to the soil to volatilize organic components. The typical range of heat capacity of soils is relatively narrow, therefore variations are not likely to have a major impact on application of a thermal desorption process.	*Chemical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Heat Capacity (Specific Heat)	This is a measurement of a fluid's capacity to carry heat. It determines indicates how many BTUs it would take to increase 1lb of fluid by 1°F. Heat capacity is used along with other properties to determine efficiency as quantified by the heat transfer coefficient.	*Lubrication*
Heat content	The amount of heat energy available to be released by the transformation or use of a specified physical unit of an energy form (e.g., a ton of coal, a barrel of oil, a kilowatt hour of electricity, a cubic foot of natural gas, or a pound of steam). The amount of heat energy is commonly expressed in British thermal units (Btu). Note: Heat content of combustible energy forms can be expressed in terms of either gross heat content (higher or upper heating value) or net heat content (lower heating value), depending upon whether or not the available heat energy includes or excludes the energy used to vaporize water (contained in the original energy form or created during the combustion process). The Energy Information Administration typically uses gross heat content values.	*Energy*
Heat convertible resin	A thermosetting resin convertible by heat to an infusible and insoluble mass.	*Material Process*
Heat cycle	A tire that has been heated up through use and then cooled down has experienced one heat cycle. This often results in a slight hardening of the tire compound, which can make the tire perform at a high level for a longer period of time. See Scrubbed Tires.	*NASCAR*
Heat distortion point	Temperature at which a standard bar of plastic material will be deflected 0.010 in (0.0245 cm).	*Material Process*
Heat Endurance	The time of heat aging that a material can withstand before failing a specific physical or electrical test.	*Electrical*
Heat exchanger	A device for transferring heat from one substance to another. Heat transfer can be by direct contact, as in a cooling tower, or indirect, as in a shell and tube condenser. Can also be the tube or fin tubed bundles in a wet/dry tower.	*Chemical Engineering*
Heat exchanger	A Device which transfers heat through a conducting wall from one fluid to another. (See "Cooler [Oil].")	*Mechanical, Process, and Operations*
Heat Fusion Joint	A joint made in thermoplastic piping by heating the parts sufficiently to permit fusion of the materials when the parts are pressed together.	*Maintenance and Repair*
Heat load	Heat removed from the circulating water within the tower. It may be calculated from the range and the circulating water flow.	*Chemical Engineering*
Heat mark	Extremely shallow, regular or irregular depression or groove in the surface of a plastic having practically no depth and visible because of a sharply defined rim or roughened surface.	*Material Process*
Heat of fusion	The quantity of heat required to convert unit weight of a solid to the liquid state. This varies somewhat with temperature, and to a much less extent with pressure.	*Material Process*
Heat pump	Heating and/or cooling equipment that, during the heating season, draws heat into a building from outside and, during the cooling season, ejects heat from the building to the outside. Heat pumps are vapor-compression refrigeration systems whose indoor/outdoor coils are used reversibly as condensers or evaporators, depending on the need for heating or cooling.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Heat pump (air source)	An air-source heat pump is the most common type of heat pump. The heat pump absorbs heat from the outside air and transfers the heat to the space to be heated in the heating mode. In the cooling mode the heat pump absorbs heat from the space to be cooled and rejects the heat to the outside air. In the heating mode when the outside air approaches 32 °F or less, air-source heat pumps loose efficiency and generally require a back-up (resistance) heating system.	*Energy*
Heat pump (geothermal)	A heat pump in which the refrigerant exchanges heat (in a heat exchanger) with a fluid circulating through an earth connection medium (ground or ground water). The fluid is contained in a variety of loop (pipe) configurations depending on the temperature of the ground and the ground area available. Loops may be installed horizontally or vertically in the ground or submersed in a body of water.	*Energy*
Heat pump efficiency	The efficiency of a heat pump, that is, the electrical energy to operate it, is directly related to temperatures between which it operates. Geothermal heat pumps are more efficient than conventional heat pumps or air conditioners that use the outdoor air since the ground or ground water a few feet below the earth's surface remains relatively constant throughout the year. It is more efficient in the winter to draw heat from the relatively warm ground than from the atmosphere where the air temperature is much colder, and in summer transfer waste heat to the relatively cool ground than to hotter air. Geothermal heat pumps are generally more expensive ($2,000-$5,000) to install than outside air heat pumps. However, depending on the location geothermal heat pumps can reduce energy consumption (operating cost) and correspondingly, emissions by more than 20 percent compared to high-efficiency outside air heat pumps. Geothermal heat pumps also use the waste heat from air-conditioning to provide free hot water heating in the summer.	*Energy*
Heat pumps	Heat pumps utilize the energy contained in the environment to heat rooms and the domestic water. Their principle of operation corresponds to that of a refrigerator, but the other way around.	*Thermal Management*
Heat Rate	A measure of generating station thermal efficiency and generally expressed as Btu per net k/Wh. The heat rate is computed by dividing the total Btu content of the fuel burned (or of heat released from a nuclear reactor) by the resulting net kWh generated.	*Energy*
Heat Resistance	Ability of a substance to maintain physical and chemical identity and chemical identity and electrical integrity under specified temperature conditions.	*Electrical*
Heat Rise	The rise in temperature above ambient that results from operating an electric pinch valve at predetermined conditions.	*Mechanical*
Heat seal	To bond or weld a material to itself or to another material by heat alone.	*Material Process*
Heat Shock	A test to determine stability of a material by sudden exposure to a high temperature for a short period of time.	*Electrical*
Heat Sink	Mechanical device that is thermally-connected to a heat-producing electronic component, designed to conduct heat away from the device. Most heat sinks are aluminum and employ fins to increase surface area and encourage the transfer of heat to the ambient environment.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Heat Tightening	Heat tightening utilizes the thermal expansion characteristics of the bolt. The bolt is heated and expands: the nut is indexed (using the angle of turn method) and the system allowed to cool. As the bolt attempts to contract it is constrained longitudinally by the clamped material and a preload results. Methods of heating include direct flame, sheathed heating coil and carbon resistance elements. The process is slow, especially if the strain in the bolt is to be measured, since the system must return to ambient temperature for each measurement. This is not a widely used method and is generally used only on very large bolts.	*Maintenance*
Heat Transfer	The process of thermal energy flowing from a body of high energy to a body of low energy. Means of transfer are: conduction; the two bodies contact. Convection; a form of conduction where the two bodies in contact are of different phases, i.e. solid and gas. Radiation: all bodies emit infrared radiation.	*General Engineering*
Heat Transfer	The process of thermal energy flowing from a body of high energy to a body of low energy. Means of transfer are - conduction; the two bodies contact. Convection; a form of conduction where the two bodies in contact are of different phases, i.e. solid and gas. Radiation - all bodies emit infrared radiation.	*Electronic Process*
Heat Treating	A process for treating metals where heating to a specific temperature and cooling at a specific rate changes the properties of the metal.	*General Engineering*
Heat treatment	Describes any process or procedure by which the internal structure of steel is altered by heating to produce desired physical and mechanical characteristics.	*General Mechanical*
Heat treatment charts	Furnace charts providing a temperature vs. time record of the heating and cooling cycle, required by a specific heat treatment process for a particular furnace load of steel or steel parts.	*Mechanical*
Heat-Affected Zone	That portion of the base metal which has not been melted but whose mechanical properties or microstructure has been altered by the heat of welding or cutting.	*Maintenance and Repair*
Heated floorspace	The area within a building that is space heated.	*Energy*
Heating Coil	See Coil Heat Exchanger	*Industrial*
Heating Degree Days (HDD)	A measure of how cold a location is over a period of time relative to a base temperature, most commonly specified as 65 degrees Fahrenheit. The measure is computed for each day by subtracting the average of the day's high and low temperatures from the base temperature (65 degrees), with negative values set equal to zero. Each day's heating degree days are summed to create a heating degree day measure for a specified reference period. Heating degree days are used in energy analysis as an indicator of space heating energy requirements or use.	*Energy*
Heating equipment	Any equipment designed and/or specifically used for heating ambient air in an enclosed space. Common types of heating equipment include: central warm air furnace, heat pump, plug-in or built-in room heater, boiler for steam or hot water heating system, heating stove, and fireplace. Note: A cooking stove in a housing unit is sometimes reported as heating equipment, even though it was built for preparing food.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Heating intensity	The ratio of space-heating consumption or expenditures to square footage of heated floor space and heating degree-days (base 65 degrees Fahrenheit). This ratio provides a way of comparing different types of housing units and households by controlling for differences in housing unit size and weather conditions. The square footage of heated floor space is based on the measurements of the floor space that is heated. The ratio is calculated on a weighted, aggregate basis according to the following formula Heating Intensity = Btu for Space Heating / (Heated Square Feet * Heating Degree-Days).	*Energy*
Heating stove burning wood, coal, or coke	Any free-standing box or controlled-draft stove; or a stove installed in a fireplace opening, using the chimney of the fireplace. Stoves are made of cast iron, sheet metal, or plate steel. Free-standing fireplaces that can be detached from their chimneys are considered heating stoves.	*Energy*
Heating value	The average number of British thermal units per cubic foot of natural gas as determined from tests of fuel samples.	*Energy*
Heatings	outbreaks of spontaneous combustion. Also fires in the waste or gob. (Mids.).	*Mining*
Heatronic	High frequency electric heating of plastics.	*Material Process*
Heat-treating	heating and cooling a solid metal or alloy in such a way as to obtain desired conditions or properties	*Materials Process*
Heave	when the floor of a roadway rises due to floor weight. Also called 'lift'.-see also Creep, Floor-weight and Floor lift.	*Mining*
Heaver	a coal cutter or hewer.	*Mining*
Heaving	Applied to the rising of the bottom after removal of the coal; a sharp rise in the floor is called a "hogsback".	*Mining*
Heavy	A molded piece thicker than the mold is designed to make, caused by overcharge or lack of pressure.	*Material Process*
Heavy Ends	The portions of a petroleum distillate fraction which are highest boiling, and therefore distill over last if the temperature is raised progressively.	*Lubrication*
Heavy gas oil	Petroleum distillates with an approximate boiling range from 651 degrees Fahrenheit to 1000 degrees Fahrenheit.	*Energy*
Heavy metals	Metallic elements, including those required for plant and animal nutrition, in trace concentration but which become toxic at higher concentrations. Examples are mercury, chromium, cadmium, and lead.	*Energy*
Heavy oils	Oils distilled over from coal-tar between 230 and 330 °C (446-626 °F), the exact range not at all definite.	*Material Process*
Heavy rail	An electric railway with the capacity for a "heavy volume" of traffic and characterized by exclusive rights-of-way, multi-car trains, high speed and rapid acceleration, sophisticated signaling, and high platform loading. Also known as "subway," elevated (railway), "metropolitan railway (metro)."	*Energy*
Heavy resin oil	Heavy coal tar oils, reddish brown liquid, nontoxic in normal usage.	*Material Process*
Heavy water	Water containing a significantly greater proportion of heavy hydrogen (deuterium) atoms to ordinary hydrogen atoms than is found in ordinary (light) water. Heavy water is used as a moderator in some reactors because it slows neutrons effectively and also has a low cross section for absorption of neutrons.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Heavy-water-moderated reactor	A reactor that uses heavy water as its moderator. Heavy water is an excellent moderator and thus permits the use of in expensive natural (unenriched) uranium as fuel.	*Energy*
hectare	The most commonly used measure of agricultural lands in the metric system. A hectare equals 10,000 square meters (or 2.471 acres). Hectare is the measure used in most of the world outside the United States. To convert hectares to acres, multiply times 2.471. (Example: 100 hectares × 2.471 = 247.10 acres.)	*Agriculture*
Hedeoma (pennyroyal, squaw mint)	Dried leaves and flowering tops of the annual plant Hedeoma pulegioide. It is volatile oil, tannin.	*Material Process*
Hedeoma oil (American pennyroyal oil, pulegium oil)	A pale yellowish limpid liquid, essential oil, characteristic, pungent, mint-like odor and taste. Sensitive to light. Soluble in two or more parts of 70% alcohol, ether and chloroform, slightly soluble in water. Chief constituents are pulegone and hedeomal. It is derivated distilled from the leaves and tops of Hedeoma pulegioides.	*Material Process*
Hedging	The buying and selling of futures contracts so as to protect energy traders from unexpected or adverse price fluctuations.	*Energy*
Hedging contracts	Contracts which establish future prices and quantities of electricity independent of the short-term market. Derivatives may be used for this purpose.	*Energy*
Hedging	Taking a buy or sell position in a futures market opposite to a position held in the cash market to minimize the risk of financial loss from an adverse price change.	*Mining*
Hedonal (CH3CH2CH2 CH(CH3) OCO NH 2) (methylpropylcarbinol urethane)	White crystalline powder, feeble aromatic odor and taste, soluble in alcohol, ether, organic solvents, sparingly soluble in cold water, more soluble in hot water. Fusing point 76 °C (168.8 °F), b.p. 215 °C (419 °F).	*Material Process*
HEFCAD	high energy, friction characteristics and durability	*Petro-Chemical Abbreviations*
Heft	another name for weight. (Som.).	*Mining*
Hehner number	The percent by weight of water-insoluble fatty acids in oils and fats.	*Material Process*
HEI	Health Effects Institute	*Petro-Chemical Abbreviations*
heifer	A young cow that has not yet given birth to a calf.	*Agriculture*
Height	Vertical measurement of a bar code.	*Gears*
height divided by section width	height divided by section width.	*Mechanical Engineering*
Heinz Case	a landmark decision of the U.S. Supreme Court upholding an order of the NLRB requiring the Heinz Company to sign a collective bargaining agreement with a union, where the wages, hours, and other terms and conditions were not in dispute.	*Industrial Relations*
Heirloom	a variety that has been conserved through years of cultivation and seed preservation. Varieties may be of specific significant to a particular era, location, or culture.	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Held by production	A legal process that allows exploration and production companies to extend the terms of the original contract for lease and royalties for the life of a producing well, even if that term goes beyond the stipulated term of the original lease.	*Petroleum Drilling*
Helical Gear	A cylindrical gear wheel which has slanted teeth that follow the pitch surface in a helical manner.	*Reliability Engineering*
Helical Overlap	The effective face width of a helical gear divided by the gear axial pitch; also called the Face Overlap.	*Mechanical Engineering*
Helical Spring Washer	A split type of spring washer whose purpose is to prevent self loosening of the nut or the bolt. The idea or principle behind the helical spring washer is for one end of the tang of the washer to indent into the fastener (the nut or bolt head) and the other into the joint surface so that any loosening rotation is prevented. Junker in his paper in 1969 on the cause of self-loosening of fasteners (reference: Junker, G., New criteria for self-loosening of fasteners under vibration. SAE Paper 690055, 1969) concluded that this type of lock washer has no ability to lock. This type of washer is sometimes called a spring lock washer or sometimes a standard lock washer.	*Maintenance*
Heliogen	Trade mark for phthalocyanine dyestuffs. Used for paints, lacquers, printing inks, wallpaper, coated paper, rubber, and organic plastics. Characterized by outstanding fastness to light as well as brilliancy of shade.	*Material Process*
Heliophan	Brand name for a proprietary product. Oil-soluble and water-soluble organic compounds used as ultraviolet filters in cosmetics, suntan preparations and also in technical products.	*Material Process*
Heliostat	A mirror that reflects solar rays onto a central receiver. A heliostat automatically adjusts its position to track daily or seasonal changes in the sun's position. The arrangement of heliostats around a central receiver is also called a solar collector field.	*Energy*
Heliotropin (C6H3(CH2OO)CHO) (piperonal, piperonyl aldehyde)	White shining crystals, turns red-brown on exposure to light, sweet floral odor, typical of heliotrope, m.p. 35.5-37 °C (95.9 -98.6°F), b.p. 263 °C (505.4 °F). Soluble in alcohol and ether, insoluble in water and glycerol. It is used in medicine, perfumery, suntan preparations.	*Material Process*
Heliozone	Trade mark for a rubber a rubber chemical. Greenish, waxy material. It is used to retard sun-checking and cracking of rubber and synthetic rubber.	*Material Process*
Helium (He)	Monatomic noble gas, most inert element, atomic number 2. Used as a plasma gas in plasma spraying and to make your voice sound like a chipmunk when inhaled.	*Paint and Coatings*
Helium (He)	Element of atomic number 2. Colorless, tasteless inert gas, does not combine chemically with any other substance. Forms hydrates under certain special circumstances, b.p. −260.0°C (−500°F), freezing point −272.2°C (−521.96°F) the lowest of any substance. Very slightly soluble in water, insoluble in alcohol. It uses for inflation of balloons and dirigibles diluent for oxygen or anesthetic gases in medicine. Component of air supplied to man working in tunnels digging under pressure, also for filling luminescent electric-light tubes, low-temperature research, leak detection, inert shield for arc welding. Nonflammable gas, green gas label.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Helix	A spiral winding.	*Electrical*
Helix Angle	The angle that a helical gear tooth makes with the gear axis at the pitch circle unless otherwise specified.	*Mechanical Engineering*
Helix Rosin	Trade name of a specially processed pale wood rosin containing approximately 5.5% of chemically combined lime, a product containing very little free lime. It uses for linoleum print paint, varnish-air drying, varnish backing, varnish-gloss oil and printing ink.	*Material Process*
Helixin (C44 H64 O11) (alfa-hederin)	Solid insoluble in water, petroleum ether, soluble in alcohol, acetone, glacial acetic acid, dilute aqueous basic solutions. Antifungal antibiotic.	*Material Process*
Hellborein (C37 H56 O18)	Glucoside crystallizable in yellow prisms. Tastes both sweet and bitter. Poisonous, soluble in water, weak alcohol, less soluble in ether and absolute alcohol, m.p. 270 °C (518 °F).	*Material Process*
Heller Committee for Research in Social Economics	a committee which has done primary research in establishing standard budgets for family groups in California.	*Industrial Relations*
Hellindon	**Trade mark of vat dyestuffs. Used for the dyeing of wool. Characterized by excellent fastness properties.**	*Material Process*
Hellium 3	A stable isotopic form of helium, one-millionth as abundant in nature as ordinary helium. Useful in theoretical investigations of nuclear chemistry.	*Material Process*
Hello	Trade mark of organic pigment dyestuffs. Used for paints, lacquers, printing inks, wallpaper, coated paper, rubber and organic plastics. Characterized by very good general fastness properties.	*Material Process*
Helmerco Colors	A class of lakes which are but very slightly soluble in water and of exceptional brightness and light fastness. Recommended for use on paper stock by beater dyeing through the use of alum and rosin. Also, for coating and wall paper printing. Noted for their ability to produce brilliant, fast- to light shades, especially whites on bond, writing and other fine types of paper.	*Material Process*
Helvering v. Davis	decision of the U.S. Supreme Court upholding the constitutionality of various provisions of the Social Security Act and the authority of Congress to levy taxes in aid of the general welfare.	*Industrial Relations*
Helvite (Mn4Be3SiO4) 2 S)	A natural silicate of beryllium and manganese. Color red to brown.	*Material Process*
Hematein (C16H12O6)	An oxidation product of hematoxylin, the coloring principle of logwood. Not to be confused with hematin. Green to reddish brown crystals, m.p. 250°C (482 °F) with decomposition. Insoluble in water, slightly soluble in alcohol and ether. Soluble in dilute sodium hydroxide giving a bright red color, soluble in ammonia with brownish–violet color. It is used as an indicator.	*Material Process*
Hematin (C34H32N4O4FeOH)	The hydroxid of heme. Blue to brown black powder. Decomposes at 200 °C (392 °F) without melting. Soluble in alkalis, hot alcohol or ammonia. It is slightly soluble in hot pyridine, insoluble in water, ether and chloroform. It derivates by dissolving hemin in dilute potassium hydroxide, precipitating with acetic acid and recrystallizing from pyridine.	*Material Process*
Hematite red (red iron ore)	Iron oxide (Fe2O3)with impurities. Brilliant black to blacked red or brick red mineral with brown to cherry red streak and metallic to dull luster. The most important ore of iron. Also, certain varieties are used as paint pigments and for rouge.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hematite	An oxide of iron, and one of that metal's most common ore minerals.	*Mining*
Hematite, micaceous	Foliated or micaceous varieties of specular iron ore. See hematite red.	*Material Process*
Hematoporphyrin (C34H38O6N4)	Deep red crystals, soluble in alcohol, sparingly soluble in ether, insoluble in water. Obtained from hemin or hematin by the action of strong acids. It is non-toxic and is reported to be preferentially absorbed by cancerous tissues, making them fluoresce under ultraviolet light.	*Material Process*
Heme (C34H32FeN4O4)	The nonamino acid portion of hemoglobin consisting of reduced (ferrous) iron bound to protoporphyrin.	*Material Process*
Hemicellulose	One component of the matrix of the wood microstructure.	*Material Process*
Hemicellulose	A type of natural substance more complex than a sugar and less complex cellulose, and occurring in woody tissue along with cellulose. Obtained in pure form from corn grain hulls (corn fiber) by lime water extraction.	*Material Process*
Hemicolloids	Linear polymers of molecular weight from 2000 to 10,000 corresponding to an order of polymerization equal to 50 to 100 monomeric units.	*Material Process*
Hemin (C34H32N4O4FeCl)	The chloride of heme. Crystals which are brown by transmitted light and steel blue by reflected light. Sinters at 240 °C (464°F). It is derivated by heating hemoglobin with acetic acid and sodium chloride. Freely soluble in ammonia water, soluble in strong organic bases, insoluble in carbonate solutions, dilute acid solutions, insoluble but stable in water. The isolation of hemin is used for the identification of blood stains.	*Material Process*
Hemlock bark	Bark of hemlock fir Tsuga canadensis. It is using in tanning industry, boiler compounds, pharmaceutical preparations.	*Material Process*
Hemoglobin (Hb) Suggested empirical formula (C738H1166 FeN203O208S2)4	Hemoglobin (Hb) Suggested empirical formula (C738H1166 FeN203O208S2)4 The important respiratory protein of the red blood cells, it is necessary in the transfer of oxygen from the lungs to the tissues and of the carbon dioxide from the tissues to the lungs. Hemoglobin is a conjugated protein consisting of approximately 94% globin (protein portion) and 6% of heme. Each molecule can combine with one molecule of oxygen to form oxyhemoglobin (HbO2). The iron found in the heme portion must be in the reduced ferrous state to enable the hemoglobin to combine with oxygen. Oxyhemoglobin is available commercially as a brownish red powder or crystals, soluble in water. It is used in medicine, and is usually called hemoglobin.	*Material Process*
Hemp	A tall plant, Cannabis sativa, cultivated for its fiber, which is taken from the inner bark and used in making cordage.	*Material Process*
Hemp	Soft, white fibers, obtained from the stems of Cannabis sativa. It is coarser than flax but stronger, more glossy, and more durable than cotton. It is blended with cotton or flax in toweling and heavy fabrics, twine, cordage, packing.	*Material Process*
Hempseed oil (hemp oil)	Light green, fixed, nondrying liquid, becomes brownish-yellow on standing. Soluble in ether, benzene and carbon disulfide.	*Material Process*
Henderson v. Mayor of New York	a decision of the U.S. Supreme Court holding that immigration is an area exclusively within the jurisdiction of the Federal Government under the clause which gives Congree the "right to regulate commerce with foreign nations."	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Henning	Purifier Trademark for a preparation having a soda-ash base and other added materials for treating steel. Produced as walnut-sized briquettes, convenient for use in foundry, open hearth, or Bessemer practice. Used as a ladle addition to produce cleaner steel by aiding in removal of dissolved oxides and silicates and fluxing nonmetallic inclusions to slag.	*Material Process*
Henry Hub	A pipeline hub on the Louisiana Gulf coast. It is the delivery point for the natural gas futures contract on the New York Mercantile Exchange (NYMEX).	*Energy*
Henry's law	the relationship between the partial pressure of a compound and the equilibrium concentration in the liquid through a proportionality constant known as the Henry's law constant.	*Chemical*
Henry's law constant	the ratio of the concentration of a compound in air (or vapor) to the concentration of the compound in water under equilibrium conditions.	*Chemical*
Heparin sodium (heparin)	The sodium salt of a complex organic acid present in mammalian tissues and having the property of prolonging the clotting time of blood. White or pale colored, amorphous powder, nearly odorless, hygroscopic, soluble in water, insoluble in alcohol, benzene, acetone, chloroform, and ether. It is derivated from animal liver or lungs and used in medicine.	*Material Process*
Heptachlor (C10H7Cll7)	A fungicide similar to chlodan. White to light tan, waxy solid, m.p. 95-96 °C (203-204.8°F). Insoluble in water, soluble in xylene.	*Material Process*
Heptadecanol ($C_{27}H_{35}OH$)	Colorless liquid, slightly soluble in water. It is used in organic synthesis, plasticizer, intermediate, perfume fixatives. For soap and cosmetic preparations, base for manufacture of wetting agents and detergents.	*Material Process*
Heptafluorobutyric acid (C3F7COOH) (perfluorobutyric acid)	Colorless hydroscopic liquid with sharp odor. Miscible with water, acetone, ether, and petroleum ether, soluble in benzene and carbon tetrachloride, insoluble in carbon disulfide and mineral oil. It is used as intermediate, surfactant and acidulant.	*Material Process*
Heptagran 20	Brand name for a granular insecticide containing 20% heptachlor. It is used in preparation of insecticide-fertilizer combination.	*Material Process*
Heptaldehyde (C6H13CHO) (oenanthic aldehyde, Heptanal, oenanthal, aldehyde C-7)	Oily, colorless liquid, with a penetrating fruitly odor. Soluble in 3 volumes of 60% alcohol, slightly soluble in water, soluble in ether. It is used in manufacture of heptyl alcohol, organic synthesis, perfumery, pharmaceuticals, rubber products.	*Material Process*
Heptanal	See heptaaldehyde.	*Material Process*
Heptane (CH3(CH2)5CH3)	Volatile, colorless liquid, highly flammable, fire hazard, dangerous. Soluble in alcohol , ether, chloroform, and i9nsoluble in water. Standard for octane rating and determinations, anesthetic, solvent.	*Material Process*
Heptanol	See Heptyl alcohol.	*Material Process*
Heptanol ($CH_3CH_2CH(OH)C_4H_9$)	Liquid light soluble in water. It is used as flotation frothier, solvent and diluents in coatings, intermediate. **Hepteen Base Trade marks for a heptaldehyde-aniline reaction product. A dark brown, free flowing liquid. Soluble in acetone, benzene, and ethylene dichloride, moderately soluble in gasoline, insoluble in water. Accelerator for pure gum, inner tube, white tire sidewall, air-cured footwear.**	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hepteen Base	Trade mark for a heptaldehyde - aniline reaction product. A dark brown, free flowing liquid. Soluble in acetone, benzene, and ethylene dichloride, moderately soluble in gasoline, insoluble in water. Accelerator for pure gum, inner tube, white tire sidewall, air-cured footwear.	*Material Process*
Heptyl acetate	A liquid with fruity odor. Preparation of fruit essences.	*Material Process*
Heptyl alcohol (C7H15OH) (1-heptanol, C-7)	Colorless fragrant liquid. Organic intermediate, solvent, cosmetic formulations.	*Material Process*
Heptyl amine (C7H15NH2)	Colorless liquid slightly soluble in water, soluble in alcohol and ether.	*Material Process*
Heptyl formate (HCOOC7H15)	A colorless liquid with fruity odor. Uses in artificial fruit essences.	*Material Process*
Herbicide	a type of pesticide that kills weeds	*Agriculture*
Hercocel A	Trade mark for cellulose acetate molding powder pellets.	*Material Process*
Hercocel E	Trade mark for ethyl cellulose molding powder pellets.	*Material Process*
Hercoflex	Trade mark for liquid plasticizers for vinyl resins and other film formers.	*Material Process*
Hercolyn	A trade name for dihydro methyl abietate esters, b.p. 365-370 °C (689-698 °F). Used as a plasticizer for lacquers and plastics, softener and plasticizer in adhesives, floor tile, and other plastic and asphaltic compositions, wax modifier, low cost transparentizer of paper, pigment-grinding medium for inks.	*Material Process*
Hercose S	Trade mark for a cellulose acetate sorbate, colorless flakes, a cross linking cellulose acetate derivative, soluble in organic solvents, may be formed and cured to insolubility, available in low and medium viscosity grades.	*Material Process*
Hercoze C	A trade name .for cellulose acetate butyrate used in coatings.	*Material Process*
Herculoy	Silicon bronze with the corrosion resistance of copper and the strength of mild steel. Made in sheet, strip, plate, rod, wire, tube and forgings. Used for chemical equipment.	*Material Process*
Herecrol	Trade mark for synthetic rubber products-sheet lining, molded products, uncompounded synthetic rubber, synthetic rubber coating, self curing or baking.	*Material Process*
Hereford	A breed of hogs first developed by R. U. Webber, La Plata, Missouri, who made his first crosses in about 1902. He used Duroc, Chesters and Ohio Improved Chester breeds. The modern breed also includes Poland China genetics. To qualify for registration, Herefords must conform to a color pattern that includes a white face, at least two white feet and a red body.	*Agriculture*
Hereford	A breed of beef cattle bred near Hereford, England, nearly 300 years ago to efficiently convert native grass into beef needed for the expanding food market created by Britain 's industrial revolution. The breed is "trade-marked" with white faces and distinctive red bodies. Hereford breeding came to the U.S. in 1840, although statesman Henry Clay of Kentucky made the first importation (a bull and two females) in 1817. (Clay's imports were absorbed by the local cattle population and disappeared from permanent identity.) The registry is maintained by the American Hereford Association.	*Agriculture*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Herefords	a term used at Birch Coppice and Desford Collieries, S. Mids. for the men of the on-coming shift, a reference to their white faces.	*Mining*
Heresite	Trade marks for a series of pure phenol-formaldehyde resinous coatings and related products of the thermosetting type. Applied by spraying, dipping, or brushing, followed by baking or air drying. It is used in anticorrosive lining for machinery and equipment for chemical, food, drug, and petroleum industries, tank cars and containers.	*Material Process*
Herkolite	Trade mark for electrical insulation comprising sheet material united by an adhesive binder/	*Material Process*
Hermetically Sealed Switch	A switch completely sealed to provide constant operating characteristics. All junctures made with metal-to-metal or glass-to-metal fusion.	*Electrical Engineering*
Herndon Case	decision of the Supreme Court in 1937 involving an organizer in Atlanta who was convicted under an 1861 statute for "inciting to insurrection".	*Industrial Relations*
Herpoco	Trade mark for a fertilizer grade of ammonium nitrate, technical grade of ammonium nitrate.	*Material Process*
Herrin Massacre	outbreak of violence during a coal strike at Herrin, Illinois.	*Industrial Relations*
Herring-	bone timbering, two half height props with two additional props above set at an angle inclined inwards, connected to a central longitudinal bar in the roof; or the latter without the half height props, the inclined props or struts being notched into the strong sides of the roadway.	*Mining*
Herring oil	Pale yellow to dark red liquid .Soluble in ether, chloroform, solvent naphtha and carbon disulfide. It is used for soap, leather, dressing, curing and finishing, lubricating special machinery.	*Material Process*
Hertz	A measure of frequency. An older term is cycles per second, or cps.	*Electrical Engineering*
Hertz	(Abbrev. H) A term rapidly replacing cycles:per:second as an indication of frequency.	*Electrical*
Hertz (Hz)	(Hz): Units in which frequency is expressed. Synonymous with cycles per second.	*Electrical*
Hertz (Hz)	Units in which frequency is expressed. Synonymous with cycles per second.	*Electronic Process*
Hertz Stress	See Contact Stress.	*Mechanical Engineering*
hertz. (lower-case h, but abbreviated Hz)	The unit of frequency. Formerly cps for cycles per second.	*Reliability Engineering*
Hesperdin (C28H34O15)	A naturally occurring product, a bioflavonoid, related to ruin and the vitamin P group. Fine needles, soluble in dilute alkalis, pyridine, very slightly soluble in water, acetone, benzene, and chloroform. It obtains by extraction from orange peel or other citrus fruits, and using in medicine.	*Material Process*
Hess's law	The heat evolved or absorbed in a chemical process is the same whether the process takes place in one or in several steps. Also, known as the law of constant heat summation.	*Material Process*
Hessite (Ag2Te)	Natural silver telluride. Color steel to lead gray, streak black, and luster metallic.	*Material Process*
Het acid	Trade mark for chlorendic acid.	*Material Process*
Het Anhydride	**Trade mark for chlorendic anhydride.**	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hetero	A prefix meaning other or different. For example, heterocyclic refers to compounds in which more than one kind of atom is joined in a ring.	*Material Process*
Heteroecious	Requiring two taxonomically different hosts to be able to complete the entire life cycle, as in the rust fungi.	*Forestry*
Heteroepitaxy	Deposition of the thin film of a composition significantly different from the substrate	*Material Process*
Heterogeneity	1. Used in a general sense to describe the variation in, or diversity of, participants, interventions, and measurement of outcomes across a set of studies, or the variation in internal validity of those studies. 2. Used specifically, as statistical heterogeneity, to describe the degree of variation in the effect estimates from a set of studies. Also used to indicate the presence of variability among studies beyond the amount expected due solely to the play of chance. See also: Homogeneous, I2	*Quality Engineering*
Heterogeneous	Containing more than one phase.	*Chemical*
Heterogeneous nucleation	The precipitation of a new phase occurs at some structural imperfection	*Material Process*
Heterogeneous reaction	Reaction that takes place at the interface between two phases.	*Chemical*
Heterolysis	The unsymmetrical breakdown of a covalent electron bond. A:B=A+ +B-.	*Material Process*
heterotrophic	designating or typical of organisms that derive carbon for the manufacture of cell mass from organic matter.	*Chemical*
HETP	(1) Abbreviation for hexaethyl tetraphosphate. (2) Abbreviation for height equivalent to a theoretical plate. It is the height of a distillation or fractionating column which gives a separation equivalent to that of a theoretical plate in the physical separation process involved. A theoretical plate may be defined as the one which produces the same difference in composition as exists at equilibrium between two phases.	*Material Process*
Hetrazan (N3OC10H21O7C6H8) (1-diethylcarbamyl-4-methyl piperazine dihydrogencitrate)	Trade mark for diethylcarbamazine. White slightly hygroscopic powder, m.p. 135-138 °C (275-280.4 °F). Very soluble in aqueous solution, soluble in alcohol, insoluble in organic solvents, pH=4.0, indefinitely stable at room temperature. It is used in medicine.	*Material Process*
Hetron	Trade mark for a line of polyester resin products available in rigid, semirigid, and flexible types. Appears clear, color varies from light yellow to light amber. It does not support combustion. Used as skylight louvers, chemical; ductwork, pickup truck body parts boats.	*Material Process*
Heughs or Heuchs	an ancient Scottish term for coal seams or coal workings.	*Mining*
HEUI	hydraulically operated, electronically controlled unit injectors	*Petro-Chemical Abbreviations*
Heulandite (H4CaAl2(SiO3)6 3H2O)	A mineral, one of the zeolite. White to red, gray or brown, white streak, vitreous or pearly luster.	*Material Process*
Hewer	A hewer was a man, usually between the ages of 17 and 70, whose job it was to break down the coal, sometimes called 'ragging', ready for the filler to load the tubs. His job would include undercutting the coal by means of a hand held pick before the advent of mechanical coal cutters. Also known as a 'collier', 'coal face worker', 'getter', 'heaver' or 'pickman'.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hewettite ($CaV_6O_{16}9H_2O$)	A natural hydrated calcium vanadate. Color deep red, powder brownish red. Metahewettite is a dimorphous form with similar properties.	*Material Process*
Hewing	the action of breaking down the coal using a hammer and wedges or a pick, to 'hew' the coal.	*Mining*
Hex / Hexagonal	Metal having six sides and six angles; six-sided.	*Metallurgy*
Hex Nut 2H, 2HM	ASTM specification for Hex nuts, material standard A194, used with API flange studs. '2H' nuts are used for standard service. When specifications (NACE) require B7M studs, use '2HM' nuts.	*Petroleum Engineering*
Hexabromoethane (C2Br6)	Yellowish-white, rhombic needles, m.p. 210-215 °C (410 - 419 °F). Slightly soluble in water, and alcohol.	*Material Process*
Hexachlorobenzene (C6Cl6)	White needles, m.p. 229°C (444.2 °F), soluble in benzene and boiling alcohol, insoluble in water. It derivates by heating hexyl iodide with iodine chloride.	*Material Process*
Hexachlorobutadiene (C4Cl6)	Clear colorless liquid with mild characteristic odor. Insoluble in water, compatible with numerous resins and plastics, soluble in alcohol and ether. Solvent for natural rubber, synthetic rubber and other polymeric substances. High boiling nonflammable solvent, nonflammable heat transfer liquid, transformer fluid and hydraulic fluid, clarifying mash before centrifuging, wash liquor for removing C4 and high hydrocarbons.	*Material Process*
Hexachlorocyclopentadiene (C5Cl6) (perchloro cyclopentadiene)	Pale yellow liquid having a pungent odor. Intermediate for nonflammable resins, dyes, pesticides, fungicides, pharmaceuticals.	*Material Process*
Hexachloromethyl ether O(CCl3)2	A liquid, phosgene like odor, very irritant!	*Material Process*
Hexachloromethyl carbonate (OCCl3)2 CO) (triphosgene)	A lachrymator. White crystals odor similar to that of phosgene. Decomposed by hot water and alkali hydroxides. Only slowly acted upon by cold water. Soluble in alcohol, benzene and ether.	*Material Process*
Hexachlorophene (C6HCl3OH)2CH2)	White, free flowing powder, essentially odorless. Freely soluble in acetone, alcohol and ether, soluble in chloroform, insoluble in water. It is used as bactericidal and bacteriostatic agent finds application in antiseptic soaps, deodorant products including soaps, various cosmetics, and dermatologicals. It is not hazard, except those associated with inhalation of fine powders.	*Material Process*
Hexachloropropene	See hexachloropropylene.	*Material Process*
Hexachloropropylene (CCl3CClCCl2) perchloropropylene, hexachloropropene)	Water white liquid, insoluble in water, miscible in alcohol, ether, and chlorinated compounds. A solvent, plasticizer, hydraulic fluid.	*Material Process*
hexadecane (Cetane) ($C_{16}H_{34}$)	A colorless liquid. Soluble in alcohol, acetone and ether. insoluble in water. Used as solvents, organic intermediates and standardized hydrocarbons.	*Material Process*
Hexadecane (Cetane) (C16H34)	n-hexadecane (Cetane) (C16H34) A colorless liquid. Soluble in alcohol, acetone and ether. insoluble in water. Used as solvents, organic intermediates and standardized hydrocarbons.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hexadecimal	Refers to a base sixteen number system using the characters 0 through 9 and A through F to represent the values. Machine language programs are often written in hexadecimal notation.	*General Engineering*
Hexagonal close packed	Common atomic arrangement for metals.	*Material Process*
Hexagonal Close-Packed (HCP)	A crystal structure found for some metals. The HCP unit cell is of hexagonal geometry and is generated by the stacking of close-packed planes of atoms.	*Engineering Physics*
Hexamethylenetetramine (CH2)6N4	Hexamethylenetetramine (CH2)6N4 White crystalline powder, or colorless, lustrous crystals, practically odorless. It has irritating action on the skin, soluble in water, alcohol and chloroform, insoluble in ether. Burns with smokeless flame. It derivates by the action of ammonia on formaldehyde. It is used in medicine, pharmaceuticals, rubber accelerator, as an absorbent for phosgene in military gas masks, synthetic resins, raw material for explosives.	*Material Process*
Hexane (CH3(CH2)4CH3)	A colorless liquid. A solvent used especially in the extraction of zein.	*Material Process*
Hexene	A comonomer (hexene-1 or 4-methyl pentene-1) used in the production of linear low-density and high-density polyethylene.	*Engineering Physics*
Hexyl acetate	A solvent ester.	*Material Process*
Hexyl alcohols	Solvents.	*Material Process*
HF	Friction losses in the suction piping. Piping and fittings act as a restriction, working against liquid as it flows towards the pump inlet.	*Heat Transfer Process*
HFC	See Hydrofluorocarbon	*Energy*
HF-O/1/2	hydraulic fluid specifications (Denison)	*Petro-Chemical Abbreviations*
HFRR	high frequency reciprocating rig test	*Petro-Chemical Abbreviations*
HHDV	heavy-heavy diesel vehicle	*Petro-Chemical Abbreviations*
HHO	home heating oil	*Petro-Chemical Abbreviations*
HIBCC	Health Industry Bar Code Council	*Gears*
HID	High-Intensity Discharge	*Energy*
Hidden Cost	All costs associated with either production or maintenance. When associated with maintenance, hidden costs represent the loss associated with unplanned downtime. Typically, hidden costs represent between 1- 3% of a company's revenues or, potentially between 30-40% of profits.	*Maintenance*
Hidden Failure	A Failure Which, On Its Own, Does Not Become Evident To The Operating Crew Under Normal Circumstances. Typically, Protective Devices Which Are Not Fail-Safe (Examples Could Include Standby Plant And Equipment, Emergency Systems Etc.)	*Plant Engineering*
Hierarchy	The ranking or precedence of the elements in a supervisory system. For example, a lower ranking element such as a local controller affects only one variable while a higher ranking element such as a computer might affect many variables.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Higgling of the Market	a phrase used to describe the interaction in the market between buyers and sellers.	*Industrial Relations*
High alloy steel	Ferrous alloy with more than 5 wt% noncarbon additions.	*Material Process*
High bit-rate Digital Subscriber Line	The oldest of the DSL technologies, it continues to be used by telephone companies deploying T1 lines at 1.5Mbps and requires two twisted pairs.	*Electrical Engineering*
High complexity tests	A CLIA category of tests that has the most demanding QC requirements. Includes any tests developed by the laboratory, modified by the laboratory, or manufacturer's tests that have been classified as high complexity.	*Quality*
High Contamination	Having heavy particle laden air, requiring extreme washdown environments.	*Electrical Engineering*
High Density Polyethylene	Tough and strong, with terrific chemical resistance, HDPE is used to make sheet and film products. Properties: HDPE is strong and puncture resistant, providing a good barrier to moisture, most chemicals (except ones with aromatic or chlorine content), and oils and grease. However, it is permeable to gas. Lusterless and translucent when uncolored, it is also available in pigmented forms. The resin can be easily processed and formed; it can be welded together, but may be difficult to glue. Because it's stiffer than some other films, it maintains its shape better. Use has grown in recent years because tough HDPE allows manufactures to thin wall packaging and "do more with less," thereby reducing the amount of material used. Applications: HDPE is used to make cereal box, cake mix and other carton liners, bakery bags, T-shirt bags, the "crinkly" kind of shopping and trash bags, industrial liners, agricultural and construction films, and envelopes.	*Engineering Physics*
High efficiency ballast	A lighting conservation feature consisting of an energy-efficient version of a conventional electromagnetic ballast. The ballast is the transformer for fluorescent and high-intensity discharge (HID) lamps, which provides the necessary current, voltage, and wave-form conditions to operate the lamp. A high-efficiency ballast requires lower power input than a conventional ballast to operate HID and fluorescent lamps.	*Energy*
High efficiency lighting	Lighting provided by high-intensity discharge (HID) lamps and/or fluorescent lamps.	*Energy*
High Flotation Sizing System For Light Trucks	A system using overall diameter in inches, section width in inches, type of tire construction, and rim diameter in inches. Example: 33x12.50R15LT	*Mechanical Engineering*
High Grade Ore	Ore which runs more silver than twenty ounces to the ton, with 50 or more per cent of lead.	*Mining*
High grade	Rich ore. As a verb, it refers to selective mining of the best ore in a deposit.	*Mining*
High Grading	A high-grader was a man who stole any big nuggets which he saw in the sluice boxes.	*Mining*
High Heat Value (HHV)	The high or gross heat content of the fuel with the heat of vaporization included; the water vapor is assumed to be in a liquid state.	*Energy*
High Level Data Link Control	An ITU-TSS link layer protocol standard for point-to-point and multi-point communications.	*Electrical Engineering*
High Load Melt Index	The ASTM condition of 190° C and a load of 21.6 Kg used for determining the flow rate of molten HDPE through a standard orifice. More often referred to as flow rate.	*Engineering Physics*

Please see the Appendix for further illustration

Term	Definition	*Industry*
High pressure	A processing unit operating at either equal to or greater than 225 pounds per square inch gauge (PSIG) measured at the outlet separator.	*Energy*
High Pressure Die Cast	A wheel manufacturing process using aluminum alloys in special high-pressure die casting machines.	*Mechanical Engineering*
High Recovery Valve	A valve design that dissipates relatively little flow stream energy due to streamlined internal contours and minimal flow turbulence. Therefore, pressure downstream of the valve vena contracta recovers to a high percentage of its inlet value. These types of valves are identifiable by their straight-through flow paths. Examples are most rotary control valves.	*Industrial Engineering*
High Strength Friction Grip Bolts	Sometimes abbreviated to HSFG bolts. Bolts which are of high tensile strength used in conjunction with high strength nuts and hardened steel washers in structural steelwork. The bolts are tightened to a specified minimum shank tension so that transverse loads are transferred across the joint by friction between the plates rather than by shear across the bolt shank.	*Maintenance*
High Strength Strand	Grade of galvanized or bright strand.	*Wire Rope & Cable*
High strength, low alloy steel	Steel with relatively high strength but significantly less than 5 wt% noncarbon additions.	*Material Process*
High Sulfur Diesel (HSD) fuel	Diesel fuel containing more than 500 parts per million (ppm) sulfur.	*Energy*
High Tc superconductor	Ceramic material such as YBa2Cu2O7, which is superconducting at a temperature higher than is possible with traditional metal superconductors, for example 30 K.	*Material Process*
High Velocity Oxy-fuel Spraying (HVOF)	A Thermal spray process. The spray powder particles are injected into a high velocity jet formed by the combustion of oxygen and fuel, heated and accelerated to the work piece.	*Paint and Coatings*
High Voltage Time Test	A high:voltage time test is an accelerated life test on a cable sample in which voltage is the factor increased.	*Electrical*
Highbanker	A mobile sluice box. Instead of being put right in the creek, it uses water to pump to transport the water and minerals to another location. It is also able to run more material in less time than the sluice.	*Mining*
High-Brightness LEDs	High-Brightness LEDs are any of a new generation of LEDs bright enough for illumination applications such as automotive interior, exterior, and display; room and architectural illumination; task and general lighting; projection display; display backlights; and signage.	*Electrical Engineering*
High-current transients	Short spikes of high electrical current in a grid, caused by lightning strikes, or rapid switching of electrical devices in the grid, especially capacitors. These transients, or surges, cause cables to overheat, potentially damaging insulation and leading to short circuits. Equipment can be protected from high-current transients by using a surge protector.	*Electrical*
High-definition television	An all-digital system for transmitting a TV signal with far greater resolution than the analog standards (PAL, NTSC, and SECAM). A high-definition television set can display several resolutions, (up to two million pixels versus a common television set's 360,000). HDTV offers other advantages such as greatly improved color encoding and the loss-free reproduction inherent in digital technologies.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
High-Density Polyethylene	This term is generally considered to include polyethylenes ranging in density from about 0.940 to 0.960 and over. Whereas the molecules in low-density polyethylene are branched in random fashion, those in the higher density polyethylenes have fewer side branches, resulting in more rigid material with greater strength, hardness, chemical resistance, and higher softening temperature.	*Engineering Physics*
Highest Point of Single Tooth Contact	The largest diameter on a spur gear at which a single tooth is in contact with the mating gear. Often referred to as HPSTC.	*Gears*
Highgrade	Rich ore. Selective mining of the best ore in a deposit.	*Mining*
Highgraded	One who steals rich ore, especially gold, from a mine.	*Mining*
High-grading	A harvesting technique that removes only the largest, most valuable trees from a stand and provides high returns at the expense of future growth potential.	*Forestry*
High-intensity discharge (HID) lamp	A lamp that produces light by passing electricity through gas, which causes the gas to glow. Examples of HID lamps are mercury vapor lamps, metal halide lamps, and high-pressure sodium lamps. HID lamps have extremely long life and emit far more lumens per fixture than do fluorescent lights.	*Energy*
Highland	A Scottish breed of beef cattle. Prized for its ability to survive rugged climate and poor grazing conditions. It has long hair, and long horns that curl upward. Registered by the American Highland Cattle Association.	*Agriculture*
Highlander Folk School	resident labor school located in Monteagle, Tennessee.	*Industrial Relations*
High-line or high-pressure gas	High-pressure (100 psi) gas from cracking unit distillate drums that is compressed and combined with low-line gas as gas absorption feedstock.	*Petroleum Engineering*
High-mileage households	Households with estimated aggregate annual vehicle mileage that exceeds 12,500 miles.	*Energy*
High-Side	An element connected between the supply and the load. High-side current sensing applications measure current by looking at the voltage drop across a resistor placed between the supply and the load.	*Electrical Engineering*
High-Speed Downlink Packet Access	HSDPA is a 3G radio interface standard in the HSPA family for wireless and cellular handsets or data cards that increase the data rate and improve the traffic handling of existing UMTS standards.	*Electrical Engineering*
High-Speed Packet Access	HSPA is a collection of radio interface standards for wireless and cellular handsets or data cards that increase the data rate and improve the traffic handling of existing UMTS standards.	*Electrical Engineering*
High-Speed Serial Interface	A short-distance communications standard for data rates from 2Mbps to 52Mbps.	*Electrical Engineering*
High-Speed Uplink Packet Access	Is a 3G radio interface standard in the HSPA family for wireless and cellular handsets or data cards that increase the data rate and improve the traffic handling of existing UMTS standards.	*Electrical Engineering*
High-strength low-alloy (HSLA) steel	steels with a high yield point and low percentages (<1.25%) of other alloying components	*Materials Process*
High-strength steel	steels that have a tensile strength over 150 ksi (1100 MPa)	*Materials Process*
High-temperature collector	A solar thermal collector designed to operate at a temperature of 180 degrees Fahrenheit or higher.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
High-voltage direct current (HVDC)	A technology developed by ABB in the 1950s to move large amounts of power over substantial distances - typically by overhead transmission lines, but also by way of submarine cables. Transmitting DC power over long distances is more efficient than AC transmission (see Direct current and Transmission and distribution) and is a cost-effective method of connecting two asynchronous grids (grids operating at different frequencies). An HVDC system takes electrical power from an AC network, converts it to DC at a converter station and transmits it to the receiving point by line or cable, where it is turned back into AC by using another converter. The conversion is carried out with high-power, high-voltage electronic semiconductor valves. These valves are controlled by a computer system, so the amount of transmitted power and also the direction of transmitted power can be precisely controlled, a feature unique to HVDC systems. Another important aspect of HVDC lines is that they can never be overloaded. Because HVDC transmits only active (real) power, no line capacity is wasted on transmitting reactive power. This means that the same power can be transmitted over fewer (or smaller) transmission lines than would be required using AC, and less land is needed to accommodate the lines. HVDC induces minimal magnetic fields, so the power lines may be built safely closer to human habitation. **In the 1990s ABB developed the HVDC Light technology which made it possible to have long underground transmission (see HVDC Light). In 2006 ABB carried out the first test circuit on +/- 800 kV ultrahigh-voltage DC (see Ultrahigh voltage). Typical power and voltage range are - Classical HVDC - 500 - 6,400 MW (± 150 - 660 kV) UHVDC - 6000-8000 MW (± 800 kV)HVDC Light - 100-1100 MW (± 150 - 320 kV). Hoist, friction hoist - In underground mining, a hoist or winder is used to raise and lower conveyances within the mine shaft. All hoists are powered using electric motors. Modern hoists are generally equipped with variable speed drives that minimize energy consumption and control the speed of the hoist.**	*Electrical*
Highwall	The unexcavated face of exposed over-burden and coal in a surface mine.	*Energy*
Highwall miner	A highwall mining system consists of a remotely controlled continuous miner which extracts coal and conveys it via augers, belt or chain conveyors to the outside. The cut is typically a rectangular, horizontal cut from a highwall bench, reaching depths of several hundred feet or deeper.	*Mining*
Hill	an inclined roadway in the mine. (Mids.), (N. East); or the surface area at a colliery. (Scot.).	*Mining*
Hill Claims	Minerals found in or under a hill.	*Mining*
Hill clerk	the person who weighed the coals for sale, either at the colliery or at a depot away from the colliery. (Scot.).	*Mining*
Hill sale	the sale of coal at the colliery from the coal hill. In carts, as opposed to coal being sent out by rail. (Scot.).	*Mining*
Hill system	a system of working coal where the seams lie close together and where three or more are worked simultaneously by longwall (S. Staffs.); or a system of working rearing coal seams.	*Mining*
hillside combine	A combine with a self-leveling mechanism that keeps the body of the vehicle level so internal parts can efficiently separate grain and chaff when operating on steep slopes.	*Agriculture*
Hillsman or Hillman	the pitheadsman, or a coal salesman. (Scot.).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hinges	a jointed or flexible device upon which a door, lid, or other swinging part turns	*Materials Process*
hinny	The offspring of a stallion (male horse) and a jenny (female ass).	*Agriculture*
Hinshaw pipeline	A pipeline or local distribution company that has received exemptions from regulations pursuant to the Natural Gas Act. These companies transport interstate natural gas not subject to regulations under NGA.	*Energy*
Hippanthrope	One who believes himself a horse	*Breakroom*
Hipped	another word to describe a 'stepped' face.	*Mining*
HIPPING	The high temperature/high pressure consolidation of a powder metallurgy component or thermally sprayed coating. Density is greatly increased and metallurgical changes provide enhanced corrosion and wear properties.	*Paint and Coatings*
Hiring	the act of taking on an employee for a designated or stated period of time.	*Industrial Relations*
Hiring Hall	sometimes known as the central hiring hall, or union hiring hall.	*Industrial Relations*
Hiring Policies	the guides established, usually by the employer, for the personnel office to follow in taking on new employees.	*Industrial Relations*
Histogram	"A graph of a frequency distribution in which the rectangles on the horizontal or x-axis are given widths proportional to the intervals of the quantities being displayed, and heights proportional to the frequency of occurrence of quantities within that interval." [CLSI]	*Quality*
Historical control	A control person or group for whom data were collected earlier than for the group being studied. There is a large risk of bias in studies that use historical controls due to systematic differences between the comparison groups, due to changes over time in risks, prognosis, health care, etc.	*Quality Engineering*
Historical Wage Differentials	those wage relationships in a particular industry between plants, occupations, or areas which have continued over a long period of time.	*Industrial Relations*
Hitch	a fault of equal or less throw or displacement than the thickness of the seam in which it occurs, also called a 'fault' or a 'trouble'; or to attach trams to a haulage rope with a short chain.	*Mining*
Hitcher	another name for the onsetter, also known as a 'hooker'.	*Mining*
Hitchman Coal and Coke Co. v. Mitchell	a decision of the U.S. Supreme Court limiting the right of a union to induce workers under a "yellow-dog contract" to join the union while still in the employ of the company.	*Industrial Relations*
Hitting the Bricks	workers who go on strike are said to "hit the bricks".	*Industrial Relations*
HMI	Human Machine Interface. Sometimes these are called Man Machine Interface. See MMI.	*Control Engineering*
HMW High-Density Polyethylene	High molecular weight high-density polyethylene is usually defined as a polyethylene with a density of 0.940 or greater and a flow rate of 1 to 20 (190° C/21.6 Kg). The weight average molecular weight ranges from 200,00 to 500,000.	*Engineering Physics*
HOA16./Pulsation	Repeated small fluctuation of pressure within a circuit,	*Mechanical, Process, and Operations*
Hob	A master steel form used to sink a desired mold shape into mild machine steel cavity blank.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hobbing	Forming a mold cavity by forcing a hardened steel master model into a soft steel cavity blank.	*Material Process*
Hobs	pillars of coal to support the roof. (Lancs.).	*Mining*
Hock	back leg of cattle	*Agriculture*
Hod	a cart or sled for transporting coal in thin seams. (F. of D.).	*Mining*
Hoe	a pick with which the breaker cuts the coal. - see also Mattock. (Som.).	*Mining*
hog	Domesticated or wild swine. In domestic swine, the term usually applies to those weighing more than 120 pounds.	*Agriculture*
Hog back	a sharp rise in the floor of a coal seam.	*Mining*
Hog Rings	Rings used to hold the shaft in a roller.	*Manufacturing*
Hogger piece	a branch pipe at the top of a 'pump tree' for delivering the water.	*Mining*
Hoggers	stockings without feet, chiefly used by the barrow-men or putters. (N. East).	*Mining*
Hogsback	A sharp rise in the floor of a seam.	*Mining*
Hoisery Workers; American Federation of (AFL-CIO)	the hoisery workers withdrew from the United Textile Workers in 1915 and remained independent until 1922 as the American Federation of Full Fashioned Hoisery Workers.	*Industrial Relations*
HOIST	The machine used for raising and lowering the cage or other conveyance in a shaft.	*Mining*
Hoisting	The vertical transport coal or material.	*Mining*
Hold	Meter HOLD is an external input which is used to stop the A/D process and freeze the display. BCD HOLD is an external input used to freeze the BCD output while allowing the A/D process to continue operation.	*General Engineering*
Hold And Drive Bolts	Special bolts that have a tang at the threaded end of the shank. This tang is gripped by the tightening tool during assembly so that the reaction torque is absorbed whilst the nut is tightened from the same side. Such bolts allow what used to have to be done by two men to become a one-man task.	*Maintenance*
Hold out	This was shouted by the banksman to the bottomer when a bant of men were about to descend the shaft to let him know that he was not to send up a load of coal against the bant, only the empty rope or chain, in order to avoid an accident by a collision known as a 'wedding'.	*Mining*
Hold-Back Pay	all moneys due an employee for services already performed but which have not yet been paid to him.	*Industrial Relations*
Hold-In Voltage	Refers to the power required to maintain a latched condition within a solenoid, keeping the plunger (or moving core) magnetically latched to the fixed pole. Power required for hold-in is approximately 10% of the pull-in power (4-7W). Operating solenoids at a low power hold level saves energy and heat.	*General Mechanical*
Hold-In Voltage	Refers to the power required to maintain a latched condition within a solenoid, keeping the plunger (or moving core) magnetically latched to the fixed pole. Power required for hold-in is approximately 10% of the pull-in power (4-7W). Operating solenoids at a low power hold level saves energy and heat.	*Mechanical*

Term	Definition	*Industry*
Holding company	A company that confines its activities to owning stock in and supervising management of other companies. The Securities and Exchange Commission, as administrator of the Public Utility Holding Company Act of 1935, defines a holding company as "a company which directly or indirectly owns, controls or holds 10 percent or more of the outstanding voting securities of a holding company" (15 USC 79b, par. a (7)).	*Energy*
Holding company	A corporation engaged principally in holding a controlling interest in one or more other companies.	*Mining*
Holding devices	fixtures used to connect fabrications/parts to be galvanized to handling equipment in the galvanizing facility	*Materials Process*
Holding Line	Wire rope on a clamshell or orange peel bucket that suspends the bucket while the closing line is released to dump its load.	*Wire Rope & Cable*
Holding pond	A structure built to contain large volumes of liquid waste to ensure that it meets environmental requirements prior to release.	*Energy*
Hold-the-Line-Order - an Executive Order (No. 9328)	issued by President Roosevelt in April 1943 designed to stabilize prices and wages.	*Industrial Relations*
Hold-Up Unionism	generally refers to corrupt unionism where employers pay tribute to the union in order to avoid violence.	*Industrial Relations*
Hole	To bore (a tunnel, passage, etc.)	*Civil Engineering*
Hole (electron)	For semi-conductors and insulators, a vacant electron state in the valence band that behaves as a positive charge carrier in an electric field.	*Engineering Physics*
Hole deviation log	a well log that conveys the directional well plan, and the associated geometric deviations between the actual well path and the planned well path.	*Petroleum Drilling*
Hole deviation	same as Technical Hole Deviation; not to be confused with general "hole deviation", which attempts to explain/model why a well bore can't economically be drilled in a continuously-straight direction.	*Petroleum Drilling*
Hole Stabilizer	A steel casing, a concrete tile, or an open hole in solid bedrock, which prevents the formation from collapsing into the well.	*Petroleum Engineering*
Hole-out	to under-cut the coal. (Leics).	*Mining*
HOLIDAY	An imperfection or "bare spot" in a coating or plating.	*Mechanical*
Holiday Pay	provisions in collective bargaining agreements which require the employer to pay workers for time not worked on a holiday.	*Industrial Relations*
Holing	the wedge-shaped section of a seam or floor removed from beneath the coal before it was broken down. Sometimes the holing was made in the top of the seam, other times in or about the middle.- see also Bannocking, Kirving and Binching; or when one working place met another, the opening was termed the holing and the one was said to have 'holed' into the other; or a short passage connecting two roads.	*Mining*
Holing about,	the first operation is to get an air current between the down-cast and up-cast shafts once the coal has been reached. (N. East).	*Mining*
Holing clod	bed of clod in which shotholes are drilled, (Yorks.).	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Holing dirt	A soft layer lying beneath, immediately above, or in the seam itself, which is worked out by the collier with his pick so that the coal itself can be more easily obtained.	*Mining*
Holing nog	a short length of timber used to support the coalface when undercutting. –see also Nog	*Mining*
Hollows	old abandoned workings.	*Mining*
Holstein-Friesian	A large, usually black and white breed of dairy cattle that accounts for 90 percent of all U.S. milk production. In common usage, the name usually is abbreviated to "Holstein." Holsteins may be a reddish color and white. The breed is prized for heavy production of low-fat milk. This Dutch breed was first imported to the United States in 1852.	*Agriculture*
Home RF	Trademarked name for Home Radio Frequency, a networking technology which uses antennae and transmitters to provide wireless home networking via transmitted radio signals.	*Electrical Engineering*
HomePlug	HomePlug (PowerLine) is an industry-standard method for transmitting data via the power lines. It can transmit audio, video, control signals, etc. HomePlug is a trademark of the HomePlug Powerline Alliance; Powerline is the generic term for the method.	*Electrical Engineering*
Homestead	the place where a family makes its home	*Agriculture*
Homestead Act	an act of congress (1861-62) which sought to provide for agrarian land reform by permitting citizens to obtain federal lands for the sum of $10 for registration, on condition that the land would be cultivated for five years.	*Industrial Relations*
Homestead Strike	a bitter strike in 1892 by workers of Carnegie Steel Company.	*Industrial Relations*
Homework, Industrial	an arrangement whereby partly processed goods are finished or made ready for further processing by persons, frequently women and children, working at home.	*Industrial Relations*
Homoepitaxy	Decomposition of a thin film of essentially the same material as the substrate.	*Material Process*
Homogeneous	Containing a single phase.	*Chemical*
Homogeneous nucleation	The precipitation of a new phase occurs within a completely homogeneous medium.	*Material Process*
Homogeneous reaction	Reaction that takes place in the bulk of a solution.	*Chemical*
Homogenization	The intimate mixing of a grease to produce a uniform dispersion of components.	*Lubrication*
Homologous series	A series of organic compounds belonging to the same fundamental group (alcohol, hydrocarbons, etc.) with molecular formulas differing by CH, or multiple of CH 2).	*Material Process*
Homopolymer	A polymer having a chain structure in which all mer units are of the same type.	*Engineering Physics*
Homopolymer	The result of the polymerization of a single monomer, a homopolymer consists of a single type of repeating unit.	*Engineering Physics*
Homotropal ventilation	ventilation by a current of air travelling in the same direction as the flow of coal out of the mine. The opposite is 'antitropal ventilation'.	*Mining*
Honeycomb structure	A structural configuration.	*Material Process*

Term	Definition	*Industry*
Honeydew	A sweetish excretion produced through the anus by certain insects, notably aphids and scale insects.	*Forestry*
Honeymoon Period	a phrase used rather loosely to describe the period immediately after a major agreement between a union and a company when both sides are anxious to please one another and try to overlook the small difficulties involved in labor-management relationships.	*Industrial Relations*
Hoo	inferior cannel coal.	*Mining*
Hooked Man	a worker who is engaged in espionage and surveillance, frequently without knowing that he is reporting to a detective agency or that the information he is passing along or that the reports that he is writing go along to the employer.	*Industrial Relations*
Hooker	a small length of chain with a spring loaded hook. The hooker was clipped to the chain on the end of the winding rope. A man would pass his leg through the hooker and hang onto the main chain. A number of men would ride the shaft in this way hanging on the end the rope (Som.)—see also Bant and Foaly bant. Also another name for 'onsetter'.	*Mining*
Hooker-on or lasher-on, a haulage hand	One who actually attaches the tubs to the haulage rope with a clip or a lashing on chain, or 'Hooker-on' was also an alternative name for the onsetter and probably comes from the days when his job was to hook the corves or hutches to the rope. (Scot.).	*Mining*
Hooke's Law	Defines the basis for the measurement of mechanical stresses via the strain measurement. The gradient of Hooke's line is defined by the ratio of which is equivalent to the Modulus of Elasticity E (Young's Modulus).	*General Engineering*
Hooking	the process of trapping a worker in order to have him spy on the union activities of his fellow workers.	*Industrial Relations*
Hook's low	The linear relationship between stress and strain during elastic deformation.	*Material Process*
hop or hops	There is much confusion over whether to use the singular hop or the plural hops when referring to this twining vine of the hemp family. Use the singular when referring to the vine or to varieties of hop. Use the plural when referring to the ripened and dried cones. Hops are grown primarily for use in the brewing industry to impart a mellow bitterness and delicate aroma to brewed beverages and to aid in their preservation. Its cone shaped pistillate catkins is used primarily to impart a bitter flavor to beer. Hops were first introduced to the United States from Europe, by the Massachusetts Company in 1629. Today the bulk of hops production is the dry valleys of the Pacific Northwest where Washington State produces 77 percent of the nation's hops.	*Agriculture*
Hopper	In polymer processing, the container holding a supply of molding material to be fed to the screw or ram. The hopper may be intermittently filled or continuously fed.	*Engineering Physics*
Hopper Blender	Mixes material such as virgin resin, regrind, blowing agents, fillers, and colorants in desired proportions. Materials to be blended are metered in ratio to a mixing chamber and then discharged into the hopper of the processing machine.	*Engineering Physics*
Hopper Loader	A device for automatically feeding resins to hoppers of extruders, injection molding machines and the like.	*Engineering Physics*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hoppit or Hoppet	see also Bowk, Bucket, Kibble (sinking bucket), used in shaft sinking.	*Mining*
Horizon	In geology, any given definite position or interval in the stratigraphic column or the scheme of stratigraphic classification; generally used in a relative sense.	*Mining*
Horizon mining	a system of working inclined seams from nearly level crosscuts and laterals, repeated at certain vertical intervals or horizons.	*Mining*
Horizontal axis wind turbine	The most common type of wind turbine where the axis of rotation is oriented horizontally. Also see Wind turbine.	*Energy*
horizontal deviation	defines how "left" or "right" the actual well path is relative to the planned well path location and orientation; is easily-visualized with a sketch, and matches directional driller common sense. Same as msHD.	*Petroleum Drilling*
Horizontal Drilling	A deviation of the borehole from vertical so that the borehole penetrates a productive formation in a manner parallel to the formation.	*Petroleum Drilling*
horizontal drilling	drilling directionally at a well bore inclination angle exceeding 85 degrees.	*Petroleum Drilling*
Horizontal Fixed Position	In pipe welding, the position of a pipe joint in which the axis of the pipe is approximately horizontal and the pipe is not rotated during the operation.	*Maintenance and Repair*
Horizontal Floor Space	Floor space required for a conveyor.	*Manufacturing*
Horizontal Movement of Labor	a phrase which seeks to describe the shift in employment by workers to other companies or employers where the worker continues to perform the same work or uses the dame general skills as those in his previous employment.	*Industrial Relations*
Horizontal Rolled Position	The position of a pipe joint in which welding is performed in the flat position by rotating the pipe.	*Maintenance and Repair*
Horizontal THD Log	a hole deviation log that includes the components of Technical Hole Deviation that address hole deviation in the horizontal sense, namely, msHD, RCHD, msAD, and RCAD.	*Petroleum Drilling*
Horizontal tie	A horizontal connection member in the tower framework. Also known as Girt.	*Facility Engineering*
Horizontal Unions	generally refers to craft unions whose organization includes all workers in a particular craft or skill across an industry, region, or country.	*Industrial Relations*
Horizontal well	A horizontal extension to the bottom hole well location to facilitate production.	*Petroleum Engineering*
Horizontal well	A technique in well drilling common to shale gas production that allows for fewer drill sites, while increasing the access to the reserves underground; used in combination with hydraulic fracturing. Injection wells: Deep wells used worldwide to dump contaminants, often suspended in water, so that they are more or less permanently sequestered below the aquifer. Injection wells are used by many industries. They are regulated by the Environmental Protection Agency, which also classifies them roughly by the type of liquid being put back into the ground.	*Petroleum Drilling*
Horizontal-Position Fillet Weld	Welding is performed on the upper side of an approximately horizontal surface and against an approximately vertical surface.	*Maintenance and Repair*
Horizontal-Position Groove Weld	The position of welding in which the weld axis lies in an approximately horizontal plane and the face of the weld lies in an approximately vertical plane.	*Maintenance and Repair*

Term	Definition	*Industry*
Horned danny	a tram or tub without solid sides or ends. Used to transport materials of any length such as rails, water pipes, long props etc. The upright iron bars that held the material on the tram constituted the horns. (Mids.). Also called a hornby tram—see also Danny.	*Mining*
Horner plot	A semi-log plot produced during pressure buildup analysis.[3]	*Petroleum Drilling*
Hornfels	A fine-grained contact metamorphic rock.	*Mining*
Horse	A mass of rock matter occurring in or between the branches of a vein.	*Mining*
horse breeds that American journalists may encounter	horse breeds that American journalists may encounter:	*Agriculture*
Horse engine, Horse whim or Horse gin	a winding apparatus powered by a horse.	*Mining*
Horse fettler	see Ostler.	*Mining*
Horse tree	a strong timber beam used to support pumps in a shaft.	*Mining*
Horse whim	a later development of the cog and rung gin, introduced at about the end of the 17th century and was constructed of a horizontal drum working on a vertical shaft or spindle, located away from the shaft. This drum was also rotated by a horse trotting around a circle. The ropes that coiled on the winding drum passed over pulleys mounted on a crude headgear over the winding shaft. This permitted the use of a larger drum and increased speed of winding.	*Mining*
Horseback	A mass of material with a slippery surface in the roof; shaped like a horse's back.	*Mining*
Horsehead	a box opened at one end attached to pipes or wooden tubbing at the surface, used for ventilating the mine. The horsehead shaped box would be kept facing into the wind; or a 'forepole', two steel girders suspended from previously set girders on hangers, they are pushed forward to provide temporary protection until permanent supports are set.	*Mining*
Horsepower	A unit for measuring the rate of work (or power) equivalent to 33,000 foot-pounds per minute or 746 watts.	*Energy*
Horsepower	A measure of an engine's maximum output in terms of torque over a period of time. Open wheel car engines produce around 900hp.	*NASCAR*
Horsepower, hp	hp = (amps × volts × 3 × Power Factor × Efficiency) / 746	*Facility Engineering*
Horst	An upfaulted block of rock.	*Mining*
Horticulturist	One who practices the science and art of cultivating fruits, vegetables or ornamental plants. Farmers and orchardists sometimes are called horticulturists, as are home gardeners. In agriculture the term usually is reserved for scientists.	*Agriculture*
Hose	A hose is a hollow tube designed to distribute fluids and steam. Hoses are usually flexible and cylindrical. Hose design is based on a combination of application and performance. Common factors are size, pressure rating, weight, length, straight hose or coilhose and chemical compatibility. Hoses are made from one or a combination of many different materials. Applications mostly use nylon, polyurethane, polyethylene, PVC, or synthetic or natural rubbers, based on the environment and pressure rating needed. Other hose materials include PTFE (Teflon), stainless steel and other metals. See also Pipe.	*Industrial*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hose	A flexible line or conduit	*Mechanical, Process, and Operations*
Hose barb	a twist-type connector used for connecting a small diameter hose to a valve or faucet.	*Chemical*
Hose, Wire braided	Hose consisting of a flexible material reinforced with woven wire braid. HYDRAULIC BALANCE - A condition of equal opposed hydraulic forces acting on a part in a hy-	*Mechanical, Process, and Operations*
Hospital Type Disinfectant	Kills most germs due to a special combination of disinfectant ingredients. More terminology than fact.	*Chemistry*
Host	A living organism serving as a food source for a parasite.	*Forestry*
Host	The primary or controlling computer in a multiple part system.	*Electrical*
Host government	The government (including any government-controlled firm engaged in the production, refining, or marketing of crude oil or petroleum products) of the foreign country in which the crude oil is produced.	*Energy*
Host rock	The rock containing an ore deposit.	*Mining*
Host rock	The rock surrounding an ore deposit.	*Mining*
Hot Bending	Bending of piping to a predetermined radius after heating to a suitably high temperature for hot working. On many pipe sizes, the pipe is firmly packed with sand to avoid wrinkling and excessive out-of-roundness.	*Maintenance and Repair*
Hot Working	The plastic deformation of metal at such a temperature and rate that strain hardening does not occur. Extruding or swaging of chrome-moly piping at temperatures between 2000 and 1600°F (1093 and 871°C) would be considered hot-forming or hot-working operations.	*Maintenance and Repair*
Hot Bolting	This term is used for the completion of maintenance work on a bolted joint when the joint is under loading. This can involve the replacement of individual bolts. There are risks both to the joint itself and to health and safety associated with this technique.	*Maintenance*
Hot Cargo Provisions	as used by labor unions, the term "hot cargo" refers to goods produced or shipped by an "unfair" employer.	*Industrial Relations*
Hot Dip Coating	A metallic coating obtained by dipping the substrate metal into a molten metal.	*Paint and Coatings*
Hot dry rock	Heat energy residing in impermeable, crystalline rock. Hydraulic fracturing may be used to create permeability to enable circulation of water and removal of the heat.	*Energy*
Hot Goods Clause	provision of the Fair Labor Standards Act which prohibits the shipment of interstate commerce of goods produced in violation of the standards of the Act.	*Industrial Relations*
Hot Goods Injunction	an injunction obtained by the Administrator of the Fair Labor Standards Act which contains an order to prevent or stop the shipment or transportation of goods produced by employees with rates below those which are required by the Act.	*Industrial Relations*
Hot isostatic pressing (HIP)	Powder metallurgical technique combing high temperature and isostatic forming pressure.	*Material Process*

Term	Definition	*Industry*
Hot Runner Mold	A mold in which the runners and secondary sprues are kept hot and fluid during the entire cycle and are not ejected in the molded part. This avoids the need for handling and reprocessing scrap normally generated from runners sprues.	*Engineering Physics*
Hot tap	A connection made to a pipeline while the line is under pressure or in service. A special procedure is required to make an opening in the pipe without leaking any of the line contents.	*General Mechanical*
Hot Taps	Branch piping connections made to operating pipelines, mains, or other facilities while they are in operation.	*Maintenance and Repair*
Hot tears	A defect occurring in castings caused where partially solidified or weak, newly solidified sections are subjected to a pull resulting from the contraction of thinner parts that have solidified earlier. A hot tear is an intergranular failure.	*Mechanical*
Hot tub	Water-filled wood, plastic, or ceramic container in which up to 12 people can lounge. Normally equipped with a heater that heats the water from 80 degrees to 106 degrees Fahrenheit. It may also have jets to bubble the water. The water is not drained after each use. An average-size hot tub holds 200 to 400 gallons of water. All reported hot tubs are assumed to include an electric pump. These are also called spas or jacuzzis.	*Energy*
Hot Water	In an industrial steam application, the hot water system includes the condensate returned from the heat exchange, which returns to the boiler to be returned into steam.	*Industrial*
Hot water temperature (HWT)	Temperature of circulating water entering the distribution system.	*Facility Engineering*
Hot Working	Any metal forming operation that is performed above a metal recrystallization temperature.	*Engineering Physics*
Hot-rolled steel	steel deformed plastically at such a temperature and strain-rate that re-crystallization takes place simultaneously with the deformation, thus avoiding strain-hardening; this is the most common type of steel galvanized	*Materials Process*
Hot-Rolling, Hot-Rolled Steel (HR)	Rolling steel slabs into flat-rolled steel after it has been reheated.	*Metallurgy*
Hotshot	Hotshot services or Hot Shot drivers deliver important items to the rig in a timely manner. Oil companies use Hotshot drivers to deliver items such as directional drilling equipment, critical parts and other items when they are needed ASAP. Hotshot trucks typically consist of a 1 ton pickup, a long trailer and gin pole setup for offloading items such as pipe.	*Petroleum Drilling*
Hot-Swap	A power supply line controller which allows circuit boards or other devices to be removed and replaced while the system remains powered up. Hotswap devices typically protect against overvoltage, undervoltage, and inrush current that can cause faults, errors, and hardware damage.	*Electrical Engineering*
Houde Engineering Case	a decision by the NLRB in 1934 (under the NRA, not under the Wagner Act) setting out the principle of majority rule.	*Industrial Relations*
Hourly Metering	Tracking or recording a customer's consumption during specific periods of time that can be tied to the price of energy.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hourly Metering or Time of Use Metering	Tracking or recording your consumption during a specific time period.	*Energy*
Hourly Non-Firm Transmission Service	Transmission scheduled and paid for on an as-available basis and subject to interruption.	*Energy*
Hourly Wage Rate	the contract or legal rate paid to time workers under a collective bargaining or other agreement.	*Industrial Relations*
Hours of Work	a general phrase which applies to the many problems relating to the time that a person spends at work.	*Industrial Relations*
Hours under load	The hours the boiler is operating to drive the generator producing electricity.	*Energy*
Hours, Ceiling	generally refers to the maximum number of hours employees may work at regular rates.	*Industrial Relations*
Hours, Nominal	the number of hours planned or scheduled for work during the day or week.	*Industrial Relations*
Hours, Standard	the hours specified in a collective bargaining agreement which constitute the work day and work week.	*Industrial Relations*
House Organ	a magazine, newspaper, or other publication issued periodically by a company to its employees in order to keep them informed about the company.	*Industrial Relations*
Household	A family, an individual, or a group of up to nine unrelated persons occupying the same housing unit. "Occupy" means that the housing unit is the person's usual or permanent place of residence.	*Energy*
Household energy expenditures	The total amount of funds spent for energy consumed in, or delivered to, a housing unit during a given period of time.	*Energy*
Housing	The framework or structure on which an instrument (radio, scales, adding machine) is built.	*Material Process*
Housing unit	A house, an apartment, a group of rooms, or a single room if it is either occupied or intended for occupancy as separate living quarters by a family, an individual, or a group of one to nine unrelated persons. Separate living quarters means the occupants (1) live and eat separately from other persons in the house or apartment and (2) have direct access from the outside of the buildings or through a common hall--that is, they can get to it without going through someone else's living quarters. Housing units do not include group quarters such as prisons or nursing homes where ten or more unrelated persons live. A common dining area used by residents is an indication of group quarters. Hotel and motel rooms are considered housing units if occupied as the usual or permanent place of residence.	*Energy*
Housters	the heavy, stony residue, after shale has been burnt (N. Staffs.).	*Mining*
Hovel	a cabin at the surface for the use of the banksman (S. Staffs.).	*Mining*
Howdie horse	a pit horse kept on the pit top for use in an emergency. (N. East).	*Mining*
Howk	to hew, to break down coal with a pick. (Scot.).	*Mining*
Howway	call to lower the cage down the shaft. (N. East).	*Mining*
hp	horsepower	*Mechanical, Process, and Operations*

Term	Definition	Industry
HPR	High Phosphorous Retention - a property of engine oils measured by the Sequence IIIG engine test.	*Mechanical, Process, and Operations*
hr	Hour	*General*
HRB	(Also often abbreviated as RB) Abbreviation for Rockwell Hardness. Refer to Rockwell B Hardness.	*Petroleum Engineering*
HRC	(Also often abbreviated as RC) Abbreviation for Rockwell Hardness. Refer to Rockwell C Hardness.	*Petroleum Engineering*
Hrottling	Modulating control as opposed to on/off control.	*Industrial Engineering*
hrough	the center of each lug hole.	*Mechanical Engineering*
HSE	Health, Safety & Environment - generally referring to relevant standards. Specifically in the UK, the abbreviation HSE also stands for "Health and Safety Executive" – a UK Government Department that has an impact upon maintenance (along with all other areas of a business).	*Maintenance*
HTA Database	A database within The Cochrane Library, containing structured records describing health technology assessment projects. Compiled by the NHS Centre for Reviews and Dissemination.	*Quality Engineering*
HTGR	High Temperature Gas-cooled Reactor	*Energy*
HTHSRV	high temperature high shear rate viscosity	*Petro-Chemical Abbreviations*
Hub	Sometimes used for hob, which see.	*Material Process*
Hub Centric	A situation where the center bore hole of a wheel is made to match up with the hub diameter of the vehicle; the wheel is then centered by the center hole, rather than the lug nuts.	*Mechanical Engineering*
Hub height	In a horizontal-axis wind turbine, the distance from the turbine platform to the rotor shaft.	*Energy*
Hubbs	mixed blacks, inferior coal and cannel, with shells, in the Adwalton Stone Coal, (Yorks.).	*Mining*
Hubs	The end connection tubes on a gate valve.	*Mechanical*
Hudge	a small box or tram without wheels running on timber slides which was drawn by a boy in thin and steep seams. (Som.); or a large iron barrel with a semi-circular iron bow on top which hooked onto the winding rope. The hudge held between 10 and 20cwt. - see Bowk.	*Mining*
Huey test	A corrosion resistance test for stainless steels, most useful for predicting resistance to intergranular corrosion.	*Mechanical*
Huey test	A corrosion resistance test for stainless steel, most useful for predicting resistance to intergranular corrosion.	*General Mechanical*
Huffing	floor weight. (Lancs.).	*Mining*
Human Body Model	An ESD test method where the ESD generator consists of a 100pF capacitor and a 1.5kohm series resistor.	*Electrical Engineering*
Human Engineering	the broad area of human relations insofar as it applies to labor-management relations.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hume Rothery rules	Four criteria for complete miscibility in metallic solid solutions.	*Material Process*
Humidification	The process of increasing the water vapor content of a gas. A humidifier is a device for dispersing water vapor into the air for the purpose of raising the humidity in a given space.	*Industrial*
Humidifier	A humidifier adds moisture to the air(often needed in winter when indoor air is very dry). It may be a portable unit or attached to the heating system.	*Energy*
Humidity	The moisture content of air. Relative humidity is the ratio of the amount of water vapor actually present in the air to the greatest amount possible at the same temperature.	*Energy*
Humus	sticky, brown part of the soil that comes from dead plants and animals and contains many nutrients	*Agriculture*
hundredweight	Abbreviated as cwt. A weight equal to 100 pounds in the United States and 112 pounds in Great Britain. Many crops are reported in hundredweight, including beans, potatoes and most vegetables.	*Agriculture*
Hund's rule	in a given orbital tends to be delayed until all levels of a given energy have a single electron.	*Material Process*
Hunger Marches	demonstrations of unemployed workers who marched to state and federal capitals to focus attention on their economic plight and to point out the need for assistance during eh depression of 1929 and succeeding years.	*Industrial Relations*
Hunky	a derogatory slang term for an unskilled foreign worker of Hungarian or Slavic Origin.	*Industrial Relations*
Hunting coal	the ribs and posts of coal left to be worked at a later date. (Yorks.).	*Mining*
Hurdle sheet or Screen	a brattice with a space left at the top, hung across a roadway to divert the air current upwards to clear gas from a hole in the roof. Also called a 'jump sheet'.	*Mining*
Hurley	a hutch or tram. (Scot.).	*Mining*
Hurrier/s	a boy employed to push loaded tubs along the gate roads; or children in general who drew corves with belt and chain on their heads from the headings to the main gates.	*Mining*
Hurry	to haul, pull or push trams of coal etc. –see Hurrier, (Yorks.); or a riddle or screen. (Scot.).	*Mining*
Hussel, Hussle or Hustle	a highly slickensided carbonaceous shale containing coal-pipes, or veins and pyrites.	*Mining*
Hutch	Originally adapted from the hutch measure, i.e. a chest or coffer with a capacity of 2 cwt. It was at first mounted on runners like a sled and then wheels were added to make it into a small tub for transporting coal in the mine. (Scot).	*Mining*
Hutch pin	a check, tally or chalk mark on the side of a hutch, which carried the collier's number.	*Mining*
Hutcheson Case	a decision by the U.S. Supreme Court affirming the dismissal of a criminal indictment charging officers of th Carpenters Union with violation of the Sherman Antitrust Act.	*Industrial Relations*
HV	Velocity head at the pump suction port. Often not included as it's normally quite small.	*Heat Transfer Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
HVAC	Heating, Ventilation, and Air Conditioning: Industry term for the systems and technology responsible for the heating, ventilation, and air conditioning in buildings. HVAC systems regulate comfort (temperature and humidity), energy efficiency, and air quality.	*Electrical Engineering*
HVAC	An acronym for heating, ventilation and air conditioning; these are among the key systems managed by facilities maintenance professionals.	*Reliability Engineering*
HVAC conservation feature	A building feature designed to reduce the amount of energy consumed by the heating, cooling, and ventilating equipment.	*Energy*
HVAC DSM program	A DSM (demand-side management)program designed to promote the efficiency of the heating or cooling delivery system, including replacement. Includes ventilation (economizers; heat recovery from exhaust air), cooling (evaporative cooling, cool storage; heat recovery from chillers; high-efficiency air conditioning), heating, and automatic energy management systems.	*Energy*
HVDC	Light is environmentally friendly, featuring oil-free cables, compact converter stations and cables that can be laid underground (thereby avoiding local planning difficulties associated with overhead lines) as well as underwater. It is the only technology available that allows long-distance underground high-voltage transmission. It is rarely used for power transmissions using overhead lines. Because of its smaller footprint, underground cable technology and superior controllability, HVDC Light has many more potential applications than classical HVDC, for example - feeding power into cities and offshore oil and gas platforms; strengthening power networks in areas where there is opposition to new overhead lines; and delivering power to islands that would otherwise need local generating plants.	*Electrical*
HVDC Light	**HVDC Light -** An adaptation of classic HVDC, developed by ABB in the 1990s. It can be used to transmit electricity in lower power ranges (tens of megawatts) to an upper range of 1,100 megawatt (MW) (±320 kilovolts). By comparison, classic HVDC (see High-voltage direct current) systems typically transmit electricity in the 500 to 8,000 MW power range. Offering both HVDC and HVDC Light systems extends the economical power range of HVDC transmission. **The superior controllability is achieved by using IGBTs (i.e., transistors) as the power electronic device used for the conversion (see Direct current).**	*Electrical*
HVI	High Viscosity Index, typically from 80 to 110 VI units.	*Oil Analysis*
HVOF	See High Velocity Oxygen fuel spraying	*Paint and Coatings*
HVP	Absolute vapor pressure of the liquid at the pumping temperature - must be subtracted in the end to make sure that the inlet pressure stays above the vapor pressure. Remember, as temperature goes up, so does the vapor pressure.	*Heat Transfer Process*
HVSC	High-voltage shore connections enable ships to draw electricity from onshore power grids while in port to operate onboard equipment such as lighting, cooling and heating systems, instead of burning fuel oil to run onboard generators. For a large cruise ship on a 10-hour stay in port, a shore connection can cut fuel consumption by up to 20 tons and reduce carbon dioxide emissions by 60 tons.	*Electrical*
HWBF	High water-based fluid	*Petro-Chemical Abbreviations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
HWO	Handwheel Operated - A valve on which the handwheel drives the stem directly to operate the valve	*Mechanical*
HWT	Hot water temperature*	*General*
Hybrid	an offspring of two animals or plants that are of different breeds, varieties or species	*Agriculture*
Hybrid Bearing	A bearing that consists of metal rings and ceramic balls.	*Lubrication*
Hybrid transmission line	A double-circuit line that has one alternating current and one direct circuit. The AC circuit usually serves local loads along the line.	*Energy*
hybrid	Offspring produced by combining genetically different parents. Hybrid corn is the classic example, in which two varieties are cross pollinated to produce a third, which has more favored qualities. Do not confuse hybridization with biotechnology, genetic engineering, etc. Hybridization has created plants that are higher yielding, more resistant to disease and that produce more desirable food or fiber.	*Agriculture*
Hybridization	Formation of four equivalent electron energy levels (sp3 type) from initially different levels (s-type and p-type).	*Material Process*
Hydration	The act by which a substance takes up water by absorption and/or adsorption.	*Petroleum Engineering*
Hydration unit	This unit mixes the water and chemical additives to make the frac fluid. Usually the blending process takes a few minutes for the water to gel to the right consistency.	*Petroleum Drilling*
Hydraulic	Pertaining to, or using, water, oil, or other liquids.	*Mechanical*
Hydraulic Radius	The ratio of area of flowing fluid to the wetted perimeter.	*Maintenance and Repair*
Hydraulic "Giant" or Monitor	The firehose-type nozzles that sprayed huge amounts of water on hillsides to recover gold out of them.	*Mining*
Hydraulic burster	a water operated device for breaking down coal on the coal face. It consisted of a stainless steel bar bored radially at intervals to accommodate small telescopic pistons which are actuated by water pressure forcing them to extend outwards from the bar. The device was inserted in suitable holes drilled along the face.	*Mining*
Hydraulic chock	-see Chock.	*Mining*
Hydraulic Claims	Claims worked by hydraulic power.	*Mining*
Hydraulic Clamp	Used in variety of molding and forming machines, a hydraulic clamp consists basically of a high speed, variable hydraulic pump, valving, a fast acting cylinder, and a high pressure cylinder. Cylinders can be single or combination units. The clamp closes the mold halves to form the part.	*Engineering Physics*
Hydraulic Conductivity	The capability of subsurface materials (sand, rock, etc.) to allow a fluid (usually water) to flow through it.	*Petroleum Engineering*
Hydraulic conductivity	a coefficient of proportionality describing the rate at which water can move through a permeable medium. Hydraulic conductivity is a function of both the intrinsic permeability of the porous medium and the kinematic viscosity of the water which flows through it. Also referred to as the coefficient of permeability.	*Chemical*

Term	Definition	*Industry*
HYDRAULIC CONTROL	A control which is actuated by hydraulically induced forces. HYDRAULIC HORSEPOWER - Horsepower computed from flow rate and pressure differential.	*Mechanical, Process, and Operations*
Hydraulic decking plant	see Balanced platforms.	*Mining*
Hydraulic Fluid	Fluid serving as the power transmission medium in a hydraulic system. The most commonly used fluids are petroleum oils, synthetic lubricants, oil-water emulsions, and water-glycol mixtures. The principal requirements of a premium hydraulic fluid are proper viscosity, high viscosity index, anti-wear protection (if needed), good oxidation stability, adequate pour point, good demulsibility, rust inhibition, resistance to foaming, and compatibility with seal materials. Anti-wear oils are frequently used in compact, high-pressure, and capacity pumps that require extra lubrication protection.	*Lubrication*
Hydraulic fracturing	Fracturing of rock at depth with fluid pressure. Hydraulic fracturing at depth may be accomplished by pumping water into a well at very high pressures. Under natural conditions, vapor pressure may rise high enough to cause fracturing in a process known as hydrothermal brecciation.	*Energy*
Hydraulic Fracturing ("Fracking")	The process in which a specially blended liquid is pumped into a well and into a formation under high pressure, which causes the formation to break open.	*Petroleum Drilling*
Hydraulic fracturing (or "fracing")	Commonly referred to as "fracing", is the process of creating small cracks, or fractures, in deeply buried geological formations to allow natural gas to flow into the wellbore. The natural gas can then flow to the surface under controlled conditions through the wellhead and be collected for processing and distribution.	*Petroleum Engineering*
Hydraulic fracturing water lifecycle	The lifecycle of water in the hydraulic fracturing process, encompassing the acquisition of water, chemical mixing of the fracturing fluid, injection of the fluid into the formation, the production and management of flowback and produced water, and the ultimate treatment and disposal of hydraulic fracturing wastewaters.	*Petroleum Drilling*
Hydraulic fracturing ("fracking," "hyrdofracking")	The process of creating fractures in non-porous rock, such as Marcellus shale, using specially formulated water-based solutions forced into wells at extremely high pressure; the cracks in the rock allow for the release and collection of the natural gas.	*Petroleum Drilling*
Hydraulic Gradient	Slope of the water surface. It is the driving force of fluid flow in a porous material. The hydraulic gradient indicates which direction groundwater will flow and how rapidly.	*Petroleum Engineering*
hydraulic gradient	the change in total potentiometric (or piezometric) head between two points divided by the horizontal distance separating the two points.	*Chemical*
Hydraulic head	The distance between the respective elevations of the upstream water surface (headwater) above and the downstream surface water (tailwater) below a hydroelectric power plant.	*Energy*
Hydraulic mining	a method of winning the coal by washing it out with high pressure jets of water.	*Mining*
HYDRAULIC MOTOR	A device which converts hydraulic fluid power into mechanical force and motion by transfer of flow under pressure. It usually provides rotary mechanical motion.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hydraulic Motor	A device which converts hydraulic fluid power into mechanical force and motion by transfer of flow under pressure. It usually provided rotary mechanical motion.	*Lubrication*
Hydraulic motor actuator (Operator)	A device by which rotation of a hydraulically powered motor is converted into mechanical motion.	*Mechanical*
Hydraulic Oil	An oil specially suited for use as either the specific gravity or the API gravity of a liquid.	*Lubrication*
Hydraulic prop	a metal hydraulic hand-operated prop, often used on the face for roof support in conjunction with steel bars. These had an initial setting of 5 tons pressure and would yield when the roof strata weight exceeded 20 tons.	*Mining*
Hydraulic pump	A device which converts mechanical force and motion into hydraulic fluid power by means of producing flow.	*Mechanical, Process, and Operations*
Hydraulic pump, positive displacement	A pump that for each cycle or revolution, positively displaces (usually by mechanical means) a specific amount.	*Mechanical, Process, and Operations*
Hydraulic seats	The movement of the seats in a valve that are controlled by using water, oil, or other liquids under pressure.	*Mechanical*
Hydraulic Set Cement	A cement that sets through reaction with water.	*Engineering Physics*
hydraulic shovel	excavates and loads by means of a bucket attached to a rigid arm that is hinged to a broom.	*Energy*
Hydraulic stowing, a method of stowing (filling or packing)	the waste where the packing material is crushed, mixed with water and injected through pipes into the waste.	*Mining*
Hydraulic System	A system designed to transmit power through a liquid medium, permitting multiplication of force in accordance with Pascal's law, which stated that "a pressure exerted on a confined liquid is transmitted undiminished in all directions and acts with equal force on all equal areas." Hydraulic systems have six basic components: (1) a reservoir to hold the fluid supply; (2) a fluid to transmit the power; (3) a pump to move the fluid; (4) a valve to regulate pressure; (5) a directional valve to control the flow, and (6) a working component – such as a cylinder and piston or a shaft rotated by pressurized fluid – to turn hydraulic power into mechanical motion. Hydraulic systems offer several advantages over mechanical systems: They eliminate complicated mechanisms such as cams, gears, and levers; are less subject to wear; are usually more easily adjusted for control of speed and force; are easily adaptable to both rotary and liner transmission of power; and can transmit power over long distances and in any direction with small losses.	*Lubrication*
Hydraulic Tensioner	A hydraulic tool used to tighten a fastener by stretching it rather than applying a large torque to the nut. After the fastener has been stretched, the nut is run down the thread to snug up with the joint, the hydraulically applied load is then removed resulting in tension being induced into the fastener.	*Maintenance*
Hydraulic Valve	A valve for controlling liquid flow or pressure.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hydraulic	Of or pertaining to fluids in motion. Hydraulic cement has a composition which permits it to set quickly under water. Hydraulic jacks lift through the force transmitted to the movable part of the jack by a liquid. Hydraulic control refers to the mechanical control of various parts of machines, such as coal cutters, loaders, etc., through the operation or action of hydraulic cylinders.	*Mining*
Hydraulics	Engineering science pertaining to liquid pressure and flow.	*Oil Analysis*
Hydraulics	The engineering science of liquid pressure and flow. (In this manual, our main interest is in oil hydraulics as applied to produce work in linear and rotary planes.)	*Mechanical, Process, and Operations*
Hydro Turbine	A rotary engine whose energy is generated from moving water.	*Reliability Engineering*
Hydrocarbon	An organic chemical compound of hydrogen and carbon in the gaseous, liquid, or solid phase. The molecular structure of hydrocarbon compounds varies from the simplest (methane, a constituent of natural gas) to the very heavy and very complex.	*Energy*
hydrocarbon	chemical compounds composed only of carbon and hydrogen.	*Chemical*
Hydrocarbon gas liquids (HGL)	A group of hydrocarbons including ethane, propane, normal butane, isobutane, and natural gasoline, and their associated olefins, including ethylene, propylene, butylene, and isobutylene. As marketed products, HGL represents all natural gas liquids (NGL) and olefins. EIA reports production of HGL from refineries (liquefied refinery gas, or LRG) and natural gas plants (natural gas plant liquids, or NGPL). Excludes liquefied natural gas (LNG).	*Energy*
Hydrocarbon	A family of chemical compounds containing carbon and hydrogen atoms in various combinations, found especially in fossil fuels.	*Mining*
Hydrocarbon	A compound containing only the elements hydrogen and carbon. May exist as a solid, a liquid or a gas. The term is mainly used in a catch-all sense for oil, gas and condensate.	*Petroleum Drilling*
Hydrocarbons	Compounds containing only carbon and hydrogen. Petroleum consists chiefly of hydrocarbons.	*Oil Analysis*
Hydrochloric acid	solution used in the cleaning stages of the galvanizing process and consisting of one hydrogen ion and one chloride ion (chemical formula: HCl) in mixture with water	*Materials Process*
Hydrochloric Acid (HCL)	Also known as muriatic acid. Used in toilet bowl cleaners in varying dilutions. Hydrogen Chloride.	*Chemistry*
Hydrochloric acid (HCl) (muriatic acid, chlorohydric acid, hydrogen chloride)	A colorless gas or colorless poisonous fuming liquid. Hydrochloric acid is a strong, highly corrosive acid. The commercial concentrated or fuming acid contains 38% hydrogen chloride. Soluble in water, alcohol and ether. This acid used as a catalyst and in the production of such compounds as vinyl chloride, ethyl chloride, etc.. It derivates 1) by-product from the chlorination of benzene and other hydrocarbons, 2) by the action of sulfuric acid on common salt, and 3) by burning of hydrogen, methane, or water gas in an atmosphere of chlorine. It uses as chemical intermediates, ore reduction (manganese, tantalum, tin, tungsten), food processing (corn syrup, sodium glutamate), pickling and metal cleaning, industrial acidizing and general cleaning. Corrosive liquid. Causes burns, avoid contact with skin or eyes.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hydrochlorofluorocarbons (HCFCs)	Chemicals composed of one or more carbon atoms and varying numbers of hydrogen, chlorine, and fluorine atoms.	*Energy*
Hydrocracking	See Catalytic hydrocracking.	*Energy*
Hydrodesulfurization	A catalytic process in which the principal purpose is to remove sulfur from petroleum fractions in the presence of hydrogen.	*Petroleum Engineering*
Hydrodynamic Lubrication	The formation of a continuous lubricating fluid film between mating surfaces of sufficient pressure to prevent contact. Film formation depends on shape of the surfaces and their relative motion.	*Lubrication*
Hydrodynamic Lubrication	A system of lubrication in which the shape and relative motion of the sliding surfaces causes the formation of a fluid film having sufficient pressure to separate the surfaces.	*Lubrication*
Hydrodynamics	The engineering science of the energy of liquid pressure and flow.	*Mechanical, Process, and Operations*
Hydroelectric	An electric generating station in which a water wheel is driven by falling water, thus generating electricity.	*Energy*
Hydroelectric Plant	A plant in which the turbine generators are driven by falling water.	*Energy*
Hydroelectric power	The use of flowing water to produce electrical energy.	*Energy*
Hydrofinishing	A catalytic treating process carried out in the presence of hydrogen to improve the properties of low viscosity-index naphthenic and medium viscosity-index naphthenic oils. It is also applied to paraffin waxes and microcrystalline waxes for the removal of undesirable components. This process consumes hydrogen and is used in lieu of acid treating.	*Petroleum Engineering*
Hydrofinishing	A process for treating raw extracted base stocks with hydrogen to saturate them for improved stability.	*Lubrication*
Hydrofluorocarbons (HFCs)	A group of man-made chemicals composed of one or two carbon atoms and varying numbers of hydrogen and fluorine atoms. Most HFCs have 100-year Global Warming Potentials in the thousands.	*Energy*
Hydroforming	Catalytic reforming of naphtha at elevated temperatures and moderate pressures in the presence of hydrogen to form high-octane BTX aromatics for motor fuel or chemical manufacture. This process results in a net production of hydrogen and has rendered thermal reforming somewhat obsolete. It represents the total effect of numerous simultaneous reactions such as cracking, polymerization, dehydrogenation, and isomerization.	*Petroleum Engineering*
Hydrogen	hydrogen	*Energy*
Hydrogen (H2)	Diatomic gas, atomic number 1, The lightest element, very reactive and powerful reducing agent. Used as a secondary plasma gas in the plasma spraying process and as a fuel gas in combustion thermal spray processes (CWS, CPS and HVOF)	*Paint and Coatings*
Hydrogen Bond	A strong secondary interatomic bond which exists between a bound hydrogen atom (its unscreened proton) and the electrons of adjacent atoms.	*Engineering Physics*
Hydrogen Bonds	strongest dipole interactions resulting between a hydrogen atom and a highly electronegative atom (F, O, or N)	*Physics*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hydrogen bridge	Secondary bond formed between two permanent dipoles in adjacent water molecules.	*Material Process*
Hydrogen Embrittlement	Steel fasteners exposed to hydrogen can fail prematurely at a stress level well below the materials yield strength. Hydrogen embrittlement occurs in fasteners usually as a result of the part being exposed to hydrogen at some time during its manufacturing process but it can also occur through in-service corrosion. Electroplating is generally considered to be a major cause of hydrogen absorption in steel fasteners due to the release of hydrogen during this process. Higher strength steels are more susceptible to hydrogen embrittlement than lower strength steels, however it is considered that there is no lower strength limit. As a rule of thumb, steels below Rockwell C 35 are considered to be far less susceptible. Tests such as the incremental load hydrogen embrittlement test can be completed to assess if hydrogen embrittlement is present in a batch of fasteners.	*Maintenance*
Hydrogen embrittlement	a condition of low ductility in metals resulting from the absorption of hydrogen	*Materials Process*
Hydrogen Ion Activity (aH+)	Activity of the hydrogen ion in solution. Related to hydrogen ion concentration (CH+) by the activity coefficient for hydrogen (f H+).	*General Engineering*
Hydrogen ion concentration (pH)	A scale for expressing acidity or alkalinity of the circulating or make-up water. A pH below 7.0 indicates acidity and above 7.0 indicates alkalinity. A pH of 7.0 is neutral.	*Facility Engineering*
hydrogen peroxide - H(2) O(2)	Hydrogen peroxide is used to increase the dissolved oxygen content of groundwater to stimulate aerobic biodegradation of organic contaminants. Hydrogen peroxide is infinitely soluble in water, but rapidly dissociates to form a molecule of water [H(2)O] and one-half molecule of oxygen [O]. Dissolved oxygen concentrations of greater than 1,000 mg/L are possible using hydrogen peroxide, but high levels of D.O. can be toxic to microorganisms.	*Chemical*
Hydrogen peroxide (H2O2)	Colorless liquid, an oxidizing polymerization catalyst for numerous synthetic resins.	*Material Process*
Hydrogen Sulfide	(H2S) a deadly poison that also has a destructive effect on high strength low alloy steels when the hardness of these steels exceeds a hardness of 22 Rockwell C.	*Petroleum Engineering*
Hydrogen sulfide (H2S)	Commonly known as sour gas. H2S is colorless and smells like rotten eggs at low concentrations and is not detectable by odor at high concentrations. It is heavier than air and is flammable and may pose a public safety hazard if released at higher concentrations.	*Petroleum Engineering*
Hydrogenation	Chemical process whereby hydrogen gas is introduced into a compound.	*Material Process*
Hydrogenation	In refining, the chemical addition of hydrogen to a hydrocarbon in the presence of a catalyst; a severe form of hydrogen treating. Hydrogenation may be either destructive or non-destructive. In the former case, hydrocarbon chains are ruptured (cracked) and hydrogen is added where the breaks have occurred. In the latter, hydrogen is added to a molecule that is unsaturated with respect to hydrogen. In either case, the resulting products are highly stable. Temperatures and pressures in the hydrogenation process are usually greater than in hydrofining.	*Lubrication*
Hydrogeologic	Those factors that deal with subsurface waters and related geologic aspects of surface waters.	*Petroleum Engineering*
Hydrokinetics	The engineering science pertaining to the energy of liquids in motion.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hydrolysis	Breakdown process that occurs in anhydrous hydraulic fluids as a result of heat, water, and metal catalysts (iron, steel, copper, etc.)	*Oil Analysis*
Hydrolysis	Decomposition of a substance by reaction with water.	*Engineering Physics*
Hydrolytic stability	Ability of additives and certain synthetic lubricants to resist chemical decomposition (hydrolysis) in the presence of water.	*Oil Analysis*
Hydrometallurgy	The treatment of ore by wet processes, such as leaching, resulting in the solution of a metal and its subsequent recovery.	*Mining*
Hydrometer	An instrument for determining either the specific gravity of a liquid or the API gravity.	*Oil Analysis*
Hydrophilic	Characterized by an affinity for water and capable of uniting with or dissolving in water.	*Lubrication*
Hydrophilic	having an affinity for water, or capable of dissolving in water; soluble or miscible in water.	*Chemical*
Hydrophobic	tending not to combine with water, or incapable of dissolving in water; insoluble or immiscible in water. A property exhibited by non-polar organic compounds, including the petroleum hydrocarbons.	*Chemical*
Hydrophobic	Lacking affinity for water.	*Engineering Physics*
Hydroplaning	Loss of traction at high speeds caused by a wedge of water, which lifts a tire off the road surface.	*Mechanical Engineering*
Hydropneumatics	Pertaining to the combination of hydraulic and pneumatic fluid power.	*Mechanical, Process, and Operations*
Hydroponic	grown in water without the use of soil	*Agriculture*
Hydrostatic lubrication	A system of lubrication in which the lubricant is supplied under sufficient external pressure to separate the opposing surfaces by a fluid film.	*Oil Analysis*
Hydrostatic Test	Pressure tests that are carried out on every valve when built to test the integrity of the pressure-containing parts.	*Industrial Engineering*
Hydrostatic test	A pressure test in which a valve is tested with water to detect leaks - may be a shell test or a seat closure test.	*General Mechanical*
Hydrostatic test (Shell Test)	A test in which a valve is completely filled with water and pressure tested. Used for conducting proof pressure testing. See "Proof Pressure."	*Mechanical*
Hydrostatics	The engineering science of the energy of liquids at rest.	*Mechanical, Process, and Operations*
Hydrothermal	Relating to hot fluids circulating in the earth's crust.	*Mining*
Hydrotreating	See Catalytic hydrotreating.	*Energy*
Hydrox	a blasting method used in gassy mines, similar to Cardox, but using a charge of Hydrox powder, a mixture of sodium nitrite and ammonium chloride. Firing results in a chemical reaction producing nitrogen and steam.	*Mining*
Hydroxy-carboxylic resins	Synthetic resins prepared from polyhydric alcohol and polybasic acids.	*Material Process*
Hydroxyethyl ethyl aniline	A solvent-amine.	*Material Process*
Hydroxyethyl ethylene diamine	A solvent-amine.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hydroxyl radical (OH)	An important chemical scavenger of many trace gases in the atmosphere that are greenhouse gases. Atmospheric concentrations of OH affect the atmospheric lifetimes of greenhouse gases, their abundance, and, ultimately, the effect they have on climate.	*Energy*
Hyel	whole or solid coal, a harder place to work. (N. East).	*Mining*
Hygrometer	Any properly calibrated instrument which indicates directly or indirectly the humidity of the air. Absorption hygrometer: Any of several types of hygrometers containing a hygroscopic substance the length, thickness, or weight of which is a measurable index of the humidity of the atmosphere. Usually such devices are graduated directly either in per cent relative humidity or in regain of stock in process, and are continuously indicating.	*Material Process*
Hygroscopic	Capacity to absorb water.	*Chemical*
Hygroscopic	Attracting or absorbing moisture from the ambient atmosphere.	*Electrical*
Hygroscopic	Readily absorbing and retaining moisture from the air.	*Material Process*
Hypalon	Du Pont trademark for chlorosulfonated polyethylene (CSPE) synthetic rubber.	*Electrical*
Hyperbolic tower	A cooling tower of hyperbolic shape, which depends on natural draft for air movement through the tower. Can be either crossflow or counterflow tower. (See Natural Draft Tower.)	*Facility Engineering*
Hypereutectic	Composition greater than that of the eutectic.	*Material Process*
Hypereutectoid	Composition greater than that of the eutectoid.	*Material Process*
Hypoeutectic	Composition less than that of the eutectic.	*Material Process*
Hypoeutectoid	Composition less than that of the eutectoid.	*Material Process*
Hypoeutectoid Alloy	For an alloy system displaying a eutectoid, an alloy for which the concentration of solute is less than the eutectoid composition	*Engineering Physics*
Hypoid Gear Lubricant	A gear lubricant having extreme pressure characteristics for use with a hypoid type of gear as in the differential of an automobile.	*Lubrication*
Hypoid Gears	Gears in which the pinion axis intersects the plane of the ring gear at a point below the ring-gear axle and above the outer edge of the ring gear, or above the ring-gear axle and below the outer edge of the ring gear.	*Lubrication*
Hypothesis	An unproved theory that can be tested through research. To properly test a hypothesis, it should be pre-specified and clearly articulated, and the study to test it should be designed appropriately. See also: Null hypothesis	*Quality Engineering*
Hypothesis test	A statistical procedure to determine whether to reject a null hypothesis on the basis of the observed data.	*Quality Engineering*
Hypothetical resources (coal)	Undiscovered coal resources in beds that may reasonably be expected to exist in known mining districts under known geologic conditions. In general, hypothetical resources are in broad areas of coal fields where points of observation are absent and evidence is from distant outcrops, drill holes, or wells. Exploration that confirms their existence and better defines their quantity and quality would permit their reclassification as identified resources. Quantitative estimates are based on a broad knowledge of the geologic character of coalbed or region. Measurements of coal thickness are more than 6 miles apart. The assumption of continuity of coalbed is supported only by geologic evidence.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Hypoxic	a condition of low oxygen concentration, below that considered aerobic.	*Chemical*
Hysteresis	Difference between upscale and downscale out-put in instrument response when subjected to the same input approached from opposite directions.	*Electrical Engineering*
Hysteresis (Electrode Memory)	When an electrode system is returned to a solution, equilibrium is usually not immediate. This phenomenon is often observed in electrodes that have been exposed to the other influences such as temperature, light, or polarization.	*General Engineering*
Hysteresis (magnetic)	The irreversible magnetic flux density-versus-magnetic field strength (B-versus-H) behavior found for ferromagnetic and ferrimagnetic materials.	*Engineering Physics*
Hysteresis loop	Graph in which a plot of a material property (such as induction) does not retrace itself upon the reversal of an independent variable (such as magnetic field strength).	*Material Process*
Hysteresis, Switching	The principle associated with sensors, such that the operate point is not at the same level as the release point. In solid state sensors, it is accomplished electrically. In mechanical switches, it results from the storing of potential energy before the transition occurs. Also known as differential, and is usually expressed as a percentage of the operate point (e.g. 3: 15%).	*Electrical Engineering*
Hysteresis	Also called deadband. That portion of a measuring system's response where a change in input does not produce a change in output.	*Reliability Engineering*
Hysterothecium	A sexual fruiting structure of the Ascomycete fungi, usually football-shaped or elongate in appearance and occurring on infected needles.	*Forestry*
Hz	HERTZ - a unit of frequency equal to one cycle per second. Most common cycle time is 60 Hertz.	*Electrical Engineering*
I	I	*Forestry*
--I--	--I--	*Petroleum Drilling*
I.D.	Inside Diameter.	*Petroleum Engineering*
I.D.	inside diameter	*Mechanical, Process, and Operations*
I/M	inspection and maintenance	*Petro-Chemical Abbreviations*
I/O	Input/Output. Refers to the electronic hardware where the field devices are wired. Discrete I/O would have switches for inputs and relay outputs to fire solenoid valves or pump motors. Analog I/O would have process variable inputs, and variable controller outputs.	*Process Control Engineering*
I/O Devices	Input/output devices used to enter data into and receive data from a computer or control system. Examples are analog and digital input and output devices for handling process measurements and conditions as well as "business" type devices such as terminals, printers, plotters, etc.	*Electrical Engineering*
I/O Module	An Input/Output module, which usually contains several I/O points.	*Control Engineering*
I/O point	An Input/Output point, used as a connection point.	*Control Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
I/O (Input/output)	A device that enables communication between electronic equipment and external devices, including human operators. Examples of I/O devices include computer keyboards, printers, sensors and all type of interface cards.	*Electrical*
I/P	An abbreviation for current-to-pneumatic signal conversion. This term is commonly used to describe a type of transducer that converts an electric (4-20m.a) input signal to a pneumatic (3-15 psig.) output signal.	*Industrial Engineering*
I/P Transducer	(Current-to-pneumatic). A device which con-	*Electrical Engineering*
I2	A measure used to quantify heterogeneity. It describes the percentage of the variability in effect estimates that is due to heterogeneity rather than sampling error (chance). A value greater than 50% may be considered to represent substantial heterogeneity. See also: Heterogeneity	*Quality Engineering*
I²C	I²C (pronounced "I-squared-C" and typeset as I²C but often typed as I2C) is short for "inter-IC bus." I²C is a two-wire, low-speed, serial data connection IC bus used to run signals between integrated circuits, generally on the same board.	*Electrical Engineering*
I²C	I²C (pronounced "I-squared-C" and typeset as I²C but often typed as I2C) is short for "inter-IC bus." I²C is a two-wire, low-speed, serial data connection IC bus used to run signals between integrated circuits, generally on the same board.	*Electrical Engineering*
IAOGP	International Association of Oil and Gas Producers	*Petro-Chemical Abbreviations*
Iatrogenic	Failures that are caused by your own service person(s).	*Maintenance*
IBBM	Iron body, bronze mounted - common term for valves with cast iron body and bonnet and bronze trim (seating surfaces, stem, bushings).	*General Mechanical*
IBBM	Iron body, bronze mounted - common term for valves with cast iron body and bonnet and bronze trim (seating surfaces, stem, bushings).	*Mechanical*
Ibit (bismuth oxyodotannate)	Greenish gray, odorless tasteless powder. Becomes brownish on exposure. Insoluble in alcohol, water or ether. It is used in medicine.	*Material Process*
IBP	initial boiling point	*Petro-Chemical Abbreviations*
IC	internal combustion	*Petro-Chemical Abbreviations*
Ice apron	A structure built in a river upstream from a bridge pier or the like for protection against drifting ice.	*Civil Engineering*
Ice apron	A structure built in a river upstream from a bridge pier or the like for protection against drifting ice.	*Civil Engineering*
Ice wall	a barrier of frozen ground formed by the 'freezing method' of shaft sinking.	*Mining*
ICEA	Insulated Cable Engineers Association (Formerly lPCEA). An Association of Engineers of most cable manufacturers.	*Electrical*
IChemE	Institute of Chemical Engineers (UK)	*Petro-Chemical Abbreviations*
Icon	A graphic functional symbol display. A graphic representation of a function or functions to be performed by the computer.	*General Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Icosahedral phases	Materials with fivefold, threefold, and twofold symmetries corresponding to the structure of the icosahedron.	*Material Process*
Icosahedron	Polyhedron composed of 20 identical equilateral triangular faces.	*Material Process*
ICP	Integrated Circuit Piezoelectric; term sometimes used to describe an accelerometer with built-in electronics.	*Electronic Process*
ICS	An Information and Command Station is used by operators to control and monitor the plant's processes.	*Control Engineering*
Icyl	Brand name of proprietary line of	*Material Process*
ID	The measurement of the inside diameter of a circular part.	*Mechanical*
Ideal solution	A solution which shows no change of internal energy on mixing, no attractive force between components, and follows Raoult's law over all ranges of temperature and concentration.	*Material Process*
Ideality Factor	A constant adjustment factor used to correct for discrepancies between an ideal PN junction equation and a measured device.	*Electrical Engineering*
Identification	marking/labeling steel so that different customer products can be distinguished from one another after galvanizing	*Materials Process*
Identification Badge	a button, badge, or other identification worn a person in the plant in order to identify him and also prevent individuals who are not authorized on the premises from entering the plant or special areas.	*Industrial Relations*
Identification stain AH	A mixture of dyes of various classes that dye each fiber, natural and synthetic, a different shade.	*Material Process*
Identified resources	Coal deposits whose location, rank, quality, and quantity are known from geologic evidence supported by engineering measurements. Included are beds of bituminous coal and anthracite (14 or more inches thick) and beds of subbituminous coal and lignite (30 or more inches thick) that occur at depths to 6,000 feet. The existence and quantity of these beds have been delineated within specified degrees of geologic assurance as measured, indicated, or inferred. Also included are thinner and/or deeper beds that presently are being mined or for which there is evidence that they could be mined commercially.	*Energy*
IDI	indirect injection	*Petro-Chemical Abbreviations*
Idle capacity	The component of operable capacity that is not in operation and not under active repair, but capable of being placed in operation within 30 days; and capacity not in operation but under active repair that can be completed within 90 days.	*Energy*
Idle Mode	A method for improving the efficiency of switching regulators by skipping pulses when the circuit is lightly loaded.	*Electrical Engineering*
Idle rope	the return rope on an endless rope haulage. The rope that does not bear a load. (Scot.).	*Mining*
Idle Time	payment for time during which a worker is unable to work at his machine because of delay in receiving material, breakdown of equipment, a power shortage, or some other factor that is out of the control of the employee.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Idler	A pulley, sheave, sprocket, or wheel around which a belt, cable, or chain passes in changing direction of travel.	*Equipment*
Idler Arm	A device attached to the frame of the car, which duplicates the movement of the Pitman arm and keeps the center link aligned.	*Mechanical Engineering*
Idler Arm	A device attached to the frame of the car, which duplicates the movement of the Pitman arm and keeps the center link aligned.	*Mechanical Engineering*
Idler Roller	Any carrying roller of a live roller conveyor not driven.	*Equipment*
Idlers	see 'Rollers'.	*Mining*
Idochlorol	**Trade mark for a chloriodized oil containing 26.5-28.5% iodine and 7.5% chlorine organically combined with highly refined peanut oil.**	*Material Process*
IDR Interval Data Recorder	IDR: Interval Data Recorder	*Energy*
IDS (INSTRUMENT DATA SHEET)	A table summarizing data such as service, valve size, supply pressure, etc., necessary for actuator sizing.	*Mechanical*
IEA	International Energy Agency	*Petro-Chemical Abbreviations*
IEC	International Electrotechnical Commission.	*Control Engineering*
IEC 61850	The International Electrotechnical Commission IEC standard for substation automation replaces a great many communication protocols that require the use of use protocol converters, which are basically "translators" that help electronic devices using different machine languages transmit information to each other. The problem is that protocol converters can cause messaging errors and delays. A single communication standard for substation automation removes the need for "translators," helps customers lower maintenance and operating costs, and makes installations easier to expand or modify.	*Electrical*
IFC	International Fieldbus Consortium. An hybrid body formed from the IFG and the OFC in 1990. It voted to stop work after the FF was created in 1994.	*Control Engineering*
IFG	International Fieldbus Group	*Control Engineering*
IFP	Institut Français du Pétrole	*Petro-Chemical Abbreviations*
Igenal	Trade mark of a line of dyestuffs for the coloring of chrome-tanned leather. Characterized by unusual tinctorial power on chrome leather.	*Material Process*
Igepal	Trade mark for a series of nonionic surfactants which are used as detergents, dispersants, emulsifiers, and wetting agents.	*Material Process*
Igepon	Trade mark for a series of anionic surfactants used as detergents, wetting agents, emulsifiers, dispersants, and foaming agents. The Igepon T and C types are sulfo-amides derived from N-methyltaurine or N-cyclohexyltaurine and fatty acids. Igepon A types are sulfo-esters derived from isethionic acid and a fatty acid.	*Material Process*
Igneous Rocks	Rocks that solidified from molten or partly molten material from magma (molten rock within the earth).	*Petroleum Engineering*
Igneous rocks	Rocks formed by the solidification of molten material from far below the earth's surface.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Ignition temperature	The lowest temperature to which a substance must be heated to cause it to take fire.	*Material Process*
III-IV Compound	Chemical compound between a metallic element in group III and nonmetallic element in group V of the periodic table. Many of these compound are semiconducting.	*Material Process*
II-VI compound	Chemical compound between a metallic element in group II and a nonmetallic element in group VI of the periodic table. Many of these compounds are semiconducting.	*Material Process*
ILD	Instrument Loop Diagram. A drawing showing the connections from the field device all the way through to the system terminations.	*Control Engineering*
ILEV	inherently low-emission vehicle	*Petro-Chemical Abbreviations*
Ill air	a stagnant atmosphere underground due to lack of ventilation. Noxious gas from an underground fire or chokedamp. (Scot.).	*Mining*
Illegal Purpose Doctrine	a principle adopted by some courts to decide whether some union activities which were not in themselves unlawful, but whose purpose or objective could be held unlawful, should be prohibited.	*Industrial Relations*
Illegal Strike	any strike which has been held unlawful under existing law.	*Industrial Relations*
Illinois Basin	Consists of Illinois, Indiana, and Western Kentucky.	*Energy*
Illness Frequency Rate	a statistical measure generally computed on a monthly basis, designed to show the total number of illnesses per one thousand employees.	*Industrial Relations*
ILMA	Independent Lubricant Manufacturers Association	*Petro-Chemical Abbreviations*
ILMA	The Independent Lubricant Manufacturers Association (ILMA) is a trade association of businesses engaged in compounding, blending, formulating, packaging, marketing, and distributing lubricants.	*Lubrication*
Ilmenite (FeOTiO2) (menaccanite, titanic iron ore)	Sometimes with some replacement of iron by magnesium or manganese. Iron black mineral, black to brownish–red-streak, submetallic luster. Resembles magnetite in appearance but is readily distinguished by feeble magnetic character. It is used for titanium paints and enamel, source of titanium metal, welding rods, titanium alloys, and ceramics.	*Material Process*
Ilmenite	An ore mineral of titanium, being an iron-titanium oxide.	*Mining*
ILSAC	International Lubricant Standardization and Approval Committee	*Petro-Chemical Abbreviations*
ILSAC	The International Lubricant Standardization and Approval Committee (ILSAC) is a joint committee of AAMA and JAMA members that assists in the development of new minimum oil performance standards.	*Lubrication*
ILSAC/OIL	An entity of ILSAC, responsible for development and introduction of lubricant specification requirements. ILSAC/OIL includes representatives from ILSAC, the Alliance of Automobile Manufacturers (AAM), the Japanese Automobile Manufacturers Association (JAMA) and oil industry organizations including, the American Petroleum Institute (API), and the American Chemistry Council (ACC).	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Image analyzer	A sophisticated microscopic system involving a microscope, a television camera, a dedicated computer, and a viewing monitor similar to a television screen.	*Oil Analysis*
Image Frequency	Receivers typically convert RF signals to a lower Intermediate Frequency (IF) for demodulation. In addition to the IF, a second signal, called the "image frequency" is often generated and filtered out.	*Electrical Engineering*
Image Rejection	The measure of a receiver's ability to reject signals at its image frequency. It is normally expressed as the ratio, in dB, of the receiver's sensitivity at the desired frequency versus the sensitivity at the image frequency.	*Electrical Engineering*
Image Rejection	The measure of a receiver's ability to reject signals at its image frequency. It is normally expressed as the ratio, in dB, of the receiver's sensitivity at the desired frequency versus the sensitivity at the image frequency.	*Electrical Engineering*
Imbalance	A non-uniform distribution of mass in a tire and wheel assembly about its axis of rotation causing bounce (static imbalance) or shake (dynamic imbalance).	*Mechanical Engineering*
IMC	Institute of Measurement and Control. InstMC.	*Control Engineering*
Immedial	Brand name of a line of sulfur dyestuffs. Used for dyeing of cotton and rayon. Characterized by very good fastness to light and good fastness to washing and perspiration.	*Material Process*
Immediate Response	Control transfers On/Off state immediately when target enters the detection range, and reverses state immediately when target leaves detection range.	*Electrical Engineering*
Immediate roof	The roof strata immediately above the coalbed, requiring support during the excavation of coal.	*Mining*
Immediate roof,	the strata immediately above a coal seam. -see Nether roof.	*Mining*
Immersion	Sinking something until completely covered with water. See also Electric Water Heating	*Industrial*
Immigration	the movement of persons to a country.	*Industrial Relations*
Immiscible	Two liquids are said to be immiscible, if when added together they do not mix but form two separate liquid phases.	*Chemical*
Immiscible	Two liquids are said to be immiscible, if when added together they do not mix but form two separate liquid phases.	*Chemical Engineering*
IMO	International Maritime Organization	*Petro-Chemical Abbreviations*
Impact	A collision between masses.	*Reliability Engineering*
Impact Test	A test to determine the behavior of materials when subjected to high rates of loading, usually in bending, tension, or torsion. The quantity measured is the energy absorbed in breaking the specimen by a single blow, as in Charpy or Izod tests.	*Maintenance and Repair*
Impact Energy	A measure of the energy absorbed during the fracture of a specimen of standard dimensions and geometry when subjected to very rapid (impact) loading. Charpy and Izod impact tests are used to measure this parameter, which is important in assessing the ductile-to-brittle transition behavior of a material.	*Engineering Physics*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Impact energy	Energy necessary to fracture a standard test piece with an impact load.	*Material Process*
Impact resistance	the ability to avoid damage due to contact with a forceful motion or object; galvanized coatings' uppermost, pure zinc Eta layer is relatively soft and absorbs impact shock, protecting the underlying alloy layers	*Materials Process*
Impact ripper	a ripping machine using a boom mounted impact unit to deliver repeated high energy blows at the rip by means of a reciprocating pick.	*Mining*
Impact strength	The mechanical energy absorbed by a standard test piece during fracture by a blow from a pendulum hammer. Energy absorbed by a standard test piece when the action of a pendulum hammer blow is just sufficient to cause fracture.	*Material Process*
Impact Strength	Ability to withstand shock loading.	*Engineering Physics*
Impact test (bump test)	A broad frequency range of structural responses is caused by a deliberate impact.	*Reliability Engineering*
Impact Wrench	A wrench, usually powered by electricity or air, in which repeated blows from little hammers are used to generate torque to tighten fasteners. The torque applied to the fastener depends upon the time and the air pressure applied to the tool (for pneumatic wrenches). The torque applied by an impact wrench to a fastener is influenced by the joint stiffness.	*Maintenance*
Impartial Chairman	the term is synonymous with impartial arbitrator or impartial umpire.	*Industrial Relations*
Impassible	A variant of impassive - incapable of suffering	*Breakroom*
Impedance	The total opposition to electrical flow (resistive plus reactive).	*Electrical*
Impedance, Input	The impedance presented by a device to the source.	*Process Control*
Impedance, Load	The impedance presented to the output of a device by the load.	*Process Control*
Impedance, Output	The impedance presented by a device to the load.	*Process Control*
Impedance, Source	The impedance presented to the input of a device by the source.	*Process Control*
Imperfection	A condition of being imperfect; a departure of a quality characteristic from its intended condition.5	*Maintenance and Repair*
Impermeable	Watertight, or not capable of being penetrated, as in rock and soil not allowing the passage of water.	*Petroleum Engineering*
Impermeable Layer	Layer of solid material, such as rock or clay, which does not allow the passage of water.	*Petroleum Engineering*
Impermex	Brand name for a proprietary product. A water dispersible organic colloid, developed for the purpose of decreasing the water loss of drilling muds, even in muds highly contaminated with salt, salt water, cement, or any other water soluble electrolyte	*Material Process*
IMPINGEMENT	The direct impact of fluid flow upon or against a surface.	*Mechanical, Process, and Operations*
Impingement Corrosion	A form of erosion-corrosion generally associated with the impingement of a high velocity, flowing liquid containing air bubbles against a solid surface.	*Paint and Coatings*
Implenal	Brand name of a product used as a leather-tanning assistant.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Implied heat rate	A calculation of the day-ahead electric price divided by the day-ahead natural gas price. Implied heat rate is also known as the 'break-even natural gas market heat rate,' because only a natural gas generator with an operating heat rate (measure of unit efficiency) below the implied heat rate value can make money by burning natural gas to generate power. Natural gas plants with a higher operating heat rate cannot make money at the prevailing electricity and natural gas prices.	*Energy*
Implied Warranty Of Fitness For A Particular Purpose	One of the warranty protections granted by law under the Uniform Commercial Code (UCC) (See Uniform Commercial Code). If the seller knows the buyer's intended use for the goods, and if the buyer has relied on the seller's expertise in choosing these goods, then the seller warrants that these goods will be fit for the buyer's intended use. Frequently sellers attempt to limit or exclude fitness for a particular purpose in their warranty terms.	*Procurement*
Importance measure	A measure of the relative contribution of a component's contribution to the overall system's reliability. The importance measure of a component is equivalent to the first partial derivative of the component reliability with respect to the system reliability.	*Reliability Engineering*
Imported crude oil burned as fuel	The amount of foreign crude oil burned as a fuel oil, usually as residual fuel oil, without being processed as such. Imported crude oil burned as fuel includes lease condensate and liquid hydrocarbons produced from tar sands, gilsonite, and oil shale.	*Energy*
Imported Refiners' Acquisition Cost (IRAC)	The average price for imported oil paid by U.S. refiners.	*Energy*
Imports	Receipts of goods into the 50 States and the District of Columbia from U.S. possessions and territories or from foreign countries.	*Energy*
Imposnite	A variety of asphaltic pyrobitumen, similar to albertite, black in color, with black streak, and fixed carbon 50-90%.	*Material Process*
Impoundment	A body of water or sludge confined by a dam, dike, floodgate, or other barrier.	*Petroleum Drilling*
Imprecision	"The random dispersion of a set of replicate measurements and/or values expressed quantitatively by a statistic, such as standard deviation or coefficient of variation." [CLSI] IFCC has recommended that the mean value and number of replicates should also be stated, and the experimental design described in such a way that other workers can repeat it. This is particularly important whenever a specific term is used to denote a particular type of imprecision, such as within-run, within-day, day-to-day, total, or between-laboratories.	*Quality*
Impregnation	A process of filling the pores of a coating with resin, wax or oil. (See sealer, vacuum impregnation)	*Paint and Coatings*
Impregnole	Proprietary products, aqueous dispersion of waxes and metalic salts. Milk white emulsions. Disperse readily in water over 50 °C (122 °F). It is used for water repellent and spot proofing for textile fabrics.	*Material Process*
Impressed voltage	A method of corrosion protection in which an external voltage is used to oppose the one due to an electrochemical reaction.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Impression	A mold cavity.	*Material Process*
Impression resins	The contact resins.	*Material Process*
Improved Plow Steel Rope	A specific grade of wire rope.	*Wire Rope & Cable*
Improved recovery	Extraction of crude oil or natural gas by any method other than those that rely primarily on natural reservoir pressure, gas lift, or a system of pumps.	*Energy*
Improvement	Combination of all technical, administrative, and managerial actions intended to decrease the dependency of an asset without changing its required function.	*Maintenance*
Improvement cut	An intermediate cut made to improve the form, quality, heath, or wildlife potential of the remaining stand.	*Forestry*
Impruvol	Trade mark for fuel and oil antioxidants.	*Material Process*
Impulse	The integral of force over a time interval.	*Reliability Engineering*
Impurities	Any substance that contaminates another.	*Chemical Engineering*
Impurities	elements or compounds in which their presence is undesired	*Materials Process*
Impurity	A substance unintentionally contained in a product other than the desired substance.	*Chemical*
IMSG	See Information Management System Group (IMSG)	*Quality Engineering*
in	Inch	*General*
In a longwall mining system	long sections of coal, up to about 700 feet, are removed and no pillars are left to support the mined-out areas. The working area is protected by a movable, powered roof support system. The caved area (gob) compacts and, after initial subsidence, supports the overlying strata. Longwall mining is used where the coalbed is thick and generally flat, where surface subsidence is acceptable.	*Energy*
In a room-and-pillar mining system	the most common method, the mine roof, is supported mainly by coal pillars left at regular intervals. Rooms are places where the coal is mined; pillars are areas of coal left between the rooms. Room-and-pillar mining is done either by 1) conventional mining, which involves a series of operations that require cutting the working face of the coalbed so that it breaks easily when blasted with explosives or high-pressure air, and then loading the broken coal or 2) continuous mining, in which a continuous mining machine extracts and removes coal from the working face in one operation. When a section of a mine has been fully developed, additional coal is extracted by mining the supportive pillars until the roof caves in; the procedure is called room-and-pillar retreat mining.	*Energy*
In an ideal differential amp	the common-mode element is cancelled out, since the differential (+ and -) inputs should subtract out the identical components. A measurement of the actual ability to do this is called the Common Mode Rejection Ratio, or CMRR.	*Electrical Engineering*
In digital broadcast satellite applications	In digital broadcast satellite applications.	*Electrical Engineering*

Term	Definition	*Industry*
In other cases,	wood is bought or cut in unusual units (for example, pickup-truck load, or trunk load). Finally, volume estimates are difficult to make when the wood is left in a pile instead of being stacked. Other factors that make it difficult to estimate the Btu value of the wood burned is that the amount of empty space between the stacked logs may vary from 12 to 40 percent of the volume. Moisture content may vary from 20 percent in dried wood to 50 percent in green wood. (Moisture reduces the useful Btu output because energy is used in driving off the moisture). Finally, some tree species contain twice the Btu content of species with the lowest Btu value. Generally, hard woods have greater Btu value than soft woods. Wood is converted to Btu at the rate of 20 million Btu per cord, which is a rough average that takes all these factors into account. Also see Btu conversion factors.	*Energy*
In real life,	sampling rate must be higher than that (because filters are not perfect). As an example, the bandwidth of a standard audio CD is a bit shy of the theoretical maximum of 22.05kHz (based on the sample rate of 44.1kHz).	*Electrical Engineering*
In situ	in its original place; unmoved; unexcavated; remaining in the subsurface.	*Chemical*
In situ leach mining (ISL)	The recovery, by chemical leaching, of the valuable components of a mineral deposit without physical extraction of the mineralized rock from the ground. Also referred to as "solution mining."	*Energy*
In situ	In the natural or original position. Applied to a rock, soil, or fossil when occurring in the situation in which it was originally formed or deposited.	*Mining*
In the case of a processing agreement	delivered to another refinery for processing for the respondent's own account.	*Energy*
Inaccuracy	"Numerical difference between the mean of a set of replicate measurements and the true value. This difference (positive or negative) may be expressed in the units in which the quantity is measured, or as a percentage of the true value" [IFCC]. We use the term biasmeas to describe the average systematic difference between a measurement procedure and a comparative method and express it in percent on OPSpecs charts.	*Quality*
Inadvertent power exchange	An unintended power exchange among utilities that is either not previously agreed upon or in an amount different from the amount agreed upon.	*Energy*
Inby	In the direction of the working face.	*Mining*
In-bye or Inbye	To travel into a mine is to go 'in-bye', i.e. in a direction away from the shaft. The opposite is 'out-bye'.	*Mining*
Inc*	planned well bore inclination at MD*. (degrees)	*Petroleum Drilling*
Incandescent lamp	A glass enclosure in which light is produced when a tungsten filament is electrically heated so that it glows. Much of the energy is converted into heat; therefore, this class of lamp is a relatively inefficient source of light. Included in this category are the familiar screw-in light bulbs, as well as somewhat more efficient lamps, such as tungsten halogen lamps, reflector or r-lamps, parabolic aluminized reflector (PAR) lamps, and ellipsoidal reflector (ER) lamps.	*Energy*
Incandescent light bulbs, including regular or energy-efficient light bulbs	An incandescent bulb is a type of electric light in which light is produced by a filament heated by electric current. The most common example is the type you find in most table and floor lamps. In commercial buildings, incandescent lights are used for display lights in retail stores, hotels and motels. This includes	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
	the very small, high-intensity track lights used to display merchandise or provide spot illumination in restaurants. Energy efficient light bulbs, known as "watt-savers," use less energy than a standard incandescent bulb. "Long-life" bulbs, bulbs that last longer than standard incandescent but produce considerably less light, are not considered energy-efficient bulbs. This category also includes halogen lamps. Halogen lamps are a special type of incandescent lamp containing halogen gas to produce a brighter, whiter light than standard incandescent. Halogen lamps come in three styles bulbs, models with reflectors, and infrared models with reflectors. Halogen lamps are especially suited to recessed or "canned fixtures," track lights, and outdoor lights.	
Incapacity for Work	relates primarily to the inability of a person to perform work and the provisions for insurance to cover that incapacity.	*Industrial Relations*
Inceloid Solution and Sheeting	Brand name for a line of transparent plastic products as well as special adhesives and lacquers. Solution available in clear and in transparent colors, pigmented, metallics, and pearl effects. Solutions for coating, impregnating and sealing. Sheeting is made from cellulose acetate and also ethyl cellulose. Water white, and in all colors both transparent and pigmented, as well as the metallic bronzes and pearl essence, nonflammable, no fire hazard, sheeting is completely waterproof, certain types are moisture impervious. It is used for general transparent wrapping for all types of food products, pharmaceuticals, tobacco, wearing apparel, etc.	*Material Process*
Incendiary gels	1) Mixtures of thermite (aluminum powder and iron oxide) suspended in oil set to a jelly with a small amount of soap, which undergoes spontaneous ignition on contact with air. Another type may contain magnesium in jellied oil. 2) Jellied gasoline combined with thickening agents such as Napalm or finely divided magnesium.	*Material Process*
Incentive Contracts	clauses in collective bargaining agreements which establish systems of incentive wage payments and specify how such systems are to be extended to new groups which may come within the bargaining unit.	*Industrial Relations*
Incentive Rate	generally applies to any type of wage rate for production above a fixed or agreed upon standard of output.	*Industrial Relations*
Incentive Wage	refers to any system of wage payment in which payment to the employee rises with increased production.	*Industrial Relations*
Incentive	A rebate or some form of payment used to encourage people to implement a given demand-side management (DSM) technology. The incentive is calculated as the amount of the technology costs that must be paid by the utility for the participant test to equal one and achieve the desired benefit/cost ratio to drive the market.	*Energy*
Incentives Demand-Side Management (DSM) program assistance	This DSM program assistance offers monetary or non-monetary awards to encourage consumers to buy energy-efficient equipment and to participate in programs designed to reduce energy usage. Examples of incentives are zero or low-interest loans, rebates, and direct installation of low cost measures, such as water heater wraps or duct work for distributing the cool air; the units condition air only in the room or areas where they are located.	*Energy*
Inch of Water	About two and a half cubic feet per minute; the water that will run out of an opening one inch square.	*Mining*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Incidence	The number of new cases of illness commencing, or of persons falling ill, during a specified time period in a given population. See also Prevalence.	*Analysis*
Incident	An undesired event which under slightly different circumstances, could have resulted in harm to people, damage to property, or loss of process.	*Reliability Engineering*
Incident	Incident usually occur through the coincident failure of two or more items, failure of equipment, control systems and instruments, and miss operation.	*Material Process*
Incipient Cavitation	A term used to describe the early stages of cavitation. At this point the bubbles are small and the noise is more of a hiss, like the sound of frying bacon. There is normally no mechanical damage associated with incipient cavitation although it could have an effect on the corrosive properties of some fluids.	*Industrial Engineering*
Inclination	the angle of the well bore defined by a tangent line and a vertical line. The vertical line is always parallel to the direction of earth's gravity. By industry standard, 0 degree inclination is vertical (downward pointing) and 90 degrees inclination is horizontal. An inclination (angle) greater than 90 degrees coincides with the term "drilling up".	*Petroleum Drilling*
Inclination and Azimuth	Inclination and Azimuth	*Petroleum Drilling*
inclinational deviation	the difference in inclination between actual and planned well paths, typically at a specific measured depth. Same as msID.	*Petroleum Drilling*
Incline	A slanting shaft.	*Mining*
Incline Conveyor Length	Determined by the elevation change from infeed to discharge versus the degree of incline.	*Manufacturing*
Inclined Conveyor	A conveyor transporting up a slope (to a mezzanine, second level storage area, an overhead line, or other elevated surface).	*Manufacturing*
Inclusion complexes	Crystalline mixtures, not true compounds, in which the molecules of one of the components are contained within the crystal lattice framework of the other component. The framework may be in the form of channels, cages or layers. The two compounds are present in constant but not stoichiometric proportions. Inclusion complexes are also called adducts, or occlusion complexes.	*Material Process*
Inclusion Shape Control	Heats calcium silicon injected at the LMF through a refractory lance (using argon as the carrier gas) into the molten steel bath, reducing sulfur levels to below 0.004 per cent. This also modifies the morphology of inclusions so that they remain globular after rolling. This technique produces steels of superior ductility and hydrogen-induced cracking resistance.	*Steel*
Incoherent	Light source in which the light waves are out of phase.	*Material Process*
Income	a gain in money usually as a result of business or labor	*Agriculture*
Income in Kind	most income received by workers is in the form of money wages.	*Industrial Relations*
Incompatibility	When a mixture of two greases shows physical properties or service performance which are markedly inferior to those of either of the greases before mixing, they are incompatible. Performance or properties inferior to one of the products and superior to the other may not be due to incompatibility.	*Lubrication*
Incompatible fluids	Fluids which when mixed in a system, will have a deleterious effect on that system, its components or its operation.	*Mechanical, Process, and Operations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Incompetent	Applied to strata, a formation, a rock, or a rock structure not combining sufficient firmness and flexibility to transmit a thrust and to lift a load by bending.	*Mining*
Incomplete	Engineering noting a truss the panel points of which are not entirely connected so as to form a system of triangles.	*Civil Engineering*
Incomplete Fusion.	Fusion which is less than complete and which does not result in melting completely through the thickness of the joint.	*Maintenance and Repair*
Incompressible Flow	A fluid such as water, which has no significant change in volume and density as the pressure increases.	*Industrial Engineering*
Incondite	Crudely or poorly constructed or composed	*Breakroom*
Incongruent melting	The case in which the liquid formed upon melting has a different composition than the solid from which it was formed.	*Material Process*
Incorporation of Unions	during the open shop drive of the early twentieth century there was a demand by anti-union forces that workers' organizations be required to incorporate.	*Industrial Relations*
Incremental Cost	An increase in cost between two alternatives. Also see Differential cost.	*Procurement*
Incremental Effects	Annual effects in energy use and peak load caused by new participants in existing DSM programs and all participants in new DSM programs during a given year.	*Energy*
Incremental energy costs	The additional cost of producing and/or transmitting electric energy above some previously determined base cost.	*Energy*
Incremental seat test	The leakage testing of valve seats in an assembled valve by increasing the applied pressure in prescribed pressure steps.	*Mechanical*
Incrustation	The process by which a crust or coating is formed.	*Petroleum Engineering*
Indene	A colorless liquid. A product of the fractional distillation of coal tar, which polymerizes itself or with cumarone to form light colored thermoplastic binding materials.	*Material Process*
Indentation	An indentation (dent) is a plastic depression caused by debris being pressed into a contact surface. Indentations can go hand in hand with (abrasive) wear. Depending on the hardness of the particle, sharp (often with raised edges) or smooth indentations result.	*Maintenance*
Indentured Apprenticeship	a procedure whereby a worker and an employer by means of written instrument agree on a special training program in a particular skill or occupation.	*Industrial Relations*
Indentured Servant	a person who agrees or is required to work for another as a servant.	*Industrial Relations*
Independent	A description of two events, where knowing the outcome or value of one does not inform us about the outcome or value of the other. Formally, two events 'A and B' are independent if the probability that A and B occur together is equal to the probability of A occurring multiplied by the probability of B occurring.	*Quality Engineering*
Independent American Shop	Independent American Shop-American Plan, it was designed to call the attention of workers to their right to work in a trade or business under conditions satisfactory to them without interference on the part of any union.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Independent Consultant	An independent consultant relationship exists when the University does not control either the manner of performance or the result of the service. Independent consultants are individuals not employed by the University, or organizations not a part of the University, with proven professional or technical competence who provide primarily professional or technical advice.	*Procurement*
Independent Contractor	An independent contractor relationship exists when the University has the right to control only the result of the service, not the manner of performance. The following elements are essential to establish the relationship of an independent contractor to its client, as contrasted with the relationship of an agent to its principal. An independent contractor must: (1) exercise independent judgment as to the means used to accomplish the result; (2) be free from control or orders from any other person; and (3) be responsible only under the contract with the client for the result obtained.	*Procurement*
Independent group design	See Parallel group trial	*Quality Engineering*
Independent Labor Federation of America	an organization of employee associations and independent unions which organized in Hershey, Pennsylvania, following a strike by th eCIO in 1937.	*Industrial Relations*
Independent National Union	a labor organization which is not affiliated with the AFL-CIO and is not a company dominated union.	*Industrial Relations*
Independent power producer	A corporation, person, agency, authority, or other legal entity or instrumentality that owns or operates facilities for the generation of electricity for use primarily by the public, and that is not an electric utility.	*Energy*
Independent Power Producer (IPP)	Wholesale electricity producers (other than qualifying facilities under the Public Utilities Regulatory Policies Act of 1978) that are unaffiliated with franchised utilities in the area in which the independent power producers are selling power and that lack significant marketing power. Unlike traditional electric utilities, independent power producers do not possess transmission facilities that are essential to their customers and do not sell power in any retail service territory where they have a franchise. An entity not regulated by the government as a public utility that owns or operates an electricity generating facility and offers wholesale electric power for sale to utilities.	*Energy*
Independent Power Producers (IPPs)	These are private entrepreneurs who develop, own or operate electric power plants fueled by alternative energy sources such as biomass, cogeneration, small hydro, waste-energy and wind facilities.	*Energy*
Independent Suspension	A suspension system in which the front or rear pair of wheels of a car are independently connected to the frame or underbody. In this system, deflection of the wheel on one side has a minimal affect on the wheel on the other side.	*Mechanical Engineering*
Independent Suspension	A suspension system in which the front or rear pair of wheels of a car are independently connected to the frame or underbody. In this system, deflection of the wheel on one side has a minimal affect on the wheel on the other side.	*Mechanical Engineering*
Independent System Operator (ISO)	An ISO is the entity charged with reliable operation of the grid and provision of open transmission access to all market participants on a non-discriminatory basis.	*Energy*
Independent Unions	these are organizations of workers, usually in a single plant or company, which are not affiliated with any national or international union.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Independent Unions; Allied (Ind)	affiliated with the National Independent Union Council.	*Industrial Relations*
Independent Unions; Congress of (Ind)	affiliated with the National Independent Union Council.	*Industrial Relations*
Independent variable	An exposure, risk factor, or other characteristic that is hypothesized to influence the dependent variable. In a clinical trial, the outcome (over which the investigator has no direct control) is the dependent variable, and the treatment arm is the independent variable. In an adjusted analysis, patient characteristics are included as additional independent variables. Also called: Explanatory variable	*Quality Engineering*
Independent Wire Rope Core (IWRC)	A wire rope used as the axial member of a larger wire rope.	*Wire Rope & Cable*
Independent	A company involved only in the exploration and production of oil and gas and possibly in the transportation. An independent will not be involved in the refining of oil.	*Petroleum Drilling*
Index Medicus	Catalogue of the United States National Library of Medicine (NLM), and a periodical index to the medical literature. Available in printed form, or electronically as MEDLINE.	*Quality Engineering*
Index Number	a statistical measure for determining differences in the magnitude of a group of related variables.	*Industrial Relations*
Index of Refraction	See Refractive Index	*Engineering Physics*
Index to Labor Union Periodicals	a monthly subject index to materials from a selected list of newspapers and journals published by major labor unions.	*Industrial Relations*
Indexing	A method of control to obtain predetermined intermittent movements.	*Equipment*
Index-Number Wages	these are wages which vary in accordance with the cost-of-living or some other index agreed upon to provide adjustments either upward or downward with changes in the index number.	*Industrial Relations*
Indian coal lease	A lease granted to a mining company to produce coal from Indian lands in exchange for royalties and other revenues; obtained by direct negotiation with Indian tribal authorities, but subject to approval and administration by the U.S. Department of the Interior.	*Energy*
Indicated coal resources	Coal for which estimates of the rank, quality, and quantity have been computed partly from sample analyses and measurements and partly from reasonable geologic projections. The points of observation are ½ to 1 ½ miles apart. Indicated coal is projected to extend as an ½ mile wide belt that lies more than ¼ mile from the outcrop or points of observation or measurement.	*Mining*
Indicated reserves	See Probable energy reserves.	*Energy*
Indicated resources, coal	Coal for which estimates of the rank, quality, and quantity are based partly on sample analyses and measurements and partly on reasonable geologic projections. Indicated resources are computed partly from specified measurements and partly from projection of visible data for a reasonable distance on the basis of geologic evidence. The points of observation are 1/2 to 1-1/2miles apart. Indicated coal is projected to extend as a 1/2-mile-widebelt that lies more than 1/4 mile from the outcrop, points of observation, or measurement.	*Energy*

Term	Definition	*Industry*
Indication	The response or evidence from the application of a nondestructive examination.5	*Maintenance and Repair*
Indicator	Flow indicator. See Flowmeter.	*Industrial*
Indicator Travel	The length of the path described by the indicating means or the tip of the pointer in moving from one end of the scale to the other.	*Process Control*
Indicator, Differential pressure	An indicator which signals the difference in pressure between two points.	*Mechanical, Process, and Operations*
Indicator, pressure	An indicator that signals pressure conditions.	*Oil Analysis*
Indicolite	A dark blue gem stone variety of tourmaline.	*Material Process*
indigenous	living or occurring naturally in a specific area or environment; native.	*Chemical*
Indirect Cost	Costs not directly related to mining or milling operations, such as overhead, insurance, security, office expenses, property taxes, and similar administrative expenses.	*Energy*
Indirect Heating	Indirect heating typically involves a heat exchanger, in which steam passes across the surface area of the heat exchanger, and the heat is transferred to the substance being heated. The steam never comes into direct contact with the product being heated, and usually some Condensation occurs during the Heat Transfer. Liquid mediums including water and oil can also be used, however indirect heating with steam proves to be more efficient than using water or oil, as it provides even, rapid heating. See also Direct Heating	*Industrial*
Indirect Labor	Indirect Labor - indirect labor includes labor cost which is not specifically charged to any operation or department but is a cost of general plant operation.	*Industrial Relations*
Indirect Labor	The labor costs of janitors, supervisors, materials handlers, and other factory workers that cannot be conveniently traced directly to particular products.	*Procurement*
Indirect Materials	Small items of material such as glue and nails. These items may become an integral part of a finished product but are traceable to the product only at great cost or inconvenience.	*Procurement*
Indirect uses (end-use category)	The end-use category that handles boiler fuel. Fuel in boilers is transformed into another useful energy source, steam or hot water, which is in turn used in other end uses, such as process or space heating or electricity generation. Manufacturers find measuring quantities of steam as it passes through to various end uses especially difficult because variations in both temperature and pressure affect energy content. Thus, the MECS (an EIA survey) does not present end-use estimates of steam or hot water and shows only the amount of the fuel used in the boiler to produce those secondary energy sources.	*Energy*
Indirect Utility Cost	Any cost that is not identified with a specific DSM category such as Administration, Marketing, etc.	*Energy*
Indirect utility cost	A utility cost that may not be meaning fully identified with any particular DSM program category. Indirect costs could be attributable to one of several accounting cost categories (i.e., Administrative, Marketing, Monitoring evaluation, Utility-Earned Incentives, Other). Accounting costs that are known DSM program costs should not be reported under Indirect Utility Cost; those costs should be reported as Direct Utility Costs under the appropriate DSM program category.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Indium chloride (InCl3) (Indium trichloride)	White powder hygroscopic, soluble in alcohol and water.	*Material Process*
Indium gallium arsenide	Ingress Protection. An Ingress Protection (IP) rating indicates how well an enclosure is protected from penetration by contaminants such as dust or fluids (such as water). IP ratings are defined in the IEC standard 60529.	*Electrical Engineering*
Indium gallium arsenide	Ingress Protection. An Ingress Protection (IP) rating indicates how well an enclosure is protected from penetration by contaminants such as dust or fluids (such as water). IP ratings are defined in the IEC standard 60529.	*Electrical Engineering*
Indium sulfate (In2(SO4)3)	Grayish powder deliquescent, soluble in water, decomposed by heat.	*Material Process*
Indium trichloride	See Indium chloride.	*Material Process*
Individual Agreement	the term is similar to the individual contract.	*Industrial Relations*
Individual Bargaining	this term applies to negotiations which take place between a single employee and his employer.	*Industrial Relations*
Individual Employee Grievances	usually refer to the rights of an individual employee under the terms of the collective bargaining agreement.	*Industrial Relations*
Individual ionic activity coefficients	f+ for cation and f- for an anion, cannot be derived thermodynamically. They can be calculated only by using the Debye-Huckel law for low concentration solutions in which the interionic forces depend primarily on charge, radius, and distribution of the ions and on the dielectric constant of the medium rather than on the chemical properties of the ions.	*Electronic Process*
Individual patient data	[In meta-analysis:] The availability of raw data for each study participant in each included study, as opposed to aggregate data (summary data for the comparison groups in each study). Reviews using individual patient data require collaboration of the investigators who conducted the original studies, who must provide the necessary data.	*Quality Engineering*
Individual Rate	the wage rate actually paid to the individual employee as contrasted with the rate for the job set up in the employer's wage or rate structure.	*Industrial Relations*
Indocarbon	Trade mark for sulfur dyestuffs. Used for the dyeing and printing of cotton and rayon. Characterized by very good fastness to light, washing, chlorine, etc.. It does not cause tendering of the fibber.	*Material Process*
Indoil Detergent Alkylate	Trade name for dodecyl-benzene, containing relatively small amounts of higher and lower alkylates. It used for sulfonation to make active ingredient for synthetic detergents.	*Material Process*
Indole (C6H4(CHNH)CH)	White to yellowish scales, turning red on exposure to light and air, odor unpleasant in high concentration but should not show a fecal quality. It is carcinogenic. Soluble in alcohol, ether, hot water, and fixed oils, insoluble in mineral oil and glycerol. It is used in perfumery, medicine and as chemical reagent.	*Material Process*
Indonesia (1962-2008)	Indonesia (1962-2008)	*Energy*
Indonex	Trade mark for heavy process oils and aromatic petroleum derivatives used in rubber processing or plastics and resin in manufacture.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Indopol Polybutenes	Trade mark for synthetic mono-olefins of high molecular weight used in electric insulation, adhesives, caulking compounds, surgical tape, and coating and laminating compositions for paper and other films.	*Material Process*
Induced dipole	A separation of positive and negative centers of charge in an atom due to the coulombic attraction of an adjacent atom.	*Material Process*
Induced draft water cooling tower	Type of mechanical draft tower in which one or more fans are located in the air outlet to induce air flow through the air inlets.	*Facility Engineering*
Induced environments	Conditions generated by operating some equipment, as opposed to natural environments.	*Reliability Engineering*
Induced polarization	A method of ground geophysical surveying employing an electrical current to determine indications of mineralization.	*Mining*
Induction	following an interview and the actual selection of a worker for a job, he is assigned to the actual work place, department, or operation in which he is to perform his regular functions.	*Industrial Relations*
Induction Heating	Heat treatment of completed welds in piping by means of placing induction coils around the piping. This type of heating is usually performed during field erection in those cases where stress relief of carbon- and alloy-steel field welds is required by the applicable code.	*Maintenance and Repair*
Induction Hardening	The localized surface heating of a medium carbon steel by an induction coil so that the temperature is raised above 900oC. The part is quenched (or self-quenches by virtue of the remaining cool bulk of the component) and tempered to produce a hard martensitic structure at the surface.	*Paint and Coatings*
Induction Heating	The heating of a electrically conductive material by an induction coil producing alternating magnetic fields which induce alternating electric currents to flow in the material and cause heating by resistance. Used in many heating process (induction fusing, induction plasma, induction hardening etc..)	*Paint and Coatings*
Induction Period	In an oxidation test, the time period during which oxidation proceeds at a constant and relatively low rate. It ends at the point where oxidation rate increases sharply.	*Lubrication*
Induction Period (Grease Oxidation)	The time during which grease oxidation proceeds at a relatively slow rate (see ASTM D-942).	*Lubrication*
Inductive Kickback	The very rapid change in voltage across an inductor when current flow is interrupted. Snubber diodes are often used to channel this energy in relays, and other inductive loads. Kickback can be a problem (causing EMI and component failure); or it can be used in power supply circuits to develop higher or opposite-polarity voltages from a single supply.	*Electrical Engineering*
Inductive Technology	The technology based on inductance, the property of an electric circuit by which an electromotive force is induced in it by a variation of current, either 1) in the circuit itself, or 2) in a neighboring circuit.	*Electrical Engineering*
Indulin	A Trade mark for an alkali lignin from the manufacture of paper by the sulfate process. Brown, free-flowing powder, insoluble in water and acids, soluble in aqueous alkali. Emulsion stabilization, storage battery plates, foam stabilization, protein precipitation, dyeing, electroplating, rubber reinforcing, rubber masterbatch production, ceramics deflocculating, ceramics binding, dispersing, drilling mud, and others.	*Material Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Indur	A trade name for phenol-formaldehyde molding plastic.	*Material Process*
Indusoil	Trade mark for distilled or fractionated tall oils and tall oil products. Sufix used for further describe products.	*Material Process*
Industrial Accident	a sudden, unforeseen, or unexpected occurrence which results in injury, disability, or death to a person while working at his job.	*Industrial Relations*
Industrial Action	generally refers to the economic strategy used by unions through such devices at picketing, boycotts, or strikes.	*Industrial Relations*
Industrial Agreement	the same as collective bargaining agreement.	*Industrial Relations*
Industrial and Labor Relations Review	a quarterly publication of the New York State School of Industrial and Labor Relations.	*Industrial Relations*
Industrial Assembly of North America	an organization established in 1864, designed to bring together on an national basis various craft unions and groups of lacal trade associations.	*Industrial Relations*
Industrial Classification	categories of industrial groups set up to provide a simple and workable arrangement for separating or classifying groups for statistical analysis.	*Industrial Relations*
Industrial Conflict	a general term designed to describe the broad areas of disagreement and difficulty between labor and management.	*Industrial Relations*
Industrial Democracy	the term is designed to describe the relationship in a plant or industry between representatives of management and labor to provide a procedure for handling basic problems in the plant.	*Industrial Relations*
Industrial Disease	those incapacities which develop on the job due to unhealthy working conditions or the handling of materials which lead to incapacity.	*Industrial Relations*
Industrial Disputes	conflicts in the field of labor-management relations which arise from inability of the parties to resolve their differences.	*Industrial Relations*
Industrial Education	sometimes used as synonymous with industrial training.	*Industrial Relations*
Industrial Effort	the term has reference generally to an employee's motivation and desire to operate at peak or maximum efficiency.	*Industrial Relations*
Industrial Employment	generally refers to employment in productive industries such as processing and manufacturing.	*Industrial Relations*
Industrial Engineering	a term designed to describe the application of engineering techniques and processes to the industrial plant.	*Industrial Relations*
Industrial IT	A series of interoperable software and hardware products and systems from ABB and/or third parties that are designed to communicate with each other and work together as part of a larger system for a specific application.	*Electrical*
Industrial Journalism	the term generally is used to describe plant publications issued by a company dealing with general conditions in the plant and reporting basic operations and activities of the company and its employees.	*Industrial Relations*
Industrial Lubricant	Any petroleum or synthetic-base fluid or grease commonly used in lubricating industrial equipment, such as gears, turbines, and compressors.	*Lubrication*
Industrial Medicine	the extension of medical techniques to the industrial scene designed to prevent and treat illness, and rehabilitate individuals who, because of sickness or injury, are unable to continue their productive employment.	*Industrial vRelations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Industrial minerals	Non-metallic, non-fuel minerals used in the chemical and manufacturing industries. Examples are asbestos, gypsum, salt, graphite, mica, gravel, building stone and talc.	*Mining*
Industrial Mobility	the ability of workers to move from one job to another.	*Industrial Relations*
Industrial Peace	the term is used to describe the relationship between labor and management in which relatively little conflict exists.	*Industrial Relations*
Industrial Physician	the doctor hired by a company to handle the problems relating to the health and care of its employees.	*Industrial Relations*
Industrial production	The Federal Reserve Board calculates this index by compiling indices of physical output from a variety of agencies and trade groups, weighting each index by the Census' value added, and adding it to the cost of materials. When physical measures are not available, the Federal Reserve Board uses the number of production workers or amount of electricity consumed as the basis for the index. To convert industrial production into dollars, multiply by the "real value added" estimate used by the Federal Reserve Board.	*Energy*
Industrial productivity	Raising industrial productivity means lowering costs for each unit (e.g., car, ton of paper, etc.) produced. Manufacturers are under intense pressure to improve productivity and performance to remain competitive, and avoid losing business to more efficient rivals. New technologies and business models are allowing companies to restructure their business processes - things like procurement, manufacturing, research, sales, distribution, and so on - establishing new combinations and locations that enable them to work more closely with partners, suppliers, and customers. Productivity improvements can be achieved by automating operations, improving the asset management, optimizing factories operations, outsourcing, and improving the supply chain management.	*Electrical*
Industrial Psychology	a relatively new and expanding field in the labor-management area.	*Industrial Relations*
Industrial Recreation	one phase of the indutrail environment of the worker.	*Industrial Relations*
Industrial Relations	the term has been defined broadly as dealing with everything that affects the relationship of the individual worker or groups or workers of the employer.	*Industrial Relations*
Industrial Relations Center	organizations, variously known as Centers, Institutes, Labor and Management Programs, which have indicated a major financial interest in the field of industrial relations.	*Industrial Relations*
Industrial Relations Manager	a term commonly used to describe the management official responsible for conduct of his company's relations with unions representing employees.	*Industrial Relations*
Industrial Relations Research Association	a private organization, formed in 1947, to encourage and disseminate research to industrial relations.	*Industrial Relations*
Industrial restrictions (coal)	Land-use restrictions that constrain, postpone, or prohibit mining in order to meet other industrial needs or goals; for example, resources not mined due to safety concerns or due to industrial or societal priorities, such as to preserve oil or gas wells that penetrate the coal reserves; to protect surface features such as pipelines, power lines, or company facilities; or to preserve public or private assets, such as highways, railroads, parks, or buildings.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Industrial Revolution	a term generally applied to the changes which occurred in England roughly between the middle of the 18th century and the first 40 years if the 19th century.	*Industrial Relations*
Industrial sector	An energy-consuming sector that consists of all facilities and equipment used for producing, processing, or assembling goods. The industrial sector encompasses the following types of activity manufacturing (NAICS codes 31-33); agriculture, forestry, fishing and hunting (NAICS code 11); mining, including oil and gas extraction (NAICS code 21); and construction (NAICS code 23). Overall energy use in this sector is largely for process heat and cooling and powering machinery, with lesser amounts used for facility heating, air conditioning, and lighting. Fossil fuels are also used as raw material inputs to manufactured products. Note: This sector includes generators that produce electricity and/or useful thermal output primarily to support the above-mentioned industrial activities. Various EIA programs differ in sectoral coverage.	*Energy*
Industrial Standards	the term is used to describe the actual criteria set up in the plant which are used as measures of performance.	*Industrial Relations*
Industrial Union	a term used to describe the structure of a particular union in relation to company operation.	*Industrial Relations*
Industrial Union Council	CIO counterpart of the AFL central labor council; an organization of former CIO unions in a locality or city.	*Industrial Relations*
Industrial Union Department (AFL-CIO)	one of the subordinate departments of AFL-CIO, concerned with the interests of "industrial" as opposed to "craft" unions.	*Industrial Relations*
Industrial Welfare	those programs which affect the conditions of employment of the individual.	*Industrial Relations*
Industrial Workers	the general term designed to apply to employees engaged in modern industrial operations and to distinguish them from agricultural workers and other groups not engaged primarily in industrial operations.	*Industrial Relations*
Industrial Workers of the World	sometimes known as the IWW or "Wobblies".	*Industrial Relations*
Industrial, Scientific and Medical	Radio frequency bands made available for use by communication equipment without license, within certain maximum emitted power limits. Equipment which uses the ISM band must tolerate interference from other such equipment. Common uses include WiFi (802.11a, b, and g) and cordless phones.	*Electrical Engineering*
Industrial, Scientific and Medical	Radio frequency bands made available for use by communication equipment without license, within certain maximum emitted power limits. Equipment which uses the ISM band must tolerate interference from other such equipment. Common uses include WiFi (802.11a, b, and g) and cordless phones.	*Electrical Engineering*
Industrialization	refers to the changes from agricultural and domestic stages or economic development to the factory or industrial system.	*Industrial Relations*
Inelastic	Not surprisingly, the opposite of elastic. A deformation of a structure or material under load is described as inelastic when the deformation remains after the load is removed. The term plastic is often used with the same meaning.	*Engineering Physics*
Inequities	working conditions, including wages and hours, which are so out of line with those prevailing elsewhere as to warrant adjustment.	*Industrial Relations*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Inert No chemically reactive	Inert No chemically reactive.	*Material Process*
Inertance (or *accelerance*.)	The ratio of acceleration to force.	*Reliability Engineering*
Inertia	The tendency of an object at rest to remain at rest, and of an object in motion to remain in motion.	*Engineering Physics*
Inertial Force	A fictitious force used for convenience in visualizing the effects of forces on bodies in motion. For an accelerating body, the inertial force is considered as a body force whose resultant acts at the object's center of gravity in a direction opposite the acceleration. The magnitude of the force is the mass of the object times the magnitude of the acceleration.	*Engineering Physics*
Inertially-referenced	Motion that is referenced to free space or to a fixed point in space. A sensor (such as an accelerometer) which measures such motion.	*Reliability Engineering*
Infant	Mortality conditional probability of failure during the period immediately after an item returns to service. It is relatively high.	*Reliability Engineering*
Infant Mortality	The Relatively High Conditional Probability Of Failure During The Period Immediately After An Item Returns To Service.	*Plant Engineering*
Infeed End	The end of a conveyor nearest the loading point.	*Manufacturing*
Inferred coal resources	Coal in unexplored extensions of the demonstrated resources for which estimates of the quality and size are based on geologic evidence and projection. Quantitative estimates are based largely on broad knowledge of the geologic character of the deposit and for which there are few, if any, samples or measurements. The estimates are based on an assumed continuity or repletion of which there is geologic evidence; this evidence may include comparison with deposits of similar type. Bodies that are completely concealed may be included if there is specific geologic evidence of their presence. The points of observation are 1 ½ to 6 miles apart.	*Mining*
Inferred reserve base (coal)	the resources in the inferred reliability category that meet the same criteria of bed thickness and depth from surface as the demonstrated reserve base.	*Energy*
Inferred resources	Coal in unexplored extensions of demonstrated resources for which estimates of the quality and size are based on geologic evidence and projection. Quantitative estimates are based largely on broad knowledge of the geologic character of the bed or region and where few measurements of bed thickness are available. The estimates are based primarily on an assumed continuation from demonstrated coal for which there is geologic evidence. The points of observation are 1-1/2 to 6 miles apart. Inferred coal is projected to extend as a 2-1/4-mile wide belt that lies more than 3/4 mile from the outcrop, points of observation, or measurement.	*Energy*
Infield	The area inside the boundary of the track.	*NASCAR*
Infiltration	Flow of water from the land surface into the subsurface.	*Petroleum Engineering*
Infiltration	the downward movement of water through a soil in response to gravity and capillary suction.	*Chemical*
Infiltration gallery	an engineered structure that facilitates infiltration of water into the subsurface. Infiltration galleries may consist of one or more horizontal or vertical perforated pipes, a single gravel-filled trench or a network of such trenches, or a combination of these.	*Chemical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
InfiniBand	InfiniBand architecture is an industry standard, channel-based, switched-fabric, interconnect architecture for servers. InfiniBand architecture changes the way servers are built, deployed, and managed.	*Electrical Engineering*
Inflation	a continuous or persistent upward movement of prices which may develop from such causes as a limited supply of goods and services or an increasing supply of money or credit.	*Industrial Relations*
Influent	The fluid entering a component.	*Oil Analysis*
Informal Complaint	A dispute or disagreement about a utility problem filed by a consumer with the PUC's Customer Protection Division. A Customer Assistance investigator reviews the informal complaint and tries to resolve the dispute. Most responses are in the form of a decision that the customer or company can appeal. If an informal complaint is appealed, it becomes a formal complaint.	*Energy*
Information Management System Group (IMSG)	The Information Management System Group (IMSG) is an advisory group to the CCSG. It is responsible for overseeing the development of any software within the Collaboration that is mandatory to use (for instance, by the editorial bases of all Cochrane Review Groups), and for advising on Collaboration-wide use of other software. Also called: IMSG	*Quality Engineering*
Infrared	Light that has a frequency below the visible light spectrum, used for remote controls, line-of-sight wireless data, and night vision applications, among others.	*Electrical Engineering*
Infrared	Zone of invisible radiations below the red end of the spectrum of visible radiations. Waves are longer and more penetrating than those of light, zone is characterized by heat.	*Material Process*
Infrared (IR)	The invisible radiation (as opposed to visible light) that certain LEDs emit. Standard MICRO SWITCH modulated LED controls have infrared emitting LEDs.	*Electrical Engineering*
Infrared Analysis	A form of absorption spectroscopy that identifies organic functional groups present in a used oil sample by measuring their light absorption at specific infrared wavelengths; absorbance is proportional to concentration. The test can indicate additive depletion, the presence of water, hydrocarbon contamination of a synthetic lubricant, oxidation, nitration, and glycol contamination from coolant. Fourier Transform Infrared (FTIR) permits the generation of complex curves from digitally represented data.	*Lubrication*
Infrared Data Association	A group of device manufacturers that developed a standard for transmitting data via infrared light waves.	*Electrical Engineering*
Infrared spectra	A graph of infrared energy absorbed at various frequencies in the additive region of the infrared spectrum. The current sample, the reference oil and the previous samples are usually compared.	*Oil Analysis*
Infrared Spectroscopy	An analytical method using infrared absorption for assessing the properties of used oil and certain contaminants suspended therein. See FTIR.	*Lubrication*
Infrared thermography	A method used to measure the status of equipment by analyzing the amount of heat it radiates.	*Electrical*
Infrared Thermography	A predictive maintenance technology that involves the estimation of surface temperatures by analyzing the emitted infrared radiation. Thermographic cameras detect radiation in the infrared range of the electromagnetic spectrum (around 900 to 14,000 nanometers or 0.9 to 14 μm) and produce images of that radiation.	*Reliability Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Infusorial earth	A fine powder composed of siliceous skeletons of diatoms, apparent density 0.24 to 0.34 g/cm3 used as a filler for plastics.	*Material Process*
ing oil are mixed with 90 ml. of ASTM preparation naptha and centrifuged under prescribed conditions (ASTM Designation D91-61).	ing oil are mixed with 90 ml. of ASTM preparation naptha and centrifuged under prescribed conditions (ASTM Designation D91-61).	*Mechanical, Process, and Operations*
Ingaunee, i.e., 'ingoing eye',	the mouth of a drift mine; or a coal seam that outcrops at the surface. Also called a 'Day Level'. (Scot.).	*Mining*
Ingested contaminants	Environmental contaminant that ingresses due to the action of the system or machine.	*Oil Analysis*
Ingot	Steel cast in a metal mold ready for rolling or forging. It is distinct from a casting, which is not rolled or forged. Ingots are usually rectangular, called slabs; square, called blooms; polygonal, eight- or 12-sided for forging. Squares and polygonal ingots can be fluted or corrugated to increase the surface area and reduce the tendency to crack while cooling.	*Metallurgy*
Ingression level	Particles added per unit of circulating fluid volume.	*Oil Analysis*
Inherent Diaphragm Pressure	The high and low values of pressure applied to the diaphragm to produce rated valve plug travel with atmospheric pressure in the valve body.	*Industrial Engineering*
Inherent Flow Characteristic	The relationship between valve capacity and valve travel – usually expressed graphically. It is derived from testing a valve with water as the fluid and with a constant pressure drop across the valve. The most common types of inherent flow characteristics are linear, equal percentage, modified parabolic, and quick opening.	*Industrial Engineering*
Inherent imprecision, inherent random error	The standard deviation or coefficient of variation of the results in a set of replicate measurements obtained when the measurement procedure is operating under stable conditions.	*Quality*
Inherent Reliability	A measure of the reliability of an item, in its present operating context, assuming adherence to ideal equipment maintenance strategies.	*Reliability Engineering*
Inherent Safety	A concept particularly used in the chemical and process industries. An inherently safe process has a low level of danger even if things go wrong. It is used in contrast to safe systems where a high degree of hazard is controlled by protective systems	*Reliability Engineering*
Inhibitor	A substance which is added to another substance to prevent an unwanted chemical reaction from occurring.	*Chemical*
Inhibitor	Inhibitors are substances that reduce or eliminate the aggressiveness of a corrosive medium and are either already contained in the corrosive medium or are specifically added to it. A substance, used in small concentrations, that decreases the rate of corrosion in a given environment. Checks or stops a chemical reaction. Used in monomers and resins to prolong storage life.	*Material Process*
INHIBITOR	Additive used to prevent or retard undesirable changes in the quality of the product, or in the condition of the equipment in which the product is used.	*Petroleum Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
In-house Demand-Side Management (DSM) program sponsor	The building's owner or management encourages consumers in the building to improve energy efficiency, reduce energy costs, change timing or energy usage, or promote the use of a different energy source by sponsoring its own DSM programs.	*Energy*
Initial enrichment	Average enrichment for a fresh fuel assembly as specified and ordered in fuel cycle planning. This average should include axial blankets and axially and radially zoned enrichments.	*Energy*
Initial operation	First availability of a newly constructed unit to provide power to the grid. For a nuclear unit, this time is when the Full Power Operating License for the unit is received.	*Energy*
Initial public offering	The first sale of shares to the public, usually by subscription from a group of investment dealers.	*Mining*
Initial Spurt	the amount of effort expended at the beginning of a work period.	*Industrial Relations*
Initial Unbalance	Initial unbalance is that unbalance of any kind that exists in the rotor before balancing.	*General Engineering*
Initial Unbalance	Initial unbalance is that unbalance of any kind that exists in the rotor before balancing.	*Electronic Process*
Initiation Fee	a fee charged by a union as a condition to acquiring membership in the union.	*Industrial Relations*
Initiator	Peroxide used as initiator of free radicals by abstracting hydrogen from polymer backbone. They are used in free-radical polymerizations, curing thermosetting resins, as crosslinking agents for elastomers and polyethylenes, and for polymer modification.	*Engineering Physics*
Injection Blow Molding	Plastic melt is injected as a parison into a preform cavity forming the preform around a core rod. A completely finished injection molded neck is formed at this station. The preform is then transferred to a blow station where it is blown through an opening in the core rod and into the final shape.	*Engineering Physics*
Injection Mold	A mold used in the process of injection molding. The mold usually comprises two sections held together by a clamping device with sufficient strength to withstand the pressure of the molten plastic when injected, and is provided with channels for heating, cooling, and venting.	*Engineering Physics*
Injection Molding	Injection molding is a repetitive process in which plastic is melted or plasticated, and injected into a mold. With thermoplastics the mold is kept at a temperature below the solidifying point of the plastic, causing the injected polymer to freeze, thus forming the article. After cooling, the mold opens and the article is ejected.	*Engineering Physics*
Injection molding	Processing technique for thermoplastic polymers. A molding procedure whereby a heat softened plastics material is forced into a relatively cool mold which gives the desired shape to the finished article.	*Material Process*
Injection Pressure	Pressure applied to the injection ram to force the plastic from the barrel and into the mold (measured in psi or Mpa).	*Engineering Physics*
injection well	a well used to inject under pressure a fluid (liquid or gas) into the subsurface.	*Chemical*
Injection well	A well employed for the introduction into an underground stratum of water or gas under pressure. Injection wells are employed for the disposal of produced water from oil and gas wells.	*Petroleum Drilling*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Injection well	A well used for pumping water or gas into the reservoir.	*Petroleum Drilling*
Injunction	a prohibitory writ issued by a court to restrain an individual or a group from committing an act that is regarded as inequitable so far as the rights of some other person are concerned.	*Industrial Relations*
Ink Jet Printers	Controlled jets of ink spray from nozzles to form image.	*Gears*
Inland Steel Co. v. NLRB	decision upholding the NLRB ruling that inland steel company was required to bargain with the Steelworkers Union with respect to retirement and pension matters.	*Industrial Relations*
Inlay	A form of weld metal deposit, where the weld deposit fills a ring groove or other cavity. A Corrosion Resistant Alloy weld metal is deposited in oversize ring grooves then machined to accept Ring Gaskets.	*Petroleum Engineering*
Inlet	Allows groundwater to enter the well, and may be a slotted well screen in overburden aquifers, or an open hole in bedrock.	*Petroleum Engineering*
Inlet air	(See Entering Air).	*Facility Engineering*
Inlet connection	Fitting to which the circulating water supply piping is connected to serve the tower distribution system. Also known as Inlet Flange.	*Facility Engineering*
INLET PORT	That end of a valve which is connected to the upstream pressure zone of a fluid system.	*Mechanical*
Inlet well	a well through which a fluid (liquid or gas) is allowed to enter the subsurface under natural pressure.	*Chemical*
Inlet wet-bulb temperature	The average of the wet-bulb temperature obtained from several stations located on both the windward and leeward sides of the tower.	*Facility Engineering*
In-line filter	A filter assembly in which the inlet, outlet and filter element axes are in a straight line.	*Oil Analysis*
In-line Inspection	A task carried out to determine the condition of a pipeline while still in use/operation.	*Reliability Engineering*
in-line rotameter	a flow measurement device for liquids and gases that uses a flow tube and specialized float. The float device is supported by the flowing fluid in the clear glass or plastic flow tube. The vertical scaled flow tube is calibrated for the desired flow volumes/time.	*Chemical*
Inner seat ring	The inner part of a two-piece valve seat assembly.	*Mechanical*
Inner Wires	All wires of a strand except the outer or cover wires.	*Wire Rope & Cable*
Inner liner	The layers of low permeability rubber, which are laminated to the inside of a tubeless tire to insure that air retention quality of the tire body.	*Mechanical Engineering*
Inner liner	The layers of low permeability rubber, which are laminated to the inside of a tubeless tire to insure that air retention quality of the tire body.	*Mechanical Engineering*
inoculate	to implant microorganisms onto or into a culture medium.	*Chemical*
Inomer	Thermoplastic that combines transparency with toughness, particularly at low temperatures. The polymer's main component is ethylene but it contains both inorganic and organic materials linked by both covalent and ionic bonds. Film is used in skin packaging.	*Engineering Physics*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Inoperable capacity	Generating capacity that is totally or partially out of service at the time of system peak load, either for scheduled outages (see GADS definition of "scheduled outages." These include both maintenance outages and planned outages.) or for reasons such as environmental restrictions; extensive modifications or repair; or capacity specified as being in a mothballed state. This does not include derated portions of generating capacity.	*Energy*
Inorganic Chemicals	A category of chemicals that do not include carbon and its derivatives as principal elements.	*Chemical*
Inorganic Thickener	See Non-Soap Thickener	*Lubrication*
Inositol (C6H6(OH)62H2O) (hexahydroxycyclohexane)	A constituent of body tissue. There are 9 isomeric forms of inositol, which i-inositol (myo-inositol or meso-inositol) is the only one having vitamin activity. It appears to prevent alopecia, promote growth, have lipotropic activity, influence gastro-intestinal motility, and to prevent the deposit of cholesterol in the liver. White crystals, odorless, sweet taste, soluble in water, insoluble in absolute alcohol and ether.	*Material Process*
In-place resource (resource potential)	The quantity of oil or gas remaining in known accumulations plus those quantities already produced from known accumulations plus those quantities in accumulations yet to be discovered.	*Petroleum Engineering*
In-plant defect rate	The fallout rate, parts per million (ppm), of all components in manufacturing and assembly that fail quality tests at any point in the production process.	*Quality*
Input	The mechanical motion, force or energy applied to a mechanical system, *e.g.* the vibratory input from shaker to test item. Or an electrical signal, *e.g.* from a shaker controller to the power amplifier driving a shaker.	*Reliability Engineering*
Input	1) The device or collective set of devices used for bringing data into another device; 2) The signal or stimulus put into a circuit to make the output do something.	*Electrical Engineering*
Input Back-Off	In a power amplifier, a measure of how far you must reduce the input power in order to receive the desired output linearity and power. Stated differently, the ratio between the input power that delivers maximum power to the input power that delivers the desired linearity.	*Electrical Engineering*
Input control signal	Originates in a control sensor; sometimes selected between or averaged between several sensors. Used to regulate shaker intensity. (May originate in a force sensor for force-controlled testing.)	*Reliability Engineering*
Input Impedance	The resistance of a panel meter as seen from the source. In the case of a voltmeter, this resistance has to be taken into account when the source impedance is high; in the case of an ammeter, when the source impedance is low.	*Electrical*
Input Impedance	The impedance (presented to the excitation source) measured across the excitation terminals of a sensor.	*Electrical Engineering*
Input Impedance -	The resistance of a panel meter as seen from the source. In the case of a voltmeter, this resistance has to be taken into account when the source impedance is high; in the case of an ammeter, when the source impedance is low.	*Electronic Process*
Input Resistance (Impedance)	The input resistance of a pH meter is the resistance between the glass electrode terminal and the reference electrode terminal. The potential of a pH-measuring electrode chain is always subject to a voltage division between the total electrode resistance and the input resistance.	*Electronic Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Input Resistance (Impendance)	The input resistance of a pH meter is the resistance between the glass electrode terminal and the reference electrode terminal. The potential of a pH-measuring electrode chain is always subject to a voltage division between the total electrode resistance and the input resistance.	*General Engineering*
Input Signal Duration	A length of time the light beam is blocked (in dark operated mode), or uninterrupted (in light operated mode). Or, the length of time a target is within the operating range.	*Electrical Engineering*
Inputs	the amount of energy and money put into a farm in order to make a product	*Agriculture*
Inrush	a sudden, unexpected large make of water or other flowing material, such as sand or peat, into the mine, very often of serious proportions, causing casualties and disruption to coal production.	*Mining*
Inrush Current	A momentary input current surge, measured during the initial turn-on of the power supply. This current reduces to a lower steady-state current once the input capacitors charge. Hotswap controllers or other forms of protection are often used to limit inrush current, because uncontrolled inrush can damage components, lower the available supply voltage to other circuits, and cause system errors.	*Electrical Engineering*
Inrush Current	A momentary input current surge, measured during the initial turn-on of the power supply. This current reduces to a lower steady-state current once the input capacitors charge. Hotswap controllers or other forms of protection are often used to limit inrush current, because uncontrolled inrush can damage components, lower the available supply voltage to other circuits, and cause system errors.	*Electrical Engineering*
Insecticide	a type of pesticide that kills insects	*Agriculture*
Insert	An article of metal or other material which is incorporated into a plastic molding either by pressing the insert into the finished molding or by placing the insert in the cavity so that it becomes an integral part of the molding.	*Engineering Physics*
Inserts	Integral parts, usually of metal, of a finished molded plastics article, set in position during the molding operation.	*Material Process*
Inset	the entrance to underground roadways at the bottom or part way down the shaft where the cages are loaded and there is access for men and materials. Also called a 'porch'.	*Mining*
Inside Organizer	the term refers generally to a union organizer who is an employee of the company whose workers he is seeking to organize.	*Industrial Relations*
Inside-mounted Seal	A mechanical seal located inside the seal chamber with the pumped product's pressure at its O.D.	*Lubrication*
Inside-out air seat test	A pressure test that can be performed only on independent seating trunnion mounted ball valves. By closing the valve and pressurizing the body cavity, all of the seals in an independent seating ball valve can then be pressure tested.	*Mechanical*
Insitu maintenance	To maintain or repair a product "in its original place," such as a top entry ball valve or regulator.	*Mechanical*
Insoluble	not soluble; in capable or difficult of being dissolved, as by liquid; as, chalk is insoluble in water	*Materials Process*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Insolubles	Contaminants found in used oils due to dust, dirt, wear particles or oxidation products. Often measured as pentane or benzene insolubles to reflect insoluble character.	*Lubrication*
Inspection	Any task undertaken to determine the condition of equipment, and/or to determine the tools, labor, materials, and equipment required to repair the item.	*Maintenance*
Inspectors	In a maintenance sense the term refers to the nominated person(s) that has primary responsibility for maintenance tasks. Inspectors can be members of the maintenance department or any other department (machine operators, drivers, security officers, custodians, etc).	*Maintenance*
Installed capacity	The total generating units' capacities in a power plant or on a total utility system. The capacity can be based on the nameplate rating or the net dependable capacity.	*Energy*
Installed Flow Characteristic	The flow characteristic when the pressure drop across the valve varies with flow and related conditions in the system in which the valve is installed. The purpose of characterizing a control valve is to help compensate for nonlinearities in the control loop.	*Industrial Engineering*
Installed nameplate capacity	See Generator nameplate capacity (installed).	*Energy*
Instantaneous Centre Of Rotation	The point in space that an eccentrically shear loaded joint rotates about. The deformation and the load sustained by an individual bolt in a bolt group is dependent upon the distance that the bolt is from the instantaneous centre. The direction that the individual bolt force acts is perpendicular to a line joining that bolt to the instantaneous centre.	*Maintenance*
Instantaneous peak demand	The maximum demand at the instant of greatest load.	*Energy*
Instantaneous water heater	Also called a "tankless" or "point-of-use" water heater. The water is heated at the point of use as it is needed.	*Energy*
Instar	- The insect itself during the time between molts in the larva or nymph, numbered to designate the various periods; i.e., the first instar is the insect between the egg and first molt.[1]	*Forestry*
Institute of Radio Engineers	IREs are units of measurement dividing the area from the bottom of sync to peak white level into 140 equal units.	*Electrical Engineering*
Institute of Radio Engineers	- IREs are units of measurement dividing the area from the bottom of sync to peak white level into 140 equal units.	*Electrical Engineering*
Institutional investors	Pension funds and mutual funds, managing money for a large number of individual investors.	*Mining*
Institutional living quarters	Space provided by a business or organization for long-term housing of individuals whose reason for shared residence is their association with the business or organization. Such quarters commonly have both individual and group living spaces, and the business or organization is responsible for some aspects of resident life beyond the simple provision of living quarters. Examples include prisons; nursing homes and other long-term medical care facilities; military barracks; college dormitories; and convents and monasteries.	*Energy*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Instrinsic Semiconductor	A semiconductor material for which the electrical behavior is characteristic of the pure material.	*Engineering Physics*
Instrument Piping	All piping, valves, and fittings used to connect instruments to main piping, to other instruments and apparatus, or to measuring equipment.	*Maintenance and Repair*
Instrument transformer	In contrast to most transformers (which are used to convert power), instrument transformers are components of devices used for measurement or monitoring (e.g., to measure voltage or current in transmission lines). As they do not actually transform any significant quantities of energy they are usually small and lightweight.	*Electrical*
Instrumentation	Electronic or electromechanical devices, often referred to as meters, used to measure the flow, level, temperature and pressure of processes in different industrial applications. They monitor processes in power generation, manufacturing and refining plants. Information collected by various instruments is processed by analyzers and used to assess performance, sending alerts if readings are not as expected.	*Electrical*
Insulated Junction	See Ungrounded Junction	*Electrical*
Insulated Junction	See Ungrounded Junction	*Electronic Process*
Insulating oils (electrical oils)	Oils used as insulators and cooling medium in transformers, circuit-breakers, switches or other electric apparatus.	*Material Process*
Insulation	Any material or substance that provides a high resistance to the flow of heat from one surface to another. The different types include blanket or batt, foam, or loose fill, which are used to reduce heat transfer by conduction. Dead air space is an insulating medium in storm windows and storms as it reduces passage of heat through conduction and convection. Reflective materials are used to reduce heat transfer by radiation.	*Energy*
Insulation around heating and/or cooling ducts	Extra insulation around the heating and/or cooling ducts intended to reduce the loss of hot or cold air as it travels to different parts of the residence.	*Energy*
Insulation around hot-water pipes	Wrapping of insulating material around hot-water pipes to reduce the loss of heat through the pipes.	*Energy*
Insulation around water heater	Blanket insulation wrapped around the water heater to reduce loss of heat. To qualify under this definition, this wrapping must be in addition to any insulation provided by the manufacturer.	*Energy*
Insulation Resistance	The resistance measured between two insulated points on a transducer when a specific dc voltage is applied at room temperature.	*Electronic Process*
Insulation Resistance	The resistance measured between specified insulated points on a sensor when a specified DC potential is applied at room conditions.	*Electrical Engineering*
Insulator	A material that is a very poor conductor of electricity. The insulating material is usually a ceramic or fiberglass when used in the transmission line and is designed to support a conductor physically and to separate it electrically from other conductors and supporting material.	*Energy*
Insulator	A material that does not conduct electric current, such as plastic, some kinds of silicon or glass. The term can also refer to a material that does not conduct heat. For clarity, the terms thermal insulator and electrical insulator may be used. (See also Conductor.)	*Electrical*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Insulator (electrical)	A nonmetallic material that has filled valence band at 0 K and a relatively wide energy band gap.	*Engineering Physics*
Insulin (C45H69O14N11S 3H2O)	The pancreatic hormone which greatly increases the combustion of sugar and leads to a reduction of the amount of glucose in the blood, a systematic deficiency of which is the cause of diabetes. White powder, amorphous or crystalline, soluble in water.	*Material Process*
Insurance Plan	a contract generally agreed to between an insurance company and the employer which covers the employees of a company.	*Industrial Relations*
Insurance, Unemployment -	an insurance system whereby workers who are able and willing to work, and who are unemployed through no fault of their own are given a percentage of their earnings during the period they are out of work.	*Industrial Relations*
Insurance, Workmen's Compensation	insurance plans which are required by law whereby the employer insures his workers against industrial accidents and occupational diseases.	*Industrial Relations*
Insured Plan	generally a life or other medical or heath plan which is funded though an insurance company.	*Industrial Relations*
Insured Population	that part of the work force which is covered by unemployment insurance and is eligible for payments when they meet the requirements for unemployment benefits under existing law.	*Industrial Relations*
Insurok	A series of laminated and molding plastics characterized by durability, lightweight, resistance to many chemicals, and high dielectric strength. These plastics have use as a replacement for cast aluminum in airplane parts and for electric uses as switches, distributors, commutators, etc.	*Material Process*
Industrial Hygiene	those aspects of medicine which apply to the environment in the plant or factory and in any way affect the well-being, health, and medical safety of workers.	*Industrial Relations*
Intake	any roadway underground through which the fresh air from the downcast is conducted to the working faces.	*Mining*
Intake	The passage through which fresh air is drawn or forced into a mine or to a section of a mine.	*Mining*
Intake Section	The lower part of the well, which lets water in, while keeping aquifer materials out.	*Petroleum Engineering*
Intangible drilling and development costs (IDC)	Costs incurred in preparing well locations, drilling and deepening wells, and preparing wells for initial production up through the point of installing control valves. None of these functions, because of their nature, have salvage value. Such costs would include labor, transportation, consumable supplies, drilling tool rentals, site clearance, and similar costs.	*Energy*
Intangible Transition Charge	The amounts on all customer bills, collected by the electric utility to recover transition bond expenses.	*Energy*
Intarvin ((C16H33COO)3 C3H5)	White lumpy masses, odor and taste of tallow, insoluble in water, freely soluble in chloroform or ether.	*Material Process*
Integral	A form of temperature control. See Automatic Reset, #2	*General Engineering*
Integral	A form of temperature control. See Automatic Reset, #2	*Electronic Process*
Integral (Reset) Control	A control algorithm which at- tempts to eliminate the offset (caused by proportional control) between the measurement and setpoint of the controlled process variable. See also "Control Action, Integral (Reset)."	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Integral Windup/ Windown	Also called "controller windup/windown" or "reset windup." Saturation of the controller output at its maximum positive or negative value due to an error signal existing for an excessive period of time. Can be caused by the controller being left on "automatic" when the measurement transmitter is out of service.	*Electrical Engineering*
Integral (Reset) Time	The proportionality constant in the equation relating the controller output to the error for integral control CO = Ki (PV – SP) dt. Where - Ki = Kp/Ti. Kp is the integral gain of the controller. Ti is the time required to produce a change in controller output equal to the change in error input.	*Electrical Engineering*
Integral Action	The "I" part of the PID controller. With integral action, the controller output is proportional to the amount and duration of the error signal. If there is more integral action, the controller output will change more when error is present. If your units on integral are in "time/rep" or "time" then decreasing your integral setting will increase integral action. If your units on integral are in "rep/time" or "1/time" then increasing your integral setting increases integral action.	*Process Control Engineering*
Integral Action Rate (Reset Rate)	Of proportional plus integral or proportional plus integral plus derivative control action devices, for a step input, the ratio of the initial rate of change of output due to integral control action to the change in steady-state output due to proportional control action. Note: Integral action rate is often expressed as the number of repeats per minute because it is equal to the number of times per minute that the proportional response to a step input is repeated by the initial integral response.	*Process Control*
Integral collector storage (ICS)	A solar thermal collector in which incident solar radiation is absorbed directly by the storage medium.	*Energy*
Integral Fastener	A term used to describe types of fasteners which are highly resistant to vibration loosening and/or removal. Some types have special thread forms.	*Maintenance*
Integral Flange	A valve body whose flange connection is an integral or cast part of the body. Valves with integral flanges were traditionally known to have the ANSI short face-to-face dimension ANSI/ISA S75.03. However, many manufacturers now produce valve bodies with both integral and separable flanges that will meet both the ANSI short and long face-to-face dimensions.	*Industrial Engineering*
Integral nonlinearity	Input CMVR (V) Common-mode voltage range (CMVR) or Input Voltage Range (IVR): For signal processing devices with differential inputs, such as an op amp, CMVR is the range of common mode signal for which the amplifier's operation remains linear. If we let the voltage present on the "-" input equal V1, and the voltage on the "+" input equal V2, then the common mode voltage is VCM = (V1+V2)/2.	*Electrical Engineering*
Integral Nonlinearity	A measure of a data converter's ability to adhere to an ideal slope in its transfer function. It can be specified using end-point or best-straight-line fit. Each of these approaches can yield very different numbers for the same data converter.	*Electrical Engineering*
Integral Seat	The flow control orifice and seat that is an integral part of the valve body or cage. The seat is machined directly out of the valve body and is normally not replaceable without replacing the body itself – although some can be repaired by welding and re-machining.	*Industrial Engineering*
Integrated circuit	A semiconductor device that combines multiple transistors and other components and interconnects on a single piece of semiconductor material.	*Electrical Engineering*

Please see the Appendix for further illustration

Term	Definition	*Industry*
Integrated Circuit (IC)	An interconnected array of active and passive elements integrated within a single semiconductor substrate or other compatible material, and capable of performing one complete electronic function.	*Electrical Engineering*
Integrated circuit (IC)	A sophisticated electrical circuit produced by the application of precise patterns of diffusable n-type and p-type dopants to give numerous elements within a single crystal chip.	*Material Process*
Integrated Company	A company involved in virtually all aspects of the oil and gas industry including exploration, production, transportation, refining and marketing. These companies are also referred to as major oil companies.	*Petroleum Drilling*
Integrated demand	The summation of the continuously varying instantaneous demand averaged over a specified interval of time. The information is usually determined by examining a demand meter.	*Energy*
Integrated electronic component	IEEE From www.ieee.org: "The IEEE (Eye-triple-E) is a non-profit, technical professional association of more than 360,000 individual members in approximately 175 countries. The full name is the Institute of Electrical and Electronics Engineers, Inc., although the organization is most popularly known and referred to by the letters I-E-E-E." IEEE also sponsors many electrical and electronic standards.	*Electrical Engineering*
Integrated gasification-combined cycle technology	Coal, water, and oxygen are fed to gasifier, which produces syngas. This medium-Btu gas is cleaned (particulates and sulfur compounds removed) and is fed to a gas turbine. The hot exhaust of the gas turbine and heat recovered from the gasification process are routed through a heat-recovery routed through a heat-recovery generator to produce steam, which drives a steam turbine to produce electricity.	*Energy*
Integrated Heat Spreader	An Integrated Heat Spreader (IHS) is the surface used to make contact between a heatsink or other thermal solution and a CPU or GPU processor.	*Electrical Engineering*
Integrated Heat Spreader	An Integrated Heat Spreader (IHS) is the surface used to make contact between a heatsink or other thermal solution and a CPU or GPU processor.	*Electrical Engineering*
Integrated Maintenance SolutionsTM (IMS)	A long-term SKF contract (2 years +) that is generally performance-based. It includes key process actions known internally as the "8 Steps to Maintenance Heaven." An IMS contract brings together all areas of expertise offered by SKF, establishing a continuous process of maintenance monitoring, analysis and improvement. It provides a planned skills transfer program for maintenance and operations personnel, and technology upgrades where required. The services and support best suited to optimize asset efficiency and integrity (safety and environment) are all included under one fixed fee performance based agreement.	*Maintenance*
